Perhaps the empirical evidence regarding the impact of community policing on quality of life can best be summarized in three precepts. First, community residents have to know that the police are reaching out to them; the efficacy of this program depends upon citizens seeing the efforts that police are making. Second, citizens must be satisfied with what the police are doing and with the means by which they are seeking to accomplish those ends. To reduce fear, police must employ community-based efforts that inspire confidence and trust from citizens. Third, the implementation effort must be genuine and involve real structural and operational change. A halfhearted program may help an organization project the "proper" image as a department that engages in community-based practices, but it will be an entirely value-based effort with no impact on task performance (see Mastrofski and Ritti 2000).

Place-Based Problem-Oriented Policing to Reduce Crime

Problem-oriented policing (POP; e.g., Goldstein 1990) possesses the inherent advantage of conforming to the myth of the crime-fighting mandate. The merit of POP's end goal is self-evident and requires no additional rationalization to the public, politicians, or other constituencies. The worthiness of its means does require justification because they depart from – and even conflict with – the normative model of policing as driven by calls for service, or what critics have derisively called the "tyrannical force" of 911 (Goldstein 1990: 19). Repeatedly underscoring the crime-based focus of POP, though, would likely help a police organization justify the redistribution of resources and the alleviation of some officers from calls-for-service duty so that they can devote their time to the scanning, analysis, response, and assessment (SARA) model that has become the catchphrase of POP.

Problem-oriented policing furthers the task-based institutional legitimacy of police because this program seems to be promising for effectively reducing crime. Braga and Bond (2008) found that even a cursory or "shallow" (p. 585) SARA-based problem-solving effort by a municipal police department significantly reduced serious crime (as measured by calls for service) and several types of disorder (as recorded during systematic social observation) in the areas receiving the POP treatment. These reductions in the target areas were not accompanied by significant increases in problems in other beats in the city. Also, place-based situational crime reduction (e.g., fencing off vacant lots, installing street lighting or surveillance cameras) demonstrated a stronger impact on reported crime than did increases in misdemeanor arrests or social service provisions (see also Lum et al. 2011).

Policies

The previous section proposed two programmatic models that hold promise for enhancing the institutional legitimacy of police. The current section describes three organizational policies that may guide officers toward positive behaviors and away from negative ones. Policies delimit the boundaries of acceptable behavior, set expectations for performance, and prescribe penalty schedules for poor conduct. It is worth noting that although the policies described here are formal in nature, their success depends upon them being reinforced informally by police executives and managers during the day-to-day communications and operations within the organization.

Prohibiting Nonfeasance to Promote Collective Responsibility

One of the most infamous aspects of the traditional police culture is the reluctance or outright refusal of officers to come forward when they have incriminating knowledge about their workmates. Within this "code of silence" or "blue wall of silence," there is a hesitance to report instances of misbehavior and to provide information during active investigations (Klockars et al. 1997). The "bad apple" myth that ascribes total blame for misconduct to the offending officers dishonestly covers up the fact that in all likelihood, somebody (possibly several people) knew what was happening and failed to take action to stop it. A strong code of silence can contribute to legitimation crises, as the public comes to see the police badge as a symbol of nepotism, corruption, and impunity.

Police organizations should thus openly and actively address the problem of nonfeasance. It should be made clear that failing to report someone else's misbehavior is as morally and ethically indefensible as is engaging in such action oneself, and that acts of nonfeasance will be discovered and penalized. Routine investigations that are mandated by department policy (e.g., after any officer-involved shooting) and investigations into possible misconduct should seek to determine not only the propriety of the acting officers' behaviors but – if the action is deemed improper – whether other officers failed to intervene to prevent it, failed to report it, or actively assisted in its attempted concealment.

Beyond establishing formal policies penalizing nonfeasance, police leaders should seek to reshape the cultural landscape to effect rejection of the code of silence. In its stead, leaders should foster a culture of mindfulness (King 2009) that instills within every officer a sense of collective responsibility (see Harcourt 2004). Officers should be socialized to see the bad acts of fellow officers as a threat to the safety, authority, and reputation of all other officers and to the image of the department.

Interaction-Based Procedural Justice to Enhance Public Trust and Voluntary Compliance

The two foregoing policies involve intraorganizational methods of promoting positive police behavior and preventing or penalizing misconduct. A third goal involves enhancement of public trust in and deference to the police. This policy entails strategic management of the ways in which officers interact with civilians. This might be analogized to an "officer persona" that emphasizes certain key elements of officer-civilian interaction that should be present in all encounters with members of the public.

People who trust the police are less likely to believe that officers engage in illegal or unethical behavior, and they are more willing to empower them to utilize discretionary decision making (Sunshine and Tyler 2003). The need for autonomy in the day-to-day decisions made at the street level is one of the institutional myths that police have created as a means of insulating themselves from public scrutiny (Crank and Langworthy 1992). A belief in the power and authority of police, moreover, helps ensure the "continued deference of citizens to police authority in the absence of specific demands, commands, or laws" that is so central to the continued existence of police (Manning 1988: 29).

A sizable body of research demonstrates the importance of interaction-based procedural justice on people's support for the police and willingness to obey their directions and commands. Encounter-based justice refers to people's perceptions of the favorableness of the outcome they receive at the close of the encounter (e.g., a citation versus a warning) and the fairness of the decision-making process by which police arrive at the conclusion that the administered outcome is the most appropriate of all options available. Research has shown that process-based fairness rivals or, in some cases, even outweighs outcome favorableness in shaping people's judgments about police (Rosenbaum et al. 2011b; Sunshine and Tyler 2003). This has become known as the procedural justice model of policing.

Procedural justice entails two types of assessments that people make about the actions of officers (e.g., Gau 2011). The first pertains to whether officers treat citizens respectfully and allow them to voice their version of the facts under dispute. The second revolves around people's beliefs as to whether officers make decisions on the basis of facts and not upon their personal beliefs, biases, or whims. This type of procedural justice can also be conceptualized as transparency of decision making. Procedural justice is strongly linked with people's trust and confidence in police and their beliefs that police possess the moral authority to represent social order and to enforce the law as needed to regulate public spaces.

Procedural justice during police-public contacts can enhance the likelihood of respect and compliance by citizens. Studies suggest that police disrespect toward civilians (i.e., a violation of procedural justice expectations) increases citizen disrespectfulness toward officers (Dai et al. 2011) and makes it less likely that citizens will comply with officer commands (Mastrofski et al. 1996; McCluskey et al. 2000). Officer respectfulness (McCluskey et al. 2000) and consideration of the citizen's point of view (Dai et al. 2011) enhance the likelihood of compliance. A procedural justice policy, therefore, could result in better police-civilian interactions and in fewer threats to officer safety and authority.

The procedural justice model of policing represents a subtle but firm subversion of the crime-fighting myth. The latter maintains that the amount of legitimacy possessed by the institution is contingent upon clearance rates, crime rates, and deterrent impact. Tyler (2006) has called this the "instrumental perspective" (p. 3). Research shows, however, that people's trust in police is based less on instrumental concerns about police effectiveness than on the perception that police treat people fairly and respectfully during encounters (Sunshine and Tyler 2003; Tyler 2006). The myth of police as detached, legalistic crime fighters may, moreover, actually be counterproductive during face-to-face interactions. Mastrofski et al. (1996) found that use of force by an officer during an encounter made it less likely that the citizen would comply with the officer's commands. The crime-fighting myth, therefore, can actually impede effective and efficient police work, while simultaneously failing to maximize institutional legitimacy. It is time for police leaders to transition from traditional measures of effectiveness (e.g., numbers of arrests and citations) toward new assessment methods, such as community satisfaction surveys, that capture a more holistic picture of the ways in which officers interact with the public (Rosenbaum et al. 2011b).

Selection and Training

Any police organization is only as good as the people it hires and the procedures with which it trains them. Demanding selection standards help weed out those who are at risk for poor performance or serious misconduct. Training introduces new recruits to the rules, ethics, and cultural values of the organization. This section proposes two strategies for helping to ensure that personnel are of high quality. As in the foregoing sections, this list is merely an example of a few of many strategies that could and should be explored.

Education Requirements to Professionalize Policing

The rationale for recommending that police organizations implement a degree requirement rests on the distinction between a profession and a trade or craft (e.g., Wilson 1968). Professions are regulated occupations that require applicants to meet formal educational requirements before they become eligible for the job. Crafts, by contrast, have "no body of generalized, written knowledge nor a set of detailed prescriptions as to how to behave—it has in short, neither theory nor rules" (Wilson 1968: 283). This idea is analogous to the debate over whether the hiring process should seek merely to select out poor candidates or, conversely, whether the focus should be on identifying and selecting in the most qualified. A profession selects in, while a craft merely selects out.

Policing has been a craft since its inception in the United States; its hiring requirements have traditionally been low, and it has relied heavily upon on-the-job training (Wilson 1968) and has even been infused with an anti-intellectual slant (Manning 2009) that idolizes its internally developed institutional understandings of crime and offenders and rejects those derived through scientific means. Results from the 2007 Law Enforcement Management and Administrative Statistics (LEMAS) survey show that 80.1 % of agencies require only high school or GED completion, 7.9 % require some college but no degree, 9.4 % mandate a 2-year degree, and a mere 1.3 % require a 4-year degree (the remaining 1.2 % have no formal policy regarding education). Coupled with the relatively short academy training period (discussed below) that emphasizes tactical skills over more abstract concepts, low education requirements mire policing in the realm of a trade and prevent its ascension to the status of a profession.

Training to Professionalize Policing

Police scholars, leaders, and policymakers lament the short, superficial training that most of the new recruits currently experience. Academies average approximately 761 h, or 19 weeks, in duration, and classes are taught primarily by part-time instructors. The focus is almost exclusively on physical fitness, firearms competence, self-defense capability, patrol tactics, and other technical aspects of the job; relatively little attention is given to human relations, communication skills, community policing tactics, domestic disputes (Reaves 2009), and other topics that relate directly to the vast majority of actual, day-to-day police work. Most instructors, furthermore, are police officers (Reaves 2009), which raises questions about whether trainees are exposed to a wide range of ideas and information or, rather, are being given a relatively narrow glimpse into the nature, purpose, and function of the job.

Inadequate training can help spark legitimation crises. This is because poor training has two predictable outcomes: (1) Officers' job performance will be compromised, and (2) the institution will eke by on marginal amounts of legitimacy. These outcomes are obviously interrelated, the second being, in part, a product of the first. Academy and in-service training should more accurately reflect the reality of the job. This will better prepare recruits for the street. It could also help reduce the infamous tendency for field training officers to preface their socialization of new recruits with an admonition to "forget everything you learned in the academy," which pits one role orientation against another. Role ambiguity or conflict contributes to officer misbehavior (Skolnick and Fyfe 1993), so restructuring training to be more realistic and to equip officers with the skills they need in actual encounters with civilians could significantly improve officer competence and effectiveness.

Managing Media Relations and Public Images

Police organizations play an active role in shaping their public images; indeed, many of the myths that currently govern the institution were created by the police themselves as a means of convincing the public that it needs police and needs them to look and act a certain way. The myth that crime is a looming threat and that its only solution is for criminals to be caught and punished, combined with the institutional myth of police as the ones who do said catching (Crank and Langworthy 1992) and the nature of police organizations as state-sanctioned entities with a guaranteed annual cash flow (Zucker 1987), might seem to be sufficient to legitimize police in the public eye and to obviate the need for additional efforts. What is missing, though, is the guarantee that the public knows that police are displaying the symbols and carrying out the rituals that make the citizenry think that the police are doing their job correctly. Media and public relations are a "missing link" between police behavior and public knowledge about and perceptions of that behavior.

Proactive Dissemination of Information to Improve Image

Most people have very little direct contact with police. According to the 2008 Police-Public Contact Survey, only 16.9 % of persons aged 16 and older had experienced face-to-face contact with police within the past year. The modal type of contact was a traffic stop (47 % of those with any contact). Traffic stops are typically perfunctory affairs that afford civilians little opportunity to form strong or substantive opinions about officers' job performance or personal character.

The impact of vicarious (i.e., indirect) experience is thus crucial to the public's formation of attitudes about and opinions of the police. Rosenbaum et al. (2005) found that between 26 % and 58 % of respondents in their sample reported being exposed to media accounts depicting other people's direct contacts with police. White respondents were more likely than Black or Hispanic respondents to report media exposure and less likely to have had direct experiences. Media exposure is related to people's attitudes toward police (Rosenbaum et al. 2005).

Strategic utilization of media opportunities can foster a symbiotic relationship. The police rely on the media as a conduit through which the community can be reached, while reporters need crime news that is easy to arrange into a print- or broadcast-ready format (Chermak and Weiss 2005). Regular press releases apprising the media of new events and of updates to ongoing matters make a police organization a valuable source of information to the media. Reporters, not wanting to risk losing this source, may avoid printing/broadcasting vitriolic attacks on or unfounded allegations about the department or its officers.

Proactive information release also capitalizes upon the difference between an interviewer and an interviewee, a distinction that is important for appearances (Kingshott 2011). The interviewer assumes the dominant position as the gatekeeper (Surette 2001) of the types and amounts of information exchanged; by contrast, the interviewee sits passively and fashions impromptu responses to questions that might be loaded, critical, or perhaps tap a content area about which the interviewee has no knowledge. When organizational representatives are providing information, they appear competent, knowledgeable, and authoritative. When fielding questions, though, they can easily come across as ill-informed, inept, or deceitful (Kingshott 2011).

Police organizations – via PIOs and community policing officers – should also utilize the broad spectrum of technologies available for pushing information out to the community and pulling input from civilians into the department. Websites containing detailed information about the department (e.g., beat maps, functional differentiation), Web links to local social service agencies, crime data, news about upcoming or recently held community policing events, and other relevant content can help organizations be interactive with the community (Rosenbaum et al. 2011a). Twitter, Facebook, email listserves, and text messaging can likewise be utilized to maintain an active outward flow of communication, including but not limited to "reverse 911" alerts and safety tips. Similarly, agencies should strive to pull in information from residents in the form of online options for filing crime reports, contacting relevant persons or units within the department, submitting complaints against officers, and offering praise for services well rendered (Rosenbaum et al. 2011a).

Civilian Review Boards

The public has become increasingly skeptical of police organizations' ability to consistently monitor their officers, conduct honest investigations into alleged misconduct, and effectively discipline those found guilty of wrongdoing. In particular, there is serious doubt about the effort that organizations exert in investigating citizen complaints. The adage "How can we expect the police to police themselves?" reflects the deep-seated suspicion – particularly prevalent among minority groups – that so long as an investigatory body's locus of operations rests within a police organization, justice will be served sporadically and inconsistently, at best. To maintain and promote institutional legitimacy, organizations need to assemble external accountability mechanisms. Civilian review is one such option.

Civilian review faces the criticism that civilians are not trained as police officers, do not have the mental vantage point of someone who has patrolled the city streets for months or years, and cannot put themselves into the positions of police officers who thought their own or someone else's physical safety was in jeopardy. An analogous critique could be leveled at the jury system. Law is complex, actions can be ambiguous, and evidence is often not overwhelming one way or the other. It might seem odd to suggest that a panel of laypersons – unschooled in law or psychology – could be in any position whatsoever to accurately judge guilt or innocence (Skolnick and Fyfe 1993).

But finely honed truth seeking is not the fundamental purpose of either juries or civilian review boards. The rationale for their existence rests, instead, on the community's right to weigh in on issues of justice and accountability from the vantage point of "regular people." Accountability is a community matter, not merely a legal one (Skolnick and Fyfe 1993). People also like being able to see the process occurring. The most thorough of internal police investigations and the most accurate adjudication regarding guilt or innocence means little to the public demanding information about the process and not merely the outcome.

Civilian review boards may be becoming increasingly normalized within the institutional environment of policing. Adoption of civilian review protocol sends a message of transparency and a willingness to "open the doors" of the organization to a civilian audience. The existence of civilian review may have a calming effect on the public (see Skolnick and Fyfe 1993).

If implemented in such a manner so as to merely pay lip service to civilian review, however, this effort can threaten an organization's legitimacy. Police have vehemently fought civilian review (Skolnick and Fyfe 1993) and a common consequence is that civilian review procedures either afford the board minimal authority or dictate that the board contain officers or ex-officers. Both of these can violate the expectations that the presence of a civilian review mechanism creates among the public. If actual civilian review procedures fall below these expectations, complainants will be dissatisfied.

Conclusion

The institutional prospective (e.g., Meyer and Rowan 1977) as applied to policing (e.g., Crank and Langworthy 1992) holds that police organizations exist within an institutional environment governed by certain values and normative rules. These myths, originally created by police as a means of shaping public opinion and expectations about the police role, took on a life and power of their own and now operate as constraints that require every organization to conform to the archetype of what a "real" police agency looks and acts like. Police agencies rely upon skillful and strategic utilization of these myths to maintain the legitimacy of their own organizations and that of the institution as a whole. As a state-sanctioned, service-oriented institution, policing has no tangible output that can be submitted to the competitive marketplace for a test of effectiveness and efficiency. The police "product" is a service, and it is a service the field must constantly "sell" to the public in order to maintain its status as a legitimate institution.

This entry considered several proposals for enhancing police institutional legitimacy. Programs (community policing and problem-oriented policing), policies (written procedures regarding nonfeasance, early warning and intervention systems, and encounter-based justice), selection and training (education requirements and professional training), and media and public image strategies (proactive dissemination of information and civilian review) were suggested. While all of the proposed activities are themselves grounded in institutional myths that are based more on values than on task performance, it was argued that each could be used to accomplish a certain goal. In other words, certain tasks can be accomplished by certain symbols and ceremonies if those symbols and ceremonies are paired closely with a desired outcome and implemented in an honest and genuine attempt to perform that task well. This would not eliminate the tension between myths and performance, but it could close the gap somewhat while still remaining within the acceptable realm of the archetypical organization and thus effecting change while maintaining and promoting legitimacy.

Overview

> Interpol demands crackdown on "serious and organised" eco crime. (Johnson 2012:1)

It has been recognized for some time that the liberalization of trade policies has had deleterious impacts on the world's natural environment. The rapid expansion of globalized goods and services continues to create a human footprint with long-lasting environmental consequences (White 2010). It is a footprint that represents rapid human activity and with it has come new commercial opportunities, not only for global businesses but also for organized criminal networks. Both the acceleration and by-products of global trade have created new markets as well as underground economies. As the opening quotation reveals, transnational environmental crime must become a policing priority as organized criminal networks continue to exploit the environment with unfrequented profits (cf. Banks 2008). Organized crime syndicates reportedly earn between US$20 and 30 billion from environmental crimes (Clarke 2011). Such earnings come at substantial social, economic, and environmental expense for communities, their livelihoods, and habitats. Indeed, organized environmental crime is identified by the UN as a key factor in the impoverishment, displacement, and violent conflicts of millions of people, notably in developing societies (UNODC 2009). The theft of biodiversity and the demise of animal species and habitats have resulted not only in financial loss but in an increase in "environmental refugees," people dislocated and forced to migrate due to loss of livelihoods. This entry will explore the links between organized crime and the environment and examine the regulatory and environmentalist responses to this growing issue of global concern.

Key Issues and Controversies

Defining Organized Environmental Crime

The United Nations Interregional Crime and Justice Institute (UNICRI) has established a now widely used categorization of organized environmental crime based on various international protocols and multilateral agreements. Other organizations including Interpol, the UN Environment Programme, and G8 also adopt the following five key areas when referring to transnational and organized environmental crime. The areas are the illegal trade in endangered species and wildlife; the illegal trade in ozone-depleting substances; illegal dumping of waste and hazardous substances; illegal, unregulated, and unreported fishing; and illegal logging and trade in protected woodlands (see Hayman and Brack 2002:5).

Illegal Trade in Flora and Fauna

It is widely recognized that organized environmental crime syndicates, motivated by substantial financial rewards, continue to flourish and expand in disadvantaged societies with porous borders where corruption is widespread and regulation poor (UNODC 2009). Emerging international laws and environmental policing efforts are gradually beginning to engage with issues inextricably linked to legitimate global trade. The impacts of these emerging markets continue to decimate flora and fauna while having widespread impacts on human populations. For example, the CITES protects about 5,000 species of animals and 28,000 species of plants, yet 4,000 African elephants per year continue to be killed for illicit trade (Interpol 2011). Banks et al. (2008:7) identify that since the 1990s, "80 % of timber coming out of Indonesia was illegal, and the government has estimated that it costs the nation US$4 billion a year." In Thailand and the Malaysian peninsula, recent reports identify that the Sumatran rhinoceros has become extinct due to organized criminal poaching. Moreover, the numbers of tigers, elephants, saiga antelopes, and anteaters have become "dangerously low" (Viegas 2011). In the United States, illegal trafficking in wildlife continues to accelerate at an alarming rate and has caused the State Department to establish a Coalition Against Wildlife Trafficking comprising government, protest groups, and corporate partners to address an industry of organized crime (US State Department 2011). The Wildlife Conservation Society in New York continues to emphasize the seriousness of the issue stating "we are rapidly losing big, spectacular animals to an entirely new type of trade driven by criminalised syndicates, and the world is not yet taking it seriously" (Coghlan 2011). The situation is equally serious across the Atlantic. During 2004 alone, European Union officials reportedly made 7,000 seizures involving "more than 3.5 million wildlife specimens that were prohibited from being traded" (WWF 2011:1).

Endangered Species International concludes that "despite international laws, animal body parts of protected species are traded around the world. For example, body parts of hawksbill turtle shells, shahtoosh shawls from the Tibetan antelope, and furs from rare otters in south east Asia are found in both black and open markets. Of the estimated 350 million animals and plants being traded worldwide every year, it is believed that 25 % is carried out illegally" (ESI 2011:1). The prices for exotic and protected species vary on the black market from tens of thousands of dollars for a macaw, to just a few dollars for a giant cockroach (PETA 2011). Recent seizures in Vietnam near the Chinese border revealed over a 1,000 t of African elephant ivory smuggled in bundles of cloth (Traffic 2011). There are numerous other examples of declines or extinction of native fauna from organized illegal activity. As Antonio Maria Costa, Executive Director of the United Nations Office on Drugs and Crime, has stated,

> People are profiting from the destruction of our planet, by dumping hazardous waste, illegal logging, or the theft of bio-assets. This crime not only damages the eco-system, it impoverishes so many countries where pollution, deforestation and population displacement trigger conflict.... (Costa 2008)

While the social, economic, and political conditions of "origin nations" undoubtedly facilitate organized environmental crime, issues of demand and global trade are noticeably absent from international discourse. Bricknall (2010:7) has previously noted that EU countries take a "soft approach" with organized environmental crime, often because the perpetrators, or those involved, are reputable business personnel engaging in essential trade. She concluded, "...enforcement agencies thus are not confronted with the classical "bad guys" but ... with often highly respected players of economic life." For many, globalization has provided the context for the "easy passage of illegal goods."

Organized environmental crime continues to flourish because of trade and market demand. Countries such as the United Kingdom, which actively promote international environmental treaties to preserve and protect natural heritage, provide the markets for organized crime syndicates to dispose of their illegal merchandise. For example, Britain is the world's third largest importer of illegally logged timber. Up to 3.2 million cubic meters of timber sold in the UK and used for household furniture or garden woodchip is stolen from the Amazon rainforest and other protected habitats, and comprises a £700 million per year British industry. Moreover, imported fish is worth £4–9 billion to Britain per annum. By conservative estimates, more than 12,000 t per annum originates from illegal fishing in the offshore waters of poor countries. This illegal fishing decimates the local industry and food supply of debt-stricken countries in Western Africa while destroying marine biology. Yet, unregistered pirate vessels enter British ports unchecked, and the stolen fish are sold at London markets without question (Walters 2012).

Internationally recognized businesses often facilitate the commercial trade in illegal and endangered species. The Internet provider "Yahoo" has reportedly been providing shopping sites in Japan for the sale of more than 130 t of endangered Icelandic whale (EIA 2011). Moreover, environmental activists have lobbied eBay to ban the sale of endangered species after 7,000 wildlife products were identified on 183 websites across 11 countries (IFAW 2011).

Illegal Disposal of Waste

Not only have endangered and protected species of flora and fauna proved lucrative for crime syndicates, but so has the illegal disposal of waste. The excesses of globalized consumption and capitalism continue to produce harmful wastes that pollute and contaminate the environment. As mentioned above, the dumping and illegal transport of various kinds of hazardous waste is widely recognized by international law as an environmental crime. However, for decades, the control and enforcement of the illegal movement in waste has proved inadequate as Rebovich (1992:125) notes,

> ...it has been said that illegal hazardous waste disposal is very much like one long game of hot potato. The idea is to make as much profit as you can by being the temporary possessor of the hot potato before unloading it on some other person, organization, or place. In the end, the final recipient is the loser.

The "losers" in the illegal movement of waste are most often the poor and vulnerable. There continues to exist within political and policing circles, noticeably across Europe, complacency, and lack of awareness regarding the seriousness of illegal waste disposal and its links to organized crime. Nowhere is this more apparent than in Italy, which is worth exploring further here in some detail to understand organized environmental crime and its links with global trade and national governance.

Throughout the 1990s, international headlines reported 11 million tons of industrial waste unaccounted for and large amounts of toxic waste dumped in Italy in what came to be known as acts of the "ecomafia." Mafia-related enterprises were reported to be monopolizing waste disposal contracts from industries producing toxic residues and illegally dumping the pollutants in various areas of the Italian countryside (Ruggierio 1996). Furthermore, the mafia or "rubbish tzars" (Ruggiero and South 2010) were bidding for, and successfully obtaining, provincial contracts to clean up the very environmental mess they themselves had created. This sort of organized criminal activity is not new. Block and Scarpetti (1985) documented the ways in which the mafia in the USA monopolized the solid waste management business, eliminated industry competition, bribed officials, and routinely illegally disposed of toxic waste in the New York and New Jersey region. Interestingly, they note how the US Environment Protection Agency was obstructive in regulating toxic waste. Indeed, Szasz (1986) argues that "lax implementation and enforcement" were key factors in the expansion of organized crime monopolies over waste management contracts and the concomitant illegal activity – an insight pertinent to southern Italy's procurement of waste contracts and lack of regulatory oversight.

Italy continues to hold the worst environmental infringement record in the EU. In early 2002, a total of 125 breaches of EU environmental directives were lodged against the Italian authorities with some cases referred to the European Court of Justice.

In December 2006, the European Parliament identified that 60 environmental infringement notices remained outstanding against the Italian government (the highest in Europe), mainly for breaches of waste management. In 2009, the European Environment Commissioner Stavros Dimas stated "EU environmental law aims to prevent damage to the environment and minimise health risks to European citizens. To ensure its citizens are provided the utmost protection I urge Italy to quickly put right the shortcomings of certain of its environmental laws in line with those of the EU" (Europa 2009:1). Italy has yet to implement seven different EU environmental directives relating to water, air, soil, waste, and nature protection, and its legal regimes are often severely criticized for not harmonizing with EU law. The European Commission is pursuing legal action against the Italian government for failing to implement environmental directives into national law.

One of the reasons for Italy's noncompliance with EU environmental regulations is, as mentioned above, the widespread organized criminal activity of the "ecomafia." As South (2010:234) rightly points out, the word "ecomafia" first coined by the environmental group Legambiente is now widely accepted in Italian society to mean "organised criminal networks that profit from illegally disposing of commercial, industrial and radioactive waste." Ecomafia is big business in Italy, its worth being estimated at 20.8 billion Euro in 2008 (Legambiente 2009). Almost all criminal activities occur in the mafia strongholds of Campania, Calabria, Sicily, and Puglia. In this area alone, 31 million tons of domestic and commercial waste simply "disappeared" in 2008, dumped at sea or in local waterways. More recently, mafia groups have taken to illegally burying waste in southern Italy and then rapidly building housing estates on top. Between 2008 and 2010, 17,000 houses were illegally built on waste dumps, and 10,000 forest fires were mafia related (Legambiente 2010). The impacts of organized environmental crime in Italy also have a global reach. In 2008, it was widely reported that mozzarella cheese exported from Campania contained high levels of dioxins, the result of dairies contaminated by the illegal disposal of toxic waste (Walters 2012).

Italy's long-standing record of environmental noncompliance combined with the prolific illegalities of the ecomafia that continue to generate media headlines has necessitated a political response. Within the Carabinieri (reputedly Italy's most elite law enforcement body) has emerged a specialist policing unit to tackle environmental crime. It should be noted that Italy has a complex structure of state policing and law enforcement. There are eight separate law enforcement agencies, all combining to govern and enforce federal, provincial, and municipal law across Italy (Walters 2012).

The creation of a specialist unit within an existing police force to tackle corporate environmental crime is a first in Europe. Yet, the resources and police personnel devoted to the initiative are minuscule. Moreover, it is the provinces in the north of Italy that have witnessed the greatest political and municipal "buy-in," while the troubled areas of the south continue to struggle for interagency collaboration against a culture of suspicion and official corruption.

Emerging from Italy's eco-policing, which is still in its early days, is a story of how environmental movements can identify and target organized crime, mobilize political opinion, involve local government, and raise public awareness. In Italy, organized environmental crime is not being addressed or tackled by senior political officials, government administrators, or policing agencies; they all play a part, but the real difference is being made through Legambiente. Established in 1980, Legambiente is a left-wing environmental activist organization with 115,000 active members across 45 offices in Italy. With the use of its technologies, databases, and local intelligence, Legambiente has been instrumental in tightening waste disposal regulations and in the prosecution of mafia personnel. In a similar fashion to the ecomafia having a public identity in Italy, Legambiente is widely thought of as the "eco-police." However, Italy's four biggest mafia groups, namely, the "Ndrangheta" in Calabria, the Sacra Corona Unita in Apulia, and the Neapolitan Camorra and the Cosa Nostra in Sicily, are so embedded in the social and economic fabric of Italian society, in that organized criminal activity accounts for 7 % of the country's gross domestic product (Phillips 2008) with the ecomafia competing among themselves for waste management contracts, amidst poor and corrupt regulation. Recent endeavors by Legambiente and its allies to highlight the extent of corruption in Italy's south has intensified EU focus on what has been dubbed the "Naples rubbish crisis" where 7,200 t of rubbish is accumulating every day in the Campania region (Ruggiero and South 2010; Walters 2012).

International Perspectives

The severity of organized environmental crime has a long history. Notably, it was environmental groups in the mid-1970s that raised awareness of this activity, and it is green and social movements that are central to current efforts of policing and regulation (Block 2002). Environmental activism plays a major role alongside international instruments in combating organized environmental crime (White 2010). Such initiatives include the Interpol Environmental Crime Committee which focuses on training, data collection, and enforcement related to pollution and wildlife crimes and implements an "intelligence-led policing" model which emphasizes "operational partnerships." In 2010, during the UN's International Year of Biodiversity, Interpol's General Assembly passed a resolution that would see 188 national law enforcement agencies agreeing to collaborate with organizations such as the World Bank and environmental movements, an initiative that promises a substantial increase in policing resources to reduce organized environmental crime (Interpol 2011). In 2007, countries signatory to the United Nations Millennium Development Goals agreed to "ensure environmental stability," through, inter alia, targeting and preventing organized environmental crime (United Nations 2007). The proceeds of organized environmental crime are laundered through legitimate commercial activities. As a result, the Financial Action Task Force now officially recognized environmental crime as explicitly associated with money laundering. The Asian Regional Partners Forum on Combating Environmental Crime (ARPEC) was set up in 2005 and continues to play an active role in coordinating enforcement endeavors in the Asia Pacific region, an area renowned for illicit trade in wildlife. One important initiative, the Partnership Against Transnational Crime through Regional Organized Law Enforcement, has witnessed significant increases in wildlife seizures via coordinated policing and information exchange. Finally, in July 2011, eight countries signatory to the Lusaka Agreement on Co-operative Enforcement Operations Directed at Illegal Trade in Wild Fauna and Flora (promoted by wildlife law enforcement officers from eight Eastern and Southern African countries) met to increase enforcement resources to prevent wildlife crime (Walters 2012).

In a similar fashion to the success of citizen involvement in environmental activism in the historically progressive regulation of environmental crime in the United States (Clifford and Edwards 2012), the above international approaches expressly rely upon organizations such as Greenpeace, Endangered Species International, Environmental Investigation Agency, Environmental Justice Foundation, Legambiente, and the World Wide Fund for Nature to combat global organized environmental crime. Environmental movements are becoming central in the identification, detection, and prevention of environmental crime. Their resources, technologies, databases, and personnel are increasingly utilized by law enforcement agencies to police, regulate, and prosecute organized environmental crime. Here, environmental activism, through technology and networks of action, local alliances, as well as appeals to citizens and officials, elevates the social movement to a reliable and reputable status that is inculcated into government and regulatory structures. Environmental activism becomes not mere representative democracy but participatory democracy with both a visible presence and impact. As such, with public and political integration, it becomes a new and important form of environmental governance. The momentum created by environmental movements is a source of mobilized power, emerging from alliances with local institutions of governance, and knowledges, that have come to be relied upon as accepted and trusted regimes of truth – in turn becoming the sources of official discourse.

Future Directions

Within criminological studies, debates about organized environmental crime have emerged within discourses on state and corporate crime or "crimes of the powerful" and within the rapidly expanding area of "green criminology" (South 1998; South and Bierne 2006). South (2010:242) argues that the growing phenomenon of green crime is a product of a late-modern risk society. As a result, he identifies emerging environmental harms and injustices as requiring "a new academic way of looking at the world but also a new global politics." This includes an intellectual narrative that moves "beyond the narrow boundaries of traditional criminology and draws together political and practical action to shape public policy" (South 2010:242). This interdisciplinary approach combined with environmental activism and public policy has facilitated a green criminological perspective with three dimensions: first, scholarship that conceptualizes environmental crime; second, that devoted to exploring and uncovering various types of environmental crimes; and finally, a commitment to environmental policing and enforcement.

A substantial amount of green criminological scholarship seeks to put issues of environmental harm on the academic, political, and public radar. As this entry argues, too often when actions violate international environmental agreements or domestic laws they are referred to as "breaches" or "offenses" and not crimes. From a purely legal perspective, this is best explained by the fact that environmental offenses are often not contained within either international or municipal criminal law. As such, they are dealt with as administrative offenses and prosecuted in civil jurisdictions. Such offenses only become issues for the criminal courts when offenders fail to comply with a court sanction and are subsequently referred to a criminal court. While the language of eco-crime is used (most often by activists and NGOs), it is not expressed in such terms at international law and only in reaction to antisocial behavior within domestic law. Eco-crime is an area requiring new conceptions of offending and regulatory responses within this “new academic way of thinking and within a new global politics” (South 2010:242).

Organized environmental crime often occurs within, and is intrinsically linked, to the free market policies of state and corporate trade. For Westra (2004:309), acts by governments and corporations in pursuit of free trade that deliberatively destroys and damages biodiversity are “attacks on the human person” that deprive civilians (notably the poor) from the social, cultural, and economic benefits of their environment. As a result, eco-crime is an act of violence and should be viewed as a human rights violation as citizens are deprived of freedoms and liberties. As Halsey and White (1998) have noted, “environmental harm” is often publicly and politically accepted as necessary for maintaining human well-being. To use a Gramscian analysis, capital accumulation and the prominence of trade are preserved through ideologies of “necessity.” There is a cultural hegemony that underpins the imperatives of trade that come about through consensus or “common sense values” that cannot be undermined. As a result, it is essential to apply a political economy analysis to understand the interconnectedness between organized environmental crime and legitimate global trade.

To understand the complexities of organized environmental crime require an examination of the networks of corruption that facilitate criminal markets (Elliot 2009). Lorraine Elliott asserts that addressing this expanding and global enterprise requires “joined-up thinking” across various transnational government and nongovernment agencies. Notwithstanding the importance of this form of network analysis, it is must be recognized that policies of free trade governed by principles of market regulation provide the contexts in which organized environmental crime may flourish. The role of green criminologists must be to unpack and disentangle the ways that policies and practices of legitimate trade facilitate the opportunities and activities of organized environmental criminal networks.

Conclusion

This entry concludes that the natural environment continues to provide immense profits for organized criminal networks while decimating protected species. Moreover, it is the world’s poorest and most marginalized people most severely affected by the cultural, social, and economic consequences of transnational organized environmental crime. While trade remains an international priority within the landscapes of global economics and fiscal prosperity, organized environmental crime takes advantage of growing markets. The trade imperatives of globalized and liberal market economies provide the challenges backdrop and contexts for both domestic and international policing initiatives. On one level, policing resources are either unavailable or limited for eco-policing; at another level, a lack of political will ensure that regulation and enforcement remain a low priority. As a result, innovations in policing partnerships, which involve environmental activist groups, have an important role to play. Movements of environmental activism are emerging as the new front in the surveillance, regulation, and prosecution of organized environmental crime. Such voices must continue to be central to future green criminological perspectives that seek environmental, ecological, and species justice.

Organized Crime, Types of

Letizia Paoli
Institute of Criminology, University of Leuven,
Leuven, Belgium

Overview

The concept of organized crime has had a winding history, with many, partially contradictory, meanings attached to it since the expression began to be used in the United States more than a hundred years ago (see, e.g., Varese 2010; for a list of definitions, see also ▶ www.organized-crime.de/OCDEF.htm). Basically, the understanding of organized crime has shifted back and forth between two rivaling notions: (1) a set of stable organizations illegal per se or whose members systematically engage in crime and (2) a set of serious criminal activities, and particularly the provision of illegal goods and services, mostly carried out for monetary gain. (Other criminological concepts, such as white-collar, political, and professional crime, entail similar definitional problems).

Originating from the now discredited official representation of organized crime in the United States in the 1950s and 1960s, the former notion is still embraced by the media and by policymakers seeking to justify draconian measures. Although it is rejected by many scholars, such understanding is corroborated by the existence of a few large-scale and long-lasting criminal organizations worldwide, which Paoli (2002) termed "mafia-type criminal organizations." These are primarily the Sicilian Cosa Nostra and Calabrian 'Ndrangheta, the Italian-American La Cosa Nostra, the Chinese Triads, the Japanese Yakuza, and the *vory v zakone* (thieves-in-law) in the Soviet Union (USSR) and its successor states.

The second view, which is now dominant in the scientific understanding of organized crime, is most clearly exemplified by the criminal activities listed as typical of organized crime in the Organized Crime (Threat Assessment) Reports produced at regular intervals by Europol and national law enforcement and governmental agencies, such the UK Serious and Organized Crime Agency and German Federal Police Office. In this second paradigm, depending on the authors and agencies, the identification of organized crime with the provision of illegal goods and services can be complete (e.g., Van Duyne 1997) or merely partial (e.g., Edwards and Levi 2008). Prohibited psychoactive drugs (e.g., heroin, cocaine, and cannabis) are the best-known examples of illegal goods, but, in addition to them, this category also includes goods produced and traded in violation of specific regulations: human beings, if trafficked for the purposes of sexual exploitation or forced labor; cigarettes, alcohol, and gasoline, if exchanged without paying excise and other taxes; and diamonds, wood, and other natural resources, if extracted illegally or sold outside the legitimate channels. The category of illegal services is also broad, as it ranges from gambling (in those jurisdictions in which it is still prohibited) to paid sex (in jurisdictions where prostitution itself or its exploitation is prohibited) and to the entry into a rich country, in the case of human smuggling.

Organized crime official reports and scholarly studies (e.g., Edwards and Levi 2008) also often include different forms of "illegal transfers" (e.g., robberies, extortions, embezzlement, and cases of fraud). Unlike the provision of illegal goods and services, these transfers do not create value but merely transfer it from one person to another. Not least for this very reason, however, the harm they generate is more evident than the harms accruing from the provision of illegal goods and services.

This entry is structured as follows: the first section gives a summary of the debate about organized crime in the USA and Europe, providing evidence of the above-mentioned alternative understandings of organized crime but also of the growing integration of the two views. The following two sections ("Mafia-Type Organizations" and "Illegal Markets/Activities and Their Actors") are, respectively, devoted to mafia-type organizations and illegal markets and their actors, as they best symbolize the two opposing views of organized crime.

Organized Crime: A Contested Concept

The meanings of organized crime have changed considerably and repeatedly over time. Reflecting the two different notions of organized crime discussed in the overview, some authors as well as national and international policy and law enforcement agencies have emphasized the "Who," that is, the offenders and their variable partnerships, whereas others have given more relevance to the "What," that is, the criminal activities conducted (see Smith, 1991).

The organization-based approach, which was dubbed the "alien conspiracy" theory by its critics due to its emphasis on foreign criminals, was first enunciated by the Kefauver Senate Investigating Committee in the 1950s. Despite the scarcity of empirical proof, the committee set out the terms of an Italian mafia-centered view of organized crime that remained the US official standpoint for almost three decades. This identified organized crime with a nationwide, centralized criminal organization that dominated the most profitable US illegal markets, allegedly derived from an analogous parallel Sicilian organization and largely consisted of migrants of Italian (and specifically Sicilian) origin (U.S. Senate 1951, p. 131). The merger of the two concepts of organized crime and mafia was fully accomplished in 1963 when Joe Valachi testified before the Senate Permanent Subcommittee on Investigations. By recalling his experiences as a low-ranking member of an Italian-American mafia association called (La) Cosa Nostra, Valachi gave a new name to the menacing criminal organization singled out by the Kefauver Committee and provided many details about its internal composition and illegal activities (U.S. Senate 1963). Thanks to extensive television coverage, Valachi's views were popularized among the American public.

This mafia-centered view of organized crime has long dominated the (USA and international) public perception of the problem: since the 1960s, hundreds of books have been written on the topic, and dozens of movies have been made. Some of these – above all, Mario Puzo's *The Godfather* (1969) and its film adaptation by Francis Ford Coppola – have been so successful that they have profoundly shaped the general understanding of organized crime and the mafia in the United States and elsewhere. For many people, the Italian-American mafia, which is de facto identified with organized crime, *is* and *behaves* as is recounted in these romanticized novels and films.

Such an interpretation received scientific systematization from Cressey (1969): in his view, La Cosa Nostra relied upon Sicilian traditional cultural codes but was also a hierarchical and "rationally designed" organization, very close to Max Weber's ideal type of legal-rational bureaucracy and therefore capable of operating in contemporary America.

The identification of the mafia with organized crime – and thus the idea of an alien conspiracy polluting the economic and social life of the country – has been rejected by the majority of American social scientists since the 1960s. These have alternatively accused the mafia-centered view of organized crime of being ideological, serving personal political interests, and lacking in accuracy and empirical evidence (e.g., Smith 1975). Some scholars, however, have overreacted, up to the early 1980s categorically denying the existence of the Italian-American mafia as a structured and longstanding criminal organization.

Scientific attention has instead been redirected from "Who" back to "What" and upon the most visible and noncontroversial aspect of organized crime: the supply of illegal products and services. In order to eradicate ethnic stereotypes of crime and direct attention to the marketplace, several authors have put forward the expression "illicit" or "illegal enterprise" as a substitute for the ethnically loaded term "organized crime." As Smith (1975, p. 335), one of the earliest proponents of the new approach, expressed it, "illicit enterprise is the extension of legitimate market activities into areas normally proscribed – i.e., beyond existing limits of law – for the pursuit of profit and in response to a latent illicit demand."

More often, however, organized crime itself has been equated with the provision of illegal goods and services. Hence, according to Block and Chambliss (1981, p. 13), "organized crime [should] be defined as (or perhaps better limited to) those illegal activities involving the management and coordination of racketeering and vice." Organized crime has thus become a synonym for illegal enterprise. That is, the involvement in illicit market activities has become nowadays the basic requirement of virtually all definitions of organized crime in the US scientific and official discourse, and this view is shared by both supporters of the mafia-centered understanding of organized crime and its critics.

A negative side effect of this partial consensus has been that the term "organized crime" is intermittently used to refer to both sets of criminal organizations and sets of activities. In the definition quoted above, Block and Chambliss clearly present organized crime as a set of activities. The identification of organized crime with a set of organizations is instead fostered by supporters of the US official standpoint and a few independent scholars, including critics of the official understanding. According to Reuter (1983, p. 175), for example, "organized crime consists of organizations that have durability, hierarchy and involvement in a multiplicity of criminal activities . . .. The Mafia provides the most enduring and significant form of organized crime." Unsurprisingly, the frequent confusion between offender and offense often leads to circular reasoning. In 1986, for example, the (second) President's Commission on Organized Crime (1986, p. 11) concluded that drug trafficking was "the single most serious organized crime problem in the United States and the largest source of income for organized crime."

With the exception of Italy and Spain, the "illegal enterprise" approach has since the 1970s acquired a dominant position in the scientific debate in Europe and has since the late 1980s been dominant in the policy debate as well, with a resulting focus on criminal activities for gain. As early as the mid-1970s, Kerner and Mack (1975) talked about a "crime industry," and in an earlier report written in German, Kerner subscribed even more explicitly to the view of organized crime as an enterprise (1973). The emphasis on illegal market activities has remained unchallenged ever since. Hence, for example, van Duyne (1997, p. 203) asks "What is organized crime without organizing some kind of criminal trade; without selling and buying of forbidden goods and services in an organizational context? The answer is simply nothing." More recently, several scholars (e.g., Edwards and Levi 2008) have suggested getting rid altogether of the expression organized crime and focusing instead on the organization of crime for gain.

The loose understanding of organized crime in terms of profit-making criminal activities has allowed organized crime to become a successful policy term even in European countries that had no mafia problems. Concern for organized crime first spreads in the late 1980s in Germany and the Netherlands and then, to various degrees, in other European states. Given its vagueness and elasticity, the term "organized crime" could be used to express the fear that the Italian mafia could invade the rest of Europe – a fear that reached its peak in the early 1990s after the murders of Judges Falcone and Borsellino by the Sicilian Cosa Nostra – but also refer to profit-making criminal activities and entrepreneurs close to home or to the real and imagined threats coming from the East after the 1989 fall of the Iron Curtain and the 1991 implosion of the Soviet Union.

With few partial exceptions (e.g., the Netherlands and Spain), the European official (or semiofficial) definitions of organized crime draw from the illegal enterprise paradigm. The definition adopted by German State Ministers of the Interior and Justice in 1986, which has been very influential and has been adopted also by other governments (e.g., Belgium), for example, states:

> Organized crime constitutes the planned commission of criminal offenses to acquire profit or power. Such criminal offenses have to be, each or in their entirety, of a major significance and be carried out by more than two participants who cooperate

> within a division of labor for a long or undetermined time-span using a) commercial or commercial-like structures, or b) violence or other means of intimidation, or c) influence on politics, media, public administration, justice, and legitimate economy. (BKA 2012)

Analogous, market-oriented definitions of organized crime have been adopted in the United Kingdom. The most recent is bafflingly simple: "Organised crime is defined as those involved, normally working with others, in continuing serious criminal activities for substantial profit, whether based in the UK or elsewhere" (SOCA 2012).

Following up on the studies of Reuter (1983) and others, policy-making and law enforcement agencies worldwide have increasingly had to realize that stable, large-scale criminal organizations far from monopolize profit-making criminal activities (e.g., Europol 2003). Rather than discarding the pair "criminal organizations" and "profit-making criminal activities," they have increasingly watered down the definition of criminal organizations so as to include also networks, gangs, cells, and any group composed by at least three people working together for some time (e.g., UNGA 2000; SOCA 2012). For some agencies (e.g., SOCA 2012) and scholars (e.g., Felson 2009, pp. 159–160), organized crime seems to mean little more than co-offending by more than two perpetrators.

The supposed territorial scope of organized crime has also changed. Originally, organized crime was equated with racketeering, another vague notion at the core of which there is, however, extortion, an activity necessarily territorially based and usually carried out only on a local basis. Since the 1990s, instead, many researchers (e.g., Williams and Florez 1994) and an even larger number of government agencies and international organizations, ranging from the USA to the United Nations (UNGA 2000; White House 2011), have emphasized the transnational nature of organized crime.

As this brief overview already shows, the policy and scientific legitimacy and relevance of the organized crime concept have also varied considerably over time. Except for the United States and Italy, most other nations did not regard organized crime as a serious domestic problem until the late 1980s. Whereas media accounts of organized crime and mafias have always fascinated the general public, most scholars shunned the topic until the early 1990s. Only since that period has organized crime become an accepted policy and scientific concept virtually throughout the world.

Since the 1990s, the majority of governments at least in the developed world and many international organizations, including the UN, have adopted bills, decrees, action plans, and international treaties specifically targeting organized crime, usually granting extensive new prosecutorial powers to law enforcement agencies – as the United States had already done in the 1960s and 1970s. The fight against organized crime has also been used to justify far-reaching criminal justice reforms in several countries, particularly in Europe (see Fijnaut 2013a).

Despite some persisting resistance, organized crime has also become a legitimate scientific research topic, attracting considerable attention from criminologists and other social scientists during the 1990s and the early twenty-first century, particularly in Europe.

Mafia-Type Organizations

Contrary to what the critics of the alien conspiracy stated, there is nowadays indisputable evidence that a few large-scale, long-standing criminal organizations exist even in Western countries, which Paoli (2002) calls mafia-type organizations. These range from the Sicilian Cosa Nostra and the Calabrian 'Ndrangheta in Italy to the Yakuza in Japan and from the Italian American La Cosa Nostra in the United States to the Triads in China, Hong Kong, and elsewhere and to the thieves-in-law in the USSR/Russia.

Long regarded by the media and public as the prototype of organized crime, these centuries-old organizations are usually loose consortia of smaller groups. The Calabrian 'Ndrangheta and Sicilian Cosa Nostra, for example, are each composed of about 150 groups (Paoli 2013). Twenty-four mafia "families" used to compose the

American La Cosa Nostra, even though many such groups are no longer active today (Albanese 2013). According to the Japanese police, there are 22 Yakuza organizations in Japan, a number that has remained stable since the 1990s (Hill 2013). Several different triads are known to be active in Asia, America, and Australia (Chin and Liu 2013).

Although the individual units enjoy considerable autonomy, it still makes sense to regard mafia-type criminal organizations as unitary. They constitute, in fact, segmentary societies – an organizational model well known to anthropologists studying "simple societies." In segmentary societies, such as mafia-type organizations, societal boundaries are drawn by the common cultural heritage and structural organization. In several cases, a process of centralization has been built upon these segmented structures. Among the families associated with the American and Sicilian Cosa Nostra and, more recently, among those belonging to the Calabrian 'Ndrangheta, this process of centralization has led to the institutionalization of superordinate bodies of coordination (Paoli 2003). In Japan, three syndicates – the Yamaguchi-gumi, Sumiyoshi-rengo, and Inagawa-kai – have succeeded in incorporating many smaller groups and now account for 80 % of the total number of initiated members (Hill 2013). The trend, however, is not univocal. There are no signs of a centralization process going on in the heterogeneous universe of Chinese organized crime. Furthermore, even when superordinate bodies of coordination exist, their competencies are rather limited. Usually their main purpose is to minimize the visibility of the criminal organizations through the regulation of the internal use of violence. In the case of Sicilian and American Cosa Nostra cases, moreover, the centralization of power has reverted and the "commissions" are no longer active (Paoli 2013).

Mafia-type organizations are based on lifelong status and fraternization contracts, which establish ritual kinship ties among the members. It is not by chance that the basic units of the Sicilian and American Cosa Nostra are called families. Although Italian and Italian-American mafia groups clearly distinguish themselves from the blood families of their associates so much so that no women are allowed, the term evokes and, at the same time, prescribes the cohesion and solidarity of blood ties (Paoli 2003). In Japan, the relationship between a yakuza chief (*oyabun*) and lower-ranking members (*kobun*), which is the pillar of the whole association, is portrayed as the relationship between a father and his sons (Hill 2013). Relying on fictive kinship ties, mafia-type organizations enjoy a flexibility that has no parallel among contemporary businesses whose employment contracts usually promise economic benefits in exchange of specific, limited tasks. The contracts imposed by mafia-type organizations on their members are so comprehensive that the latter are expected not only to deny family and friendship bonds but even to sacrifice their own life if the group requests it. In exchange, individual members benefit from the collective action and the reputation of the organization in the pursuit of both licit and illicit businesses. The membership in a mafia-type organization group is, hence, typified by a crisscrossing of instrumentality and solidarity, of personal selfishness and unconditional involvement.

The ritual kinship ties established at the moment of the initiation ceremonies have historically been used by both the organizations as such and their members to achieve a plurality of goals and to accomplish a variety of functions. Only by sacrificing empirical evidence, it is possible to single out an encompassing function or goal that can characterize mafia-type organizations throughout their lives. In particular, although their members are heavily involved in illegal businesses today, neither the development nor the internal structure of mafia-type organizations is the product of illegal markets dynamics. Indeed, many of these organizations arose before the consolidation of modern illegal markets: the predecessors of Triads and Yakuza groups in the course of the eighteenth century and Southern Italian mafia groups in the late nineteenth century (Chin and Liu 2013; Hill 2013; Paoli 2013).

Among the many functions historically carried out by mafia-type organizations, political functions, even more than economic activities, have always had a key relevance, and it is to Diego Gambetta's credit that he brought attention to this dimension that had long been neglected in the scientific discourse on the mafia and organized crime. According to Gambetta (1993, p. 1), in fact, the Sicilian mafia is "a specific economic enterprise, an industry that produces, promotes and sells private protection" (The provision of protection is one of the most important functions historically played by mafia groups, a quintessential one, we could say, since it derives from their exercise of violence in the villages and neighborhoods where mafia groups are based. Gambetta's analysis is rather to be criticized for his one-sided emphasis on protection and his denial of the polyvalence of mafia groups. It is furthermore regrettable that out of polemical reasons, Gambetta overshadows the analogies between the mafia, as he defines it, and the state. Such a similarity was instead outlined by Charles Tilly (1985, p. 169): "if protection rackets represent organized crime at its smoothest, then war making and state making – quintessential protection rackets with the advantage of legitimacy – qualify as our largest examples of organized crime."

Although not employed on every occasion, ultimately violence constitutes the backbone of mafia-type organizations' power. These use violence foremost to secure the obedience of their own members and to punish those that have betrayed or not respected their authority. They also employ it as a means to threaten, render inoffensive, or even physically eliminate whoever endangers the power positions and the business activities of the organization or its individual units. Through the threat or the effective use of violence, mafia-type organizations have also been trying – enjoying for a long time a fairly high degree of success – to impose their rules on society at large in their territory of influence. As such, criminal organizations of mafia type can be seen as proto-states that have the ambition to impose their own legal order within a given territorial area through the threat and the use of physical force. Each family associated with either Cosa Nostra or the 'Ndrangheta, for example, claims sovereignty over a well-defined territory which usually corresponds to a village or to the district of a city.

Mafia-type organizations' political ambitions mirror the weakness of state authorities in the contexts in which they developed. The oldest among them consolidated in contexts in which the local state authorities were not able to guarantee even a minimum of security and the residents had to protect their property, women, and own lives by themselves. The American La Cosa Nostra rose in the early twentieth century when the US government still had limited authority in the Italian ethnic community and some of its representatives preferred to come to terms with, rather than prosecute, La Cosa Nostra bosses and other criminal entrepreneurs fostered by Prohibition. Founded in Stalinist prisons in the 1930s, *vory v zakone* and other Russian crime groups gained unprecedented political power and control over economic resources after the implosion of the Soviet Union in 1991 (Volkov 2013).

While criminal groups posing as proto-states rose in several parts of pre-modern Europe (e.g., Fijnaut 2013b), most of them were swept away by the consolidation of modern state structures. The current mafia-type organizations have survived in contexts in which government structures have remained weak or their representatives have been willing to enter into pacts with them. At least up to the mid-twentieth century, for example, Italian government officials came to terms with the representatives of mafia power and de facto delegated to the latter the maintenance of public order over wide areas of western Sicily and southern Calabria, where the authority of the central government was scarce and even the officials' personal safety was in danger. In Japan as well, Yakuza bosses have held close ties with members of the political establishment and specifically the Liberal Democratic Party, Japan's dominant political party since WWII (Hill 2013).

Exploiting the weakness of the state and, at the same time, their own privileged contacts with corrupt politicians and civil servants, mafia-type criminal organizations have traditionally fostered their popular legitimacy by providing income and other nonmaterial advantages to their associates and a variety of services for the general population, such as civil-service jobs, a pension benefit, or impunity for their supporters or votes for befriended politicians. Additionally, in Italy, Japan, Russia, and Chinese communities all over the world, they have occasionally controlled the workforce and carried out "dirty work" for colluding companies and landowners, for example, by protecting them from ordinary criminals or by breaking strikes or other forms of protests. Furthermore, mafia-type organizations have supplied goods and services for which there is, despite their official prohibition, a public demand. It is through the latter function that mafia-type organizations become involved in the criminal activities being considered exemplary of the alternative understanding of organized crime – thus, creating a partial overlapping between the two views. Contrary to what is often maintained, however, mafia-type organizations are far from controlling illegal markets worldwide, and indeed, according to a plurality of independent researchers, their "market share" has in recent years further declined (Chin and Liu 2013; Hill 2013; Paoli 2013).

Illegal Markets/Activities and Their Actors

Despite the exaggerations of some moral and political entrepreneurs, the growing worldwide concern about organized crime partially reflects real changes that directly impinge on illegal (market) activities and their actors – which is the second paradigmatic understanding of organized crime.

Among these changes, the most significant has been the rise of the illegal drug industry. Since the 1970s, this has become the largest and most profitable illegal market activity in virtually all Western countries, attracting the greatest number of traditional underworld figures and fostering a reorientation of professional crime toward the drug business. According to a conservative estimate, the world drug markets generated US $322 billion in retail sales in 2003, corresponding to 0.9 % of global GDP (UNODC 2005, pp. 123–143). These are substantial figures, probably much larger than the revenues of any other illegal entrepreneurial activity, although there are no reliable estimates for any of them.

The demand for illegal drugs in rich countries has been a key promoting factor of the expansion of the world drug industry, which now connects opium poppy and coca cultivation areas in Afghanistan, Burma, or Colombia to retail users several thousands of kilometers away. However, Western countries are far from being merely consumers or importers of illegal drugs. Some of them, and most notably the Netherlands, Belgium, and the United States, have also become major producers of cannabis and synthetic drugs, while others play a key role as transit countries (e.g., Spain).

Despite the reorientation of many professional criminals toward drug trafficking and dealing, several – traditional and nontraditional – profit-making criminal activities have continued to proliferate. As a matter of fact, some of these activities – ranging from car theft to robberies and the exploitation of prostitution – experienced an unexpected revival in the years immediately following the fall of the Iron Curtain, when Eastern European criminals primarily resorted to violence and ruthlessness to earn a "fast buck" in Western Europe.

A third group of entrepreneurial crime activities has also flourished since the 1980s, although they hardly are the prerogative of traditional underworld members. These activities range from fraud and other financial crimes to bid-rigging in public works tenders and the illegal wholesale trade in toxic waste, weapons, diamonds, and gold. They undoubtedly form a part of organized crime, if one accepts the loose official definitions of organized crime. Albeit difficult to estimate precisely, the harm these activities cause to society might be considerably higher than the harms of the illegal activities, such as drug and human smuggling, traditionally regarded as typical of organized crime.

Whereas the more white-collar forms of organized crime usually attract public attention only in the immediate aftermath of a big scandal, a second wave of expansion of Western illegal markets began in the mid-1980s, raising much concern in government institutions and the general public. This expansion was largely triggered by the enactment of increasingly restrictive immigration policies in most Western countries during the 1980s and 1990s, which created a large demand for human smuggling services. The number of potential customers as well as victims of veritable human trafficking also suddenly multiplied, as the liberation of Eastern Europe in 1989 and the collapse of the Soviet Union in 1991 abolished restrictions on the mobility of almost 400 million Eastern European and former Soviet citizens. Crises in other parts of the world, ranging from several African countries to Iraq, Afghanistan, and East Timor, also engorged the flow of prospective migrants, at the same time as growth and improvement of transportation facilitated their movements, by drastically reducing logistical constraints.

To meet this demand, human smuggling "companies" popped up at all the crucial borders of "Fortresses Europe and USA." Although many smugglers merely sell services desperately wanted by their customers, their prices are often extortionate and the smuggling conditions dangerous and even inhuman, as proven by the accidents all over Europe and on the US-Mexican border that cost the lives of undocumented migrants. (These incidents are caused, however, not only by the smugglers' ruthlessness but also by the rigor of Western governments' border interventions.) Moreover, this flourishing black market has opened up space for all kinds of exploitation that sometimes end up as real trafficking in human beings.

It is almost a platitude to note that public demand constitutes the main determinant for the provision of illegal goods and services. The evidence for such a statement is most compelling in the case of illegal drugs, which are willingly consumed by about 230 million people worldwide (approximately 5 % of the world population aged 15–64; UNODC 2012).

Political conditions – again primarily the strength and legitimacy of government authorities – also impact illegal markets. For example, they play a key role in determining the location of production of agriculturally based drugs (especially, heroin and cocaine). All else being equal, the cultivation of the plants from which these drugs are extracted tends to concentrate in countries with no effective enforcement of drug prohibitions and with local government or quasi-government tolerance or support for drug production and trade. Afghanistan and Burma, the world's two leading opium producers, most clearly illustrate this principle.

The draconian measures occasionally imposed by authoritarian governments and quasi-state authorities also vividly demonstrate the impact that government decisions can have, at least in the short term, on illegal markets. With a radical and concerted opium suppression campaign, the Chinese Communist led regime eliminated in the early 1950s opium consumption and production in China, which was then by far the largest market in the world. Such a campaign, however, entailed degrees of coercion that no democratic government can rightfully employ (Paoli et al. 2009). Totalitarian regimes have also been able to prevent the integration of their countries into international illegal markets. Most Western illegal drugs, for example, were unavailable in Russia until the implosion of the Soviet Union in 1991. The bulkier the product is, the higher the chances of control. As already mentioned, the Iron Curtain effectively deprived 400 million people of their right of free movement and "protected" them from falling prey to human trafficking and smuggling.

The chances of controlling illegal markets are, however, much more limited for democratic governments committed to the rule of law and a market economy. As long as these are not willing to resort to authoritarian border and law enforcement methods or to disrupt legitimate trade by, say, inspecting every container crossing their national borders, it will be almost impossible for them to stop illegal market flows. Indeed, these can be regarded as the price we need to pay for democracy and a market economy. Much like the informal economy, of which they are part, illegal markets constitute a "normal," unavoidable component of all modern societies. Contemporary governments have even less leverage than their predecessors over illegal – and legal – market flows as a result of economic globalization. The diminution of state-enforced restrictions on exchanges across borders – the core trait of globalization – has accelerated the interconnections between previously separate domestic, legal and illegal, markets and increased the mobility of goods, capital, and human beings. For illegal entrepreneurs, it has become easier than ever to move drugs and other illegal commodities from producing to consuming countries, to repatriate profits, to establish business partnerships with foreign counterparts, and even to operate in foreign countries themselves.

If the prospects of controlling global illegal market flows are quite bleak, the in-depth analysis of the world heroin market by Paoli et al. (2009) suggest that government authorities, even in democratic societies, are not powerless vis-à-vis organized crime activities. One of their main conclusions is that the strictness of governments' enforcement of prohibitions – in other words, the degree of effective illegality to which opiates (i.e., opium and its derivatives, including heroin) are subject – is the most important single factor to shape how the opiate/heroin market is organized in a particular country and the behavior of its producers and traffickers. It impacts, in particular, the size, organization, and operating methods of enterprises that produce or traffic illicit opiates.

These findings tie in well with a growing body of literature on organized crime in Western countries that show that the great majority of illegal exchanges in Western countries are carried out by numerous, relatively small, and often ephemeral enterprises. In other words, "disorganized crime" (Reuter 1983), rather than organized crime understood in terms of large-scale stable criminal organizations, predominates on the illegal markets of Western countries, reflecting the constraints deriving from the enforcement of prohibitions. These constraints have to do with the fact that illegal market entrepreneurs are obliged to operate both without and against the state.

First, since the goods and services they provide are prohibited, illegal market actors cannot resort to state institutions to enforce contracts and have violations of contracts prosecuted. Nor does the illegal arena host an alternative sovereign power to which a party may appeal for redress of injury. As a result, property rights are poorly protected, employment contracts cannot be formalized, and the development of large, formally organized, long-lasting companies is strongly discouraged (Reuter 1983).

Second, all illegal market actors are forced to operate under the constant threat of arrest and confiscation of their assets by law enforcement institutions. Participants in criminal trades will thus try to organize their activities in such a way as to assure that the risk of police detection is minimized. Incorporating illegal transactions into kinship and friendship networks and reducing the number of customers and employees are two of the most frequent strategies illegal entrepreneurs employ to reduce their vulnerability to law enforcement moves (Reuter 1983; see also Bouchard and Morselli 2013).

Due to the threat of police intervention, either in terms of seizing assets or imprisoning participants, the planning time horizons of illegal entrepreneurs are likely to be much shorter than those in legal markets. Since an illegal enterprise can hardly be sold as the entrepreneur ages, he is likely to divert an increasing share of his profits to legal assets which can be passed on to his heirs.

Finally, since they are operating against the state, illegal enterprises are prevented from marketing their products. They cannot create their own brand image and try to bind customers to it. Strong economies of scale, however, are associated with advertising, and the advantages linked to the nationwide marketing of one's own products have long been recognized as a very important factor in the rise of modern large-scale corporations. Illegal enterprises, however, are by definition excluded from the possibility of exploiting these advantages because, by doing so, they would obviously attract law enforcement attention and damage their own businesses. For the same motives, illegal enterprises in Western countries resort sparingly to violence: as Pearson and Hobbs (2001, p. 42) put it, "violence and killings attract police attention and leave traces, as well as attracting retaliation. Violence is therefore strictly 'bad for business."

For all the above reasons, it is rather unlikely that large, hierarchically organized enterprises will emerge to mediate economic transactions in the illegal marketplace of countries with effective governments. The factors promoting the development of bureaucracies in the legal portion of the economy – namely, taking advantage of economies of scale of operations and specialization of roles – are outbalanced in the illegal arena by the very consequences of product illegality. Even mafia-type organizations are subjected to the constraints deriving from the illegal status of products, and when they deal in drugs or other illegal products, they do not operate as monolithic productive and commercial units. On the contrary, their members frequently set up short-term partnerships with other mafia members, or even nonmembers, to carry out illegal transactions.

Nor are the average illegal market actors of Western countries interested in, or capable of, exercising a quasi-political power similar to that of mafia-type organizations. As Europol (2003, p. 10) recognizes, "politically, few OC groups pose a direct threat to Member States." Most organized crime groups active in the richest Western countries are simply too small and ephemeral to be able to exercise such political power.

The situation can look radically different in countries with lax or no enforcement of official prohibitions. Paoli et al.'s (2009) analysis of the world heroin market, for example, concludes that opiate enterprises can become large and stable and assume bureaucratic characteristics if they are closely linked via corrupt ties to, or coincide with, a powerful state or quasi-state authority. Under conditions of lax or non-enforcement, opiate enterprises may form oligopolies or even monopolies, if powerful and engaged state or quasi-state authorities back them up. The extent of violence and bribery also depends on the strength and involvement of state or quasi-state authorities. Violence may be high, if the supporting state or quasi-state authority is weak; it may be low, if the state or quasi-state authority is strongly institutionalized and directly involved in the drug trade.

This model also predicts that for countries that have become accustomed to lax or non-enforcement, a shift toward strict enforcement may imply a worsening of drug-related corruption, violence, and instability in the interim. What happened in Afghanistan during the first decade of the twenty-first century clearly demonstrates the potential for worsening conditions: powerful drug producing and trafficking organizations have used all available means to oppose state efforts to enforce prohibition more rigorously and fight for the "right" to continue their established businesses.

Illegality and enforcement seem to have similar effects on the size and operating methods of cocaine and cannabis trafficking enterprises as they have on opiate-related firms. For example, large and stable cocaine trafficking organizations having no qualms about openly challenging state sovereignty have consolidated in countries lacking consistent enforcement of prohibitions, such as Colombia and Mexico (e.g., Medel and Thoumi 2013; Thoumi 2013). Presidents Fox and Calderon's determined fight against Mexican drug cartels has plunged the country into an unprecedented spiral of violence. Mutatis mutandis, the model of varying effective illegality seems to be applicable to the enterprises producing and dealing with synthetic drugs and other illegal goods and services.

Conclusion

The analysis shows that the manifestations of organized crime in any single national context depend – to a considerable, albeit not exclusive, extent – on the authority of the local government agencies. A full analysis, however, would also have to weigh the benefits and costs of governmental control interventions. The US war on drugs of the past two decades may have helped keep the US drug market relatively "disorganized" but has failed to reach its main goal of reducing drugs availability and has produced huge social and financial costs: it is enough to say that a considerable proportion of the over two million people behind bars and about five million more on probation or parole have been convicted for drug offenses.

Criminal repression is undoubtedly a necessary reaction to the most serious forms of organized crime, such as a mafia-type organization challenging government authority. Nonetheless, governments should always aim at reducing the total harms associated with organized crime *and* policies and not lose sight of the fact that they also carry responsibility for these harms.

Organized Fraud

Michael Levi
Centre for Crime, Law and Justice at Cardiff
School of Social Sciences, Cardiff University,
Cardiff, Wales, UK

Overview

The relationship between fraud, organized crime, and white-collar crime is a complex one. When Sutherland (1945) wrote his classic presidential address for the American Sociological Association toward the end of the Second World War, "White-collar crime *is* organized crime," he was pointing to the "organizedness" of the crimes committed by the otherwise legitimate corporations he had researched as well as, perhaps, appropriating some of the demonization that attaches to the "organized crime" label. Later theorists such as Shapiro (1980), arguing that the focus on offender status was too confusing, redefined white-collar crimes as crimes of deception and as characterized by interest clashes between principals and agents. Pushed to its limits, this would mean that all white-collar crimes are organized fraud (though of course, not all organized crimes are fraud). According to the UN Transnational Organized Crime Convention, one needs three or more people acting together for some undefined period of time to constitute organized crime, so some large-scale elite as well as junior opportunist "well-organized" frauds are *not* "organized crime" in this sense: if you are in charge of a large organization – business or political party – and people do what you tell them, you may not need active conspirators. In practice, as the Dutch Organized Crime Monitor has shown, "organized fraud" can be a shorthand phrase for frauds committed by career criminals rather than by respectables (e.g., van Koppen et al. 2010): the very mindset that Sutherland was seeking to undermine in his analogy, which remains a powerful folk image because part of the apparent threat of "organized crime" is that everything an "organized criminal" does threatens "legitimate society" (whereas, by omission, whatever those who are *not* organized criminals do is *less* threatening to society). Hence, the regular references to organized criminals "infiltrating" or "corrupting" commerce. Indeed, the criminal careers of white-collar criminals are more uneven than one usually finds elsewhere (Piquero and Benson 2004). Measuring "organized fraud" involves two difficult components: measuring how much of different frauds there are and measuring what proportion of them are "organized" (and by what criteria this "organizedness" is to be judged). The settings for frauds influence and reflect networks, in the context of fraud opportunities and "capable guardians," in the classical situational opportunity model.

Fundamentals of Organizing Frauds

One way of thinking about how frauds are organized is to develop a process model. When analyzing the dynamics of particular crimes and/or criminal careers, these procedural elements can be broken down further into much more concrete steps, sometimes referred to as "crime scripts" (Morselli 2008).

The Organization of Fraud: A Process Model

1. See a situation as an opportunity for fraud.
2. Obtain whatever finance/equipment/data needed for the crime.
3. Find people willing and able to offend (if conspirators are needed, inside and/or outside the victim organization), preferably those who are controllable and reliable.
4. Carry out offenses in domestic and/or overseas locations with or without physical presence in jurisdiction(s).
5. Minimize immediate enforcement/operational risks. Especially if planning to repeat frauds, neutralize law enforcement by technical skill, by corruption, and/or by legal arbitrage between jurisdictions.
6. Convert, where necessary (e.g., where goods rather than money are obtained on credit), the proceeds of crime into money or other usable assets.
7. Spend as much of the proceeds as desired.
8. Find people and places willing to store those proceeds the offenders wish to retain (and perhaps conceal their origin).
9. Decide which *available* jurisdiction(s) offers the best balance between comfort and the risk of asset forfeiture/criminal justice sanctions.

There is also a personality dimension (van Duyne 2000): some people seek out opportunities to defraud and look for facilitators like accountants or lawyers, whereas others just take what comes opportunistically. Felson (2003) has sought to account for some variations between area crime rates as the product of "crime chemistry": features of a setting that come together to foster crime, including the presence of likely offenders and suitable targets as well as the absence of capable guardianship against the offenses that would otherwise take place. Features relevant to crime levels also include three other "often-important elements": "props that help produce or prevent a crime," "camouflage that may help an offender avoid unwanted notice," and "an audience that the offender wants either to impress or to intimidate" (Felson 2003). Although Felson did not have white-collar offenses in mind, one might consider the extent to which these constructs help comprehend aspects of fraud.

Those who are connected to "organized crime" may already have in place all the steps as part of their ongoing "criminal enterprise." Criminal finance, some or all criminal personnel, or the "tools of crime" (from companies registered in "secrecy jurisdictions" to anonymous prepaid debit cards which can be used globally) may come from or go to another country, constituting "transnational" crimes, or else remain within one country. The exploitation of international regulatory and criminal justice asymmetries – for example, different levels of enforcement in the states or countries in which the fraudsters operate and victims are located – represents a positive advantage for fraud compared with most other property crimes.

Applying the sort of script found in the process model above, fraudsters seek potential victims for their schemes and develop techniques for getting them to part with their money voluntarily. In some cases, they or others may revictimize the same people by offering (for a fee) to help them get back the money they have lost. Another characteristic difference is that the offender and victim do not ever have to be in the same place at the same time. Some such offenses involve face to face contact throughout or at some stage; others are done wholly remotely, like lottery and eBay scams. An example of the latter is "419 frauds," so called after section 419 of the Nigerian criminal code (explored in detail by Schoenmakers et al. 2009). Most e-mail users have received scam emails – which usually arrive from a Yahoo! Mail, Hotmail, or Gmail address – offering them vast wealth if only they will help their previously unacquainted banker/relative of a famous deceased corrupt dictator put their "dormant account" or "unknown to the authorities but at risk" money into their own account for 25–40 % of the "take" (often £/€/$25 billion or million). The victim is later persuaded to pay "advance fees" to remove blockages in the funds transfers and may even be lured to Nigeria, South Africa, or some other country to pay out more. Nigerians turn to their advantage the stereotype of their corruption in order to make the proposition more plausible to their intended targets. Alternatively, they make religious-type appeals – starting with "Dear Brother in Christ" – to assist orphans, or some other spoof rationale for large funds being available, such as money being left to the target in an unknown relative's will.

Choice of offender or victim location is determined by convenience or by deliberate targeting by globally mobile offenders, though consumer frauds can be plotted from afar: see, e.g., Holtfreter et al. (2005, 2008). Businesspeople find it easy to transfer funds out of the company and/or to commit bankruptcy fraud, making relationships with organized crime groups usually unnecessary, though the latter may offer economies of scale and protection from the police or impose their will by threats of violence. The corporations can be substantive and real or they can be mere fronts or shells for the perpetration of fraud. But people can also commit frauds against companies and the government as outsiders or from more junior positions. Fraud permits a variety of offender organizational permutations, from Mafia-type associations to sole or small group offending.

As for the persistence of crime techniques over time, this varies depending on the countermeasures taken by potential preventers, who are mostly outside criminal justice. Fraudsters can now use payment card numbers skimmed from unsuspecting cardholders or hacked/copied from corporate databases to order hundreds of computers on the net from different suppliers, have them delivered to "drop addresses" in any credible country, and then forwarded to addresses elsewhere for resale: all of this before the cardholder or card issuer becomes aware that anything has happened to their card or account. This and other cyberfraud techniques reflect a comparative criminal advantage arising from the combination of high technological skills and high motivation because of poor opportunities in their home countries. There are also large-scale credit card and loan "bust outs" using stolen identities to obtain goods and money. Although these are often referred to as "identity theft," they are more accurately referred to as identity duplication, since the original person is not deprived of their existing identity (see Vieraitis and Copes, this volume, for a more extensive account of identity theft). The illustrations above show that behavior of victims-to-be and "capable guardians" has to be considered as part of the organization of crime. Nowadays, electronic credit histories are omnipresent in the UK and USA, but such data are less available elsewhere, especially in emerging economies where long business and individual commercial data do not exist. Even addresses in Africa are usually postbox numbers rather than physically identifiable dwellings. Many of the features upon which "identity validation" rests are not uniformly available, and this creates difficulties for legitimate people wanting to open bank or other credit accounts in the face of anti-money-laundering identification requirements developed for advanced economies.

Felson and Boba (2010) view white-collar crimes as "crimes of specialized access." However, though useful, this is an inadequate compass for all frauds. Some frauds require professional licenses, some involving lengthy training, which "organized criminals" (in the conventional usage of that term) are ill-equipped to undertake in the short run. Thus, Italian-American Mafiosi who aspired to become "penny stock" fraudsters had to find people with licenses before they could diversify – fortunately for them, some Americans of Russian origin who had licenses were willing to assist them. But other frauds, like some credit card and insurance frauds, and even corporate bankruptcy frauds, do not require specialized access but are available to new entrants who have enough initiative and some basic skills, which have become greater as the introduction (outside the USA) of cards with chip and PINs has made it difficult to use stolen cards (see Forsyth and Castro (2007) for a professional credit card fraudster's perspective). "Stealth frauds," like the illegal downloading of personal information from data sets and using it for "identity fraud," the copying of magnetic stripe data from credit cards, and illegal electronic funds transfers, may but do not always need specialized access. Shover et al. (2003) state that the sales agent in telemarketing scams generally works from a script that lays out successful sales approaches and responses. Promising contacts are turned over to a "closer," a more experienced, and a better-paid sales agent. The hierarchy of the firms and the routine of turning prospects over to more experienced closers explain why victims typically report contact with multiple salespersons.

What factors influence the choice of venue for boiler room telemarketing frauds and their modus operandi? From UK cases examined by this author (see also http://www.cityoflondon.police.uk/CityPolice/Departments/ECD/Fraud/boilerroom.htm), boiler rooms are commonly based abroad (e.g., in Spain, where police interest is low); never seek authorization by the regulator, the Financial Services Authority (FSA), which authorization is a legal requirement to sell securities in the UK; and use high-pressure sales and telephone techniques (author interviews with UK officials and police). One more sophisticated technique is to approach a small UK company not listed on the stock exchange and propose to raise capital by selling £100,000 worth of shares in that company on their behalf. Of this £100,000, the boiler room would agree to take 60 % as its fee, leaving the small company with £40,000 capital. In reality, the boiler room will "cold call" (i.e., telephone without prior contact) UK investors to sell the shares at up to 100 % over the agreed price, take their fee, and vanish. The small companies involved may become liable to refund investors the full price paid for their shares. There are several variations on the method of committing the crime:

- Complete con, where there are no shares in existence
- Different instruments used – stock, currency options (and even bull sperm)
- Restricted (e.g., US "Regulation S"), worthless, or overpriced shares
- Purported involvement in raising capital for companies
- Market manipulation where there are shares in existence and a (limited) market
- Deceptive share promotion via bulletin boards

(For a broader examination, see Shover et al. 2003; Stevenson 2008.) If the fraudsters have sufficient nerve, they can seek to become regulated in one EU country and obtain a "passport" to operate in another under EU single market regulations, using that as a base for fraud and making it difficult for local regulators to intervene to close them down. In all of these cases, what the boiler room is really selling is deceptive and worthless expectations. Similar patterns exist in the USA (Tillman and Indergaard 2005), though within the USA interstate scams constitute federal offenses: hence, the preference of some fraudsters for operating from Canada.

One common type of tax fraud in Europe is known as "carousel fraud." This may involve any type of standard-rated goods or services. Goods or services are acquired zero-rated from the EU, with the acquirer then going missing without accounting for the value-added tax (VAT) due on the onward supply. However, in the case of a British scam, the goods or services do not become available in the UK for consumption, but are sold through a series of companies in the UK and then exported or dispatched, prompting a repayment from the government (HMRC) to the exporter/dispatcher. This process can be repeated over and over again using the same goods or commodities. When this happens, it is called "carousel fraud." In some cases, no real products are traded at all but the transactions exist only on paper (Fig. 1).

Mortgage Frauds

The social construction of mortgage fraud is intriguing and has been relatively little researched (though see Nguyen and Pontell (2010), and

Organized Fraud, Fig. 1 A simple missing trader intra-community (MTIC) fraud carousel scheme transaction chain their respondents and – for a quick summary – Black 2009). The FBI (2011) notes that its "perpetrators include licensed/registered and non-licensed/registered mortgage brokers, lenders, appraisers, underwriters, accountants, real estate agents, settlement attorneys, land developers, investors, builders, bank account representatives, and trust account representatives. There have been numerous instances in which various organized criminal groups were involved in mortgage fraud activity. Asian, Balkan, Armenian, La Cosa Nostra, Russian, and Eurasian organized crime groups have been linked to various mortgage fraud schemes, such as short sale fraud and loan origination schemes. . ..Mortgage fraud perpetrators have been known to recruit ethnic community members as co-conspirators and victims to participate in mortgage loan origination fraud." A later report (FBI 2012) gives a lucid overview of the process:

> Fraud has been identified throughout the loan process, which commences with the borrower providing false information to the mortgage broker and/or lender. The next layer of potential fraud – the corporate fraud – occurs with the banks, brokerage houses, and other financial institutions that package loans through the securitization process. As the housing market declined, subprime lenders have been forced to buy back a number of nonperforming loans. Many of these subprime lenders have relied on a continuous increase in real estate values to allow the borrowers to refinance or sell their properties before going into default. However, based on the sales slowdown in the housing market, loan defaults increased, the secondary market for subprime securities dwindled, and the securities lost value. As a result, publicly traded stocks dramatically decreased in value as financial institutions realized large losses due to the subprime securities they held or insured, resulting in financial difficulties and bankruptcies.

Though the subprime securitization racketeering was a US specialty, mortgage fraud still appears easy to commit in the UK, by solicitors (UK lawyers) in collaboration with property buyers. In Legal Futures (2012), a foreign lawyer registered with the English regulators to work in a law firm was sentenced to 7 years in prison as being "at the helm of a criminal gang that defrauded high street banks out of almost £8 m by taking out mortgages on properties they did not own" and indeed for consequential money laundering. A Mr Younas, using an alias, was director of Montague Mason Solicitors:

> He submitted false paperwork to Birmingham Midshires and Abbey banks in connection with 33 fraudulent mortgage applications in a two-month period in late 2008. His fellow gang members had previously identified suitable properties across the south-east to use for false mortgage applications – with the homeowners unaware of the crime. The fraudulent mortgages were finalised when false paperwork was completed by the solicitors, and signed by Younas, including the certificates of title requesting the banks release the funds. Once the deals were signed off and the funds transferred, the stolen money was quickly transferred from the solicitor's account into a network of bank accounts, controlled by Younas and the rest of the gang. The money was then withdrawn in cash.

The regulators had already closed down Montague Mason in February 2009, and he was struck off the register of foreign lawyers in 2010, incapacitating him from crimes that involve authorized lawyers in the UK, *provided that anyone checked the register*. Middleton (2005) has critically examined responses to frauds by English lawyers.

It is possible to review the dynamics between setting and criminal act for identity and other frauds, such as application frauds and insurance frauds. In mortgage frauds, fraud typically takes two forms: customers lying about their own means – that is, exaggerating their income – and/or falsifying documents, such as creating fake payslips that show they earn an amount large enough to justify the mortgage they need, even if it is a multiple of their real income. This can be done simply by printing fake payslips, if necessary, on a color printer. Self-certificated mortgages (at higher interest rates in the UK) were allowed to cater for the increasing number of self-employed persons who could not produce genuine payslips; in the USA, the brokers simply filled some invented number in for them. One incentive for mortgage introducers is that they are paid commission; one incentive for lenders is that they have sales targets to hit and performance bonuses to get, and nonpayment usually comes much later. In some cases, the borrower is told there is no way they are going to get the mortgage they want with their income and that they should leave that part of the mortgage application form blank. After they have gone, the broker inserts the false income. In the USA particularly, there have been widespread scandals relating to commission-hungry brokers lying to purchasers about the affordability of mortgages, which they discover only when the initial low rates expire (Financial Crisis Inquiry Commission 2011). In other cases, the would-be purchaser colludes with the broker. In other cases still, the broker (or lawyer) purchases the properties for themselves as beneficial owner, using the names and real or fictitious income details of clients. In a rising market, where there is demand (e.g., from students) for rental properties, fraudulent purchasers see little downside risk. In some cases, professionals appointed by lending institutions are aware that the lenders need to lend, and their judgment is swayed by this to give the valuation required to enable the mortgage to be granted: this is especially so where all the parties' desires are in the same direction (author interviews with surveyors, 1980s and 2008). However, when the market turns, as it did in 2007 (and earlier in the USA, where FBI warnings of a mortgage fraud epidemic went unheeded by politicians and regulators), these frauds are shaken out as people cannot keep up with repayments. (This was less common in Europe, though European banks – and later European taxpayers – ended up suffering because they purchased triple A-rated derivatives based on these nonperforming loans).

Fraud and Money Laundering

In any dataset of suspicious activity reports from banks, law firms, brokers, etc., a significant percentage of reports have "fraud" ticked as a reason for suspicion. Oftentimes, this is the product of hunch rather than specific knowledge, but there is so much confusing rhetoric about money laundering that I will try to bring some clarity here. There are in essence two definitions of money laundering. The first, more or less universalized following the success of the Financial Action Task Force in pressurizing countries around the world to legislate, is that anything that is done with the proceeds of crime to hide or store them becomes "laundering." Thus, all proceeds of fraud that are not directly consumed in "lifestyle" are laundered. The second – which may correspond more closely to what people think laundering is – is that all proceeds of fraud that are sought to be legitimated as "clean money" are laundered. The difference between these two categories depends on how much effort is made and expected to be made by civil creditors and law enforcement to trace funds.

Many parties can be involved in laundering, but the number can be as low as one. This insider involvement is not uncommon for large-scale financial frauds: just as Cressey (1955) argued that all accountants *could* commit embezzlement, the fraudster has exactly the skills required to also conceal the sources of his funds. Where offenders start out with a business that is being used as a medium for what looks like legitimate activity – which is not the case for credit card fraudsters, for example – then placement of funds in banks may not attract suspicion: corporate lawyers may be falling over themselves to offer well-paid services in the construction of corporate vehicles. They will not routinely suspect senior corporate staff of being major criminals, perhaps especially since they were appointed by them and would like to be paid by them in the future. Since many frauds would be unsuccessful if they did *not* look like legitimate activity, this gives them a structural advantage over other types of offenders. On the other hand, if corporations are paying bribes to public servants to defraud their countries or to private purchasing officers to defraud their companies, then more subtle mechanisms for concealment may be necessary. Such conduct would seldom be associated with "organized crime" as conventionally defined, however. Surprisingly, little research has taken place (or has been commissioned by governments around the world) on how criminals generally, or fraudsters in particular, launder their funds. In recent years, the greatest attention has been paid to how the proceeds of grand corruption are laundered: but the overlap between fraud and corruption means that many of these cases are really cases of fraud against the governments that both the bribe payers and the bribe recipients are committing. For good studies of this process of laundering the proceeds of corruption, see de Willebois et al. (2011) and Sharman (2012).

Enron

In the last year at Enron Global Finance group, managers were sometimes handed a list of Enron assets and instructed to go out and sell some to the special-purpose vehicles. A manager would pick something, from a plant to stock to a piece of a start-up company, and then discuss the deal with a team of internal lawyers and auditors. A bank or other investor lent money to the newly created company to finance the purchase. The new company, in turn, paid the money to Enron. The use of an intermediary was to make the loan belong to the new company, not Enron, and thus not to count as a debt on Enron's financial statement. Instead, it counted as income to Enron when the new company passed on the proceeds. Less debt and more income assured Enron would keep its high credit rating (making borrowing cheaper) and would keep the stock price up.

Top graduate school employees told the Houston Chronicle (20 January 2002) there were many uses for the vehicles that they considered legitimate, such as bringing in outside partners to share the risks of a particular venture: but there was little question, especially toward the end, that many had no real "business purpose" other than improving financial appearances. Say the asset was 100 shares of IBM stock. Enron would divide each share into two parts, one called a "control interest" and one called an "economic interest." Then it would sell the economic interest to a newly created special-purpose vehicle. The asset was rarely as simple as 100 shares of another company's stock. So Enron had to put a value on it. Because there was no real outside buyer, it decided the price itself and had that number approved by its auditor, Arthur Andersen.

The deal was placed with a bank, insurance company, or other major lender, which put up 97 % of the money. Sometimes the promise of Enron stock would be put up to guarantee the loan, although Enron stockholders were never told of the risk that their shares could be diluted if such new shares had to be issued. To qualify as "independent" from Enron for accounting purposes, a special-purpose vehicle had to be owned by someone else. So an outside entity would be brought in to make the required investment, perhaps a tiny percentage of the SPV's total start-up cash, sometimes illicitly lent by Enron itself. An employee told the Houston Chronicle (20 January 2002):

> Enron no longer owned the economic interest in the asset, but it did own control over it. In the sales contract with the vehicle, Enron promised always to act in the interest of the SPV. Lawyers and auditors said all this was OK. As the asset made money for the SPV – if it did, and many didn't – it made principal and interest payments to the lender and issued dividends to the outside equity partners, just like in a normal company.
>
> Enron got to report the proceeds of the sale of the asset as earnings. It had to repay the loan. . .but the debt didn't show up on Enron's financial statements.
>
> "Investors don't like to hear you say, 'Oh, I was wrong.' So you start having a yard sale to boost CFO (cash flow from operations) and net income," the employee said.

As the Enron indictments showed, there were plenty of accountants, bankers, and lawyers as well as some senior management willing to participate in criminal or marginal operations. But they had nothing to do with any minority ethnic or national communities (except for White Anglo-Saxon Protestant Americans), nor with any criminal subcultures as conventionally defined. Likewise, the many works on the savings and loans "failures" (Black 2005; Calavita and Pontell 1993) and on accounting frauds (Tillman and Indergaard 2005) emphasize the culpable involvement of elite networks rather than marginal firms, whereas there is no reason why elite *and* marginal firms (plus "organized criminals") cannot be involved in frauds and money laundering.

Conclusions

Globalization of fraud is affected by settings, with their rich and varied opportunities (reflecting patterns of business, consumer, and investment activities), the abilities of would-be perpetrators to recognize and act upon those opportunities (the "crime scripts" perspective), and their interactions with controls including law enforcement and formal regulation (touched only lightly upon here). Even in law enforcement circles (WEF 2012), the structure of groups is becoming less important than analyzing what people need from the largely illicit and largely licit worlds to go about the business of fraud. Such observations or claims about the contested and shifting nature of analysis over time complicate the already difficult question of whether fraud "itself" has changed over the years (Levi 2008a, b, 2012). It seems reasonable to reflect on two "historical" questions:

1. In what respects has fraudulent activity changed, in terms of the sorts of techniques and organization that are or can be used, in relation to the efforts made (intentionally or not) to prevent frauds?
2. In what respects has the world of fraud changed and what would the sort of people with the sort of skill sets/networks who committed frauds in the 1960s and 1970s have contemplated doing today?

In relation to the first question, although the basic techniques used by fraudsters 50 or even a hundred years ago are still available today, especially against those investors and trade creditors who make only modest enquiries, the professionalization of investor protection and credit management, interest by "consumer programs" on television and sections in newspapers, and websites and other electronic sources make the commission of such frauds harder. E-commerce, the growth of lightweight, high-value electronic products, and the technology of rapid delivery anywhere in the world have cut down decision times and opened up domestic and foreign markets to fraudsters operating within and from outside all developed economies. At the high end of insolvency frauds, however, it seems doubtful whether the more skillful abuses of insolvency by those who, for example, establish beneficially owned corporate fronts offshore and then create artificial debts to them which enable them to vote in friendly liquidators or administrators are any harder to commit or are any more likely to be punished today than they were 50 years earlier. Formal social control – the police and criminal courts – has not been particularly interested in frauds other than the more visibly harmful "widows and orphans" cases and those committed by gangsters, "professional criminals," and terrorists in whom they already have an interest irrespective of the frauds they have committed. In Australia and Europe, and even in smaller jurisdictions such as Mauritius, pushed by international technical assistance, there has been a growth in "civil recovery" regimes, applying financial investigation and asset forfeiture (irrespective of criminal conviction) to supplement post-conviction confiscation remedies. However, even if they have substantial savings rather than (e.g., as did the high-spending bankruptcy fraudsters interviewed by Levi 2008a, and did the telemarketers interviewed by Shover et al. 2003) spending "their" proceeds as they went along, few fraudsters are high-profile career criminals of a seriousness level that would interest enforcement agencies specializing in combating "organized crime." This question is connected to the second.

The dominant mode of thinking about serious crime for gain has been the "rational choice" model implicit not only in the economic analysis of crime but also in situational crime prevention "theory" (see Schuchter and Levi 2013). The selection of fraud in general or particular forms thereof in particular depends on the confidence, skills, and contact set of any given individual offenders. The presence or absence of "crime networks" known to and trusted by the willing offender makes a difference to "crime capacitation": an issue often neglected in individualized explanations of involvement in crime. Choice of crime type might also be affected by age. Those offenders who were in their 50s and over might be deterred by the technological challenges of cyber activities, and the age gap might apply to co-criminality as it does to other feature of contemporary life. So today's new generation fraudsters might gravitate toward more hi-tech forms of fraud, whereas if they were in late career, it might seem too risky to adapt in unfamiliar territory unless they can find someone younger to collaborate with. Some fraudsters display a remarkable aptitude for creativity and constant testing out of commercial systems and private individuals for signs of weakness. This focus on "criminal transferrable skills" – the set of aptitudes including social networking that individual/sets of offenders have – concentrates our attention on offender creativity, energy and social networking skills in finding co-offenders (or "turning" non-offenders into co-offenders), and in adapting techniques: many offenders (and non-offenders) lack one or all of these qualities.

With only modest sophistication, the Internet has made it easier for foreign natural and legal persons to defraud consumers and suppliers, for example, via counterfeited or cloned payment cards. Fraudsters could be involved in the theft of personal data from garbage ("bin raiding") or by hacking into data storage facilities; or they could simply send "phishing" emails offering academics invitations to conferences on "child protection and the economic crisis" to try to con them into giving their personal details for the free visa and transport arrangements that will later turn out to be illusory. They could also be involved in account manipulation by insiders, whether in call centers or elsewhere. (The offshoring of call centers led to periodic media alarm stories about blackmail and corruption in India: but it is nonsensical to think that this cannot happen in the developed world, with badly paid, high turnover staff ratios. Indeed, there may be tougher regimes in Indian call centers – staff searches and prohibitions on mobile phones – than might be allowed in Europe.) Rings of staged accidents with claims for hard-to-falsify personal injuries would be within the skill set of many (once they worked out what to do), as would organized benefit fraud and – especially – the sale of counterfeit products, whose quality digital technology has done so much to improve. For the more adventurous, scams can involve some currently fashionable musical or sporting events, or the Muslim Hajj, or a social cause such as "renewable energy" or commercialized carbon trading. The underlying concepts were available to investors centuries ago, at the time of the South Sea Bubble or the Dutch Tulip Mania, but every generation has to learn the lessons for itself. When times get hard, people may take more risks to avoid downward mobility; when times are good, everyone wants to get onto a rising bandwagon. Both circumstances offer opportunities to fraudsters.

Organizing and Supplying Forensic Science Services

Christopher Lawless
University of Edinburgh, Edinburgh, UK

Overview

The issue of how to organize and regulate the provision of forensic scientific services is a topic which has attracted increasing discussion. Concerns have been expressed about whether police control of forensic laboratories best serves the interests of justice. Elsewhere, instances of official scrutiny have made a link between the efficiency of forensic science laboratories and the capacity of police forces to combat crime. In response to ongoing controversy over the quality and timeliness of forensic science, recent decades have seen an increase in calls to reform its provision along market-led lines. Such reforms have been pursued with particular vigor in England and Wales. Developments in this jurisdiction have however raised considerable controversy, particularly in the light of the announcement in December 2010 to close the leading forensic science provider, the Forensic Science Service (FSS).

Introduction

This entry first devotes attention to exploring the arguments for and against the regulation of forensic science through competitive and market-led means. Attention is drawn upon the experience of England and Wales in order to give a flavor of the empirical consequences of such policies. Attention is also devoted to exploring how discourses of "marketization" and "liberalization" have been differentially interpreted and the resultant implications for the epistemic character of forensic science. While less data currently exists regarding developments in other jurisdictions, A brief overview is provided of those states where reform has been considered or where it poses further issues.

This entry is organized to provide information regarding the following topics:

– Arguments and counterarguments for the commercial reform of forensic science
– The empirical impact of market reforms to forensic science?
– The effect of commercialization on the epistemic character of forensic scientific knowledge
– Measuring and codifying the "value" of forensic science
– Comparing the experience of commercialization in England and Wales with other jurisdictions

The Arguments for and Against a Competitive Market for Forensic Science

Concerns over the quality of forensic science have been accompanied by calls to reconsider ways of organizing the production of scientific knowledge within criminal justice systems. Suggested reforms to the shaping and provision of forensic science have sought to redress perceived disadvantages to defendants (see ▶ Cognitive Forensics: Human Cognition, Contextual Information, and Bias). Other calls for reform have sought to improve the efficiency of analyses (see ▶ Forensic Science Effectiveness) and to help maximize the use of forensic science by police forces (see ▶ Forensic Science and Criminal Investigation).

The effect of institutional structure on the nature of forensic scientific knowledge has received particularly comprehensive attention through the work of Roger Koppl (2005, 2006, 2010). These studies of forensic science in the USA have drawn upon a series of theoretical and methodological perspectives from inter alia economics, social epistemology, and organization studies. These studies indicate that current modes of organization have led to poor-quality work being performed in laboratories, with high risks of error, bias, or even outright scientific fraud. Koppl (2005) argues that eight features of forensic science organization in US laboratories contribute to suboptimal quality: (a) the *monopoly* that each laboratory holds over the evidence it analyzes, with no other laboratory likely to analyze the same evidence; (b) *dependence* on police forces, under which they are normally organized and whom they depend on for funding; (c) weak *quality control* systems (see ▶ Forensic Science and the Paradigm of Quality); (d) ability of forensic scientists to gain *information about case circumstances* which may prejudice how they interpret evidence (see ▶ Cognitive Forensics: Human Cognition, Contextual Information, and Bias); also (e) *no division of labor between analysis and interpretation* (i.e., the scientist who performs the technical work of an analysis also interprets the results and reports them to police); (f) *lack of forensic counsel* for defendants, creating an information asymmetry; (g) *lack of competition to provide defense services*; and (h) *public ownership* of forensic laboratories which Koppl argues reinforces the dependence on police. This dependence is also seemingly compounded by performance criteria for law enforcement agencies which include numbers of arrests, prosecutions, and convictions. Koppl (2010) argues that these conditions promote bias toward the prosecution: "When making a monopolistic subjective judgment about ambiguous evidence, forensic scientists in the employ of law enforcement agencies have an incentive to interpret evidence in ways that support the interests of law enforcement" (Koppl 2010, p. 79).

In addressing these perceived shortcomings, Koppl has suggested a number of measures. Perhaps the most notable of these interventions concerns proposals to overturn the monopoly control that US forensic laboratories hold over evidential analysis. Koppl (2006) uses the term "monopoly epistemics" to describe this arrangement. Drawing upon experimental data, Koppl argues that the analysis of forensic evidence at multiple sites decreases the chance of error or bias and that the presence of multiple suppliers of information to the judge and jury improves decision-making on the part of the latter (Koppl 2005). Building on these arguments, a different arrangement has been proposed, described as "competitive self-regulation" (Koppl 2005). This involves the introduction of competition within a jurisdiction, with multiple laboratories able to analyze the same evidence. Forensic scientists in one laboratory may not know whether evidence in a specific instance is also being analyzed elsewhere, but awareness of this possibility should facilitate a higher quality of scientific work. Competitive self-regulation also involves the hiding of extraneous, circumstantial information from forensic analysts so that work proceeds in a context-free environment.

While the rigorous application of economic and organization theory to forensic science administration is to be welcomed, certain criticisms of the work of Koppl et al. can be identified. The argument that the quality of forensic scientific work improves in the absence of contextual information is not accepted by all (see ▶ Forensic Science Culture and ▶ Forensic Science and Criminal Investigation). This therefore remains a key point of contention. Even if one accepts Koppl's position, the question remains as to what exactly constitutes "contextual" information and to what extent it can be fully excluded from analysis. Koppl's arguments also do not reflect the distinction between traces (collected at a crime scene) and the subsequent production of evidence presented in court. A variety of processes may be involved in transforming traces into evidence, and forensic scientists themselves have multiple roles (forensic science culture).

Koppl's suggestions for reorganizing forensic work also do not allow for the possibility that the same individual employees may be involved in a reformed system. Previous career experience of casework could still permeate into forensic practice even in a rearranged working environment, which could perpetuate bias. Another issue concerns the involvement of multiple laboratories. While in theory this could be effective, serious practical problems could result from a lack of sufficient evidence to distribute to multiple sites of analysis. DNA evidence, for example, may only be present in trace quantities which might preclude multiple analyses. Further, if single evidential items are recovered from an incident, the nature of certain forensic tests may irreversibly alter the nature of the source evidence which might not make it amenable to subsequent tests under "blind" conditions.

Koppl et al. also argue in their work for the replacement of state dependency with a privatized mode of forensic science provision. In justifying this argument Koppl regards publicly owned laboratories as having weak financial incentives to improve the quality of work. Other commentators have also previously advocated the advantages of private firms entering forensic science markets. In an earlier assessment of forensic science in England and Wales, Gallop (1992) argued that the presence of independent firms would be advantageous to both defendants and forensic scientists working alongside the police. Gallop argued that the presence of an independent sector could remove the burden from government scientists being distracted by defense considerations (although in some jurisdictions, two scientists may respectively work for opposite sides in a case). With defendants being well served by commercial options, government scientists would be free to fully focus on prosecution work. Gallop also argued that an expansion of the sector naturally provided more career opportunities for government scientists, contributing to a healthy employment base and sense of professional collegiality.

Gallop (2003) made later arguments in favor of the route to privatization, advocating further potential benefits including (Gallop 2003, p. 59):

– Proper choice for police forces, allowing them to be more demanding in terms of quality, cost, and speed of service
– An expansion of the number of forensic laboratories
– Easier access to the forensic science community
– Better quality assurance standards

Fraser (2005) argued that privatizing reforms were necessary to improve the efficiency and turnover rate of casework. Even with a relatively modest degree of reform, Fraser argued that the speed of delivery in England and Wales compared far more favorably to publicly funded laboratories in other jurisdictions, seen to be characterized by incessant backlogs. A 2002 report of forensic science in the USA, for example, found a backlog of 500,000 cases (Fraser 2005, p. 119). More recent data from New Zealand also supports the claim that some form of economic restructuring has helped to clear backlogs (Bedford 2010).

As we shall see, market reforms in the UK were largely motivated by efficiency concerns. Not all commentators however agreed that such policies were appropriate for forensic science. In one prominent early intervention, Roberts (1996) provided a critical review of the arguments for marketization. In addressing the issue of market-based reforms, Roberts scrutinized the arguments for a free market in forensic science on its own terms. Considering the economic arguments "squarely on their merits" (Roberts 1996, p. 56), Roberts made three predictions which argued against the use of market mechanisms in forensic service provision. First, was the argument that coordination problems would prevent the production of necessary public goods, in this case research findings and datasets which could lead to improvements in forensic science as a whole. Roberts argued that the commercialization of forensic science held no incentives for actors to pool resources to promote innovation in the area, nor to provide resources of common utility or to improve standards. Second was the argument that the predominant position of the UK's FSS would block fair and true competition. Rather than creating an environment which promoted efficiency through competition, the "vast resources and unparalleled expertise" of the FSS were viewed at the time as risking driving smaller companies out of the market, leaving the FSS "with an unregulated monopoly interest" in forensic service provision. Third, and most significant according to Roberts, was that criminal justice only resembled a market in an "imperfect and attenuated sense" (Roberts 1996, p. 47). Roberts argued that a market system would fail to meet the needs of all its "consumers," particularly defendants. Access for this group to forensic scientific services was viewed as being determined not by the laws of supply and demand but by the availability of Legal Aid (Roberts 1996, p. 56). Another key consumer group, the police, was seen as constrained by budgetary limitations and the need to balance other spending priorities. Roberts argued that the emergence of charging for forensic services would risk police forces selecting cheaper (but not necessarily high-quality) services or cutting back on their use of forensic science altogether.

The empirical consequences of attempts to shape a forensic marketplace in England and Wales are outlined in the next section. Particular attention is devoted to this jurisdiction as it is here where commercialization has been pursued in a particularly systematic and comprehensive way, and for which a substantial amount of data exists. As we shall see however, commercialization has aroused considerable controversy, linked in part to the proposed plan to close the FSS.

Tracing the Emergence of Forensic Marketplaces: The Example of England and Wales

The effectiveness through which police forces in England and Wales apply scientific techniques in the course of their work became the subject of considerable official discussion from the late 1970s onward. In 1987, a survey conducted by accountants Touche Ross concluded that police management of scientific support was "generally poor" (Touche Ross 1987). It portrayed an environment in which forensic technologies had begun to significantly expand in terms of potential scope but had not been fully utilized to address a rise in serious crime. Among the many issues considered in this report was the scope for changes in the method of funding and organization of the FSS, the sole provider of forensic science to the police at the time.

The FSS was then a state agency, publicly funded by a central grant. Concluding that the police management of scientific support (both in-house and externally provided by the FSS) was "generally poor" (Touche Ross 1987, p. 3), the report recommended the appointment of managers of scientific support in each force. Each such manager would be employed by police forces (as opposed to an agency such as the FSS) and be responsible for the provision of all scientific services and the management of their own force forensic science budgets. This step represented one sign of the growing devolution of budget responsibilities to operational law enforcement actors.

The Royal Commission on Criminal Justice which reported to Parliament in July 1993 recognized the emergent policy discourses surrounding the possibility of market reform of forensic science. The Royal Commission had been established in the light of several high-profile miscarriages of justice and in direct response to the decisions by the Court of Appeal to quash the convictions of the Guildford Four and the Birmingham Six. While the Commission addressed a wide-ranging series of issues relating to criminal justice, two notable themes were advanced in its conclusions regarding forensic science (Roberts 1996). First, it provided "cautious endorsement" (Roberts 1996) of further development of free market competition for forensic scientific services. Secondly, it recognized the considerable growth in the number and variety of private firms offering scientific support to both prosecution and defense, which reflected concerns about how the quality of forensic science could be maintained (Roberts 1996, p. 39).

As the 1990s progressed, other firms had begun to emerge in direct competition with the FSS, such as LGC, Scientifics Ltd, and Forensic Alliance. During the same period, the FSS introduced product-based charging, where each product, such as a body fluid search, tool mark examination, or cannabis identification, was defined as encompassing a wider set of activities. This new definition of "product" as activity was intended to reflect more closely the actual work performed, "thus providing customers with a better understanding of the true costs of services and enabling them to make informed judgments about their value" (NAO 1998, p. 30). As the pricing strategies of forensic service providers began to become more sophisticated, sign emerged that forces were exploiting the new market conditions. Communication between the FSS and police improved, and the FSS educated police officers about the value of certain forms of evidence.

Some of these assertions about the benefits of the emerging marketplace were supported in the government-commissioned McFarland review of the FSS, completed in 2003. This review explicitly addressed the "effectiveness of the organization in meeting the needs of the criminal justice system in terms of the quality, timeliness and cost effectiveness of its services" (McFarland 3.1). McFarland also assessed the management and business structures of the FSS in the light of possible increased competition for forensic science services (McFarland 2003). Forensic science providers (FSPs) were, at this time, offering volume discounts and loyalty schemes, which convinced the McFarland review that a "truly competitive market" was "beginning to develop" in UK forensics (McFarland 2003). Furthermore, the review went on to argue that the introduction of "best value" principles "had forced the police to seek better value for money in the bought-in services" (McFarland 2003), and that the police had become "informed customers," playing off "suppliers against each other." McFarland concluded that police forces were adapting well to the new market conditions and that true competition was "beginning to develop" in UK forensics (McFarland 2003, Section 3.1). Police reported that they had begun to receive "a more personalized and responsive service" from suppliers, which was taken as a sign that competition had started to yield the kind of benefits claimed by advocates of marketization, such as "greater choice, value for money and improved service delivery" (McFarland 2003, Section 3.3). The McFarland review also recommended that the FSS should make the transition toward full privatization, although this never occurred. The FSS was however converted into a "government company" ("GovCo") in 2005, obliged to run on a profit-making basis.

At around the same time, Fraser (2003) outlined a typology of this evolving "forensic marketplace." This analysis distinguished between *strategic suppliers*, *primary niche suppliers*, *secondary niche suppliers*, *primary individual suppliers*, and *secondary individual suppliers*. Here, *strategic suppliers* were regarded as providing a comprehensive range of police support services and able to supply these services in an integrated way. These organizations had the potential however to be relatively inflexible in terms of the products and services they offered and potentially highly bureaucratic. *Primary niche suppliers* were perceived to display a similar level of experience in the forensic sector to strategic suppliers, but to differ in that they were seen to provide a far narrower range of products or services, albeit to a high standard. *Secondary niche suppliers* were to seen differ in that the main functions of the organization may *not* be to provide forensic science, but that this may be one of a portfolio of different scientific services. The knowledge of the broader context of criminal justice that secondary niche suppliers held could potentially be highly variable. *Primary individual suppliers* were described as individuals who offer particular forms of forensic scientific expertise. This may be highly specialized but might be vulnerable to questions of competence and quality. Finally, *secondary individual suppliers* described individuals who held specific scientific expertise which might appeal to some of the needs of police forces but not exclusive to forensic science. The experience of criminal justice contexts of such individuals might vary and again were regarded as potentially vulnerable to questions of competence.

Fraser's typology reflects how the modern marketplace for forensic science in England and Wales had encompassed a diverse array of FSPs with a considerable degree of variance in terms of their size, scope, and product range. Fraser's overview also highlighted the ongoing concerns over the consistency and quality of scientific work produced within this marketplace. Key oversight bodies such as the National Policing Improvement Agency (NPIA) sought to standardize the level of service provision from FSPs. In August 2008, 12 FSPs, including the FSS, agreed to participate in the National Forensic Framework Agreement (NFFA), which sought to function as an organizing mechanism for forensic science procurement by most police forces in England and Wales. A growing proportion of forensic scientific work remained in the hands of the police forces themselves, however, through the presence of in-house facilities.

The NFFA represented a notable reinforcement of the market system. A BBC radio documentary broadcast in December 2009 however identified serious issues with the commercialization process. It was reported that forensic scientists often disagreed with police over the best course of action during casework, although they were constrained by the contractual arrangements imposed by the NFFA. The program gave an example of one forensic scientist who had contributed to the successful investigation of a case only by ignoring police instructions and pursuing analyses which had not been originally commissioned.

More seriously still, the same documentary reported that the FSS was experiencing severe financial difficulties and had become dependent on government bailouts. By this time the FSS had implemented a "transformation program" which included the closure of three of its regional laboratories, which in turn contributed to speculation over the future of the organization. The announced closure of the FSS by UK Government in December 2010 nonetheless surprised many. It also stimulated a high degree of controversy, with many commentators expressing fears about the future viability of scientific support to police forces. In response the House of Commons Select Committee on Science and Technology conducted an inquiry into the proposed closure, which also focused on the state of the forensic market in England and Wales as a whole.

Although the Committee experienced significant difficulties assessing the exact condition of the forensic science market, the findings indicated that the overall size of the market was in serious decline (House of Commons 2011, p. 15). Police expenditure on external forensic science provision has decreased markedly in previous years. Police forces had, however, invested increasingly in their own "in-house" forensic scientific provision over the same period. While figures for 2010–2011 show a slight decrease in overall police spending on both internal and external provision, the former continued to considerably outweigh the latter. In 2010–2011, the total expenditure of police forces in England and Wales on internal provision was £181 million, compared to £138 million for external services over the same period (House of Commons 2011).

The inquiry heard conflicting evidence to explain the shrinkage of the market. The NPIA claimed that the reduction in external spend had been caused by the NFFA, leading to forces enjoying considerable savings on their external spend. Other witnesses to the inquiry pointed out however that forces may have viewed in-sourcing as a cheaper option in the light of wider budget cuts (House of Commons 2011, p. 17). The House of Commons Committee criticized the trends toward in-sourcing. Such a shift, with the customer becoming a competitor to external FSPs, was viewed as undermining the very idea of a fully functioning market for forensic science. The Committee also reported "almost unanimous alarm" (House of Commons 2011, p. 35) about forensic science in police laboratories, which were not subject to the same quality accreditation procedures as those of external FSPs. The inquiry concluded by expressing concerns "about the risks to impartiality of forensic evidence produced by nonaccredited police laboratories" (House of Commons, p. 43). It also highlighted what it perceived to be a more serious risk, namely, "the introduction of bias based on selective forensic examination of exhibits, arising from the need to make savings." The Committee concluded that a reliance on in-sourced forensic practitioners would increase the risk of the collection of evidence being influenced by immediate policing concerns rather than working in the more balanced interests of justice.

Commercialization and the Epistemic Character of Forensic Scientific Knowledge

The possibility of increasing in-sourcing returns us to some of the concerns expressed by Koppl et al. regarding the effect of organizational context on forensic reasoning. The question of how commercialization has affected the epistemological foundations of forensic science is one that has been recently explored by the author and colleagues (Lawless 2011; Lawless and Williams 2010). These studies have explored how liberalizing policies have been interpreted by actors in different ways, manifesting themselves in varying infrastructural arrangements for the market-led provision of forensic science. Differing initiatives can be seen to construct the epistemic character of forensic science in differing ways.

Initiatives such as the Case Assessment and Investigation (CAI) model, originally developed on behalf of the FSS, arose partly due to the challenges posed by the introduction of charging. CAI, a framework for evaluating evidence incorporating principles of Bayesian probability, was aimed at reforming practices of evidence interpretation and first introduced during 1990s (see ► Probability and Inference in Forensic Science). At the same time, it was also intended to help police optimize value for money from forensic science, as the newly introduced market conditions began to take hold. The type of forensic knowledge produced via CAI displays a markedly distinct epistemic character (Lawless and Williams 2010). Here, the evaluation of evidence is reported in probabilistic terms, allowing for both the contextual interpretation of "prosecution" and "defense" positions. This reflects the intent to shape a more balanced view of forensic evidence. CAI consciously facilitates the reporting of interpretative data in a way which conveys its utility to a specific investigation *and* the financial cost of its processing. The initiative therefore represents a manifestation of marketized forensic knowledge which seeks to manage the relationship between the "producers" and "consumers" of forensic science, in a way which accounts for both epistemic risk and budgetary concerns.

The kind of forensic epistemology promoted by CAI has had to compete however with contending appropriations of commercialization. As described above, the NFFA served to formalize the manner in which the various police forces enter into service agreements with external forensic science providers (FSPs). It aimed to guarantee to police forces a standardized form of scientific support across a range of criminal investigative functions. These functions, or "work packages," range from routine scientific analyses in areas such as DNA analysis, fire investigation, or footwear analysis to far more complex "casework" packages in which forensic scientists may act in a more investigative role. Each work package is highly specified and costed. The NFFA has however received significant criticism for constraining the investigative contribution forensic scientists can make to criminal casework. Research by the author (Lawless 2011) indicates that NFFA is regarded as having severely challenged the professional autonomy of forensic scientists. Elsewhere, NFFA is reported as having maximized the "commodification and disaggregation of supply" (House of Commons 2011) with a number of different providers handling different tests in a single investigation. This has prevented the systematic exchange of "contextual information and scientific results as anticipated by CAI" (House of Commons 2011). The NFFA is perceived to have seriously reduced the ability of scientists to use their initiative in the course of investigations, giving more relative power to the police. Although some scope exists within the NFFA for FSPs to explicitly provide evidence interpretation services, these are costed more highly than basic analytical work. One witness to the inquiry alleged that too often, police took the cheaper option: "Getting a DNA profile does not necessarily solve a crime but is a lot cheaper than interpretation of how the DNA got there, which is the more important aspect of successfully solving a crime" (House of Commons 2011, p. 22).

CAI and NFFA represent different ways in which marketization has been interpreted to reform forensic science. Scientists may prize scientific objectivity, but police may simply demand want technical support and may be less keen on the investigative contribution scientists might want to contribute. The presence of contending appropriations of commercialized forensic science exposes the coordination problems facing a heterogeneous set of stakeholders. These actors have experienced considerable difficulty in mediating between differing expectations of forensic science. Disagreements manifest themselves concerning precisely what constitutes the "products" in the forensic marketplace. Uncertainty about the nature of the final "product" also impacts upon problems concerning how the overall quality of these "products" can be judged and ultimately how they should be priced. Judging the "value" or "effectiveness" of forensic science has therefore become a highly complicated matter.

Likewise, measuring the quality of forensic science is fraught with a number of complications. Firstly, forensic science encompasses a considerably wide array of specialisms, some of which are employed more often than others. Establishing generic forms for assessing all of these provides a significant challenge. Second, the definition of quality as "fitness for purpose" raises problems in a criminal justice context. Multiple purposes are apparent. For example, forensic science can be used to eliminate an individual from suspicion as well as helping to secure a conviction. Third, complications are apparent if one considers that the *production* of forensic scientific data can be separated from its *interpretation* in the course of specific case circumstances. In the adversarial context, poor-quality scientific work may still be able to help secure a conviction. Likewise, the products of high-quality scientific labor may still fail to satisfy the court (Gallop 1992). Efforts to measure the quality of forensic science are complicated by questions about exactly *who* is the final “customer” of forensic science (York 2011) – with inter alia police, defendants, lawyers, and victims of crime all raising a claim but with different needs and priorities.

While England and Wales has the most extensive experience of the marketization of forensic science, other jurisdictions have responded in different ways to the challenge of organizing and procuring forensic science. In the next section, a brief overview is provided of developments elsewhere.

Forensic Marketplaces in Other Jurisdictions

In Scotland and Northern Ireland, forensic science is provided via single organizations working alongside the police, and in the Republic of Ireland, forensic science is still controlled by the country’s police force, the Garda Siochana. In the USA, it has long been recognized that the commercial sector played an important role in advancing the development and use of forensic science, particularly recent technologies like DNA profiling. However, while commercial science firms have supplied equipment, and in some cases consulting services, most forensic laboratories remain under public control, via law enforcement agencies.

US forensic science has been regarded as having existed in a largely unregulated environment (Koops et al. 2010). Partly in response to concerns about the status of forensic science, the US National Academy of Sciences submitted a report to the Department of Justice in 2009. Among other shortcomings, the report highlighted an array of serious resource disparities across local, state, and federal law enforcement agencies (see ▶ Critical Report on Forensic Science, NAS 2009, p. 5). Severe inequalities in skilled personnel, equipment, and funding were identified. Although activities at the federal level were found to be relatively well-supported, state and local jurisdictions, the sites of the vast majority of criminal law enforcement, were often found to be “sorely lacking” in the kinds of resources needed to facilitate and maintain suitably robust forensic laboratory infrastructures (NAS 2009, p. 6). The report concluded that these inequalities strongly contributed to a substantial variation in the “depth, reliability, and overall quality” of information arising from forensic examinations (ibid). Resourcing problems were also found to continue to perpetuate severe backlogs (page ref).

The NAS proposed a solution to these types of issues which significantly contrasted with the reforms implemented in England and Wales. Rather than promoting further market competition, the NAS argued for the establishment of a publicly funded “National Institute of Forensic Science” (NIFS), an independent federal body to oversee the development of forensic science at all jurisdictional levels within the USA. Overall however, the question of the economics of forensic science received relatively little attention in the report compared to other concerns such as standards and interpretation issues.

Marketization has yet to be implemented in most other jurisdictions, although there are some examples where a concern with the economics of forensic science is evident. In New Zealand, for example, forensic scientific support is provided solely by Environmental Science and Research (ESR), a government-owned research institute which since 1992 has operated on a “user-pays” system similar to the direct charging model associated with the early reforms to forensic science in England and Wales. ESR currently operates on a “fee for service” billing model where every product or service is priced (Bedford 2010). Although most prices are unit-based (“units” referring to, e.g., a DNA test, a drug identification, and a screening procedure), some pricing is time based. This brings with a considerable accounting overhead including the need for a sophisticated laboratory information management system (LIMS) and financial management system (Bedford 2010).

There are some signs that some jurisdictions are beginning to seriously consider implementing competitive market systems. Most notably, Koops et al. (2010) have recently carried out an assessment of the forensic scientific landscape in the Netherlands. In their study they explicitly address the question of whether some degree of competition should be introduced in this jurisdiction. In their exploration of this question, they tentatively conclude that competition may be an option for some specialisms within forensic science, provided the quality of providers can be guaranteed and competition is introduced on a gradual basis. In their survey, however, they found opinions to be divided about whether competition could be introduced and at what pace.

Little data is currently available on attitudes to the marketization of forensic science in emerging or developing economies. De Ungria and Jose (2010) do however provide some illumination about the economics of forensic science in the Philippines. They point out that in this kind of economy, the establishment of technologies such as DNA databases involves difficult political decisions to allocate a significant proportion of resources from an already limited national budget (De Ungria and Jose 2010, p. 324). Such technologies have to compete for budget priority with a raft of fundamental concerns such as those relating to basic healthcare, education, and poverty amelioration. At issue here are matters of tradeoffs between short – and long-term national benefits. Efforts to address health, education, and welfare issues hold tangible, perceptible benefits. Investment in DNA databasing *may* carry long-term benefits in terms of crime reduction and improved national security but represents something of a calculated risk. The devotion of resources to expensive technologies where the future expected utilities are uncertain is a particularly difficult decision for developing economies. Further, the successful implementation of advanced forensic technologies naturally involves a well-trained and motivated workforce and requires a suitably robust management and technical infrastructure, which comes at a price. These kinds of overheads may place an extra burden on the crime and policing budgets of developing nations. Some countries may opt to rely on the expertise in university science sectors, which has been suggested by some English commentators (Mennell 2006).

Given the risks of the success of such technology, and the need to provide common goods, it is difficult to envisage what clear incentives exist for commercial firms to enter such markets. Possible intervention from such firms may come about only with considerable demands attached. Research in science policy has indicated that multinational firms may be otherwise reluctant to transfer technological knowledge and knowhow to developing economies (Pavitt and Patel 1999). It may be that the costs for commercial firms to invest heavily in forensic science in the developing world may outweigh the benefits. Much more research however is needed before any concrete conclusions can be reached.

Conclusion: Future Directions

Further possibilities for research can be gleaned from this exploration of forensic marketplaces. For example, more work is needed on how context shapes the epistemic character of forensic science (see ▶ Forensic Science Culture, 9). The work of Koppl and colleagues provides some very useful data to highlight the consequences of poor-quality forensic science and of the possibilities of competitive regulation. More research in the area of forensic science administration needs to be done however to understand the way in which forensic scientific reasoning is contextually shaped in actual criminal investigative contexts (see ▶ Forensic Science and Criminal Investigation). In particular, work in this area could focus on further comparisons of the epistemic character of forensic science performed by internal and external providers to the police. This could help meet one pressing issue raised by the recent House of Commons inquiry concerning the possible differences in quality of scientific work carried out in external laboratories and in-sourced facilities. Comparative work could also focus on how certain items are selected for forensic analysis and how forensic traces are collected at the crime scene.

There is also a pressing need for further research on actual or potential forensic marketplaces in other jurisdictions. While the experience of England and Wales provides a useful case study, strong caution must be exercised with regard to the conclusions that can be drawn from a single example. While developments in other jurisdictions across Europe, North America, and Australasia remain of interest, it is equally important to consider how the organization and provision of forensic science is progressing in non-Western and emerging economies. It is in these latter jurisdictions where interesting questions may be raised regarding how the provision of forensic science, possibly through commercialized means, interacts with broader questions regarding economic development and human rights.

The economic outlook across Europe and indeed globally has been highly uncertain. How the character of forensic science may be affected by an adverse (and largely unforeseen) economic climate is only starting to be understood. Many governments have had to make considerable cuts to public spending. In the UK, these spending cuts may strongly impact upon the police, and further cuts to force budgets are likely to continue to affect their spend on forensic science. Police forces have to balance a series of spending priorities, including personnel, transport, equipment, and trained animals, and studies suggest that forensic science may lie low on their priorities (Roberts 1996). The experience of the employees of FSPs under market conditions has not inspired confidence so far, and the future of these firms, and the market system in England and Wales as a whole, is far from certain. At the same time, it is unclear whether forces will continue to invest in further in-house capacity. This may be a difficult decision for forces, as the development of such resources themselves comes with considerable start-up costs and overheads, which appear to be increasing given the need to meet a wider and more stringent range of standards (see ► Forensic Science and the Paradigm of Quality).

This brief overview is nevertheless sufficient to indicate the uncertainties which lie ahead for forensic marketplaces in England and Wales and elsewhere. Predicting the future arrangement of forensic science in an era of rapid technological, political, and economic flux arguably represents the most pressing challenge to researchers.

Outdoor Serious Violence: The Role of Place

Lucia Summers
School of Criminal Justice, Texas State
University-San Marcos, San Marcos, TX, USA

Overview

Like many other crime types, outdoor serious violence is not randomly distributed in space. This article critically considers why this may be the case from the perspective of environmental criminology. Special consideration is given to routine activity theory, which argues that for a crime to occur three elements need to coincide in space and time: a motivated offender, a suitable target, and the absence of a capable guardian. In the case of outdoor serious violence, both targets and guardians are often mobile. Therefore, to understand the geographic distribution of this type of crime, the movement patterns of offenders, victims, and guardians all need to be considered. But there are different types of outdoor serious violence, each with its own "optimal" place and set of circumstances. For example, predatory violence (e.g., sexual- or robbery-related) tends to take place in secluded locations such as quiet streets, parking lots, and parks. In contrast, unplanned or expressive attacks, such as those resulting from alcohol-related altercations, are more common in crowded spaces, often near entertainment venues. A third type is gang-related violence, which also has a strong geographical element due to the territorial nature of gang activity. While considering these scenarios from a routine activity perspective, a number of theoretical and methodological issues arise, such as the role and significance of guardianship and the difficulties associated with measuring the ambient population. The article concludes with the implications these issues may have for research and policing.

Introduction

This entry examines the influence of "place" on the geographical distribution of outdoor serious violence (hereafter, OSV) by considering two separate but interrelated questions. The first considers whether OSV concentrates spatially, either through the formation of clusters (i.e., hot spots) or through common characteristics across disperse crime locations (i.e., the offenses are not clustered geographically but the types of places where they occur are similar in some way). The second question considers the level of specialization of OSV locations; in other words, does OSV occur in places that are different from where other types of crime – or no crime – occur?

The entry is structured as follows. The first section sets the context by providing a working definition of OSV, a rationale for its study, and an overview of the theoretical framework employed. Three main types of OSV are identified and these are considered separately in the second section, which summarizes the state of the art. The third part of the essay highlights areas of controversy and suggests further research.

Background Description

For the purposes of this entry, OSV is defined as the unlawful killing, or near killing, of another person which takes place in an open public space (usually a street). As such, it incorporates unlawful homicides and "near misses" where an individual sustains near-lethal injuries (e.g., attempted murder, aggravated assault).

Although researchers often provide summaries of the type of location where homicides occur, it is not common for the type of offense location (such as "outdoor") to be used as a classification variable per se. Instead, homicides tend to be defined in terms of motive (e.g., sex murder), the offender-victim relationship (e.g., stranger homicide), or the victim characteristics (e.g., child homicide). While these variables will no doubt be informative, knowledge about the immediate social and physical setting should also be considered when generating typologies, particularly if the focus is on understanding the crime event itself – as opposed to, for example, an individual's propensity to engage in criminal activity.

This is precisely the focus of environmental criminology. Within this approach, it is not just the offender's predisposition to engage in criminal activity that is considered but also the roles of victims and bystanders, as well as a range of other situational variables that may influence the likelihood of a crime occurring. Theories of environmental criminology include routine activity theory (Cohen and Felson 1979), which argues that for a crime to occur three elements need to coincide in space and time: a motivated offender, a suitable target, and the absence of a capable guardian.

Open public spaces are particularly interesting from a routine activity perspective. As the definition implies, they are usually accessible to anyone at any time, which means potential victims and offenders can come together without any access restrictions. Because individuals tend to move through these spaces or remain there only for small time periods, the nature of the environment is in a constant state of flux. Public spaces are also seen as singular in that they belong to everyone and no one at the same time, which results in space users being less inclined to regulate them (e.g., than they would be to regulate their own yard or store; Newman 1972). As Campbell (1986: 120–121) put it,

> There is no starting- and finishing-time for street life. It is an ongoing party that changes its character constantly as individuals join and leave in the course of the day. The streets are above all public places. Unlike in someone's home, those present are not beholden to their host, nor are they required to constrain their behaviour out of respect for someone else's property or territorial rights. The street therefore represents an area that is "up for grabs" in terms of control and territorial rights.

In this entry, environmental criminology and, more specifically, routine activity theory provide the theoretical framework for discussing why OSV may occur in some places (under certain circumstances) but not in others. The next section summarizes what we already know in this respect.

State of the Art

When considering whether OSV happens in some places but not in others, one question should be whether OSV clusters geographically. While the identification of geographical clusters for homicide and other forms of serious violence is neither uncommon nor new (e.g., Bullock 1955), only a very small number of authors have reported disaggregated figures based on the type of place where the crime occurred. One such author is Per-Olof Wikström, who uses a contextual classification of violence – originally developed by McClintock in 1963 – based on both victim-offender relationship and crime location type.

In a study published in 1994 (cited in Wikström 1995), he reported that outdoor homicides were highly concentrated in space and that these hot spots were fairly stable over a four-decade period (1951–1991). These outdoor homicide hot spots highly overlapped with hot spots of street violence identified in a previous study (Wikström 1991). This seems to indicate that either these two offense types are similar in nature or that they are enabled – or facilitated – by the same kind of environment(s).

Both outdoor homicides and outdoor violence were concentrated in the central business district (CBD). From a routine activity perspective, this makes sense. CBDs are places where vast amounts of people congregate, hence making it more likely that a motivated offender and a suitable target will come together in time and space. At the same time, most of these people are strangers to each other, thus creating an environment low in social order, where individuals are less inclined to act as guardians (see Wikström 1995).

A Need to Disaggregate

At a more micro level, however, different types of OSV are likely to be associated with different types of places. At least two main types are worth considering: (1) planned or predatory violence and (2) unplanned or expressive attacks. Where an offense is planned (e.g., robbery-related, sexual murders, retaliatory attacks), the offender is likely to have chosen the attack location a priori based on specific criteria, such as the area being isolated and thus lacking a capable guardian. In many cases, predatory offenders would not have planned to go out and commit an offense but rather take advantage of an opportunity as it presents itself. However, these cases as still regarded as "planned" in that thought would have been given in advance as to how to commit the crime and which circumstances and/or locations would be appropriate. Because isolated areas will not only have fewer potential witnesses but also a reduced victim pool, predatory offenders often need to identify their victims at a busier, nearby location (i.e., the encounter site) and follow them to a location where they feel comfortable assaulting the victim (i.e., the attack site). As a result, isolated street segments in close proximity of busy areas may be particularly risky locations (Rossmo 2000).

Unplanned violence such as dispute-related attacks, on the other hand, may occur in busy places where friction is more likely. These offenses are more expressive in nature which means offenders may not be dissuaded by the presence of potential guardians. Outdoor dispute-related violence often occurs near alcohol outlets (e.g., Nelson et al. 2001). This is especially the case if these facilities are in close proximity of each other and have similar closing times, as this results in what has been termed a "potentiation effect" (see Rossmo 1995). In such circumstances, crowds of intoxicated individuals try to navigate the street network and compete for available resources (e.g., taxis, fast food), often leading to disorder, crime, and violence. Additional "crime generators" for outdoor serious violence, albeit to a lesser extent, include retail stores (Nelson et al. 2001) and neighborhood parks (Groff and McCord 2011).

Offender Awareness Spaces

Whatever their motives and levels of planning, offenders "consistently commit crime in neighbourhoods they personally know well or that are very similar in physical, social and economic characteristics to their home neighbourhoods" (Brantingham and Brantingham 1995: 13). In predatory violence, these are areas where they feel comfortable as familiarity provides them with a degree of control (e.g., they know how frequented the street is, what escape routes are available). Predatory offenders are familiar with these areas because they have come to know them while engaging in noncriminal activities or, less commonly, through targeted spatial exploration (i.e., they have familiarized themselves with these areas with the intention of committing crimes there). In unplanned violence, the crime usually occurs *while* the offender is engaged in everyday routine activities (Rossmo 2000).

Because the behavior of offenders – just like everyone else's – is influenced by the least effort principle (Zipf 1949), the areas offenders frequent during the course of their routine activities tend to be close to their residence (or another significant anchor point such as work or entertainment). This translates into crime sites being close to the offender's home, a finding that has been used to explain spatial distributions of crime and to prioritize suspects during crime investigations (i.e., geographic profiling; Rossmo 2000).

When targets are stationary, examining the distances between the crime sites and the offender's home (referred to as journey-to-crime; JTC, hereafter) seems appropriate. But when targets are mobile, a greater understanding can be achieved by also considering the location of the victim's home, as this may be different from that of the crime site. Tita and Griffiths (2005) have devised a mobility-based spatial typology of homicide, based on how these three locations (i.e., the crime site, the offender's home, and the victim's home) relate to one another. Five separate types of homicide can be identified in this way, as follows:

1. internal, where all three locations lie within the same census tract;
2. predatory, where the crime site and the victim's home are in the same tract while the offender lives elsewhere;
3. intrusion, where the crime site and the offender's home are in the same tract while the victim lives elsewhere;
4. offense mobility, where the offender and the victim live in the same tract but the crime occurs elsewhere; and
5. total mobility, where each location is located in a separate census tract.

Outdoor homicides are less likely to be "internal" or "predatory" and, more likely, to be "intrusions" or have "total mobility," which led the authors to conclude that "events occurring outside are predicated primarily on the mobility of the victim" (Tita and Griffiths 2005: 303).

Gang-Related Violence: A Special Case

Although OSV may be loosely divided into planned (predatory) and unplanned (expressive, altercation) attacks, gang-related violence is worth special attention. This is because gang-related violence is often turf-related in nature, and, as such, it has a strong spatial component. Gangs tend to claim territories within which they engage in drug-selling and other criminal activities or simply hang out. Although the territories claimed can be as big as a whole neighborhood, gang members tend to congregate in smaller areas defined by Tita et al. (2005: 280) as the gang's "set space":

> . . .a gang may "claim" an entire neighborhood as its domain or "turf," but set space is the actual area within the neighborhood where gang members come together as a gang. Thus, just as sets are part of a larger gang, set space is a subset of a larger gang turf or territory.

Set spaces are usually located in open public spaces, leading to most incidents of gang-related violence taking place outdoors. Where rival gangs occupy territories that are in close proximity of each other, this can lead to an increased prevalence of violence. As described by Valdez et al. (2009: 303) in their study of Mexican American street gangs,

> Geographic proximity of gang territories emerged as an important characteristic in explaining these gang homicides. The fact that most of the homicides were between members of gangs bordering the same neighborhood or area may provide an understanding of the escalation of violent acts between these groups of youth in these neighborhoods. The spatial proximity of two gangs results in frequent contact and high visibility that create a volatile environment susceptible to aggression and violence. These findings are similar to the findings of others that gang homicide was more often turf related than drug related.

George Tita and colleagues have carried out extensive work on how the geographic distribution of gang-related homicide – and violence in general – can be explained in relation to the location of the "set space" of different gangs in relation to one another (e.g., rivals vs. neutral vs. friendly; see Tita and Radil 2011 for a recent example).

Gang-related attacks may be planned or unplanned. Planned attacks are usually retaliatory (as part of ongoing violence between rival gangs or as a punishment for not showing "respect") or used as a means of solving disputes arising during the course of illegal activities such as drug-selling. Unplanned or spontaneous attacks tend to occur in unclaimed territories or within gang turf if infiltrated by a rival gang member. An example of the latter scenario is described by Valdez et al. (2009: 295–6):

> Me and RadioMan were walking over by the wall and didn't notice we went into their neighborhood. It was around Christmas time. At first I thought they were firecrackers, but then I saw they were shooting at us from the alley. I got shot in the stomach. When I turned around, RadioMan got shot too. All I remember was seeing him lying there, and he died in the ambulance.

Routine Activity Theory and Outdoor Serious Violence

Routine activity theory provides a useful framework for explaining the spatial distribution of OSV. The routine activities of both offenders and victims dictate where crime occurs, although

Outdoor Serious Violence: The Role of Place, Table 1 Variables influencing the activity spaces of motivated offenders, suitable targets, and capable guardians in relation to predatory and expressive outdoor serious violence

	Offender	Victim	Guardian
Predatory (planned)	Routine activities	Routine activities	Routine activities
	Active exploration		Formal guardianship
Expressive (unplanned)	Routine activities	Routine activities	Limited influence

some predatory offenders may also purposively familiarize themselves with an area not normally frequented with a view to committing crimes there (i.e., active spatial exploration; see Table 1). Guardianship may play a lesser role in OSV as compared to violent incidents taking place in other locations. This is because, as argued earlier, the public nature of the outdoor environment can make bystanders less willing to intervene, particularly when exposed to expressive violence (Felson 1993).

Most predatory violent offenders look for a particular type of victim (as opposed to a particular individual; Rossmo 2000); hence, the location of predatory attacks is mainly determined by the offender's routine activities and the absence of a capable guardian which may be a bystander or some form of formal guardianship (e.g., CCTV camera). Where the victim has been predetermined a priori, the victim's routine activities will be the most decisive factor.

Expressive attacks occurring outdoors tend to be either alcohol- or gang-related. As described earlier, the former usually take place in close proximity of alcohol outlets and are overrepresented in downtown areas. Gang-related OSV, on the other hand, is often reported in gang turf or in unclaimed areas nearby.

Controversies and Open Questions

Despite extensive research on the spatial concentration and specialization of serious violence, consensus is still to be reached in relation to some issues. These issues, as well as the impact of recently emerging techniques, are considered in this section.

Should Homicide Be Considered a Separate Offense or Is It Just an Outcome?

As Gottfredson and Hirschi (1990: 34) put it, "the difference between homicide and assault may simply be the intervention of a bystander, the accuracy of a gun, the weight of a frying pan, the speed of an ambulance or the availability of a trauma centre." In a similar vein, Block (1977: 10) argues that "most killings are the outcome of either an aggravated assault or a robbery which somehow progressed beyond the degree of harm intended by the offender" and that this should prompt us to regard lethal and near-lethal attacks as similar in nature. In this way, homicide and near-lethal attacks are seen as a single form of crime albeit with outcomes varying in severity and which can be positioned along a continuum.

A contrasting view is offered by Felson and Messner (1996: 520), who state that "a substantial proportion of homicide offenders really do intend to kill their victims and not merely injure them" and claim this is an indication that homicides and near-lethal violence are different entities. The fact of the matter is that intent to kill is difficult – if not impossible – to measure and that, when an assumption is made as to whether intent to kill is present, this is imperfectly associated with the outcome of the offense (i.e., in manslaughter, there is no intent to kill but a fatal outcome, while attempted murder results in a nonfatal outcome despite the intent being lethal).

Although most authors tend to favor the former position, most homicide research still considers just homicide data, as opposed to, for example, also including attempted murder and aggravated assault. A number of studies have included both in an attempt to identify risk factors associated with lethality, which has resulted in some interesting findings (e.g., Weaver et al. 2004). The question to consider here is if lethal and near-lethal violent acts are essentially of the same nature, should future research aim to include both in their analyses? This approach might be advantageous in that it may provide a fuller picture, while also increasing sample sizes, which can be particularly helpful when studying low incidence crimes such as homicide.

Does Alcohol-Related Homicide Really Cluster Around Alcohol Outlets?

While most research findings point to an association between the spatial distribution of alcohol-related homicide (and violence in general) and that for alcohol outlets, contradictory results have also been reported. For instance, Block and Block (1995) described how hot spots for "liquor-involved" homicide did not overlap those for alcohol outlets (i.e., taverns and liquor stores) or even hot spots for crime within such premises.

But Block and Block – like many other authors – included in their analysis all instances of homicide where alcohol was thought to have played a role, regardless of where the incident took place. Including residence-based offenses in the analysis has the potential of obscuring any associations that may exist. The situational context in such cases is markedly different, which means different crime facilitators may be at play: while the disinhibiting effects of alcohol may apply in all cases, the environment within and around taverns is thought to present additional risk factors (e.g., crowds, competition for limited resources) which are tied – geographically – to the taverns themselves.

Michael Townsley and colleagues at Griffiths University in Australia have recently carried out an observational study into violence around taverns. What is interesting about this research is that it specifically examines crowding and waiting in line as precipitating factors (see Wortley 1998). One of the findings is that it is not so much overcrowding that leads to aggression, but how pedestrians' direction of travel (as influenced by the street network and surrounding land use) increases the likelihood of individuals running into each other (Townsley and Grimshaw 2013).

Studies like this where the microenvironments of violence are examined are essential in helping us understand when a potential offender may be motivated enough to physically attack another individual. As stated earlier, guardianship is thought to have a limited role in such cases, and the roles of victims and offenders are often interchangeable. This means that research may be more informative – from a preventative viewpoint – if it focuses on the circumstances that increase an individual's propensity to violence and his/her ability to inflict serious harm.

Interpreting Journey-to-Crime Distances

As discussed, offenders tend to commit (violent) crime in familiar areas close to their home. This has been reported to be particularly the case for violent offenses, as compared to property crime. But these figures should be interpreted with caution, as analyses often involve offenses that are committed in the offender's own home. When these cases are excluded, the mean (or median) distances traveled are likely to be on a par with those for property crime.

To illustrate, the JTC mean distance for the 363 homicides in Pizarro et al. (2007) study was 1.8 miles; if the homicides taking place at the offender's home are excluded (67 in total), the mean JTC increases to 2.2 miles. Unsurprisingly, the biggest differences are in domestic homicide: when considering all domestic cases (71), the mean JTC is 0.6 miles; if zero JTC distances are excluded, the mean JTC increases to 2.9 miles.

Of course it is important to determine which proportion of offenses takes place within the offender's home, but these should be examined separately when providing summary statistics.

Assessing Victimization Risk

Dangerous places are not necessarily those where many incidents of outdoor serious violence occur. This is because dangerousness relates to the odds of being victimized and, as such, it is mediated by a denominator that represents the population at risk (i.e., the number of potential victims). The number of residents is the most commonly used denominator when calculating violent crime rates. This may be appropriate for some crime types, such as domestic violence, which tend to occur in the home. For crimes that occur outdoors, however, a better denominator would be the number of people on the street, often referred to as the ambient population. This is particularly important when calculating rates for central business districts, which tend to have busy streets but small resident populations.

While resident population statistics can usually be obtained from national census polls, ambient population figures are not readily available, meaning researchers are forced to generate these data themselves. This is usually done through observation, where a fieldworker stations him/herself at a "gate" (i.e., a specific point within the street network) and counts the number of pedestrians (or vehicles) crossing such a gate over a particular period of time. Data may be collected at the same gate at various times of the day, week, or year, to determine whether the ambient population varies accordingly.

For instance, Chainey and Desyllas (2006) used a pedestrian model to calculate victimization rates of street robbery and "snatch" theft in central London, England. The model was calibrated with relevant key variables (i.e., land use patterns, availability of public transport, sidewalk capacity, and straight-line visibility for easier navigation) and observation data from 231 block segments in 107 different locations. The application of the model to a new area for testing revealed a strong association between estimated and actual pedestrian counts ($R^2 = 0.74$).When the spatial distributions of the two crime types were examined, it emerged that the maps displaying the victimization rates based on estimated pedestrian counts bore little resemblance to those where the resident population was used as a denominator instead. Both types of rates led to distributions that were also different from simple crime density hot spot maps.

But studies of this nature are rare. Collecting data to measure the ambient population can be incredibly resource intensive, especially for larger areas. This has led a number of authors to question whether the changes potentially observed in the new crime rates (i.e., as compared to the rates where the resident population is used as the denominator) are sizeable enough to justify the cost (e.g., Cohen et al. 1985).

In recent years, however, at least two different methods of estimating the ambient population have become available, namely, LandScan and Space Syntax. LandScan is a geographic data set developed by the Oak Ridge National Laboratory which provides ambient population estimates worldwide (see Dobson et al. 2000). These estimates are calculated on the basis of census information, physical geography data, lighting intensity, and other spatial data sets. Despite the level of resolution (approximate one-square-kilometer or 30-arcsecond square cells) still not being fine enough for microlevel analyses, LandScan has already been demonstrated to improve our understanding of the spatial distribution of homicide and other violent crime (e.g., Andresen 2011). At the time of writing, LandScan data at an improved 90m resolution (3-arcsecond) were already available for the US and select OCONUS areas, with plans to extend this further.

A second methodological advance in this area comes from the Space Syntax literature (Hillier and Hanson 1984). Space Syntax provides a means for systematically measuring the configuration of street networks. It does this by representing the street network as an inverted graph where the nodes are the block segments and the links (between them) denote whether the nodes intersect. Using this inverted graph and formulae adapted from graph theory, a number of measures are generated for each segment. Examples of these measures are integration, which indicates how accessible a block segment is within a particular area, and choice, which is the number of times a segment is passed through when generating all shortest paths. These measures have been shown to correlate with pedestrian flows and vehicular flows (Hillier and Iida 2005).

Unlike LandScan, Space Syntax is not normally used to generate pedestrian counts that can then be used as denominators in the calculation of victimization rates (although there is no reason why this should be avoided). Instead, Space Syntax studies tend to examine the relationship between integration (and other graph-derived measures) and crime levels. These tend to indicate that it is more segregated (isolated) segments that are associated with higher crime counts. This applies to residential burglary, street robbery (e.g., Hillier and Sahbaz 2008), and lower level violence (Friedrich et al. 2009). In contrast, Summers and Johnson (2011) found outdoor serious violence – including homicide – to be associated with more integrated (busier) segments.

A problem with Space Syntax is that the proxy measures it generates are atemporal. Values are assigned purely based on the structure of the street network; because this is constant over time, so too are the measures generated. But pedestrian and vehicular flows are known to vary dependent on the time of the day, week, or year. Efforts have been made to address this issue by disaggregating crime data by time of offense (e.g., Hillier and Sahbaz 2008), but more work needs to be done, especially in relation to incorporating land use data into the analyses.

In regard to LandScan, daytime and nighttime ambient population data have been made available for the USA (see LandScan USA). It is expected that these estimates will be further disaggregated in the near future and extended to other geographical areas.

A developing field awash with contradictory findings, combined with a lack of research in relation to OSV, calls for more studies to be performed in this area before a full understanding of the spatial distribution of this crime type can be achieved. Research incorporating various measures of the ambient population, different crime types, and complementary data sets (e.g., land use, census) would be particularly helpful in clarifying inconsistencies.

Situating the Crime Event Within the Neighborhood Context

To achieve a better understanding of the context of the crime event, it is important to establish not just how many people are around but also what these people are like. In recent years, researchers have used multilevel analyses and spatial econometric statistical models to examine the joint effect of microlevel variables (e.g., number of bystanders) and neighborhood characteristics (e.g., deprivation) on the spatial distribution of crime. For instance, Bernasco and Block (2009) employed such an approach with robbery data for the city of Chicago to examine what affected offender target choices. Their results suggested that offenders avoided neighborhoods high in collective efficacy and those where the predominant racial or ethnic group was different from theirs. Collective efficacy is defined as "social cohesion among neighbors combined with their willingness to intervene on behalf of the common good" (Sampson et al. 1997: 918). Proximity measures for a lack of collective efficacy include ethnic heterogeneity and high levels of residential mobility.

Most studies of this kind have focused on residential burglary and other property crime. However, recent research by Summers and Johnson using homicide and attempted murder data for London, England, seems to indicate that neighborhoods of similar racial profiles are also favored by offenders engaging in OSV (Summers and Johnson 2011). Another factor found to be associated with higher crime rates was proximity to the offender's home area. Though promising, more research needs to be carried out in this area to advance understanding of how the interaction between offender characteristics and micro- and meso-level situational variables influence the spatial distribution of OSV.

Concluding Thoughts

The aim of this entry was to provide an overview of what we already know about OSV and to highlight the areas within this field where controversy and gaps in knowledge remain. As previously stated, our understanding of this phenomenon is severely restricted by the fact that research findings are seldom disaggregated by location type. Outdoor crime events are qualitatively different in two main ways. First, because individuals tend to move through these spaces or only remain there for limited time periods, the environment is highly fluid. The second difference between outdoor and indoor violence is that guardianship is severely impaired in the former, as its public nature makes bystanders less willing to intervene.

Still, the presence of bystanders is important for some types of OSV, namely predatory attacks. Offenders committing such offenses are likely to be deterred by potential guardians. As a result, the placement of these offenses will be different to that of other forms of OSV, as predatory attacks will tend to take place in more isolated areas (or at times of the day where it is more isolated, e.g., late at night).

An understanding of where and under what circumstances OSV might occur is important from a preventative perspective. Police in many cities are aware of the issues leading to violence in downtown areas and have in some cases implemented interventions that are informed by such knowledge, including taxi marshals and staggered closing times for taverns and nightclubs. More recent research (e.g., Townsley and Grimshaw 2013) aims to improve understanding and lead to further preventative responses, such as modifying the street layout and land use to minimize pedestrians running into each other. Crime prevention efforts by police – and other agencies – in outdoor settings are likely to be markedly different from what may be required in other environments, which again calls for researchers to treat such offenses as a separate entity.

To sum up, there is much we already know in relation to homicide and other forms of serious violence, but it is important to separate events taking place in different settings. This will aid our understanding of the drivers within such localized environments, which will in turn help us to develop more fitting preventative strategies.

Overturning Wrongful Convictions and Compensating Exonerees

Myrna Raeder
Southwestern Law School,
Los Angeles, CA, USA

Overview

DNA has provided incontrovertible proof that individuals can be convicted for crimes they did not commit. The DNA exonerations now stand at 302, with 18 released from death row. Since DNA evidence is estimated to be present in only a small fraction of cases, at best 10–20 %, it is likely that the major systemic issues that are responsible for those wrongful convictions (mistaken eyewitness testimony, faulty forensic evidence, false confessions, lying informants, government misconduct, and ineffective defense counsel) also infect at least some of the cases for which proof of innocence is confined to more traditional sources such as confessions by actual perpetrators, recantation of witnesses, and newly discovered evidence. For example, one study found that 196 non-DNA exonerations occurred from 1989 to 2003 (Gross et al. 2006), and the Death Penalty Information Center's website indicates that since 1973 a total of 140 people sentenced to death have been released from death row with evidence of their innocence (Innocence and the Death Penalty, accessed February 5, 2012, http://www.deathpenaltyinfo.org/innocence-and-death-penalty). The most recent report in June 2012 of all exonerations based on innocence since 1989 identified the number as 891 (Gross and Shaffer 2012). However, this excludes an estimated 1170 defendants whose convictions were dismissed in 13 "group exonerations" resulting from major police scandals. For example, the police scandals in such places as Los Angeles (California) and Tulia (Texas) produced more than 200 exonerations, with the vast majority of overturned convictions resulting from guilty pleas, rather than trials. Wrongful convictions cast doubt on the reliability and fairness of the criminal justice system and expose public safety failures because perpetrators, who include serial rapists and murderers, remain at large to pursue new victims. Thus, all of us, not just wrongfully convicted defendants, are harmed by these systemic breakdowns. Yet, because the criminal justice system depends on finality of judgment, it was exceedingly rare to obtain postconviction relief on the grounds of innocence prior to the advent of DNA testing.

While statutes now afford more opportunity to challenge convictions based on DNA testing, old attitudes die hard, and Chief Justice Roberts pointed out in *District Attorney's Office for the Third Judicial District v. Osborne*, 129 S. Ct. 2308 (2009), that the mere existence of new technology cannot mean that no case is final. Moreover, for cases without biological evidence, the ability to obtain relief has changed little. This entry will present an overview of postconviction remedies involving claims of innocence (Raeder 2009) and the requirements that must be satisfied to receive compensation for being wrongfully incarcerated (Raeder 2008).

Postconviction Requests for DNA Testing to Establish Innocence

Appellate remedies in the American criminal justice system are designed to ensure that defendants receive a fair trial, not to second-guess jury verdicts in the absence of insufficient evidence supporting a conviction. Finality concerns have long dictated very short time windows for new trial motions. Such statutes of limitations often expire less than 1 year from conviction, standing in stark contrast to 13.5 years, which is the average length of time served by DNA exonerees. With the advent of forensic DNA testing came the recognition of the inequity of a criminal justice system that had no apparent remedy to free individuals who were clearly factually innocent. To remedy this problem, the Innocence Protection Act (IPA), 18 U.S.C. § 3600, was passed in 2004 to permit DNA testing for federal inmates who assert their innocence under penalty of perjury and meet a number of detailed criteria, including:

- The evidence was not previously tested, and the applicant did not knowingly or voluntarily waive the right to request testing.
- The evidence was tested, but current methods are substantially more probative.
- The evidence to be tested is in the possession of the government, has been subject to a chain of custody, and retained under conditions sufficient to ensure that it has not been substituted, contaminated, tampered with, replaced, or altered.
- The evidence supports a theory that is not inconsistent with any affirmative defense at trial.
- The proposed testing would provide new material evidence that would raise a reasonable probability that the applicant did not commit the offense.
- Identity was an issue at trial.
- The applicant has provided a DNA sample for purposes of comparison with profiles in the FBI database.
- The request is timely, with detailed criteria for determining rebuttal presumptions of timeliness and untimeliness.

The court can appoint counsel for the applicant, issue a preservation order to the government, and direct the government to pay the cost of testing for indigent applicants. Inculpatory results have a number of potentially negative consequences for the applicant who may be held in contempt, receive a sentence of 3 years consecutive to the current sentence if convicted of making false assertions in a proceeding, be required to pay for the testing, lose good time, be denied parole, and if relevant have the results sent to state officials.

In contrast, exculpatory results excuse any time bar that would otherwise preclude a new trial or resentencing motion. The new trial motion is granted if the DNA test results, considered with all other evidence in the case (regardless of whether such evidence was introduced at trial), establish by compelling evidence that a new trial would result in an acquittal. The statute also indicates it is not an exclusive remedy and does not count as a habeas corpus motion for purposes of evaluating the existence of successive motions. A writ of habeas corpus is the typical way that prisoners challenge the lawfulness of their detention when they have exhausted the right to directly appeal from their conviction. Beyond being a model for states, the IPA also actively encouraged states to follow its dictates by providing DNA grants to law enforcement in states that adopt "comparable" postconviction DNA testing statutes (118 Stat. 2285).

By 2011, 48 states had adopted such statutes (Brooks and Simpson 2011). However, some states have enacted restrictions that hinder applicants from obtaining testing, such as prohibiting applications by individuals who plead guilty, who admit guilt to obtain parole, or whose attorneys did not request testing; limiting the crimes for which relief can be sought; applying only to individuals sentenced to death; requiring applicants to establish a "likelihood" rather than a "possibility" that the testing will be exculpatory, or clear and convincing evidence that the new results would be significantly more discriminating than the results of previous testing; and failing to provide adequate safeguards to preserve biological evidence. A few states even retain a statute of limitations in their DNA testing statutes.

Even the federal statute is limited to cases in which identification was an issue at trial and contains chain-of-custody requirements that if interpreted literally may be virtually impossible to meet. Judge Higginbotham reversed a district court's denial of testing that was based on a claim of insufficient chain of custody, explaining "we cannot place upon the defendant the burden of proving history while it is held in government custody. To do so would create an entrance gate so difficult to enter as to frustrate the core objective of the statute" (*United States v. Fasano*, 577F.3d 572, 577 (5th Cir. 2009)). In addition, Garrett (2008a, b) found that 20 % of exonerees did not obtain DNA testing because of the failure of defense counsel to request it. Although this failure could bar an applicant from obtaining testing, it may not meet the test established in *Strickland v. Washington*, 466 U.S. 668 (1984), for incompetent counsel, if a strategic reason for the failure can be articulated.

In *District Attorney's Office for the Third Judicial District v. Osborne*, the Supreme Court refused to recognize a constitutional right to obtain postconviction DNA. *Osborne* recognized that "DNA testing can provide powerful new evidence unlike anything known before" (129S. Ct. at 2916) and noted the dual role of DNA in exonerating wrongly convicted people while confirming the convictions of "many others" (Garrett 2008a, b). However, the court could not overcome its apprehension about the effect of DNA on finality. The *Osborne* majority ceded DNA postconviction relief to state and federal legislators, claiming for the most part that these legislators had already enacted statutes with varying requirements to provide relief. In addition to finding no procedural due process claim, *Osborne* also rejected an invitation to create an "untethered" substantive due process right to DNA evidence for purposes of testing. Both finality concerns and a "reluctan[ce] to enlist the Federal Judiciary in creating a new constitutional code of rules for handling DNA" (Garrett 2008a, b) doomed the plea for a specific right to obtain DNA testing.

The court cited the prompt response by states to the "challenge" to the criminal justice system posed by DNA technology as reason to reject the court's preempting the field and forestalling public debate about appropriate remedies.

While *Osborne* recognized that DNA has confirmed that the system "cannot be perfect" (Garrett 2008a, b at 2323), it was not ready to craft a judicial remedy for the systemic flaws exposed by DNA. More recently, in *Skinner v. Switzer*, 131S. Ct. 1289 (2011), the court held that a convicted state prisoner seeking DNA testing of crime-scene evidence could assert a procedural due process claim in a civil rights action under 42 U.S.C. § 1983 challenging the Texas postconviction DNA statute. Success in his suit for DNA testing would not "necessarily imply" the invalidity of his conviction since results might prove inconclusive or they might further incriminate Skinner. Therefore, the court found that he did not have to proceed by habeas corpus action, which had significant barriers to relief, though constraints imposed by the Prison Litigation Reform Act of 1995 (PLRA), 110 Stat. 1321–66, still apply.

Other than by enacting new statutory remedies, the best way to avoid the barriers to DNA testing may lie with prosecutors, not the courts, even though some prosecutors refuse to admit that they could have been responsible for convicting an innocent person (Orenstein 2011). A 2008 amendment to the ABA Model Rules of Professional Responsibility 3.8(g) provides that in cases where there is "a reasonable likelihood" that a convicted defendant did not commit the offense, prosecutors should (1) promptly disclose that evidence to an appropriate court or authority and, unless a court authorizes delay, promptly disclose that evidence to the defendant and (2) undertake such further inquiry or investigation as may be necessary to determine whether the defendant was convicted of an offense that the defendant did not commit. Rule 3.8(h) was added to apply when a prosecutor knows of clear and convincing evidence establishing that a defendant was convicted of an offense that the defendant did not commit. In that case, the prosecutor shall seek to remedy the conviction. These rules may be key in cases where testing has taken place or other evidence establishing innocence is present, such as credible recantations and/or third-party confessions. However, they leave open how prosecutors should react before testing. In this regard, Comment 1 added to 3.8(g) lends support for proactive action even in non-DNA cases by explicitly referencing the prosecutor's role as a minister of justice that carries obligations to see "that special precautions are taken to prevent and to rectify the conviction of innocent persons." At a minimum, this comment cautions against objecting to testing requests without good cause.

However, the practical difficulty with testing requests is determining whether evidence has been preserved that can lead to establishing innocence. While the existence of such evidence is particularly problematic in older cases, even new preservation statutes may be limited to evidence in only certain crimes, permit disposal of evidence prematurely, or do not have adequate penalties for unauthorized destruction of evidence. The ABA has urged legislation be drafted to generally ensure the preservation of material evidence for postconviction review (Resolution 111 F, approved August 2004), and the ABA Standards on DNA Evidence, Standard 2.6(b), provides for the preservation of DNA evidence until the convicted defendant has completed the sentence.

Obtaining Habeas Release Based on Innocence

AEDPA Restrictions

Because collateral attacks on convictions typically depend on evidence not presented at trial, they often are raised in petitions for habeas corpus. While statutory remedies concerning DNA testing and reliance on § 1983 eliminate some of the need for habeas, when relief is sought for a wrongful conviction, habeas will still be the likely remedy. In addition, new trial motions are not usually very helpful in non-DNA cases, because of their strict statutes of limitations, limited access to discovery, and high legal and evidentiary thresholds (Medwed 2005). For example, *Farrar v. People*, 208 P.3d 702 (Colo. 2009), held that a complaining witness's postconviction recantation of testimony that raises a reasonable doubt about the defendant's guilt is not enough to justify a new trial unless the court finds the recantation credible and would probably have led to an acquittal. As a result, a teenager's recantation of her uncorroborated accusations of sexual abuse by her stepfather was not enough to justify a new trial for the stepfather.

The complexities of habeas corpus practice are beyond the scope of this entry. However, timeliness and exhaustion questions often arise in the context of innocence claims. Title 28 U.S.C. § 2244(d)(1)(A) of the Antiterrorism and Effective Death Penalty Act (AEDPA) of 1996 created a 1-year limitation period for petitions for writ of habeas corpus brought pursuant to 28 U.S.C. § 2254 by state prisoners. While the time during which a properly filed application for state postconviction or other collateral review is pending does not count toward any period of limitation (28 U.S.C. § 2244(d)(2)), AEDPA effectively blocks many claims.

The law concerning an innocence exception to the timeliness requirement of AEDPA is in complete disarray, with some federal circuits recognizing the exception, some rejecting it, and a few refusing to reach the issue because the petitioner had not met the high burden of proof needed to establish the innocence claim. Most recently, *Lee v. Lampert*, 653F.3d 929 (9th Cir. 2011) (*en banc*), adopted an equitable exception to AEDPA based on a credible showing of actual innocence. To the extent that courts permit equitable tolling of AEDPA's statute of limitations, *Lawrence v. Florida*, 549 U.S. 327 (2007), provides that the petitioner must establish both due diligence and that extraordinary circumstances prevented timely filing. However, *Martinez v. Ryan*, 132S. Ct. 1309 (2012), clarified that inadequate assistance of counsel at initial-review collateral proceedings may establish cause for a prisoner's procedural default of a claim of ineffective assistance at trial and that AEDPA did not bar a prisoner from using ineffectiveness of his postconviction attorney to establish "cause" for his procedural default.

In October 2012, the Supreme Court granted certiorari in *McQuiggin v. Perkins* to determine two questions: (1) whether there is an actual innocence exception to AEDPA's requirement that a habeas petitioner must show an extraordinary circumstance that prevented timely filing from its 1-year limitation period and (2), if so, whether there is an additional actual innocence exception to the requirement that a petitioner demonstrate that "he has been pursuing his rights diligently."

While this should resolve those discrete issues, it will not end the disarray fueled by the Supreme Court's continued refusal to explicitly recognize a federal constitutional right to be released upon proof of "actual innocence." As Chief Justice Roberts admitted in *Osborne* "[w]e have struggled with it over the years, in some cases assuming, arguendo, that it exists while also noting the difficult questions such a right would pose and the high standard any claimant would have to meet.... In this case too we can assume without deciding that such a claim exists, because even if so there is no due process problem" (Garrett 2008a, b at 2321–22).

The rejection of his second habeas petition in *In re Davis*, 565F.3d 810 (11th Cir. 2009), led Troy Davis, a death row inmate, to file an original petition for habeas corpus in the Supreme Court claiming actual innocence to excuse his untimely filing. This route was taken because the Supreme Court had agreed in *Felker v. Turpin*, 518 U.S. 651(1996), that one of AEDPA's provisions prevented it from reviewing a Court of Appeals' order denying leave to file a second habeas petition. *Felker* held, however, that the Supreme Court was not deprived of appellate jurisdiction because AEDPA did not remove the court's authority to entertain an original petition for habeas corpus. As a result, in *In re Davis*, 130S. Ct. 1 (2009), the court took what Justice Scalia characterized as "the extraordinary step-one not taken in nearly 50 years-of instructing a district court to adjudicate" a claim of innocence (*id.* at *2). The court's unsigned one-paragraph decision ordered the district court to "receive testimony and make findings of fact as to whether evidence that could not have been obtained at the time of trial clearly establishes petitioner's innocence" (Garrett 2008a, b at 1). In contrast, the dissent of Justice Scalia, which is joined by Justice Thomas, would appear to allow an innocent petitioner to be put to death so long as that individual had received a fair trial.

Davis was convicted of the 1989 murder of an off-duty Savannah police officer, but claimed he was not the shooter. Seven key witnesses later recanted, and several people identified the main prosecution witness as the shooter. Davis' request for a pardon had been denied before he petitioned the Supreme Court. Ultimately, the trial court held a hearing and concluded that his evidence of innocence consisted largely of "smoke and mirrors" (*In re Davis*, No. CV 409–130, 2010 WL 3385081 *59 (S.D.Ga. Aug. 24, 2010)). The court also denied a certificate of appealability (COA) on the grounds that any appeal must be directed to the Supreme Court, a decision affirmed by the Eleventh Circuit in *Davis v. Terry*, 625F.3d 716 (11th Cir. 2010), *cert. denied sub nom*, *Davis v. Humphrey*, 131S. Ct. 1787 (2011). Finally, in *Davis v. Humphrey*, 131S. Ct. 1788 (2011), the Supreme Court denied both Davis' direct appeal and request for certiorari from the district court's decision. Thus, the Supreme Court was ultimately unwilling to reach the merits of Davis' innocence claim. After this, Davis was again denied a pardon and was executed in September of 2011.

Gateway Claims that Excuse Procedural Defaults

Generally, a procedural default may be excused in habeas if the petitioner can show that failure to address the claim on the merits would lead to a fundamental miscarriage of justice, often referred to as the "actual innocence" exception (*Wainwright v. Sykes*, 433 U.S. 72, 90 (1977)). Pre-AEDPA, in *Schlup v. Delo*, 513 U.S. 298 (1995), the court discussed these so-called gateway claims of innocence, which simply permit the federal court to hear a constitutional claim brought by a federal habeas petition that was procedurally defaulted in state court. *Schlup* held that to state a claim of actual innocence sufficient to excuse procedural default, a defendant must show that, in light of all the evidence, "it is more likely than not that no reasonable juror would have convicted him in light of the new evidence" (Garrett 2008a, b at 314). *Schlup* requires the petitioner to establish factual innocence rather than mere legal insufficiency and explicitly limited the miscarriage of justice test to "extraordinary" cases:

> To be credible, such a claim requires petitioner to support his allegations of constitutional error with new reliable evidence–whether it be exculpatory scientific evidence, trustworthy eyewitness accounts, or critical physical evidence–that was not presented at trial. Because such evidence is obviously unavailable in the vast majority of cases, claims of actual innocence are rarely successful. (Garrett 2008a, b at 324)

Pro se litigants can hardly be expected to meet this criterion, but even inmates who find lawyers willing to champion their innocence are hard-pressed to find this quality of evidence in the absence of DNA, because most other evidence comes from recantations by accomplices or witnesses, which are viewed skeptically by judges. In the 10 years after *Schlup* was decided, less than 10 % of decisions citing that case resulted in consideration of otherwise barred claims, and of those 31 cases, only 20 were resolved in favor of the petitioner. Thus, 11 individuals with enough evidence to suggest their probable innocence were denied relief (Segal 2008).

House v. Bell, 547 U.S. 518, 536–37 (2006), was the first Supreme Court case to satisfy the *Schlup* standard, which it described as follows: "Prisoners asserting innocence as a gateway to defaulted claims must establish that, in light of new evidence, it is more likely than not that no reasonable juror would have found petitioner guilty beyond a reasonable doubt." *House* also reaffirmed that the reviewing court must make a "holistic judgment" about all the evidence and its likely effect on reasonable jurors applying the reasonable-doubt standard (Garrett 2008a, b at 539). The difference between the 5–3 decision favoring House and the 5–4 decision in *Osborne* rejecting a right to DNA testing was Justice Kennedy's swing vote in both cases, which may have been influenced by the strong facts favoring innocence in *House* and the much weaker factual showing in *Osborne*. The exculpatory evidence in *House* included DNA, which confirmed the semen on the victim's underwear belonged to her husband and not to House. This undermined the state's argument at trial that House's motive to kill the victim was to mask that he had sexually assaulted her. Expert evidence also indicated that incriminatory bloodstains actually resulted from a spill from House's reference sample. Finally, new evidence indicated that the victim's husband had confessed to the crime.

Even with this evidence, three justices did not believe that House met the innocence threshold necessary to establish a gateway claim. Chief Justice Roberts' dissent faulted the majority for disregarding the district court's evaluation of discounting the reliability of House's new evidence. He also opined that it was more likely than not that at least one juror acting reasonably would vote to convict. In other words, he argued that the threshold was not simply reasonable doubt but "such compelling evidence of innocence that it becomes more likely than not that no single juror, acting reasonably, would vote to convict him" (547 U.S. at 571).

Because *House* did not find actual innocence but only permitted litigation of an otherwise barred procedural claim of ineffective assistance of counsel, the case was remanded. In other words, being more likely than not that no reasonable jury would convict him would not have saved House from execution unless his claim of constitutional procedural error was granted. Without that finding, he could not be freed, let alone granted a new trial. As difficult as House's journey to freedom proved, his petition did not raise any thorny AEDPA issues because it was his first federal filing, so not barred as a successive claim. Because *Schlup* was decided a year before the enactment of AEDPA, its relationship to AEDPA is not clear, meaning that many habeas litigants will have to surmount the previously mentioned AEDPA barriers, as well as satisfying innocence criteria. Ultimately, House was granted a conditional writ of habeas corpus that did not prohibit the state from retrying him. Although the local District Attorney had vowed he would retry House, charges were dropped shortly before the new trial date in 2009. House was originally convicted of capital murder in 1986 and was not released from prison until July 2008 after additional DNA testing and investigation further bolstered his claim of innocence, although even that decision generated a dissent. While his long road to freedom proved the system can rectify its errors, it reinforces how difficult the process is.

"Newly" Discovered Evidence and New Trial Motions

What constitutes "new" evidence for new trial motions and gateway claims is currently in dispute, with some circuits allowing evidence not previously presented, even if it technically would have been available, while others consider only evidence that could not have been discovered prior to trial through the exercise of due diligence (Nelson 2008). Only the broader rule encompasses evidence that is often relevant in cases alleging innocence, such as (1) evidence excluded because of actions of the defense counsel, whether or not they reach the level of incompetent counsel, or (2) the defendant's own testimony, which may have been absent because the defendant failed to take the stand or plead guilty. Similarly, in federal court, a majority of circuits exclude a codefendant's posttrial offer of exculpatory testimony from the definition of "newly discovered evidence" (Brennan 2008).

Another problem with the definition of newly discovered evidence is demonstrated by the developing scientific consensus about fire investigation, which suggests that there may be as many as 200 people convicted of setting fires that were actually accidents, based in part on expert testimony that would currently be subject to exclusion (Wolf 2009). Is this newly discovered evidence? And would it reach the level of a freestanding innocence claim? It may not be helpful in a gateway claim, since it is difficult to claim incompetence of counsel or prosecutorial misconduct when the field would not have excluded the evidence at the time it was offered. These questions are not academic since an influential article in *The New Yorker* argues that Cameron Todd Willingham, who was executed in Texas in 2004 after spending 12 years on death row for killing his three children by arson, was innocent (Grann 2009). Willingham always proclaimed his innocence and refused a deal that would have given him a life sentence. Expert reports that challenged the finding of arson in his case years after his 1992 trial did not prevent Willingham's execution. A 2009 report of an independent expert contracted by the Texas Forensic Science Commission rejected the conclusion the fire was arson. The only other evidence of guilt was by a jailhouse informant whose evidence was even viewed skeptically by the prosecution. The commission never reached a decision on the merits of Willingham's innocence claim after the governor replaced several of its members. More recently, *Han Tak Lee v. Glunt*, 667F.3d 397 (3d Cir. 2012), treated the advances in arson science as newly discovered evidence that could raise a due process claim of innocence in habeas based on the unreliability of expert testimony originally given in1990.

However, many courts are hesitant to permit review long after trial in the absence of DNA. In such cases, finality concerns are more significant because innocence cannot typically be demonstrated by a neutral source, there may be circumstantial evidence of guilt, and second-guessing juries could result in retrials with stale evidence and upset victims without a guarantee that justice will be done. In some states like California, the bias against newly discovered evidence is pronounced and in the habeas context does not warrant relief unless it points unerringly to innocence (Medwed 2007). Yet, since the early days of our republic when "dead" people reappeared after defendants were sentenced to death for murder, there have been several hundred exonerations without DNA (Gross and Shaffer 2012; Gross et al. 2006). Statutory changes to facilitate non-DNA innocence claims are long overdue. Medwed makes a number of suggestions for specific reforms such as extending the time frame for bringing new trial motions, only demanding evidence that "would have probably changed the outcome at trial," allowing direct appeal of a superior court's denial of habeas claims, not applying the abuse of discretion standard to summary denials of newly discovered evidence, and not sending newly discovered evidence claims to the original judge. Medwed also proposes developing a single remedy for newly discovered non-DNA evidence claims, resembling New York's approach, which combines attributes of new trial, habeas corpus, and writs of coram nobis, which can be used to correct fundamental errors of fact and law.

Freestanding Constitutional Right to Innocence

Innocence claims brought in habeas petitions typically allege violations of due process under the Fifth or Fourteenth Amendments and claim cruel and unusual punishment under the Eighth Amendment. In *Herrera v. Collins*, 506 U.S. 390, 417 (1993), the U.S. Supreme Court assumed without deciding that "in a capital case a truly persuasive demonstration of 'actual innocence' made after trial would render the execution of a defendant unconstitutional, and warrant federal habeas relief if there were no state avenue open to pursue such a claim." *Herrera* refrained from announcing a standard for evaluating a freestanding innocence claim, but cautioned that due to the disruptive effect on finality and the "enormous" burden on the state in having to retry cases on stale evidence, the threshold of such a claim would be "extraordinarily high" (Gross et al. 2006). The court characterized Herrera's showing as "falling far short" of satisfying this standard (Gross et al. 2006). His affidavits were submitted shortly before the scheduled execution, which was more than 10 years after the conviction, and asserted the defendant's brother who died 6 years earlier had committed the murder.

Justice O'Connor's concurrence, which was joined by Justice Kennedy, observed "executing the innocent is inconsistent with the Constitution" and would be "a constitutionally intolerable event" (Gross et al. 2006 at 418). The dissent of Justice Blackmun, joined by Justices Stevens and Souter, agreed with Justice O'Connor, declaring "the Constitution forbids the execution of a person who has been validly convicted and sentenced but who, nonetheless, can prove his innocence with newly discovered evidence" (Gross et al. 2006 at 431). Thus, five justices agreed that the execution of an actually innocent person would violate the Constitution.

In *House*, the court once again left open whether a truly persuasive freestanding innocence claim in a capital case would warrant federal habeas relief if no state avenues of relief remain available. In dicta, *Osborne* again assumed without deciding that an actual innocence claim could be brought in habeas, but noted "the high standard any claimant would have to meet" to succeed with such a claim (129S. Ct. at 2321). Given such language, it is not surprising that *Herrera* relief was denied to five people whom DNA later proved innocent, including one who had actually presented initial DNA results that excluded him as the perpetrator (Garrett, Claiming Innocence 2008). However, some circuits do not even recognize freestanding claims of actual innocence on federal habeas review (*see*, e.g., *In re Swearingen*, 556F.3d 344 (5th Cir. 2009)). Garrett suggests that judicial reliance on finality in this debate is misplaced since state DNA testing statutes have abandoned this rationale (Claiming Innocence 2008).

The concurring decision of Justices Scalia and Thomas in *Herrera* suggested that "[w]ith any luck, we shall avoid ever having to face this embarrassing question again, since it is improbable that evidence of innocence as convincing as today's opinion requires would fail to produce an executive pardon" (506 U.S. at 428). But some question whether the standard is set too high. As previously mentioned, despite the Supreme Court's direction that the district court hold a hearing concerning Troy Davis's innocence, the Supreme Court ultimately refused to review the merits of his claim. Moreover, even if a circuit permits a freestanding innocence claim, some categories of non-DNA cases appear never able to meet the test. For example, in *Mills v. Hill*, 330 Fed. Appx. 135, 136 (9th Cir. 2009), the court noted that "[w]e have rejected freestanding claims of innocence based on the affidavit of a mental health expert hired by the defense, reasoning that '[b]ecause psychiatrists disagree widely and frequently on what constitutes mental illness, a defendant could always provide a showing of factual innocence by hiring psychiatric experts who would reach a favorable conclusion.'" Until the Supreme Court provides more guidance about the existence and scope of actual innocence claims, the case law will likely continue to favor finality over innocence.

Compensation for Exonerees

Individuals who are exonerated in postconviction litigation are precluded by absolute immunity from successfully suing judges (*Pierson v. Ray*, 386 U.S. 547 (1967)) or prosecutors who are acting either as advocates or in their administrative roles (*Van de Kamp v. Goldstein*, 555 U.S. 335 (2009)). Law enforcement personnel are protected by qualified immunity (*Hunter v. Bryant*, 502 U.S. 224 (1997)), which also defeats many claims. As a result, even when a wrongful conviction is overturned, exonerees must rely on compensation statutes, section 1983 suits for violations of constitutional rights, state tort claims or private bills to obtain any monetary relief for their wrongful incarceration (Ad Hoc Innocence Committee 2006; Bernhard 2009; Bernhard 2004).

To date, less that 30 states have adopted compensation statutes. Without this avenue of relief, many unjustly convicted individuals who have had their lives virtually destroyed by their lengthy incarceration are unable to obtain any monetary reimbursement or services. While they can never recover their lost years, for some spent housed on death row or labeled as sexual predators, many states have yet to acknowledge a moral obligation to provide them with compensation and social services. Even some jurisdictions that have enacted statutes appear to remain hostile to providing full relief. For example, when such statutes are adopted, they are oftentimes quite miserly, with very low dollar caps, and may require proof of economic injury or have very short statutes of limitations (Ad Hoc Committee 2006; Raeder 2008). Few of them provide for any services, whether medical, psychological, educational, or assistance in obtaining housing or employment (Raeder 2008). In contrast, probationers and parolees are entitled to more assistance and social services than those who are released because they did not commit any crime. The lack of resources for exonerees poses a serious problem for individuals, many of whom who suffer from post-traumatic stress disorder from their lengthy prison ordeals (Raeder 2008), as well as for those who were incarcerated before the technological revolution vastly changed the nature of skills needed for employment.

Some of the existing statutes also require that exonerees obtain a pardon despite the fact that DNA may have clearly excluded the person as the wrongdoer. A more significant hurdle to recovery is that a number of statutes disallow compensation for those who are claimed to have contributed to their convictions (Ad Hoc Committee 2006). This can occur because the defendant pled guilty, as was evident in the nearly 200 cases reversed in the wake of the police scandals in Los Angeles and Tulia. Similarly, in cases involving false confession, many of those who confess are youths or have mental disabilities or low IQs. Yet, some of the statutes literally prohibit recovery per se, rejecting a case-by-case basis which would look at the surrounding circumstances (Ad Hoc Committee 2006).

Jurisdictions can differ about the details of what an appropriate statute should look like, but when unrealistically high barriers are enacted, the relief provided by such statutes becomes illusory. In the absence of any statute, exonerees are placed at the mercy of convincing a legislator to pass a private bill for compensation, unless they can find a lawyer who is willing to argue that their incarceration resulted from a constitutional violation. When constitutional violations are established, multimillion dollar verdicts can be returned, though recovery can be a lengthy process. In too many other cases, an exoneree comes away empty handed. Like the lottery, people who have spent decades in prison for crimes they did not commit get to see which one will receive $3 million, $300,000, or more typically nothing.

This lack of uniformity in providing compensation encourages arbitrary results (see Fact Sheet, Innocence Project, Compensating the Wrongly Convicted, accessed February 5, 2012, http://www.innocenceproject.org/Content/Compensating_The_Wrongly_Convicted.php). One possible model for legislation is the Federal Innocence Protection Act, 28 U.S.C.A. § 2513(e). The IPA sets compensation at $100,000 a year for those who have served time on death row and $50,000 a year for others. Several states have increased their compensation since the federal legislation was enacted.

Innocence awards may also be subject to taxation. Unlike California, very few state statutes exempt wrongful conviction compensation awards from state taxation. Moreover, a real question exists about whether the awards are also exempt from federal taxation. Efforts to pass a Wrongful Convictions Tax Relief Act failed in 2010 and 2007. To date, no federal tax legislation has been enacted. In 2010, a memorandum from the Office of Chief Counsel Internal Revenue Service on Tax Treatment of Compensation to Exonerated Prisoners clarified that an exonerated prisoner could exempt his compensation from federal taxation because he had suffered physical injury and sickness (Number: 201045023, Release Date: 11/12/2010, http://www.innocenceproject.org/docs/IRS_Compensation_Ruling.pdf). However, *Stadnyk v. C.I.R.*, 367 Fed. Appx. 586 (6th Cir. 2010), explicitly states that physical restraint alone does not provide the physical injuries or physical sickness necessary to exempt an award from taxation and notes that compensation for mental distress is also not exempted. Freeing the innocent requires more than releasing them to the streets penniless and with skills that atrophied a decade ago. Today many exonerees must rely on the fortuity of having family or friends to provide them with a home and a basic standard of living when they cannot obtain compensation.

Conclusions and Future Directions

In the absence of DNA exclusions, postconviction claims of innocence tend to be discounted because of our inability to readily identify individuals who were wrongfully convicted. *Arizona v. Youngblood*, 488 U.S. 51, 58–59 (1988), poses the most telling example of this dilemma. *Youngblood* denied relief where the state had not preserved evidence that the defendant claimed could exonerate him and also rejected any constitutional remedy in the absence of bad faith destruction of such evidence by the government. The decision did not even require any showing of good cause for the destruction. Yet some 12 years later, evidence was found that when submitted to newer DNA analysis exonerated Youngblood. In other words, the Supreme Court downplayed the possibility of Youngblood's innocence in setting a high threshold in a case where the defendant was factually innocent. That *Youngblood* is not an isolated example of our failure to accurately determine after conviction who is innocent is demonstrated by Garrett's study of exonerees, which revealed that the reason for denial of relief in one-third of the cases with written decisions on direct appeal was harmless error (Garrett, Judging Innocence 2008). He found that in half of the written decisions, courts referred to the likely guilt of the defendant, and 10 % referred to the evidence of guilt as overwhelming. Thus, appellate review not only failed to rectify the wrongful conviction, but judges also incorrectly identified innocent defendant as guilty and thereby disregarded the strength of the procedural errors during trial. Given the lack of a viable constitutional theory to raise claims of innocence on direct appeal, it is not surprising that of the 16 exonerees who sought a new trial based on newly discovered evidence of their innocence, none received relief prior to obtaining DNA testing. Similarly, the five who raised *Herrera* claims had them denied.

To respond to this disconnect, North Carolina has set up a commission that inquires into individual cases and actually reviews evidence not submitted at trial (The North Carolina Innocence Inquiry Commission, accessed February 5, 2012, http://www.innocencecommission-nc.gov/index.html). This type of commission resembles the model used in the United Kingdom and Canada (Ad Hoc Committee 2006; Griffin 2001; Scheck and Neufeld 2002). While such an approach may be considered too bold at present for most jurisdictions to adopt, commission review is no guarantee that innocence will be established, although three of the four cases currently decided resulted in exonerations.

Thus, until technology or forensic science is able to provide the equivalent of DNA exclusions in cases not involving biological evidence, such postconviction claims of innocence will understandably continue to be treated skeptically. Dedicated prosecutors and defense counsel are the best protectors of innocence, but we also need to be more open to reviewing policies, practices, and legal doctrines across the criminal justice system to ensure that procedures that appear to create high risk of error are changed to reduce the risk of wrongful convictions. In addition, more attention should be paid to providing fair and speedy compensation and services to individuals who have satisfied the high standard necessary to establish their factual innocence.

Parametric Sample Selection Models

William Rhodes
Abt Associates Inc., Cambridge, MA, USA

Overview

James Heckman's work (1976, 1979) regarding the consequences and solutions for sample selection bias has influenced three decades of social science research. For this and related contributions, he won a Nobel Prize in economics. Heckman's original solution requires strong parametric assumptions. When wrong, those assumptions can lead to parameter estimates with mean-squared errors worse than those of estimators that ignore selection bias.

Nevertheless, the parametric approach remains popular. Discussions appear in econometrics textbooks (Davidson and MacKinnon 1993, pp. 542–545; Cameron and Trivedi 2005, pp. 546–569; Greene 2008, pp. 863–903) and technical papers; estimation routines appear in standard econometrics software; and the approach is frequently used in criminal justice research (Bushway et al. 2007). Criminologist and criminal justice researchers cannot disregard the parametric approach.

All estimators require some parametric assumptions, so what distinguishes estimators that are parametric from another class? Estimators considered in this entry require strong distributional assumptions about error terms in a regression and are distinguished thereby from estimators that impose weaker assumptions.

Without being comprehensive, this entry identifies six cases where selection bias occurs in criminal justice research:

- Sample selection due to unobserved variables
- Estimating treatment effects using observational data
- Breakdowns in randomized controlled trials
- Survival models with censoring and competing events
- Endogenous stratification/choice-based sampling
- Missing data

This entry shows how parametric assumptions can overcome bias but also how the approach can fail. It illustrates points with Monte Carlo experiments.

Theoretical Background

To motivate a discussion, consider a *data generation process* (DGP) comprising two equations. The first is the *outcome equation*: It explains the outcome of interest in terms of explanatory variables. **The objective is to estimate one or more parameters of this outcome equation**. The second is the *selection equation*: It explains how data get sampled for analysis. Selection bias *may* occur when the same factors affect both sampling and outcome (Rosenbaum 2002). After introducing notation, this entry explains when selection bias occurs and how parametric models correct for bias.

G. Bruinsma, D. Weisburd (eds.), *Encyclopedia of Criminology and Criminal Justice*,
DOI 10.1007/978-1-4614-5690-2, © Springer Science+Business Media New York 2014

When writing the two equations, use the notation:

Y Denotes the outcome measure: the dependent variable in the first equation. A subscript denoting the ith observation is implicit.

S Denotes the selection measure: the dependent variable in the second equation. Its interpretation will differ across the six cases.

X This is an *observed* row vector of variables that affect both Y and S. Observed means that the researcher has measured these variables and uses them in the analysis. X typically includes a constant.

W This is an *unobserved* row vector of variables that affect both Y and S. The researcher has not measured these variables or else omits them from the analysis. Assume that unobserved variables are distributed independent of other explanatory variables appearing in the outcome equation; consequences of assuming otherwise are discussed subsequently.

V This is a vector of observed variables that affect Y but not S.

Z This is a vector of variables that affect S but not Y. When observed, the vector comprises *instrumental variables* used to impose *identification restrictions*.

β This represents a conformable column vector of parameters appearing in the outcome equation. Subscripts will denote whether these pertain to X, W, or V. Conformable means the column vector β has as many elements as the row vectors X, W, and V.

α This represents a conformable column vector of parameters appearing in the selection equation. Subscript will denote whether these parameters pertain to X, W, or Z.

e This represents an error term pertaining to the first equation.

u This represents an error term pertaining to the second equation.

For simplicity, assume the error terms are mean-zero, identically and independently distributed within each equation, independently distributed across equations, and independent of X, W, V, and Z. Assuming otherwise would add complications without enhancing insight.

Given this notation and limiting the immediate discussion to linear models, a general data generation process (DGP) is written:

$$Y = X\beta_X + W\beta_W + V\beta_V + e \tag{1}$$

$$S = X\alpha_X + W\alpha_W + Z\alpha_Z + u \tag{2}$$

A DGP is the *actual* stochastic process generating the data. The researcher necessarily omits unobserved variables from the analysis, so a model of the DGP is expressed as:

$$Y = X\beta_X + V\beta_V + e^* \tag{3}$$

$$S = X\alpha_X + Z\alpha_Z + u^* \tag{4}$$

The error terms change to e* and u*:

$$\begin{aligned} e^* &= e + W\beta_W \\ u^* &= u + W\alpha_W \end{aligned} \tag{5}$$

Some additional notation will be useful:

$\sigma^2_{e^*}$ This is the variance of e*.

$\sigma^2_{u^*}$ This is the variance of u*.

$\sigma_{e^*u^*}$ This is the covariance of e* and u*.

Although e is independent of X in the population, the following section will show that e* is not independent of X in the sample used for estimation. Consequently, a regression based on model (3) will violate a fundamental assumption: errors must be independent of explanatory variables. Standard regression procedures yield biased and inconsistent estimates of β_X.

Is the DGP encapsulated by Eqs. 1 and 2 plausible or just abstract mumbo-jumbo? In fact behavioral models often translate into DGPs with counterparts to Eqs. 1 and 2. Based on perceptions of self-interest, individuals elect to participate in activities (Eq. 2) studied by researchers (Eq. 1). Alternatively, based on perceptions of community interests, agents (prosecutors, judges, probation officers, etc.) perform selection to enhance community safety. Thus, the DGP and statistical models cover situations common to criminology/criminal justice.

Correctly specified parametric models eliminate selection bias. One approach uses maximum likelihood or partial likelihood to estimate parameters of the joint distribution of e* and u* in the sample. The joint distribution is written as

$$\phi_b(e^*, u^*|\text{sample}) \quad (6)$$

The α, β, and σ parameters are implicit arguments in this distribution. The notation indicates that the distribution depends on the sampling procedure, and different sampling procedures lead to various distributions (Maddala 1983), only a few of which are discussed in this entry.

A second approach is to estimate the expected value of e* in the sample and introduce this expected value into the model. Equation 3 now becomes

$$Y = X\beta_X + V\beta_V + \varsigma E[e^*|\text{selection}] + v \quad (7)$$

The new error term *v* is mean-zero in expectation but heteroscedastic, so computed standard errors require adjustment (Cameron and Trivedi 2005, p. 567; Greene 2008, p. 888). Modern software applies these corrections.

Some parametric assumptions are required. Although other distributions might be used, typically analysts assume that e* and u* are distributed as bivariate normal, perhaps after transformations to increase model flexibility and perhaps after converting the σ from scalars to functions of explanatory variables. Inferences are asymptotic, meaning that valid inferences require large samples.

Econometricians have introduced semiparametric approaches for estimating E[e*|selection] (Vella 1998). These approaches are not commonly used; they do not appear in standard computing software; and (Greene 2002, pp. E23–2) for one is skeptical that semiparametric approach will reach mainstream application. This entry does not discuss semiparametric approaches.

In practice Eqs. 6 and 7 will not produce the same results. Results may be very different if the distributional assumptions are wrong. Furthermore, Eq. 6 can be adapted for models that are nonlinear in the outcome equation. This is unclear for Eq. 7 (Cameron and Trivedi 2005, p. 192). Many models are nonlinear, so Eq. 6 seems preferable, but Eq. 7 has heuristic and practical value.

The form provided by Eq. 7 is especially useful for interpreting results. Let x represent a single component of X and let β_x represent the corresponding parameter. If the researcher's interest is how x changes Y in the population, then the answer is β_x. But often the researcher's interest is how Y changes with x given a selection mechanism that has behavioral interpretations. Then the answer is

$$\frac{\partial Y}{\partial x} = \beta_x + \varsigma \frac{\partial E[e^*|\text{selection}]}{\partial x} \quad (8)$$

The correct interpretation depends on a well-specific research question (Heckman and Vytlacil 2007a, b).

The difficulty of applying these solutions depends on an as yet unspecified assumption about the selection process. When population data are available for estimating Eq. 4 but only selected data are available for estimating Eq. 3, the data are *censored*. When only sampled data are available for estimating both Eqs. 3 and 4, the data are *truncated*. This entry deals exclusively with censored data although similar concepts apply to truncated data. Unfortunately there is room for confusion, because the censoring problem is sometimes referenced as *incidental truncation* to mean that the data for estimating Eq. 3 are truncated by the process described by Eq. 2.

This entry is focused on selection rules that bifurcate the population, but other selection processes occur. Especially in criminal justice applications, where justice administration acts as a sieve, selection may involve a sequence of decisions (Vella 1998, p. 153). Also in criminal justice applications, the selection rules may put individuals into ordered categories (low risk, medium risk, high risk) or into nominal categories. There exist suitable econometric models (Vella 1998), some of which have been programmed into conventional computing software, but discussion of alternative selection rules goes beyond the scope of this entry.

Six Cases Illustrating Selection Bias

Sample Selection Due to Unobserved Variables

Assume that the selection equation determines which data enter into estimation of the outcome equation. Specifically, a data point is selected when S is larger than a threshold value; the threshold is 0 here. Elaborate the data generation process:

$S \geq 0$ implies selection into the sample used to estimate the outcome equation.

$S < 0$ implies exclusion from the sample.

From Eq. 2, sample selection occurs when $S = X\alpha_X + W\alpha_W + Z\alpha_Z + u \geq 0$ or when $W\alpha_W \geq -X\alpha_X - Z\alpha_Z - u$

When the linear combination $X\alpha_X$ is very large in the population, any value of the linear combination $W\alpha_W$ will likely pass the test for inclusion in the sample; when $X\alpha_X$ is very small, only large values of $W\alpha_W$ will likely pass the test. This induces a negative correlation between $X\alpha_X$ and $W\alpha_W$ *in the sample*. The reason is that the linear combination $W\beta_W$ is an element of e* in the model represented by Eq. 3. Given their common elements, $W\alpha_W$ and $W\beta_W$ are likely correlated, in which case elements of X will be correlated with the error term e* in the sample.

The same argument establishes that X will be correlated with Z in the sample. This does not matter, however, because Z is not part of the outcomes equation. V appears in the outcomes equation, but V does not affect e*. The entire explanation for selection arises because the unobserved W appears in both the outcome equation and the selection equation (Rosenbaum 2002). The classification of variables as X, W, V, and Z depends on the model, an observation important for model building (Pearl 2000; Gerring 2012), but those implications are not discussed here.

What are the solutions? An obvious solution is to assure that X comprises variables that affect both the selection and outcome equations so there are no W variables. That may be impossible and the solution is uncertain because there is seldom reason to justify that X is inclusive. A researcher who relies on this reasoning will typically face validity challenges. Nevertheless, this assumption underlies all estimation procedures that assume *selection on the observables*.

In contrast, Heckman's solution assumes selection on the unobserved W. As noted, estimation requires assuming a joint distribution of e* and u*. Assuming that e* and u* are bivariate normal is problematic. Even if e and u are independent normal, bivariate normality of e* and u* depends on $W\alpha_W$ and $W\beta_W$ being distributed as normal in the population. Although possible, it is a strong assumption, and if wrong, $\hat{\beta}$ will be inconsistent.

Criminologists and criminal justice researchers have used the parametric model to deal with selection bias (Bushway et al. 2007). For example, in an early application in criminal justice research, the author used Heckman's approach to estimate how risk factors predict pretrial misconduct; the sample selection mechanism entered because the worst pretrial risks were detained pending trial so they were omitted from the sample for estimating the outcome equation. That application illustrates a point: Eq. 4 can be estimated consistently because the analyst observes release/detention decisions for every offender. Selection bias affects the estimation of Eq. 3 because the outcomes are observed for only those offenders released pending trial, but the inference is about risk in the population of offenders. The application motivates two-step estimation: Estimate the pretrial release decision first and then estimate the pretrial misconduct equation.

Estimating Treatment Effects Using Observational Data

In the second case, the selection equation determines who enters treatment. An explanation requires modest changes to Eq. 1 through Eq. 4. Let

T is a dummy variable that denotes treatment when $T = 1$ and no treatment when $T = 0$

δ a vector of parameters (the treatment effect), which is the objective of estimation

Then

$S \geq 0$ implies selection into treatment ($T = 1$).

$S < 0$ implies no treatment ($T = 0$).

Treatment potentially changes all the parameters in Eq. 1, so rewrite Eq. 1 as

$Y = X\beta'_X + W\beta'_W + V\beta'_V + e$ if treated

$Y = X\beta_X + W\beta_W + V\beta_V + e$ otherwise

Equivalently the DGP can be rewritten as a single equation with interactions

$$\begin{aligned} Y =& X\beta_X + W\beta_W + V\beta_V \\ &+ [X\delta_X + W\delta_W + V\delta_V]T + e \end{aligned}$$

The model becomes

$$\begin{aligned} Y =& X\beta_X + V\beta_V + [X\delta_X + V\delta_V]T \\ &+ [W\beta_W + WT\delta_W + e] \\ =& X\beta_X + V\beta_V + [X\delta_X + V\delta_V]T + e^{**} \end{aligned}$$

Where

$$e^{**} = W\beta_W + WT\delta_W + e$$

Often selection into treatment depends on whether the person being treated his or her agent perceives treatment to be beneficial. This theory motivates specification of the selection equation. It is common to assume that the δ are zero except for a constant—that is, $X\delta_X + V\delta_V = \delta$ and $WT\delta_W = 0_.$ This assumption has negative consequences if wrong. Nevertheless, for simplicity, treat δ as a scalar.

T is not orthogonal to e**. The reasoning is the same as before. T is partly determined by W; also, e** is correlated with W. Hence, T is correlated with e**. An analyst could not estimate δ consistently in a regression that fails to account for selection.

Simple solutions follow when selection on observables holds (Imbens and Wooldridge 2009). Otherwise, estimation rests on strong parametric assumption about the joint distribution for e** and u**. As a practical matter, parameter identification requires that Z be observed and included in the model. Identification is discussed later. For example, in the criminal justice literature, the author and his or her colleagues (Rhodes et al. 2001) used the parametric approach to evaluate within prison substance abuse treatment.

Breakdowns in Randomized Controlled Trials

RCT imposes selection by design. Unless the design is perverse, random assignment typically solves the selection bias problem. There are three situations. First, selection is purely random: The selection mechanism contains no variables in common with the outcome equation. Estimation is straightforward: the mean difference between the treated and control group is an unbiased estimate of the average treatment effect; a regression might be used to increase efficiency or to learn about heterogeneous treatment effects.

Second, selection is random conditional on X (exogenous sampling). Stratified sampling obviously qualifies, as do most complex survey designs. There is no sampling bias provided the evaluator uses an estimator that accounts for X. This might be done with weighting, but that topic goes beyond the scope of this entry.

Third, selection is random conditional on W. This perverse case happens. Consider a multisite study where the researcher samples randomly from within a site but does not select randomly across sites – perhaps because many sites decline to participate in the study. Or, consider the problem where some subjects assigned to treatment refuse the treatment or some subjects assigned to the control condition cross over to the treatment condition, or both. Random assignment involves selection bias in these common cases. Evaluators sometimes use the terms internal and external validity to describe this perverse case.

Thus, well-crafted and implemented RCTs are free of selection bias. However, true RCTs are difficult to design and implement, and selection bias occurs when design/implementation is faulty. Selection may be present in RCT (Berk 2005; Sampson 2010), and furthermore, the RCT may be unable to answer important policy questions about the distribution of treatment effects (Heckman and Vytlacil 2007a; Heckman et al. 1997). Meta-analysis (Borenstein et al. 2009) often integrates experimental and quasi-experimental studies to understand selection bias and better estimate treatment effects.

Survival Models with Censoring and Competing Events

Survival analysis has a long history in the study of criminal recidivism. Advances have incorporated competing events into the study of criminal recidivism. Selection bias can occur when estimating survival models for the reasons discussed in 2.2 through 2.4, but survival models sometimes raise special selection problems.

Equations 1 and 2 will again be useful but now recast those equations by assuming there are two events, A and B. Event A might represent the occurrence of criminal recidivism, defined as an arrest for a new crime while under community supervision. Event B might represent the occurrence of a revocation for a technical violation of the conditions of supervision, treated here as a competing event. Y and S represent the logarithm of the time until events A and B, respectively. The error term e is the distribution of log-time until an arrest conditional on X, W, and V; the error term u is the distribution of log-time until a revocation conditional on X, W, and Z. The analyst can observe the timing for whichever event occurs first: A or B. Consequently, one can treat B as "selecting" what is observable about A.

Almost always, analysts assume that the timing of event A (the outcome of interest) is conditionally independent of the timing of event B (competing events). This is equivalent to assuming selection on observables. If selection on observables is wrong, traditional survival analysis will result in biased parameter estimates.

Given censoring because of unobservables, the solution is also familiar. The analyst needs to model the joint distribution of e* and u*, but accounting for the error structure is complicated (van den Berg 2008). Moreover, commonly available software lacks estimation routines. Nevertheless, the maximum likelihood approach introduced earlier provides a solution requiring parametric assumptions; the author used this approach to study criminal recidivism under community supervision.

To extend this observation, the reader might note that survival models are simply censored regressions. Therefore, the same selection problems that affect survival models also affect Tobit models, which are frequently used in criminal justice research.

Endogenous Stratification/Choice-Based Sampling

Many samples depend on the occurrence of some event. For example, data from the Arrestee Drug Abuse Monitoring (ADAM) survey requires a subject to be arrested and booked. Samples used in the criminal careers literature require a subject to acquire a criminal history. Such samples involve endogenous stratification or choice-based sampling.

To illustrate the problem, return to Eq. 1 and think of Y as a count variable – zero arrests, one arrest, two arrests, and so on occurring from a Poisson process. The research question is to estimate the arrest rate during a period of interest.

Return to Eq. 2 and think of S as being the event: arrested and booked on the day that ADAM arrestees were sampled. Selection bias occurs because offenders with high crime commission rates have relatively high sampling probabilities. The sample will not represent the general population of offenders.

Notice a subtle difference between endogenous stratification and the other selection problems: Selection into the sample depends on the process determining the outcome. To illustrate, assume a subject is sampled into the study depending on the outcome, so:

$Y > 0$ implies selection into the sample

$Y \leq 0$ implies no selection into the sample

The outcome equation is written as

$$Y = X\beta_X + V\beta_V + e^{***}$$

The expected value for e^{***} *in the sample* is

$$E[e^{***}] = E[e|e > -X\beta_X - W\beta_W - V\beta_V]$$

The error term e^{***} will be correlated with X and V in the sample.

Endogenous stratification raises complex estimation issues (Cameron and Trivedi 2005, pp. 822–829). Solutions may be best developed for Poisson and negative binomial models (Cameron and Trivedi 1998), which is fortunate given the ubiquitous role of Poisson models in criminal justice modeling. The criminal careers literature has sometimes dealt with the issue; early illustrations come from the Rand Corporation and others. The author has used a negative binomial model with endogenous stratification to estimate the arrest rate for drug-involved offenders in the community based on a sample of arrestees (Rhodes et al. 2007).

Missing Data

Analysts often deal with missing data (Schaefer 1997; Little and Rubin 2002). For example, within a data set, sex may be missing for some subjects, age may be missing for others, and both age and sex may be missing for still others. The *variable* is observed (it is an X variable), but its *value* is missing for some observations.

One way to deal with missing data is to exclude cases where any data are missing. This is called list-wise or case-wise deletion. This depletes the sample and thereby reduces power; it can bias parameter estimation.

An alternative approach is to impute values for the missing data, and imputation software is available for common problems. Imputation and estimation with imputed data is complicated. Consider a simple problem: A single variable x from the vector X has missing values. Assume that x is the Kth element of X and that the other K-1 elements are never missing. To focus attention on x, rewrite Eq. 1 equivalently as

$$Y = X_{1:K-1}\beta_{X_{1:K-1}} + x\beta_{X_K} + W\beta_W + V\beta_V + e \tag{9}$$

Interpret the selection equation as determining when x is observed ($S > 0$) and missing ($S < 0$). To emphasize the role of x, rescale so the $\alpha_K = 1$ and rewrite Eq. 2 as

$$S = X_{1:K-1}\alpha_{X_{1:K-1}} + x + W\alpha_W + Z\alpha_W + u \tag{10}$$

This implies that x is observed when

$$x \geq -X_{1:K-1}\alpha_{1:K-1} - Z\alpha_Z - W\alpha_W - u \tag{11}$$

As before, the motivation is to estimate the parameters in the model:

$$Y = X_{1:K-1}\beta_{X_{1:K-1}} + x_K\alpha_K + V\beta_V + e^* \tag{12}$$

Consider three cases. The first is when elements of α in Eq. 11 are 0 except perhaps for the constant. Selection, which depends only on u, is called *missing completely at random*. Missing data will not bias the parameter estimates for Eq. 12 because the error term e* will not be correlated with X, x, or V. The second situation is when α_W is zero but other α parameters are not zero. Selection, which now depends on one or more of the observed variables, is called *missing at random*. Missing data will not bias parameter estimates because the error term e* will be uncorrelated with X, x, and V. The third situation is where $\alpha_W \neq 0$. Selection, which now depends on unobservable variables, is called *missing not completely at random*. This leads to biased parameter estimates because the missing data will be correlated with the error term e*.

There are parametric solutions to the first two cases and approximate solutions to the third case. The solution requires specifying x as a function of observables. A specification might be

$$x = Y\varsigma_Y + X_{1:K-1}\varsigma_{X_{1:K-1}} + V\varsigma_V + Z\varsigma_Z + R\varsigma_R + v \tag{13}$$

There are some surprises in Eq. 13. One is that the outcome variable Y appears in the specification. The intuition is that x predicts Y, so Y predicts x, and predicting x is the purpose of Eq. 13. A second surprise is inclusion of a vector of variables R that did not appear elsewhere in the DGP. Again, the instrumental objective is to predict x, and it seems plausible that some set of variables R might predict x yet not explain Y. Finally, v is an error term *whose distribution is known* except for some unspecified parameters. The solution is parametric because of the linear specification and the assumed distribution for v. Estimation of Eq. 13, including the parameters of the distribution of v, leads to a predicted (posterior) distribution for missing values for x.

Estimation of Eq. 9 proceeds by sampling values of x from this posterior distribution and using those sampled values to estimate the parameter appearing in Eq. 9. The approach is conceptually simple but estimation rests on the specified distributional assumptions, is computer intensive, and requires specialized software.

In the first two cases—missing completely at random and missing at random—Bayesian logic leads to consistent estimates for the parameters in Eq. 9. This is not true in the third case. There the analyst has two choices. The first is to construct an imputation model that is explicit about the selection mechanism; this is not frequently done. The second is to use imputations from Eq. 13 with an expectation that these will reduce mean-squared errors in the β. This is plausible because the imputations are based on additional information that would otherwise be ignored by case-wise deletion.

The single imputation problem is simple compared with a multiple imputation problem where all of the X and V variables may have missing values. In that case, the starting assumption is that X and V are distributed as multivariate normal perhaps after transformations and after conditioning on other variables such as Y and R. This solution is highly parametric and probably unrealistic. Nevertheless, experience shows that estimation is insensitive to distributional assumptions although one would be dubious of applying this approach to data that have a high proportion of missing to known values.

As an illustration, the ADAM survey randomly samples arrestees, questions them about drug use, and requests a urine specimen to test for recent drug use. Not all arrestees are able or willing to comply with the request, leading to missing results for urine tests. ADAM analysts have developed procedures used to impute urine test results conditional on self-reports about recent drug use.

Identification

The first five cases share a common problem: The arguments assume that W is orthogonal to X and V. This assumption was convenient because it meant that in the absence of any selection bias, an analyst could consistently estimate the β parameters.

What if the distribution of W is not orthogonal to X and V? Then when W is omitted from the outcome equation, the β parameters would not be identified even absent selection bias. The problem is omitted variable bias, which is discussed in introductory textbooks and is widely appreciated by researchers. One can nevertheless think of Eq. 3 as estimating a *conditional mean* for the population (Angrist and Pischke 2009). Provided the analyst considers his or her estimates to pertain to a conditional mean function, the argument regarding selection bias does not require any assumptions about independence between W and either X or V, so one can focus on selection bias as *the* problem.

Putting this discussion about orthogonality aside, the parametric solution to selection bias requires an assumption about the joint distribution between e* and u*. Suppose the assumption is correct. Is this sufficient to identify the β? The answer is a qualified *yes*, but asymptotic justification for the parameter estimates and their sampling distributions may require very large samples.

Equation 7 provides some intuition. Absent Z, $E[e^*|\text{sample}]$ will be nearly collinear with X. The relationship will not be perfectly collinear because the nature of the joint distribution ϕ_b will induce nonlinearities, but the departure from collinearity will be slight in most real-world applications. Consequently, the standard errors for β_X would be large and inference tenuous. Few analysts would feel comfortable relying on identification resting on nonlinearities induced by correct specification of the joint distribution of e* and u*.

A more compelling case for identification requires the presence of Z. Intuition is again useful. The larger is the explanatory power of Z in Eq. 4, the smaller is the correlation between X and $E[e^*|\text{sample}]$. The availability of Z mitigates the collinearity problem. There is an extensive literature on instrumental variables (Hahn and Hausman 2003; Stock et al. 2002). This entry is not the place to summarize that literature except to review some properties of a good instrument.

First, to be an instrument, Z must appear in the selection equation but not in the outcome equation. Second, to be a *useful* instrument, Z must account for a good deal of the variance in S. A weak instrument (e.g., one that accounts for a negligible amount of the variance in S conditional on X) can provide an estimate with worse mean-squared error properties than estimates from models that ignore selection bias. Unfortunately, good instruments are difficult to find and to justify, a fact that greatly limits the appeal of the Heckman estimation procedures.

This is a good point to pose the question: If correcting for selection bias can worsen estimates, can an analyst tell if correcting for selection bias is necessary? The answer is a tentative yes: The test is equivalent to testing whether $\sigma_{e^*u^*} = 0$. The practical problem is that without a strong instrument, this test will lack power. An analyst would frequently fail to reject the null hypothesis of no selection bias when, in fact, selection bias is serious. There are tests of whether the parameters are identified by nonlinearities or identification restrictions, but these tests require correct parametric assumptions and, anyway, do not answer the question of whether selection bias exists.

A final point closes this section: Much of the argument regarding instrumental variables pertains to linear regression models and does not translate readily into the nonlinear models often used in criminology/criminal justice research. For useful discussions, see Davidson and MacKinnon (1993), pp. 224–226 and Cameron and Trivedi (2005), pp. 192–199. This is a difficult problem. Angrist and Pischke (2009) advise researchers to assess if the research question is answerable without actually estimating the β. The author (Rhodes 2010) adopted that recommendation in a justice context.

Monte Carlo Illustrations

A Monte Carlo experiment illustrates points based on the first case (section "Sample Selection Due to Unobserved Variables"). There are single X, W, V, and Z variables. X, V, and Z are distributed as independent normal with mean of zero and standard deviation of 1; W has different distributions across the experiments. The α and β parameters all equal 1. The error terms e and u are distributed as normal with mean of zero and standard deviation of 2. The simulation generates 1,000 observations before selection (about 500 after selection), and the experiment is replicated 5,000 times.

In the first experiment (see Table 1), W is distributed as normal with mean of 0 and standard deviation of 2. This is ideal for the Heckman estimator because e* and u* are distributed as joint normal. The table shows parameter estimates using an OLS regression, Heckman's maximum likelihood, and Heckman's two-step procedure. The table reports the average of the three β parameters across 5,000 replications (β_C is the constant), the "true" standard error across those 5,000 replications (based on the 5,000 replications) and the average of the estimated standard errors across those 5,000 replications.

OLS with a robust covariance estimator yields biased and inconsistent parameter estimates for β_X and β_C. The estimate for β_V is not biased. The maximum likelihood Heckman procedure yields consistent parameter estimates at the expense of inflating standard errors. The two-step procedure yields consistent parameter estimates although the standard errors are even larger. The Heckman estimators perform well in this ideal case.

The second exercise changes the distribution for the instrument Z. Although still normally distributed with mean of zero, it now has a standard deviation of 0.01. This simulates a weak instrument. Everything else in the simulations remains the same. Results are reported as exercise 2 in Table 1.

The table shows no results for the maximum likelihood procedure, which often fails to converge on a solution. The two-step estimator is less demanding and makes the intended points. First, the two-step estimator yields seriously biased parameter estimates, which should give pause to those who seek to rely upon nonlinearity to identify parameters. Second, the mean-squared error properties of the two-step estimator are worse

Parametric Sample Selection Models, Table 1 A Monte Carlo demonstration of selection bias

		Least squares			Maximum likelihood			Two-step		
		Estimate	True standard error	Estimated standard error	Estimate	True standard error	Estimated standard error	Estimate	True standard error	Estimated standard error
Experiment 1	β_X	0.728	0.123	0.122	0.993	0.163	0.160	1.002	0.176	0.174
	β_V	0.999	0.118	0.118	0.999	0.117	0.117	0.999	0.117	0.117

	β_V	0.999	0.086	0.086	0.999	0.086	0.086	0.999	0.086	0.086
	β_C	1.576	0.088	0.089	1.499	0.244	0.240	1.498	0.242	0.241
Exercises:										

1. W has a normal distribution and the instrument is strong
2. W has a normal distribution and the instrument is weak
3. W has a lognormal distribution with variance of 1.02 and the instrument is strong
4. W has a lognormal distribution with variance of 1.02 and the instrument is weak
5. W has a binomial distribution with probability equal to 0.5

than those of the OLS estimator: 0.329 for OLS and 1.033 for Heckman.

The third exercise is the same as the first but changes the distribution for W. Previously distributed as normal, it is now distributed as lognormal. This is easily accomplished by taking the exponential of the original W multiplied by 0.7. The distribution of W now has a mean of 1.278 and a standard deviation of 1.02. The exercise subtracts 1.278 from the simulated values of W to center the new distribution of W on zero. The assumption of a lognormal distribution for W violates the assumptions that e* and u* are distributed as bivariate normal. Nevertheless, the maximum likelihood and two-step procedures perform tolerably given a strong instrument.

The fourth exercise is the same as the third but weakens the instrument by changing Z to have a normal distribution with standard deviation of 0.01. As before, convergence is a problem for the maximum likelihood solution, but the two-step approach provides a solution. Estimates are biased with large sampling variances.

The fifth and final exercise uses the original W but now changes it to a dummy variable coded 1 if W exceeds 0 and coded 0 otherwise. The instrument is strong. As before, the Heckman procedure provides tolerable solutions especially for the slope coefficient despite the faulty distributional assumptions.

Simulations cannot cover all situations, but generalizing based on the above leads to two conclusions: First, the Heckman procedure is fairly robust to departures from bivariate normality provided the instrument is strong. Second, the Heckman procedure provides poor estimates when instruments are weak regardless of whether distributional assumptions are correct.

Conclusions

Application of the parametric approach is demanding, but this is equally true of partially parametric approaches. An applied researcher should provide a sober, informed consideration of whether his or her data can answer the research question. The following observations might inform that consideration.

First, when the researcher has access to a rich set of data, which includes all variables relevant to the outcome equation according to substantive theory, the researcher might assume selection on the observables. In general, assuming selection on the observables is difficult to justify, but justification is advanced when the setting allows repeated observations (difference-in-differences) and exogenous interruptions (regression discontinuity) provided the researcher is content with estimating a subset of the β identified by these designs.

Second, when selection on the observables is untenable, the researcher needs strong instruments to impose identifying restrictions. Good instruments are difficult to find and justify, but examples exist in criminal justice research. Although nonlinearities can provide identifying restrictions, these are not reliable.

Weak instruments are a problem. All the estimators discussed in this entry provide estimates of β that are biased but consistent provided distributional assumptions hold. The weaker the instrument, the larger the sample required to reduce the bias to an acceptable level. Asymptotic justification can require samples in the tens of thousands when instruments are weak.

Third, it is common for a researcher to estimate two competing models that (1) do not adjust for selection bias and (2) adjust for selection bias using parametric assumption. If the two approaches provide different results, the researcher might conclude that the second model is preferred and even necessary. Exercise 2 demonstrated that this is a poor test that provides no basis for concluding that the Heckman model is an improvement.

Along this line, this entry does not cover an important body of work that uses RCT to estimate a treatment effect (case 2 from above) and then applies the Heckman estimator to observational data to estimate ostensibly the same treatment effect. Researchers interpret the difference between the two estimates as demonstrating failure of the Heckman approach, but this comparison does not accurately quantify the bias. Rather, observational data have different coverage and consequently provide estimates for a different population (Heckman et al. 1998). Thus, the comparison does not demonstrate failure of the parametric approach to produce useful estimates of treatment effectiveness.

One final point ends this entry: This entry has treated estimation of the outcome equation as providing the estimates of scientific interest. This is not always the case. Especially when making policy recommendations, the researcher may be interested in estimation and interpretation of the selection equation, or the researcher might be interested in the distribution of treatment effects across the population, or both (Heckman and Vytlacil 2007a, b). Even when the selection equation has little scientific interest, careful thought about the selection equation is essential for applying the parametric approach. This thought exercise is a design consideration driven by substantive theory. Statistical theory alone cannot provide a magic solution.

Overview

The US prison and parole population declined in 2009 for the first time in 30 years, perhaps indicating the beginning of the end of America's long commitment to mass incarceration. But current prison population declines may well be reversed if we do not do a better job of planning for the reentry of prisoners who have finished their sentences. At release, many prisoners are unable to find jobs and suitable housing. Some will be legally barred from voting, receiving public assistance, obtaining a driver's license, or retaining custody of their children. If the past is any lesson, many (upward of two-thirds) eventually return to crime and prison, where the cycle begins again.

Faced with these realities, what can we do? Fortunately, there is much that *can* be done. We must focus attention on parole policies and practices. Parole – which refers to both a release mechanism and a method of community supervision – is central to crime control and prisoner reintegration. If parole is effective, dangerous offenders remain in prison, and those who are released are better prepared for reentry. If parole resources are misdirected, community safety is threatened as prisoners return home with few resources and little surveillance. Which scenario proves true will depend on realistic expectations and an understanding of parole's history, current operations, needs of the parole population, and "what works" in reentry programming.

Fundamentals of Parole and Reentry

Definition and Functions of Parole

People often confuse probation and parole. *Probation* is a judge's sentence that allows a convicted offender to continue to live in the community after criminal conviction, with restrictions on activities and with supervision for the duration of the sentence. *Parole* refers to offenders who have spent time in prison and are released to complete the remainder of their sentence under community supervision. Parole is usually granted from authorities in the correctional system (i.e., a parole board), since responsibility for offenders passes from the judicial system to the correctional system upon imprisonment. Parolees are technically still in state custody; they have merely been granted the privilege of living in the community instead of prison. If parolees or probationers violate the rules of their release, they can be returned to incarceration.

Inmates are released from prison mandatorily or discretionarily. *Mandatory release* is release after a specified period of time, as required by law, and occurs in jurisdictions using determinate sentencing. In determinate sentencing, the offender is given a set amount of time to serve by the court, although these sentencing structures may still incorporate a degree of discretion. Determinate sentencing eliminates parole boards, although the exact requirements vary by state. *Discretionary release* is at the paroling authority's discretion, within boundaries established by the sentence and by law.

In those states that permit discretionary release, state laws give parole boards the authority to change, within certain limits, the length of a sentence that is actually served. Parole officials may also change the conditions under which convicted offenders are supervised and may release offenders from prison to supervision in the community or to an outside facility. Parole authorities can also issue warrants revoking parole and reincarcerating offenders who violate parole conditions. For jurisdictions with determinate sentencing and no discretion for the timing of release, the paroling authority may still determine conditions of release. They thus can have a direct effect on prison management. For example, they can increase the number of prisoners required to be on post-prison supervision, or they can decrease, by policy, the number of parole revocations returned to prison. It is this gatekeeper role that makes paroling authorities so central to current debates about prisoner reentry and prison crowding.

With parole, like probation, information about an offender is gathered and presented to a decision-making authority, and that authority has the power to release the offender under specific conditions, which are articulated in a contract signed by the offender. Contractual conditions may be standard (applicable to all parolees) or tailored to particular offenders. Standard parole conditions are similar throughout most jurisdictions and include payment of supervision fees, finding employment, not carrying weapons, reporting changes of address and employment, not committing crimes, and submitting to search by the police and parole officers. Examples of special conditions include periodic drug testing for substance abusers and registration for sex offenders and arsonists.

The principal responsibility of the parole officer is to monitor this court-imposed contract and conditions. If offenders fail to live up to their conditions, they can be revoked and returned to jail or prison to serve out the remainder of the original sentence or to serve a new sentence. Parole can be revoked for two reasons: (1) the commission of a new crime or (2) the violation of the conditions of parole (a technical violation). Technical violations pertain to behavior that is not criminal, such as the failure to refrain from alcohol use or remain employed. In either event, the violation process is rather straightforward. Given that parolees are technically still in the legal custody of the court or prison authorities, their constitutional rights are severely limited. When parole officers become aware of violations of the parole contract, they notify their supervisors, who make a recommendation to the parole authorities and can easily return a parolee to prison. Two US Supreme Court cases, *Morrissey v. Brewer*, 408 U.S. 471 (1972) and *Gagnon v. Scarpelli*, 411 U.S. 778 (1973), established minimum requirements for the revocation of parole, giving parolees some rights (such as written notice of the violation and the opportunity to confront the accuser) in revocation proceedings.

The goals of probation and parole supervision are identical: to protect the community and help rehabilitate offenders. These dual functions are referred to as the law enforcement function, which emphasizes surveillance of the offender and close control of behavior, and the social work function, which attempts to provide supportive services to meet offenders' needs. Both have always been a part of community corrections, and debating which should be of higher priority has always caused strain. Currently, the social work function has given way to the law enforcement function, and probation and parole officers are often less interested today in treating clients than in controlling their behavior. Higher risk clients, combined with shrinking resources, has caused many agents to prioritize offender monitoring. Parole agents are equipped with legal authority to carry and use firearms; to search places, persons, and property without the requirements imposed by the Fourth Amendment (i.e., the right to privacy); to order arrests without probable cause; and to confine without bail.

Monitoring parolee behavior and delivering services is managed through caseloads (the number of parolees assigned to a single parole agent). Higher-risk parolees are placed on smaller caseloads, which facilitate more intensive services and surveillance. Caseload assignment is usually based on a structured assessment of parolee risk and an assessment of the needs or problem areas that have contributed to the parolee's criminality. By scoring personal information relative to the risk of recidivism and the particular needs of the offender (i.e., a risk/need instrument), a total score is derived, which determines the particular level of parole supervision (e.g., intensive, medium, regular, administrative). Each jurisdiction has established policies that dictate the contact levels (times the officer will meet with the parolee). Officers may also contact family members or employers to inquire about the parolee's progress. The purpose of the contacts is to make sure that parolees are complying with parole conditions.

Parole and Reentry

The term *prisoner reentry* began affecting community corrections in early 2000. Unlike probation and parole, prisoner reentry is not a legal status or program, but a new conceptual framework for thinking about the processing of criminal offenders, from sentencing to parole discharge. Prisoner reentry is defined as the process of leaving incarceration and returning to society and includes all activities and programming conducted to prepare ex-convicts to return safely to the community and to live as law-abiding citizens (Petersilia 2003). Reentry is an inevitable consequence of incarceration. As Jeremy Travis (Travis 2005, p. xxi) reminds us, "reentry is not a form of supervision, like parole. Reentry is not a goal, like rehabilitation or reintegration. Reentry is not an option. Reentry reflects the iron law of imprisonment: they all come back."

Refocusing the justice system around a reentry perspective represents a fundamental paradigm shift that impacts decisions about the timing of release, the procedures for making the release decision, the preparation of the prisoner for release, supervision after release, and the linkages between in-prison and post-release activities.

Except for those who die naturally or are executed in prison, 95 % of all state prisoners will eventually leave prison (Petersilia 2003). Estimates from the Department of Justice show that nearly one-half of all state inmates will be released within 1 year and three-quarters will be released within 5 years (U.S. Government Accountability Office 2001). Parolees represent 11 % of the 7.2 million people "under correctional control" (incarcerated or on community supervision) (Glaze and Bonczar 2010). Regardless of whether ex-prisoners are on formal parole supervision, they all return home forever changed, often facing isolation, stigma, and a narrowed array of life chances.

Today's parole population is mostly male (88 %), although the number of females has risen steadily over the past decade. The average parolee is in his or her mid-thirties, with a median age of 34. For both males and females, most parolees are members of racial or ethnic minorities (37 % are black and 19 % are Hispanic or Latino) (Glaze and Bonczar 2008). The Bureau of Justice Statistics reported that 37 % of *all* adults on parole in 2007 were convicted of drug crimes (Glaze and Bonczar 2008). Many states are reconsidering the harsh drug laws passed in the 1980s and 1990s, rolling back mandatory sentences and accelerating releases for some drug offenders. The anticipated accelerated pace of drug-involved prison releases will strain parole and community resources even further.

Most of those released from prison today have serious social and medical problems. More than three-fourths of all prisoners have a history of substance abuse (one-fourth have histories of injection drug use), and one in six suffers from mental illness (Ditton 1999). Yet less than a third of exiting prisoners have received substance abuse or mental health treatment while in prison. And while some states have recently provided more funding for prison drug treatment, the dramatic increase in the prison population has resulted in a decline in the percentage of state prisoners participating in such programs that have been declining, from 25 % in the 1990s to about 10 % in 2001 (Lynch and Sabol 2001).

A significant share of the prison population also lives with an infectious disease. Two to three percent of state prisoners are HIV positive or have AIDS, a rate five times higher than that of the US population (Hammett et al. 2002). According to the Centers for Disease Control, about 25 % of *all* individuals living with HIV or AIDS in the United States had been released from a prison or jail that year (National Commission on Correctional Health Care 2002). This proportion may continue to increase as more drug offenders, many of whom engage in intravenous drug use, share needles, or trade sex for drugs, are released from incarceration. Prisoners with health problems may have a more difficult reentry process than others, as they are additionally confronted with the tasks of managing their health problems, obtaining health care, and keeping up with medications or appointments.

Few inmates have marketable skills or sufficient literacy to become gainfully employed at release. A third of all US prisoners were unemployed at their most recent arrest, and just 60 % of inmates have a GED or high school diploma (compared to 85 % of the US adult population). The National Adult Literacy Survey established that 11 % of inmates, compared with 3 % of the general population, have a learning disability and 3 % are mentally retarded (National Center for Education Statistics 1994). Again, despite evidence that inmates' literacy and job readiness has declined, fewer inmates are participating in prison education or vocational programs. Just over 25 % of all those released from prison in 2001 had participated in vocational training programs, and about a third of exiting prisoners will have participated in education programs – both figures down from the previous decade (Lynch and Sabol 2001).

In 2007, the nation spent about $47 billion in state general funds on corrections (which was 7 % of all state general fund spending), yet spending on treatment equaled just 6 % of the annual cost of housing a prisoner (Pew Center on the States 2009). The need for services for substance-abuse treatment and educational programming in prison has never been greater, but the percentage of prisoners receiving these services has declined. More punitive attitudes, combined with diminishing rehabilitation programs, mean that more inmates spend their prison time "idle." Ironically, as inmate needs have increased and in-prison programs decreased, parole supervision and community services have also decreased for most returning prisoners.

Current Issues and Controversies

The Decline of Rehabilitation and Discretionary Parole Release

The pillars of the American corrections systems – indeterminate sentencing coupled with parole release, for the purposes of offender rehabilitation – collapsed during the late 1970s and early 1980s. Attacks on indeterminate sentencing and parole release centered on three major criticisms. First, *there was little scientific evidence that parole release and supervision reduced subsequent recidivism*. Robert Martinson and his colleagues published the now-famous review of the effectiveness of correctional treatment and concluded, "With few and isolated exceptions, the rehabilitative efforts that have been reported so far have had no appreciable effect on recidivism" (1974, p. 25). Of the 289 studies they reviewed, just 25 (9 %) pertained to parole, and yet Martinson's summary was interpreted to mean that parole supervision (and all rehabilitation programs) did not work. Once rehabilitation could not be legitimated by science, there was nothing to support the "readiness for release" idea and, therefore, no role for parole boards or indeterminate sentencing.

Second, *parole and indeterminate sentencing were challenged on moral grounds as unjust and inhumane*, especially when imposed on unwilling participants. Research at the time showed there was little relationship between in-prison behaviors, participation in rehabilitation programs, and post-release recidivism. If that were true, then why base release dates on in-prison performance? Prisoners too argued that not knowing their release dates held them in "suspended animation" and contributed one more pain of imprisonment.

Third, indeterminate sentencing permitted parole authorities to use a great deal of *uncontrolled discretion in release decisions*, and these decisions often were inconsistent and discriminatory. Since parole boards had a great deal of autonomy and their decisions were not subject to outside scrutiny, critics argued that it was a hidden system of discretionary decision making that led to race and class bias in release decisions.

It seemed as if no one liked indeterminate sentencing and parole in the early 1980s, and the time was ripe for change. Crime control advocates denounced parole supervision as being largely nominal and ineffective; social welfare advocates decried the lack of meaningful and useful rehabilitation programs. A political coalition resulted, and soon incapacitation and "just deserts" replaced rehabilitation as the primary goal of American prisons.

With that changed focus, indeterminate sentencing and parole release came under serious attack, and calls for "abolishing parole" were heard in state after state. In 1975, Maine became the first state to eliminate parole. The following year, California and Indiana established determinate sentencing and abolished discretionary parole release. By 2002, 16 states had abolished discretionary parole release for nearly all offenders. In 19 other states, parole authorities had discretion over a small and decreasing number of parole-eligible inmates. Likewise, at the federal level, the Comprehensive Crime Control Act of 1984 created the US Sentencing Commission and phased out discretionary parole for most federal prisoners in 1997 (Petersilia 2003).

Proponents hoped that determinate sentencing with mandatory parole would make sentencing more consistent across offenders and offenses – and it has (Marvell and Moody 1996). It was also thought that abolishing parole would lengthen the time inmates spent behind bars. After all, parole release was widely regarded as letting them out early. Solomon et al. (2005) did find that prisoners released to post-prison supervision served nearly a year less than those released without supervision (mandatorily), but it is not clear whether the longer prison terms served were the result of discretionary parole systems or the nature of the inmate's crime or institutional misconduct.

Opponents of parole also assert that there is no evidence that placing offenders on parole supervision helps reduce their recidivism rates. A controversial study by the Urban Institute "Does Parole Supervision Work?" found no difference in the rearrest rates of offenders released from prison with and without parole supervision. After statistically controlling for the offenders' demographic characteristics and criminal histories, the researchers found that 61 % of mandatory parolees (those *without* supervision) were rearrested, compared with 57 % of discretionary (*with* supervision) parole releasees. Solomon et al. (2005, p. 37) concluded that "Parole has not contributed substantially to reduced recidivism and increased public safety." This is not to say that parole supervision *could not* reduce recidivism, only that at the aggregate level in which it was studied, there was no evidence that it reduced rearrests.

Rehabilitation Programs, the Cost of Parole Supervision, and Civil Disabilities

Although 70 % of all persons under correctional control are on probation or parole, nearly nine out of ten correctional dollars goes to funding prisons. Nationally, the 2008 average annual cost of a year in prison was $29,000. In contrast, the average annual cost of parole supervision was $2,750. In California, with the nation's largest prison and parole population, the figures are dramatic: for every dollar California spends on prisons, it spent 15 cents on parole (Pew Center on the States 2009). Parole officers complain of growing paperwork and diminishing resources devoted to treatment of parolees. Some parolees do not participate in *any* parole programming at all. It is no wonder that recidivism rates are so high. In a sense, we get what we pay for, and we have never chosen to invest sufficiently in parole or reentry programs.

In addition to few treatment resources, parolees are also subject to a number of statutory restrictions or "civil disabilities" when they return home. Many restrictions are statutory, stemming from a common-law tradition that people who are incarcerated are "civilly dead" and have lost all civil rights (Travis 2005). Their criminal record may preclude them from voting or retaining their parental rights and be grounds for divorce, and they may be barred from serving on a jury, holding public office, and owning firearms. In 11 states in 2004, ex-prisoners were permanently denied the right to vote (Manza and Uggen 2006). Employers are also increasingly forbidden from hiring parolees for certain jobs and are mandated to perform background checks for many others. The most common types of jobs with legal prohibitions against parolees are in the fields of childcare, education, security, nursing, and home health care – exactly the types of jobs that are expanding. Since the mid-1980s, the number of barred occupations has increased dramatically.

Even if a parolee is not legally barred from a particular job, research shows that ex-offenders face bleak prospects in the labor market, with the mark of a criminal record representing an important barrier to finding work (Pager 2003). More than 60 % of employers claim that they would not knowingly hire an applicant with a criminal background (Holzer et al. 2002). Overcoming the barriers that ex-offenders face in finding a job is critical to successful reintegration, since employment helps ex-prisoners be productive, take care of their families, develop valuable life skills, and strengthen their self-esteem and social connectedness. Research has also empirically established a positive link between job stability and reduced criminal offending. Lipsey's (1995) meta-analysis of nearly 400 studies found that the single most effective factor in reducing re-offending rates was employment.

Revolving Door Justice: Inmates Release, Recidivism, and Prison Return

Staying out of prison is a lot harder than getting out. The landmark BJS study of prisoners released in 15 states in 1994 found that fully two-thirds (67 %) were rearrested and just over one-half (52 %) were back in prison, serving time for a new prison sentence or for a technical violation of their release, within 3 years (Langan and Levin 2002). The "two-thirds rearrest rate" after 3 years has been documented in the United States for about 35 years, ever since Daniel Glaser conducted his classic follow-up study of prisoners in *The Effectiveness of a Prison and Parole System* (1969). The Langan and Levin (2002) study also found that certain characteristics were associated with parole failure: black parolees had higher rearrest rates, as did males in general, those with fewer prior arrests, those incarcerated for property offenses, and those who were younger at release (under 25). The failure rate for prisoners who had been previously released on parole and were now being re-released was much higher (64 %) than for prisoners being released to parole for the first time (21 %) (Travis and Lawrence 2002).

Rosenfeld et al. (2005), using data from the BJS recidivism study, calculated arrest probabilities by month for each of the 36 months after release. They adjusted the probability of arrest by subtracting out persons who were in jail, in prison, or dead during the month and therefore not eligible for arrest. Their results show that the probability of arrest declines with months out of prison and that the probability of arrest during the first month out of prison is roughly double than that during the fifteenth month. Arrest probabilities also differ by type of crime: prison releasees arrested on property or drug offenses are more likely to be arrested early in the post-release period than those arrested for violent offenses.

Clearly, the first few months after prison release represent high crime risks, but Binswanger et al. (2007) also found that death rates for new prison releases – within the first days and weeks – are much higher than for matched demographic groups in the general population. The higher prisoner-release death rates (12 times the average for the general population) were caused by high rates of homicide and drug overdoses. These results have led to calls to front-load parole services and surveillance so as to reduce these and other negative outcomes during the first 6 months after release (National Research Council 2008).

While individual recidivism studies have always shown high failure rates, until recently there was little attention paid to the overall amount of crime returning prisoners were responsible for. Rosenfeld et al. (2005) reanalyzed the BJS data and estimated that parolees accounted for 10–15 % of all violent, property, and drug arrests between 1994 and 1997 and the share of total arrests attributable to released prisoners grew as general crime rates declined during the 1990s. In 1994 the arrests of prisoners released in the previous 3 years accounted for 13 % of all arrests. By 2001 that figure had increased to more than 20 %. If former prisoners are accounting for nearly one-fifth of all the nation's arrests, then investing in prisoner reentry is unquestionably a matter of public safety. Such evidence has encouraged law enforcement organizations such as the International Association of Chiefs of Police (IACP) and the National District Attorneys Association to develop policies, training, and other tools that support effective prisoner reentry (La Vigne et al. 2006).

Parole Violators and Their Impact on Prison Populations

The BJS reports that about 50 % of released prisoners will be returned to prison in the 3 years following release – and most of them will eventually be re-released, and the revolving door process will continually be repeated. Prisoners refer to it as "doing a life term on the installment plan." The constant churning of parolees in and out of incarceration is a major contributor to the growing US population. As a percentage of all admissions to state prisons, parole violators more than doubled from 17 % in 1980 to nearly 35 % in 2006 (Sabol and Couture 2008).

In these budget-strapped times, many question the public safety benefits of violating parolees for technical violations, such as missing a meeting with a parole agent, being out after a curfew time, and, increasingly, failing a drug test. Processing admissions of parole violators takes as much time and costs as much money as processing admissions of new convictions and for offenders who often will be in prison for only a few months. Many advocates argue that technical violations should not result in a return to prison and can be handled in the community with less-drastic intermediate sanctions. The contrary view is that some violations, even of a procedural nature, are significant signs that a parolee is not respecting the terms of the parole contract and should suffer consequences. This can also be a sign that even if the current violation is minor, if left unattended, it might lead to more serious ones. Several states have begun to use parole violation decision-making instruments to respond systematically to violations. The goal of such instruments is to differentiate technical violations and the response to them by the severity and risk posed by the offender, ultimately decreasing prison admissions for technical violations and reducing disparities in parole decision making.

Responding appropriately to parolee recidivism is one way to manage correctional resources better, but preventing parolees from failing in the first place is a more proactive strategy. But that begs the all-important question of whether we can implement reentry programs to increase the odds of success.

Future Directions

No one believes that the current parole and reentry system is working, but the $64,000 question is, can we do better? Can we improve the outcomes for people returning from prison so that they are less likely to be rearrested? Fortunately, the last decade has seen an explosion of interest in parole and prisoner reentry, and the "what works?" literature has improved. After extensively reviewing all of the literature, the National Research Council (2008, p. 82) concluded, "'Nothing works' is no longer a defensible conclusion from assessment of program effects on re-entry outcomes."

What Works in Reentry Programming?

Using a variety of techniques, researchers have developed a list of principles of effective intervention and found that programs adhering to these principles significantly reduced recidivism, sometimes by as much as 30 % (Andrews and Bonta 2006; Lowenkamp et al. 2006). Petersilia (2004) summarized these principles and their applicability to reentry programs:

- Treatment services should be behavioral in nature; interventions should employ the cognitive behavioral and social learning techniques of modeling.
- Reinforcements in the program should be largely positive, not negative.
- Services should be intensive, lasting 3–12 months (depending on need), and occupy 40–70 % of the offender's time during the course of the program.
- Treatment interventions should be used primarily with higher-risk offenders, targeting their criminogenic needs (dynamic risk factors for change).
- The best strategy for discerning offender risk level is to rely on actuarial-based assessment instruments.
- Conducting interventions in the community as opposed to an institutional setting will increase treatment effectiveness.
- In terms of staffing, there is a need to match styles and modes of treatment service to the learning styles of the offender (specific responsivity).

It is impossible to know the extent to which these evidence-based principles are being used in current parole and reentry programs. Interest in prisoner reentry over the last decade has fueled the development of hundreds of programs across the United States. Some reentry programs are small and administered by community- and faith-based organizations, whereas other programs are large statewide initiatives, often administered by the state's corrections department. Some programs start inside the prison and continue into the community, whereas others begin when the prisoner has returned home. Some programs are residential, others involve day reporting, and still others involve a meeting every month or two. They rely on existing and volunteer community treatment services, primarily Alcoholics Anonymous and Narcotics Anonymous. The academic "what works" literature barely touches these programs, but these programs are delivering vital services and should not be dismissed, as they are the foot soldiers of the reentry movement.

Many other reentry programs are part of federally funded reentry initiatives implemented in recent years. The "what works" literature is influencing their design and evaluations. The largest effort to implement evidence-based reentry principles systematically is the federal government's Serious and Violent Offender Reentry Initiative (SVORI). In 2003, 69 agencies representing all 50 states received more than $110 million in federal funds to develop programs to improve the outcomes of serious and violent prisoners coming home (Lattimore et al. 2005). The federal government's SVORI goals were to improve a variety of outcomes, including family relationships, work, health, community integration, housing, and reduced crime. Programs were also encouraged to focus specifically on serious and violent offenders, or both. Most programs used a formal risk assessment tool to identify risks and needs, as recommended in the "what works" literature. Early outcome results appear promising. SVORI participants were more likely to receive services and participate in needed programs, and SVORI participants are doing better across a wide range of outcomes. Recidivism outcomes are not yet reported, but other outcomes, including housing, employment, mental health, and substance abuse, have improved. As Lattimore and Visher (2009) reported to Congress, "In most cases, the difference in outcomes between those participating in SVORI programs and the comparison subjects indicates that SVORI program participation resulted in an improvement in outcomes." It is important to note that most SVORI participants were repeat serious offenders (the males had an average of 13 prior arrests), so that even relatively small reductions in recidivism rates may be quite cost-beneficial.

In sum, it is possible to reduce offender recidivism in a cost-effective manner. The answer lies in investing in reentry programs that incorporate "what works" principles, targeting those programs on specific offenders who can most benefit, and continually evaluating and revising program models as the science accumulates.

Conclusions and Future Research

Parole and prisoner reentry issues have captured the nation's attention, and the US parole system is entering another chapter in its history. Attacks on parole and community-based programs have virtually disappeared and have been replaced with calls for investing *more*, not less, in parole and prisoner reentry. Where there was little scholarly attention paid to parole just 10 years ago, the volume and visibility of work around parole and prisoner reentry issues has grown to such an extent that it is now commonly referred to as a full-fledged movement (Petersilia 2009). And the reentry momentum is likely to continue. Voters are tiring of our dependence on mass incarceration as a response to crime and more willing to embrace a more balanced system of punishment.

For all that has been learned about parole and reentry in recent years, a number of important research questions remain. We now know a good deal about the needs of returning prisoners and have some evidence about the services they receive. However, much less research exists on the effectiveness of particular approaches to delivering services, and only a small number of studies have used rigorous scientific methods to test promising practices. The highest priority for future research is more credible program evaluations. To date, no studies have analyzed the differences among low-, medium-, and high-risk offenders using an experimental design. A recent panel of the National Research Council (2008, p. 82) concluded that while there is a great deal of experiential and practitioner knowledge with regard to the apparent efficacy of reentry programs, "the challenge now is to subject these promising practices to rigorously designed evaluations." Rigorous program evaluations should accompany every significant reentry initiative, and outcomes for these studies should focus not solely on recidivism but also on other behavioral outcomes, such as sobriety, stability in housing and employment, and attachment to families and communities. Our studies must also disaggregate the characteristics of the offender population so that we can design better programs for specialized populations, such as women, the elderly, sex offenders, or the mentally ill. A higher proportion of parolees in the future are likely to be composed of one of these distinct population groups, and we know very little about how to deliver services to meet their specific needs.

We also need a better understanding of how neighborhood characteristics affect the reintegration of offenders. Hipp et al. (2010) recently reported that the presence of more social service providers nearby (within two miles) led to lower recidivism rates and that this protective effect was particularly strong for African American and Latino parolees. They also found that parolees living in neighborhoods with higher levels of concentrated disadvantage experienced greater rates of recidivism, even after taking into account the individual characteristics of these parolees. This study highlights the importance of social context for successful reintegration. Research must move beyond simple statistical models that attempt to explain parolees' return to prison solely as a function of the parolees' background and behavior, since the characteristics of their agent, supervising agency, and community may be significant predictors as well.

Finally, researchers must study successful parolees in order to uncover the factors that encourage offenders to shift from formal social controls to informal social controls. Ultimately, parolees who make it shift from being accountable to programs and criminal justice agencies (e.g., police, parole) to being accountable to more informal social controls (e.g., families, neighbors). Ideally, formal criminal justice sanctions should act as "presses" to increase social bonds to law-abiding family members and conventional institutions. Ethnographic studies can identify how to promote positive social bonds between ex-convicts and community members.

We are now witnessing the start of a new ideological pendulum shift in US punishment policy. A declining economy that is pressuring states to reduce incarceration, combined with a growing body of evidence identifying effective reentry programs, has created a window of opportunity for change. Parole and prisoner reentry may well serve as a major conceptual framework for reorganizing criminal justice policy in the twenty-first century.

Pathways to Delinquency

Rolf Loeber
Department of Psychiatry, University of
Pittsburgh, Pittsburgh, PA, USA

Overview

Modern criminological theories aim to explain crime, but they do so with a different emphasis on pathways to crime and ranges of explanatory factors (e.g., Farrington 2005; Thornberry and Krohn 2003). Although theories of antisocial and delinquent behavior often have several factors in common (e.g., juveniles' relationships with parents and peers), they differ in their relative emphasis on domains, settings, and details of explanatory factors, and the ways that these factors are developmentally interrelated (see above sources and chapters in Farrington 2005, and in Lahey et al. 2003). The models also much differ in the extent to which they are two-dimensional (i.e., on one surface) on paper or can be visualized in a better ways. This entry concerns advances in the conceptualization and visualization of development of behavioral stages, leading to serious forms of delinquency and explanatory factors that account for individual differences in how far individuals progress in their offending.

Issues in the Construction of Models to Explain Delinquency and Crime

Criminological theories (Thornberry and Krohn 2003) almost always share three themes with the goals of explaining: (a) antisocial and delinquent behavior over the life-course, particularly in terms of prevalence, frequency, and severity of delinquent acts; (b) individual differences in antisocial/delinquent behavior and developmental changes in these differences; and (c) nonoffending or low-level offending. The key is for researchers, practitioners, and policy makers to understand how the combination of (a), (b), and (c) explains why some individuals and not others become serious property offenders or violent offenders and understand this both on the population level (e.g., all youth in a particular city) and on the individual level (i.e., a particular juvenile minor offender at risk of becoming a serious offender). Along these lines, there is a need for better life-course models that incorporate the development and *accumulation* of risk *and* protective factors.

To date, the integration of these components in a model has taken place almost exclusively through the following methods. Firstly, model specification is usually visually illustrated in a two-dimensional plane of variables in boxes (representing usually a single outcome of delinquency, such as violence or property crime) and their interrelationships are expressed by arrows between the boxes. Secondly, virtually, all model specification rests on multivariate statistical tests of the hypothesized relationships between independent measures also called risk factors (the boxes) and an outcome, such as serious delinquency. Risk factors are defined here as events or conditions that are associated with an increased probability of serious forms of delinquency, distinguishing risk factors from protective factors, which are factors associated with lowered risk of delinquency.

However, there are at least five limitations to the models tested to date (Loeber et al. 2006). Firstly, the empirical results of the multivariate models have been enormously diverse. The second disadvantage is that most models have not delineated developmental pathways to serious forms of antisocial behavior (such as violence) by the specification of developmental antecedents to such serious outcomes (e.g., nonviolent forms of aggression). Third, current models do not specify differences between individuals in their exposure to an *accumulation* of specific risk (or protective) factors with development. A fourth disadvantage has to do with the fact that the majority of studies focus only on risk factors as a way of explaining antisocial behavior and either neglect to consider protective factors or the combined effect of risk and protective factors on antisocial outcomes.

We argue that criminological theories can be enhanced in at least two other ways, firstly by incorporating past development, and secondly, by incorporating possible future development. In the first category are differences in individuals' *past history of offending* (and history of behavior problems that are precursors to delinquency), *and* differences in the *individuals' exposure to earlier risk factors* (e.g., prenatal exposure to toxins or child abuse during the preschool period) *and protective factors* (e.g., a good relationship with an adult). The second understudied area has to do with two aspects of individuals' futures: firstly, the possible course of subsequent delinquent development (or pathways) as examined by longitudinal studies of youth who have been followed up into adulthood; and secondly, expected exposure to risk and protective factors based on the observation of such factors in older populations of youth. Examples of "new" risk factors that individuals may be exposed to during adolescence include: gang membership, violent victimization, and alcohol intoxication. In summary, we propose that developmental models should benefit from knowledge of pathways and exposure to risk and protective factors based on past studies which can then provide a framework in which to place the development of specific individuals. In that sense, population data can describe both the stages in pathways to serious delinquency (the latter being the outer, more severe boundary) and the gradual accumulation of risk and protective factors that can maximally take place in populations (another instance of an outer boundary). Knowledge of these two types of outer boundaries will make it possible to describe the past history of an individual's antisocial and delinquent behavior, his/her past exposure to risk and protective factors, and possible future exposure to ongoing or new risk and protective factors.

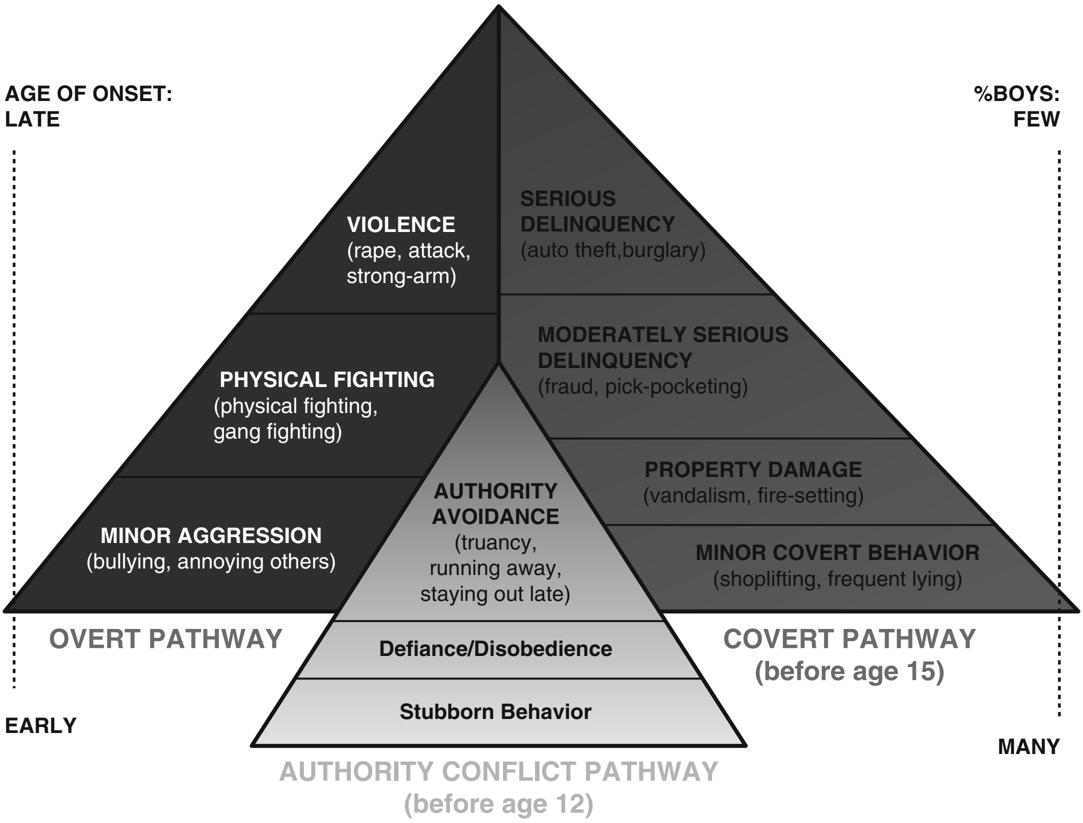
One of the key advantages of such a model is that, in contrast to current statistical models, it is likely to provide valuable information about choices and targets of intervention. This is very much in line with contemporary principles of prevention and intervention, with its focus on behavioral development and an emphasis on reducing exposure to risk factors while at the same time increasing exposure to protective factors (Pollard et al. 1999).

We argue that the complex of factors described above is easier to understand by policy makers, informed lay-persons, and practitioners when visualized in a model of a three-, rather than a two-dimensional space or model specified as a multivariate formulae. To construct such a visual model, it is necessary to review five key topics: (1) pathways representing individuals' escalation toward serious property offenses and violence; (2) differences between individuals in their exposure to risk and protective factors at birth (called start-up factors) and subsequently during childhood, adolescence, and early adulthood; (3) developmental accumulation of risk and protective factors over time; (4) the existence of a dose–response relationship between the number of risk/protective factors and later serious delinquency and violence; and (5) additive and compensatory effects of protective and risk factors. Finally, we integrate these five aspects into a single, three-dimensional cumulative, developmental model.

Escalation and the Formulation of Developmental Pathways

Youth who commit acts of violence or serious theft rarely do so *de novo*. Instead, many criminologists, child psychologists, and psychiatrists agree that the majority of youth who commit acts of violence or serious theft practiced less serious forms of delinquency earlier in life (e.g., Le Blanc 2002; Warr 2002). Thus, the onset of violence is usually preceded by a history of escalation in the severity of aggression, which often, but not always, starts in childhood (Moffitt 1993).

The findings of several studies focus on a single escalation pathway. However Loeber et al. (1993) challenged this and tested a triple pathway model (Fig. 1), which better fitted the data. The three pathways are as follows: (a) An *Authority Conflict Pathway* prior to the age of 12, that starts with stubborn behavior, and has defiance as a second stage, and authority avoidance (e.g., truancy) as a third stage; (b) *A Covert Pathway* prior to age 15 which starts with minor covert acts, has property damage as a second stage, and moderate to serious delinquency as a third stage; and (c) *An Overt Pathway* that starts with minor aggression, has physical fighting as a second stage, and more severe violence as a third stage. It is possible that within this last stage, homicide constitutes a separate, most serious component (Loeber et al. 1993). Recent longitudinal research on the Pittsburgh Youth Study (Loeber et al. 2011) indicates that 94 % of later homicide offenders have displayed violence earlier in life. The pathways are hierarchical in that those who have advanced to the most serious behavior in each of the pathways have usually displayed persistent problem behavior characteristics at the earlier stages in each pathway. By a process of selection, increasingly smaller groups of youth become at risk for the more serious behaviors. The pathways are also related to neighborhoods. For example, a higher



AGE OF ONSET:

Pathways to Delinquency, Fig. 1 Developmental pathways to serious delinquency and violence (Loeber et al. 1993)

percentage of youth in the most disadvantaged neighborhoods escalates from minor aggression to violence than youth living in more advantaged neighborhoods (Loeber and Wikström 1993). The three-pathway model has been subsequently replicated across two other samples in the Pittsburgh Youth Study. In addition, several other studies have replicated the pathways model (Loeber et al. 1999; Tolan et al. 2000).

Risk Factors

The majority of theories about the causes of crime and antisocial behavior are generally based on risk factors alone, although different terms for such factors have been used (e.g., Gottfredson and Hirshi 1990; Moffitt 1993). Risk factors can be distinguished according to the different domains and contexts in which they operate. Overall, researchers and theoreticians agree (with some variation) to distinguish risk factors in the following domains: individual, family, and peer group. In addition, some risk factors are associated with children's exposure to risk factors in specific contexts, including characteristics of the school attended and the neighborhood in which the children reside or spend their time (Howell 2003; Loeber and Farrington 1998; Wikström and Loeber 2000). Data from prediction studies indicate that risk factors from each of the domains (individual, family, peers, schools, and neighborhoods) contributes to the explanation of why some individuals and not others progress from minor problem behavior such as bullying, to physical fighting, to violence (e.g., Farrington 1997; Loeber et al. 2011). Individuals' exposure to an accumulation of risk factors in multiple domains rather than in a single domain heightens the probability of later adverse outcomes. For example, Deater-Deckard et al. (1998) find that each of four domains (child characteristics, sociocultural, parent, and peer experiences) contributes to the prediction of externalizing problems.

Many researchers have been relatively silent about the developmental saliency and priority of different domains of risk factors (individual, family, peer, etc.), other than noting that children's exposure to family factors usually precedes their exposure to peer factors. As children develop, the configuration of problem behaviors changes, with children becoming more mobile and becoming also more active in selecting settings with their own risk and protective factors, when children become exposed to risk and protective factors of peers, school, and, eventually, work. Thus, with development, there is a reconfiguration of risk domains with new domains and new risk factors being introduced over time.

Developmentally graded Risk Factors. Among the risk factors, some are thought to be present at birth or become manifest shortly afterward, while other risk factors emerge later in individuals' lives. Before discussing each category of risk factors, our overall strategy is to view risk factors from a developmental angle in that children's exposure to different risk factors is gradual, that with development, children's exposure to different risk domains increases, and that many risk factors persist over time and, consequently, are "stacked" over time. It would be clearly untenable to insist that all the risk and protective factors mentioned in the preceding section are present in juveniles' lives from a very young age onward. Instead, it is much more likely that selection processes operate in which certain categories of children and youth are incrementally exposed to certain risk and protective factors as they grow into adults (see below).

Loeber et al. (2006) reviewed the emergence of risk factors during childhood and adolescence, starting with risk factors present at birth, and those emerging during the following periods: preschool, elementary school, middle/high school, and early adulthood. Emergence is defined as the probable earliest exposure of children to risk factors. Systematic knowledge in this respect is still wanting, and as a result, we have made estimates (knowing that some of the onset of risk factors, such as in the case of poor executive functioning, partly depends on the state of measurement in that area). Note that emergence should not be taken too literally and may apply differently from one child to another. However, we maintain that an accumulation of risk factors may take place over many years, and that risk factors at birth (e.g., low IQ, negative emotional temperament) may be followed by exposure to "new" risk factors emerging during early childhood, such as language problems, which in turn may be followed by other novel risk factors emerging during middle to late childhood, such as poor social skills, or poor academic achievement. During adolescence, novel risk factors may consist of heavy substance use or delinquent victimization. These examples are risk factors in the individual domain, but a similar accumulation of new risk factors may occur in other domains as well, such as the family, peers, schools, and neighborhood (including work). It should be noted that, to some extent, risk factors emerging in one life period may persist across another life period and that even when they are time-limited (e.g., child abuse), they may influence the probability of serious delinquency in a cumulative manner.

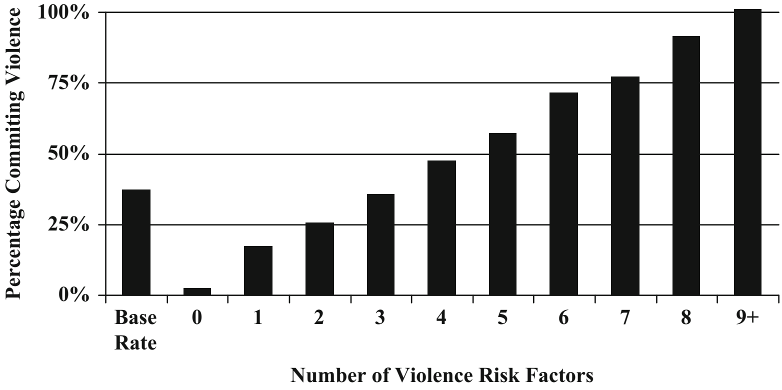
Loeber et al. (2006) concluded that the total number of risk factors associated with antisocial behavior and delinquency to which children *can* be exposed is about equally divided at or close to birth (15), emerging in the preschool years (12), and emerging in the elementary school age years (18). Much lower numbers of risk factors probably first appear during the middle and high school years (5). Thus, the most salient risk window of children's exposure to risk factors is prior to adolescence. This must be true for early-onset cases of antisocial behavior and delinquency. Even within the category of early-onset cases, the model is flexible in that we assume that none of the early risk factors are necessary (i.e., absolutely required) for the emergence of antisocial behavior and delinquency. In that sense, there can be some substitution of risk factors that apply to some and not to other early-onset cases. In summary, the evidence suggests that individual risk factors continue to increase in numbers and in different configurations after childhood and constitute a substantial proportion of all known risk factors after early childhood.

Dose–Response Relationship Between Risk Factors and Delinquency

Studies agree that the higher the number of risk factors, the greater the likelihood that individuals will be affected by a negative outcome or other deviant behavior such as serious delinquency. This association is usually called a dose–response relationship and has been demonstrated for the full range of indicators of antisocial behavior: sociopathy, externalizing problems (Deater-Deckard et al. 1998), conduct problems (Fergusson and Woodward 2000), serious delinquency (Smith et al. 1995), and violence (Loeber et al. 2011).

As an example (Fig. 2), a prediction index in the Pittsburgh Youth Study was constructed on the basis of the 11 strongest predictors of violence (Loeber et al. 1993): truancy, low school motivation, onset of delinquency before age ten, cruelty to people, depressed mood, physical aggression, and callous/unemotional behavior, low family SES, family on welfare, high parental stress, and bad (i.e., disadvantaged) neighborhood (parent report). Figure 2 also shows that the dose–response relationship applies to the number of predictors and the probability of later violence (Odds Ratio (OR) = 6.0 for four or more risk factors). Remarkably, the range of probabilities in the Pittsburgh data is from 3 % at zero risk factors to 100 % at 11 or more risk factors. In summary, these results (and those of several other studies) indicate a robust association between the number of risk factors and the probability of later violence. Remarkably, the association holds even when slightly different risk factors are measured from study to study.

Stability. Implied is that some risk factors may persist over time. Investigations of risk factors often ignore the fact that such factors, similar to the outcomes that they purportedly predict, may vary in their temporal stability over time. Yet few studies have addressed the issue of stability of risk factors. An exception is Sameroff et al. (1998), who found that environmental risk factors correlate .77 over a 5-year period (ages 13–18), which is about the same level of stability as intelligence. Loeber et al. (2000) found that the year-to-year stability coefficients for the interactions between parents and their boys between ages 6 and 18 average.66 for bad parent–child relationship,.70 for poor parent–child communication, and lower for poor supervision (.56) and physical punishment (.46). Examination of absolute stability reveals that this is higher for bad relationships and poor communication, but decreases with age for poor supervision and physical punishment. It should be noted, however, that despite level changes in risk factors with development, many of the known risk factors continue to predict later negative outcomes, including delinquency, at different ages of children (e.g., Loeber and Farrington 1998; Loeber et al. 2008).



Pathways to Delinquency, Fig. 2 Proportion of boys committing violent offenses for different levels of risk (Based on Loeber et al. 2005)

It is plausible that the presence of some risk factors set in motion a cascade of other risk factors. For example, the toxic teratogenic effect of maternal smoking may increase the probability of several other risk factors in the offspring, including poor executive functioning, poor academic achievement in school, low motivation to attend school, truancy, and, subsequently, delinquency. As another example, the presence of several risk factors (e.g., parents' exposure to enduring stress and parents' substance abuse) may increase the chance of antisocial behavior in the offspring at home, which in turn, may set the scene for heightened risk of problem behavior outside of the home. Yet, as Howell (2003) points out, it remains to be seen when and how risk factors operate in a "sequential causal chain" (p. 110). It is clearer that the prevalence of different risk factors is higher in disadvantaged compared to advantaged neighborhoods (Stouthamer-Loeber et al. 2002; Wikström and Loeber 2000).

Protective Factors

Most criminology and psychopathology studies with a public health slant have routinely neglected the study of protective factors (Lösel and Bender 2003). Protective factors are associated with the likelihood of reduced antisocial behavior/delinquency and/or increased positive outcomes, including positive adjustment and positive mental health.

Developmentally graded Protective Factors. There is an increasing body of research on protective factors (see review by Lösel and Bender 2003), but that body is still miniscule in comparison to the number of publications on risk factors pertaining to antisocial behavior and delinquency. In particular, we know very little about the developmental aspects of the accumulation of protective factors through the life-course. However, the framework proposed by Hawkins and colleagues (Catalano and Hawkins 1996) and ourselves (Stouthamer-Loeber et al. 2002) is unusual in criminology because each postulates changes within protective factors to explain individual differences in the development of offending. At the risk of being speculative, we postulate that some protective factors, like risk factors, may be present at birth, but that other factors emerge during the first decades of life. Loeber et al. (2006) shows protective factors mentioned in the research literature (or factors that are probably protective according to our view) as being relevant to antisocial behavior and delinquency (based on Loeber and Farrington in press; Lösel and Bender 2003; Pollard et al. 1999; Sampson and Laub 1990; Stouthamer-Loeber et al. 2002, 2004). Most of the protective factors are the inverse of risk factors, in that many, but not all, of the protective factors represent the other pole of risk factors. However, we do not advocate that protective factors are the complete inverse of risk factors (see Stouthamer-Loeber et al. 2004 for details). Research shows that there are several protective factors that do not have a risk factor equivalent (Loeber et al. 2008). Examples of these unique protective factors are low Attention-Deficit Hyperactivity Disorder symptoms, and low anxiety. As with the development of risk factors, we assume that there is a developmentally graded emergence of protective factors (Loeber et al. 2006). Some of the protective factors are thought to be present at birth (e.g., moderate to high intelligence, absence of prenatal exposure to toxins), while other factors become manifest later. It is also thought that there is a high degree of temporal stability of protective factors, although the data on this have not yet been reported. In the Pittsburgh Youth Study (Stouthamer-Loeber et al. 2004), accountability, perceived likelihood of getting caught for delinquent acts, and low physical punishment are recurring factors that are associated with desistance in persistent serious delinquency at different ages. Relatively little is known about increases in protective factors with development. Stouthamer-Loeber (2002) found that the proportion of significant associations between protective factors and delinquency increases with age. This conclusion, however, is limited by the reason that the age comparisons are based on different cohorts, and, therefore, require replication to be proven.

It is likely that protective factors, such as risk factors, are correlated, in that one protective factor may set the scene for another protective factor to emerge. For instance, association with prosocial peers may generate new prosocial behavior, which, once adopted by an individual child, may further decrease the probability that that child will engage in delinquent acts. Hawkins and his colleagues (2003) are among the few who have specified prosocial pathways in the delinquency research that can be conceptualized as a string of protective factors. They postulate that opportunities for prosocial behavior set the scene for interpersonal involvement, which in turn produces rewards, improving bonding to others and promoting belief in a moral order. Research shows that the prevalence of different protective factors is highest in the most advantaged neighborhoods (Stouthamer-Loeber et al. 2002; Wikström and Loeber 2000).

Inverse Dose–Response Relationship Between Protective Factors and Delinquency

Is there an inverse dose–response relationship between the number of protective factors and later deviance (the higher the number of protective factors, the lower the probability of deviance)? There are very few research studies addressing this question. Outside the area of delinquency, Sameroff et al. (1998) found that the higher the number of protective factors, the lower is the probability of behavior problems, with the results mirroring the results of the risk factors: "The more risk factors, the worse the outcomes; the more protective factors, the better the outcomes" (p. 172). Similar results have been reported by Wikström and Loeber (2000), thus lending support to the notion that the accumulation of protective factors in juveniles' lives counters the likelihood of later delinquent involvement.

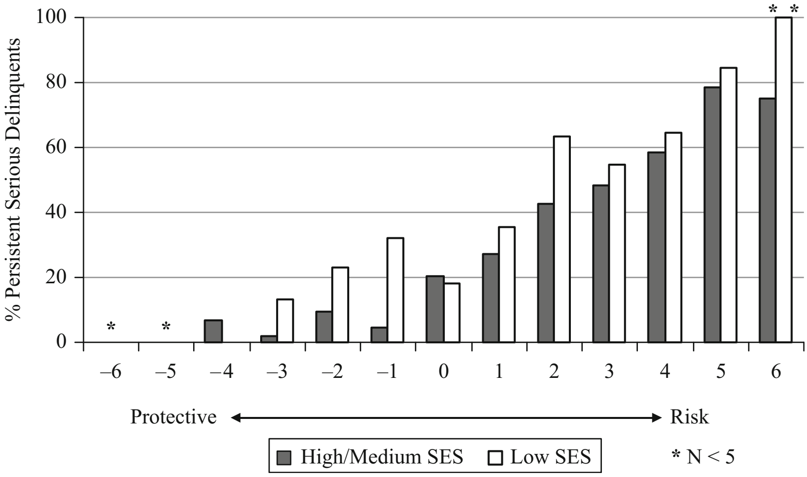
Do Protective Factors Offset the Impact of Risk Factors?

What is the evidence that protective factors buffer the risk for later antisocial behavior and delinquency? Stouthamer-Loeber et al. (2002) showed that even at the level of the number of risk or protective domains (child behaviors, child attitudes, school, peers, family, demographic characteristics), the sum of risk and protective domains (where the number of protective domains is deducted from the risk domains) linearly predicts persistent serious delinquency (Fig. 3). The higher the number of risk domains to which a youth is exposed and the lower his/her exposure to protective domains, the greater the likelihood of later persistent delinquency. Conversely, the higher the number of protective domains and the lower the number of risk domains, the smaller the likelihood of later persistent serious delinquency. This was replicated for the youngest and oldest samples; for different degrees of neighborhood advantage and disadvantage, for specific risk and protective factors, and for early and late onset forms of delinquency (Loeber et al. 2008; Stouthamer-Loeber et al. 2002; Wikström and Loeber 2000). Not all researchers, however, have found that the relationship between risk and protective factors is linear. For example, Pollard et al. (1999), studying such diverse outcomes as substance use, arrest, and attack to hurt, found a nonlinear effect with the effect of risk factors greater as the level of risk increased. However, it is plausible that once neighborhood context is taken into account, nonlinear associations occur. For example, Wikström and Loeber (2000) report that, "the overwhelming majority of boys with a high risk score were involved in serious offending regardless of the socioeconomic context of their neighbourhood" (p. 1130). However, neighborhood matters greatly for those with a balanced score of risk and protective factors.

Toward a Three-Dimensional Model of Developmental Pathways and Developmentally Graded Risk and Protective Factors

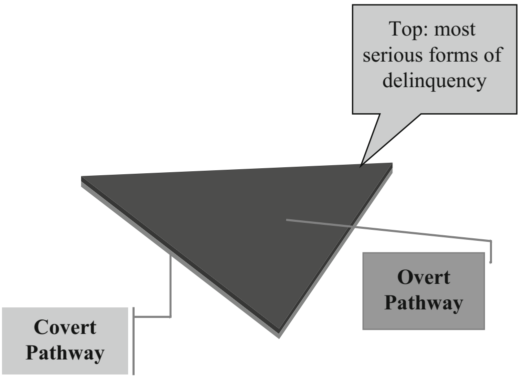
To summarize firstly, we have reviewed developmental pathways from minor to serious delinquent behavior. Secondly, we have discussed

Pathways to Delinquency, Fig. 3 The higher the number of risk domains (and the lower the number of protective domains), the higher the risk of later persistent serious delinquency (Stouthamer-Loeber et al. 2002)



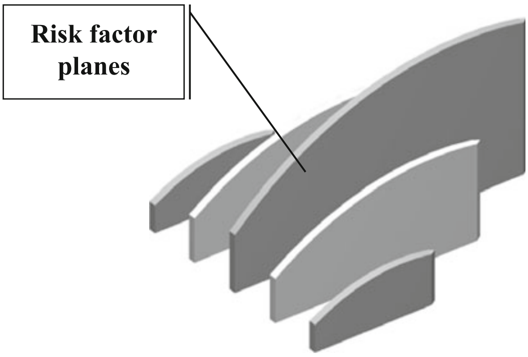
developmentally graded, cumulative onset of risk factors and developmentally graded, cumulative onset of protective factors (Loeber et al. 2006). Thirdly, we have seen that there are dose–response relationships between the number of risk factors and the probability of later delinquency and violence, and an inverse dose–response relationship between the number of protective factors and the reduced probability of later delinquency and violence. Finally, we have seen that knowledge of the proportion of risk and protective factors is more important than knowledge of either. The question then is how to bring these different strands of evidence together? At this point, we want to take a rather unconventional route. In science, the verification of models is usually accomplished by mathematical formulae. We are not aware of formulae that describe the different aspects that we have stressed. An alternative or rather a step toward such a composite model is to display the above interrelationships visually in a three-dimensional model.

Before discussing this model, we will present each component. Figure 4 shows a version of two of the pathways depicted in Fig. 1, which has been reoriented into the horizontal plane. These two pathways are overt and covert behavior (leaving aside for the moment the authority conflict pathway), with the overt pathway triangle superimposed on the covert pathway triangle. Figure 5 represents the developmentally graded,

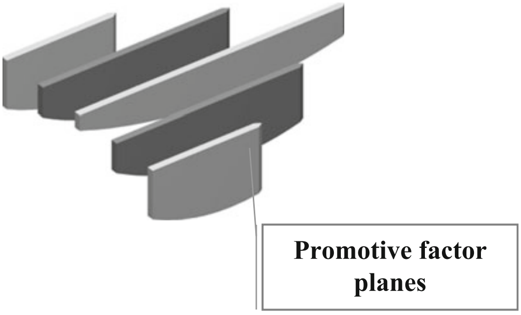


Pathways to Delinquency, Fig. 4 Pathway model flipped horizontally (overt pathway on the top and the cover pathway underneath)

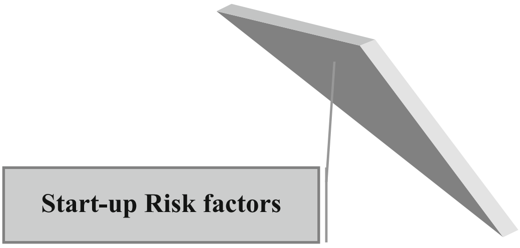
cumulative onset of risk factors into a number of vertical panels, each of the same shape, but with ribs of different sizes, representing different degrees of individuals' exposure to risk factors, so that they would fit on the horizontal pathway picture (Fig. 4). In the central and highest risk rib, the number of risk factors present at birth is thought to be higher than in the adjoining ribs, the accumulation of risk factors is highest, and the length of the rib is shown to be longest to represent the higher degree of severity of delinquency. In contrast, the adjoining smaller ribs represent fewer risk factors at birth and a smaller accumulation of later risk factors. Figure 6 represents the distribution of "start-up" risk factors at birth in the form of a long triangle.



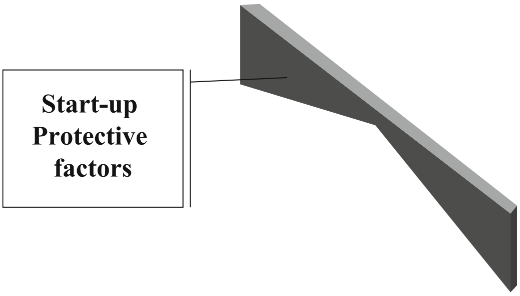
Pathways to Delinquency, Fig. 5 Accumulation of risk factors at different levels of accumulation



Pathways to Delinquency, Fig. 7 Accumulation of promotive factors at different levels of accumulation



Pathways to Delinquency, Fig. 6 Distribution of risk factors at birth



Pathways to Delinquency, Fig. 8 Distribution of promotive factors at birth (start-up promotive factors)

The central top of that triangle indicates a category of children with the highest number of risk factors at birth and at the extremes are those with the fewest number of risk factors at that time. Figure 6 represents developmental rather than chronological time.

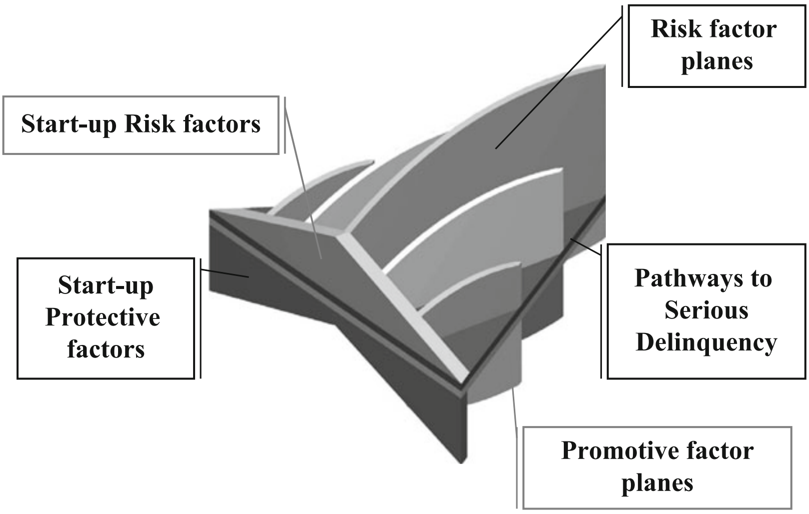
Figure 7 represents ribs of the accumulation of protective factors in an inverse way to the risk factors. However, the central rib is the least tall because those who advance to the most serious acts are usually exposed to the lowest number of protective factors. In contrast, individuals who do not advance to serious delinquency outcomes tend to start out in life with and accumulate more protective factors than those in the central rib. Figure 8, in the form of half a butterfly, may clarify the “start-up” protective factors which are thought to be lowest in the center and highest at the extremes.

Finally, Fig. 9 shows how each of the above elements is put together. Individuals who advance to the most serious delinquent acts on the horizontal pathways (the flat, double triangle) are thought to be exposed to the highest number of risk factors over time *and* the lowest number of protective factors over time. At birth, they also tend to have the highest number of risk factors (see the start-up risk panel) and the lowest number of protective factors (see the start-up protective factors). To clarify this cumulative, developmental model, Fig. 10 shows how it looks from the front, while Fig. 11 shows how it looks from underneath.

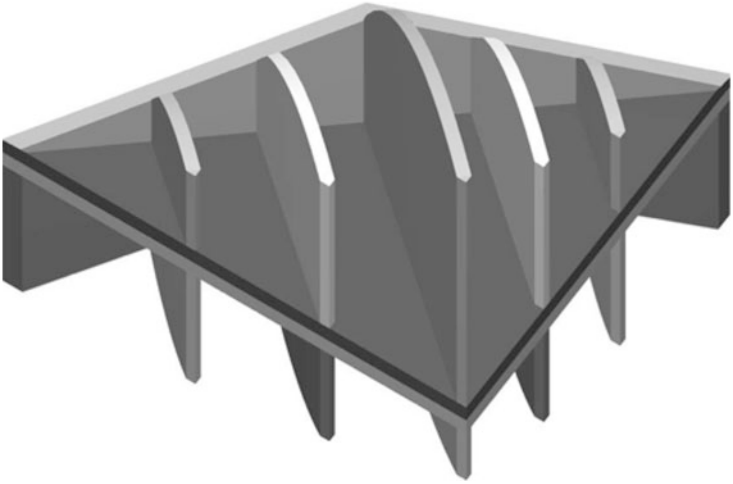
Relevance of the Model for Assessments and Interventions

What is the relevance of the cumulative, developmental model for assessment and the evaluation of preventive and remedial interventions?

Assessments. Advances have been made in the past decades in the area of more precise assessment of juveniles’ problem behavior in terms of



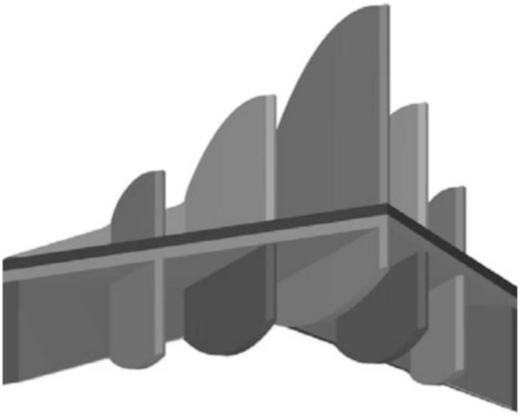
Pathways to Delinquency, Fig. 9 The full model of developmental pathways as a function of the accumulation of risk and promotive factors (shown from above)



Pathways to Delinquency, Fig. 10 The full model of developmental pathways as a function of the accumulation of risk and promotive factors (shown from the front)

the types of behavior, their severity, and prognostic validity. In addition, screening instruments are now available to go beyond the range of problem behaviors of juveniles that also include the past history of risk factors to which juveniles have been exposed. Based on the information provided in this entry, we argue however that assessments can probably benefit from two other components: (a) an appraisal of current and past protective factors to which juveniles are exposed, because it is the mixture of risk and protective effects that appears most crucial in determining the future risk of serious offending as well as the probability of full desistance or lower-level offending. We also argue that the next generation of risk assessment devices could potentially also benefit from (b) an appraisal of juveniles' expected future exposure to risk and protective factors based on knowledge from longitudinal survey studies. Specifically, assessments of developmentally graded exposure to risk factors, based on longitudinal survey studies, could be employed to calculate the probability that juveniles will be exposed in the future to risk and protective factors typically emerging for that age-group.

One might argue that cross-sectional studies contain such information. There are several reasons why this is not the case. Firstly, in contrast to cross-sectional studies, longitudinal studies have



Pathways to Delinquency, Fig. 11 The full model of developmental pathways as a function of the accumulation of risk and promotive factors (shown from the bottom)

the power to specify selection processes determining which groups of youth are most likely to be exposed to future risk and protective factors. The second reason has to do with protective factors associated with stable nonoffending or a de-escalation from serious to minor or offending-nonoffending. Since juveniles' engagement in delinquency varies from year to year, it is important to establish which protective factors are associated with persistent nonoffending or, alternatively, with a stable de-escalation in the severity of offending. Longitudinal studies, rather than cross-sectional studies, are the best methods by which to identify protective factors.

Preventive and Remedial Interventions. We agree with Howell (2003) that a developmental approach to offending needs a reconceptualization of when interventions, preventive or remedial, can best take place. He has been a primary proponent of the influential Comprehensive Strategy that addresses the full continuum of antisocial development with two foci for implementing change: prevention and early intervention, and graduated sanctions. We believe that this orientation, which is based on knowledge of risk and protective factors (called protective factors in this case), can also greatly benefit from the assessment of future risk through developmentally graded expectations of exposure to risk and protective factors. We argue that this is especially important because of the fact that even the most effective interventions still do not reduce the risk of recidivism by more than 40 % (Lipsey and Wilson 1998) and that the reoffending rate of high-risk populations of youth still remains extraordinary high (Loeber and Farrington 1998).

It should be understood that knowledge of risk and protective factors (Loeber et al. 2006) does not mean that we have available the tools to change each of them, and of course some are not malleable (e.g., single parenthood). However, we hope that our list of the risk and protective factors and our model will stimulate the development of other forms of interventions that can augment the overall efficacy of interventions currently available. It is our impression that most treatment programs lack components that focus on increasing or strengthening protective factors. We foresee that interventions that mobilize or enhance protective factors (together with the reduction of risk factors) eventually are likely to improve treatment efficacy and, possibly, the maintenance of treatment effects. We agree, however, with Pollard et al. (1999) that a sole focus on interventions enhancing protective factors only, because of the compensatory function of risk and protective factors, is likely to be inadequate. Another possible beneficial result of our model specification is the further individualization of interventions tailored to an individual's past, present, and possible future exposure to risk and protective factors.

Finally, we should stress that our design of a three-dimensional model of antisocial behavior has certain limitations. Firstly, we are mostly focusing on the cumulative processes of risk and protective factors rather than the specifics of mediation and moderation within and between risk and protective factors. Also, we do not focus on possible reciprocal processes between risk and protective factors and negative or positive child behaviors, or the fact that as children's mobility in the community increases with age, they become more able to select settings and situations in which novel risk and protective factors may present themselves. We are also aware that our model may have different components depending on the subject population of study (girls vs. boys, different ethnic groups), but we think it is generic enough to serve as a model to explain a range of forms of maladjustment other than serious delinquency. Moreover, the model depicts escalation in the severity of antisocial behavior better than de-escalation to lower severity levels, but de-escalation could perhaps be incorporated in the next iteration of the model. Also, there is a need to transfer the basic mathematical properties of our model into future model testing. It is clear that many tasks await, and we hope that this text will inspire others to improve on where we are at this point.

Penal Abolitionism

Vincenzo Ruggiero
School of Law, Middlesex University,
London, UK

Overview

Abolitionism is not only a strategy or a set of demands aimed at the reduction (or suppression) of custody, it is also a perspective, a philosophy, an approach. Penal abolitionism challenges conventional definitions of crime and the law, while defying official views of the meanings and effects of punishment. This entry examines the origin, philosophy, and achievements of penal abolitionism, collecting and discussing the key arguments and views expressed by its leading proponents. It sets off with reference to Tocqueville's view that prisoners lose their right to humanity and Foucault's remarks, during his visit to Attica, about the "consumption and elimination" of the excluded enacted by prison institutions. It then discusses the degree to which the abolitionist stance can be deemed utopian and presents the classic arguments which constitute the components of that stance. Three areas are addressed: crime, the law, and punishment, namely, the key areas in which abolitionism elaborates its own philosophy while distancing itself from conventional sensibilities and, at the same time, responding to its mainstream critics.

Introduction

Abolitionism fights against the "curious mechanism of circular elimination" identified by Foucault during his visit to Attica, where he noted that society excludes certain specific types of its members, and by sending them to prison, it breaks them up, crushes them, physically eliminates them. Then

> The prison eliminates them by "freeing" them and sending them back to society; the state in which they come out insures that society will eliminate them once again, sending them to prison. Attica is a machine for elimination, a form of prodigious stomach, a kidney that consumes, destroys, breaks up and then rejects, and that consumes in order to eliminate what it has already eliminated. (Simon 1991, p. 27)

Similarly, observing the American prison system, de Tocqueville (1956) noted that offenders released from custody remained among humans, but they lost their rights to humanity; people fled them as impure, and even those who believed in their innocence abandoned them. Once released, they could go in peace, with their live generously left to them, but a life worse than death.

Against this strategy of elimination, the primary challenge for penal abolitionists is "to construct a political language and theoretical discourse that disarticulates crime from punishment" (Davis 2008, p. 3). However, such strategy is accompanied by alternative conceptualizations of crime, critical analyses of law, and radical thinking around the very nature, function and philosophy of punishment.

According to one of the most representative figures of this multifaceted school of thought, abolitionism is a manifestation of

> the general human urge to do away with and to struggle against those phenomena or institutions of a social, political or religious nature that at a given time are considered to be unjust, wrong or unfair. (Bianchi 1991, p. 9)

The "general human urge" in the definition provided by Bianchi is the same urge that gave strength to the ancestors of contemporary abolitionists, namely, the women and men who fought against slavery, and later the campaigners who battled, and continue to do so, for the abolition of the death penalty. But the battle also continues on other fronts. Abolitionism posits that the criminal justice system as a whole constitutes a social problem in itself. Some forms of abolitionism, however, are already in place. Surely, there is an abolitionist stance in the proposition that the state-centralized administration of penal justice should be replaced by decentralized forms of autonomous conflict regulation. Echoes of abolitionism are also heard when critics warn that, if we want to reform the penal system, we have to start a process of collective conversion away from the traditional and conventional grammar that characterizes it. It should be reiterated, therefore, that abolitionism does not advocate the immediate suppression of all custodial institutions, a program which, on the other hand, would enjoy the support of many a critic who find the conditions of imprisonment all over the world shameful. Abolitionism t is not a "program," but an approach, a perspective, a methodology, and most of all a way of seeing. By observing the concepts and the cultural matrix which give shape to abolitionism, one may discover that this school of thought sits very comfortably within Western popular culture, which guides the conduct of many and which many could mobilize to justify their conduct.

Utopia?

If the activist ancestors of abolitionism are the men and women who fought against slavery and the death penalty, their philosophical ancestors are harder to identify with precision. But let us start with a general, preliminary characterization. Abolitionism, I would submit, is grounded in a variety of social philosophies which are primarily concerned with discussing processes of social development that can be viewed as pathological or as "misdevelopments" (Honneth 2007).

Among these philosophies are those expressing the view that societies should support a rich plurality of activities, each valuable in its own right, and that each person should be treated as an end, not as a mere means to the ends of others. This Aristotelian view would deny "that a society can be flourishing as a whole when some members are doing extremely badly" (Nussbaum 2000, p. 106).

There is nothing utopian in attempts to redress "remediable injustices": abolitionists do not pursue perfect justice, rather, they aim at enhancing justice. Their focus on social interactions rather than institutions, on precise settings in which people live rather than official norms and extraneous professionals, locates them in a specific political and philosophical tradition. According to a distinction suggested by Amartya Sen (2009), there are contractarian approaches and comparative approaches to the idea of justice. The former establish general, universal, principles of justice and are concerned with setting up "just institutions." For such institutions to function, total compliance of people's behavior is required. The latter assess the different ways in which people lead their lives, actually behave and interact. A contractarian approach is described by Sen as "transcendental institutionalism," in that it searches for the ideal institutions capable of forging a perfectly just society. By contrast, a comparative approach is led by the search for social arrangements that satisfy people in their concrete collective life.

> When people across the world agitate for *more* global justice – and I emphasise here the comparative word "more" – they are not clamouring for some kind of "minimal humanitarianism". Nor are they agitating for a "perfectly just" world society, but merely for the elimination of some outrageously unjust arrangements to enhance global justice. (Sen 2009, p. 26)

Comparison entails information, which in turn presupposes proximity to the actors involved in the process of forging ideas of justice. Abolitionists propend for this type of approach.

Some forms of human suffering may be unavoidable, and perhaps cannot be remedied in some particular place or at some particular time. Correspondingly, however, there are forms of suffering that are needless at particular times and places. According to Gouldner (1975), it is the sociologist's job to give special attention to the latter. Penal suffering is avoidable, particularly if its ineffectiveness can be proven, and the prisoners' standpoint deserves to be heard not because they have any special virtue and not because they alone live in a world of suffering.

> A sociology of the underdog is justified because, and to the extent that, his suffering is less likely to be known and because – by the very reason of his being underdog – the extent and character of his suffering are likely to contain much that is avoidable. (Gouldner 1975, p. 37)

Similarly, Nils Christie often reminds us that all he wants to do is to reduce the amount of suffering in the world: "I have never known someone who wants to increase it" (personal communication). Christie may have been particularly fortunate in his encounters, but his views and those of other abolitionists sit comfortably with a variety of insights found in sociology, politics, and philosophy.

Problematic Acts

Are crimes exceptional events? Louk Hulsman's reply to this rhetorical question takes the form of an excursus into the criminal justice system as a "special" set of procedures addressed to a "not so special" category of individuals. We are accustomed, he argues, to regarding the criminal justice system as a rational apparatus specifically devised to respond to crime and to control or neutralize its effects. We are also accustomed to interpreting crimes as exceptional events, "events which differ to an important extent from other events which are not defined as criminal" (Hulsman 1986, p. 63). In conventional perceptions, criminal conduct is at odds with the average conduct in that it deviates from the type of interactions supposedly established by the majority. Such deviation, statistically exceptional, is thus deemed to trigger the special responses offered by official institutions: special events justify the special nature of the reaction against them.

According to abolitionist analysis, conducts classified as criminal are only a small proportion of a variety of similar conducts which escape criminalization. On the one hand, therefore, only certain types of events are selected as specific, undeniable, self-evident, representatives of what we understand as crime. On the other hand, the events selected are brought together in a discreet category, as if they constituted a homogenous group of conducts. "Within the concept of criminality a broad range of situations are linked together. Most of these, however, have separate properties and no common denominator" (Hulsman 1986, p. 65). What do violence within the family and street violence have in common? Do shoplifting, drug selling, and armed robbery belong to the same rubric of behavior? What makes dangerous driving similar to fencing? And political violence to pollution? Neither the motivation of those involved nor the techniques required, let alone the consequences of those specific conducts, displays a precise set of common components. If we are led to analyze them by referring such conducts to a common logical and moral framework, it is because the framework we adopt is inspired by the criminal justice system: "All these events have in common is that the criminal justice system is authorised to take action against them" (Hulsman 1986, p. 65).

This is not denying that human interactions may cause considerable degrees of suffering to those involved: abolitionism would only question why some types of suffering mobilize the intervention of institutional agencies while others do not. Moreover, in an imaginary scale of personal hardship, the distress caused by some interactions of a criminal nature would not score particularly high when compared to those of a quotidian, apparently prosaic, nature. "Matrimonial difficulties, difficulties between parents and children, serious difficulties at work and housing problems will, as a rule, be experienced as more serious." In brief, there is nothing that intrinsically distinguishes, for those directly involved, criminal events from a variety of other unpleasant events. Most episodes causing hardship are normally dealt with informally by the individuals affected, at times with the mediatory participation of people or groups belonging to the community in which such episodes occur. Many conducts that generate serious harm do not elicit responses from the criminal justice system, while those involved in problematic situations mostly attempt to find solutions within the context in which they arise: the family, the group of friends or neighbors, and the work place. All this means, Hulsman concludes, "that there is no 'ontological reality' of crime" (Hulsman 1986, p. 66). Some examples may provide support to this conclusion.

A murder occurs in a town inhabited by some 300,000 people, and the alleged murderer is a university lecturer. A few days earlier, the lecturer had delivered a public speech and no one in the audience noticed anything unusual in the speech and in the speaker. The event is incomprehensible and the investigators feel the necessity to entrust a team of psychiatrists with the explanation of the mystery. Let us now imagine another murder occurring 200 years before in a small town.

> If we had lived in that small town at that time, we would probably have found it ridiculous to call in an expert of the mind to explain why the killer had killed. Ridiculous because we all knew why he killed. After all, we would not have been surprised, and we would have agreed among friends that this was exactly what we all might have expected all along, (Nils Christie, personal communication)

The difference between the experience and perception of the two murders resides in the nature and amount of information the residents share about one another. So many people live in a middle-sized modern town that it is impossible to know them all. In addition, life is organized in ways that only allow us to hold a superficial or segmented knowledge of other beings. We have a narrow basis for predicting behavior outside the specific group to which we belong.

Another example comes from the Norwegian valleys, where the traditional institutional figure of the *lensmann* is still operative. A local sheriff of sort, the *lensmann* performs a variety of civil tasks and his/her ability to function is dependent upon the support received by fellow citizens. The *lensmann* may direct auctions, help mothers get money from absent fathers, and deal with crime. When Christie interviewed one such institutional figure, he was told that there was no crime in the district. But during the course of the interview, several things happened that testified to the contrary.

> The telephone rang, a lady had lost her purse: the *lensmann* asked his assistant to drive down to the close-by café; the purse was found and brought back to the lady. So was the young man who was using the purse. He happened to be the lady's son. A report came in on breaking and entering into a store of weapons. The *lensmann* jumped into his car, drove far up into the mountains in the direction of the store, met a car high up there, stopped the car, found Ole drunk as usual, with a carload of guns he had stolen just to irritate his farther. He brought Ole home and took the guns to a safer depot. What a cliff-hanger story lost for the mass-media! Helicopters and anti-terrorist police might have been engaged in the crime-hunt of the century. Now, it was Ole. An old story of misery and family quarrels. (Christie 1982, pp. 73–74)

These cases and the one following show that definitions of crime are based on "ignorance" or lack of familiarity with the events at hand.

A man administers some drugs to his wife and causes her death by suffocation. He then writes to the police, saying that he has committed murder and that he is going to drown himself. The letter reaches the police 2 days after the man's suicide. The flat where the coupled lived is visited by the officers, who find the dead woman. She had Alzheimer's and, before killing her, the man had looked after her with deep love. "To some this is a story of Romeo and Juliet. To others, it is one of plain murder" (Christie 2004, p. 1). From numerous stories and situations such as this, abolitionists derive the argument that crime is a shallow concept, too imprecise to allow the subtle distinctions and understandings we need. The alternative concept of "trouble" may be a better starting point, trouble being something which is widely experienced and simultaneously caused by people interacting. Moreover, trouble requires responses, solutions, lest it causes harm and suffering. "The danger is too hastily to define troubles as crime." The next step is, therefore, to examine in detail which acts are beneficial and which harmful.

> Then follows an analysis of these acts perceived as bad – a classificatory scheme with categories as irritation, unpleasantness, disgust, sin - and then, but only as one among so many alternatives – crime. When crime is the last concept in the line, it is easier to raise the analytical question: What are the social conditions for acts to be designated as crimes? Crime does not exist. Only acts exist, acts often given different meanings within various social frameworks. (Christie 2004, pp. 2–3)

Let us take a final example of how social frameworks determine the meaning of acts. A man carrying a bag-load of beer cans arrives in a park. He starts drinking one can after the other, and because he acts "funny," he attracts the attention of the children playing nearby who surround him and enjoy the show. Suddenly, the man goes behind a bush with the intention of relieving himself and the children, who are carried away by the entertaining situation, follow him. It is summer, and many people are enjoying the sun from their windows or balconies in two adjacent blocks of flats. Christie names the two buildings as, respectively, The House of Perfection and The House of Turbulence. The former was built by an efficient and reliable company, the tenants moved in smoothly, on the agreed day, and to their satisfaction they found everything they expected perfectly in place. The latter was built by a company that went bankrupt, causing delays and distress among buyers, who organized themselves with the aim of claiming some form of compensation. The inhabitants of The House of Turbulence, in other words, knew each other fairly well, had experienced some form of collective action, and identified some common understanding of their needs. Now, a situation in which a man relieving himself while surrounded by children lends itself to highly different interpretations. For the inhabitants of the House of Turbulence, the case was clear.

> The man is Peter, son of Anna. He had an accident when he was little, behaves generally a bit strangely, but is as kind as the midsummer night is long. When he drinks too much, it is just to phone his family and someone comes to take him home. (Christie 2004, p. 5)

On the contrary, in The House of Perfection nobody knows Peter: he is just a man urinating in front of children. The police must be called, because this is a case of indecent exposure. In Christie's analysis, the inhabitants of this house never had a chance to get to know each other, nor were they ever forced to establish forms of cooperation with their neighbors. In conclusion, a "limited amount of knowledge inside a social system opens the possibility of giving an act the meaning of crime." (Christie 2004, p. 5).

Substantial Law

Moving on to the abolitionist analysis of the law, it is necessary to start from a general, conventional premise. Juridical equality may be described as everybody's right to mobilize state institutions for the protection and safeguard of their wellbeing. In this perspective, it is, therefore, the right to mutual coercion. Disrespect for the liberty of others amounts to the denial of their freedom. The state intervenes to deny that denial and restore the initial situation. Coercion is therefore legitimate in that it denies an act which has denied the freedom of others. Abolitionists would retort that such arguments might only be suitable for societies in which equal access to the law is complemented with equal access to resources. Their critique of the law and the criminal justice system is addressed to the iniquitous societies in which we live, while critical responses are also provided to other key assumptions, namely, that the law addresses individual rather than collective actors, and that liability and non-liability can be scientifically assessed.

Institutional intervention into problematic situations aims to obliterate an ethics of shared responsibility for conduct while affirming an ethics of individual responsibility. In this way, institutions can establish their monopoly over the power to punish or pardon, namely, their right to destroy or "repair" the individual responsible. The weakening of any networks contesting this right, be they neighborhood, religious, political, or cultural aggregations of people claiming their own right to deal with problematic situations and responsibility, is crucial for that monopoly to be accomplished. When the official power to punish or pardon solidifies, penal sanctions as chief characteristics of the criminal law emerge.

> It is only then that crime – as defined by the state itself – becomes possible. It is only then that the continuity of crime in some form becomes fundamental to the very existence of the state. And this form is determined by what the state chooses to sanction penally. (Kennedy 1976, p. 63)

The abolitionist stance, here, echoes some aspects of conflict theory. Conflict theorists propose that law in the books and law in action favor the interests of special groups, and that, therefore, rather than being concerned with the explanation of crime, theory should engage in explaining the function of criminal law (Vold 1958; Chambliss 1969, 1975; Turk 1969; Quinney 1974; Akers 1997). Similarly, abolitionists do not ask why some people commit crime, but rather why some acts are defined as criminal? As succinctly stated by Quinney (1970, p. 18): "criminal definitions describe behaviour that conflicts with the interests of the segments of society that have the power to shape public policy." From another, though adjacent, perspective, the criminal law itself is described as devoid of rationality and replete with conflicting principles, as its central features derive from struggles taking place in previous epochs. Such features took shape amid social and political conflicts and, inevitably, bear the mark of previous historical events: "The central principles of the law are the site of struggle and contradiction... The fate of law as a rationalising enterprise is tied up with the nature of law as a social, historical force" (Norrie 1993, p. 9).

Elements of Marxist analysis are detectable in these formulations, and in general in all conceptions of law as expression of group conflicts. The law, according to Marx, allows states to deal with "social imperfections" as if they were "evil dispositions of the poor" rather than products of specific economic and political arrangements.

Marx, however, defines the law as the form in which the individuals of a certain ruling class assert their common interests.

Abolitionist analysis, however, develops some central tenets of conflict theory in an original manner. Where conflict theorists seem to limit themselves to the critique of the criminal justice system as an expression of antagonistic values and interests operating from above, abolitionists reappropriate the very notion of "conflict" and turn it into a critical tool to be utilized from below. Nils Christie (1977, p. 1), for instance, remarks that conflicts are hijacked by the criminal justice system and that criminology lends a helpful hand in the process: "conflicts have been taken away from the parties directly involved and thereby have either disappeared or become other people's property." Law specialists are not the only ones to "steal" conflicts; conflict theorists in criminology, in effect, do the same, though in a different fashion: they turn interpersonal conflicts into class conflicts, thus again taking them away from those directly involved.

Comparing two opposite scenes, an adjudication case in a small village in Tanzania and a case dealt with in a juvenile court in England, Christie provides the following description. In the former, the contending parties, a man and a woman, occupy the center of the judicial scene, they make their claims, while their respective friends and relatives take part without "taking over," and the audience intervenes with questions, information, and jokes. In the latter, the predominance of professionals is visible, while the young defendant appears to be confused by those surrounding him, whose role he does not understand and who do not take any notice of him. "The truth is that, for the most part, the business of the criminal courts is dull, commonplace, ordinary and after a while downright tedious" (Christie 1977, p. 2).

Christie (1998, p. 19) provides two pictures of how rules are created. In the first, Moses descends from the mountains carrying the rules engraved in granite. "Moses was only a messenger, the people – the *populus* – were the receivers, controlled from far above." The other picture sees a group of women gathering at the fountain, around the well, or along a river, who while fetching water exchange information and evaluations.

> The point of departure of their conversation will often be concrete acts and situations. These are *described*, *compared* to similar occurrences in the past or somewhere else, and *evaluated* – right or wrong, beautiful or ugly, strong or weak. Slowly, some common understanding of the occurrences might emerge. This is a process whereby norms are *created*. It is a classical case of horizontal or *equalitarian justice*. (Christie 1998, p. 119)

The act whereby conflicts are hijacked by professionals entails a specific construction of reality hinging on an incident, narrowly defined in time and space, whereby the individual is separated from the context in which the action takes place. According to the abolitionist critique of legal professionalism, those who act, in this way, are isolated from the very incident involving them, from the environment in which it occurs, from their "friends, family, and the material substratum of their life world" (Hulsman 1991, p. 23). Also, they become separated from those people who, in that specific situation, feel victimized by certain acts. Hulsman focuses on the culture and the organizational make up that extrude people from their social context and artificially sets them against one another: "In this sense the cultural organisation of criminal justice creates 'fictitious individuals', and a 'fictitious' interaction between them" (Hulsman 1991). The core function of such an organization is the apportioning of blame, whereby events are assembled and sanctions catalogued on the basis of seriousness and gravity, respectively. A hierarchy is, therefore, postulated and patterns of acts and institutional responses to them are artificially established. Events, in their turn, are chosen among a limited range of conducts and interactions, namely, those which the criminal justice organization feels more comfortable in explaining and evaluating. "No comparison is made with events and behaviours outside that range." Patterns and hierarchies are drawn in a universe which is far removed from the context in which events took place, so that what appears to be consistent within the criminal justice profession is experienced as inconsistent by those who constitute the objects of that profession. Hulsman remarks, in this respect, that "values and perceptions in society are not uniform." And in this way he echoes conflict theorists such as Sellin (1939), who emphasizes "culture conflicts," that is the differences between social groups, their aspirations and behavioral models, leading to acts defined as crime. But he adds that the "program" for blame allocation typifying the criminal justice system is a true copy of the doctrines of "the last judgment" and "purgatory" developed in certain varieties of Western Christian theology. The criminal justice system, in his view, maintains the features of "centrality and totalitarianism which belong to those theological doctrines. Naturally, those origins – this 'old' rationality – are hidden behind new words: 'God' is replaced by the 'law' and the consensus of the people" (Hulsman 1991, p. 24).

The notions of separateness and isolation, applied by abolitionism to the offender, the victim, and the problematic situation characterizing their interaction, are also mobilized by conflict theorists, when their analyses focus on the law as the realm of individualist philosophies and as the reflection of egoistic interest. Abolitionism enriches this approach with detailed descriptions of contexts and events, suggesting that these are subjected to a process of abstraction or outright obliteration. It is the very cultural organization of the criminal law that fosters this process, a process whose "frame of reference," as Hulsman terms it, gives no room "for active participation and guidance for the parties involved."

> When the police operate within a criminal justice frame they tend not to be directed by the wishes and desires of the complainant, but by the requirements of the legal procedure which they are preparing. The complainant becomes a guide for their activities as "witness". A witness is mainly a tool to bring legal proceedings to a successful end. In a comparable way the frame of court proceedings precludes – or makes it anyway specially difficult – for the victims to express freely their view on the situation or to enter in an interaction with the person who is standing as a supposed offender before the court. (Hulsman 1991, p. 24)

If classical conflict theory would mainly examine structures and agencies while omitting to look in any detail into their specific social composition, abolitionism devotes particular attention to such composition, particularly to the increasing separate specialization characterizing it. In brief, it is argued that each institutional agency develops its own criteria for action, its own ideology and culture which may lead it to collide with other agencies. Agencies are bureaucracies pursuing internal goals, such as expand, attenuate internal problems, monitor the wellbeing of their members, and ultimately ensure their own survival. "The process of bureaucratisation and professionalisation within the criminal justice system makes it a soulless machinery" (Hulsman 1982, pp. 56–57).

Limits to Pain

Among the most critical traits characterizing abolitionist theories and practices are those concerned with the nature, function, and philosophy of punishment. The infliction of punishment might be justified if it contributed to the maximization of happiness rather than the maximization of pain. Hence the need for any theorizing on punishment to consider its social consequences. Those who defend institutional coercion in the form of punishment may advocate rehabilitative treatment, may value its general or individual deterrent effect or its function of incapacitation aimed at prolific offenders. Abolitionists argue against such philosophies and their practical outcomes. In Mathiesen's (1990) view, by contrast, prison has no defense whatsoever, particularly when inspired by penal retribution, whereby offenses are said to possess a "punishment value" that can be translated into a specific amount of "time." Mathiesen argues that time is only measurable subjectively, and that the perception of its entity depends on one's proximity to those serving a prison sentence.

After crossing almost four centuries, Mathiesen (1990, p. 33) identifies four major components in the rehabilitative ideology which have been remarkably constant through time. "Work, school, morality and discipline have run through the centuries as main pillars of thinking." While the emphasis may constantly shift from one to the other component, rehabilitation itself, understood as "return to competence" is rarely achieved. Evidence of this failure is found by Mathiesen in a variety of studies grouped in three main areas. First, he refers to prison treatment studies, which yield largely uniform findings: the effects of treatment, in terms of preventing recidivism, and regardless of strategy or intensity, are generally poor. He then considers the notion of treatment in relation to the actual environment in which it is expected to be carried out. The organization of prison life, the authoritarian principles governing it, along with the bureaucratic arrangement stifling creative projects, provide a setting which is conducive to everything but treatment. Moreover, prisons are usually "overcrowded, run-down, and more or less dangerous places to those who inhabit them," and if anything, they exacerbate the conducts of those they purport to treat (Mathiesen 1990, p. 41). Finally, he looks at a range of studies devoted to prison as a social organization or focused on prisoners' communities, arguing that inmates become soon "prisonized," that is they internalize the values and rules of a violent and coercive environment and adopt a culture which is impervious to change (Clemmer 1940). Such culture, which protects the inmates from the very setting that they inhabit, makes prison perform the function of a crime school, and prisoners more or less immune to treatment or readjustment programs.

Moving on to the discussion of deterrence as general prevention, Mathiesen (1990) suggests that the failure of this alleged function of imprisonment should prompt a dramatic reduction of the use of imprisonment as a whole. Research into the actual effectiveness of general prevention is so inconclusive that, when seen against the harmful outcomes of custodial punishment, it would be wise to limit the use of custody altogether, until its effectiveness is soundly proven. General deterrence consists of a message addressed to the general population, but it would appear that something goes horrendously wrong in the communicating process: "general prevention functions in relation to those who do not 'need' it. In relation to those who 'need' it, it does not function" (Mathiesen 1990, p. 69). It is for moral reasons, therefore, and due to lacking evidence of the actual working of general deterrence, that the use of imprisonment should be reduced to a minimum. There is, however, a supplementary argument that would strengthen Mathiesen's reductionist stance, namely, that deterrence makes no difference between guilty and innocent individuals, in the sense that if non-offenders were punished its goal would still be achieved. By punishing people at random, irrespective of whether or not they have committed crimes, one may well assume that the general population is discouraged from violating the law. But, although acceptable from a utilitarian perspective, punishing the innocent would run counter the Kantian moral principle whereby individuals must not be treated as mere instruments for the achievement of a social good: all individuals should be treated as ends in themselves, in accord with their dignity and worth as persons.

Considering how ideas of general deterrence have increasingly replaced notions of treatment, Christie (1982, p. 29) notes that at least the latter "had a formally clear target: those receiving treatment." The former, instead, chooses as a target a vague entity described as the general population, which is composed of people who, if deterred from one type of offense may resort to another type; people who, in the face of a punitive message launched in one country, may decide to move to another country; or finally, people who might find it hard to receive the punitive message altogether. "Conceptually, as well as empirically, ideas of general prevention or deterrence are thus more cumbersome to handle than ideas of treatment" (Christie 1982, p. 29).

As for individual deterrence, the belief that imprisonment amounts to a form of training for criminal activities to come is persuasive enough, in the abolitionist view, to discard this specific official function of prison as inappropriate. Schools of crime teach resentment and hostility rather than respect for norms and others. In addition, it could be stressed that deterrent effects are notoriously difficult to establish, "since they involve counterfactuals: would these individuals have acted differently had the threat of criminal penalties been other than it was?" (Duff and Garland 1994, p. 25).

The history of punishment may be interpreted as an evolutionary process leading to distinct stages characterized by increasing leniency. Some commentators may describe the development occurring as one bringing a gradual decrease in pain, a progressive shift from brutality to sweetness. Of course, there is difference between gruesome public executions and incarceration, between suffocating reclusion and custody in a single room, with cold and hot water and a TV set. But does this indicate an objective reduction of the pain caused by imprisonment?

> I just do not know. Each form would have to be evaluated according to its own time, by those receiving the pain, in the framework of their usual life and other people's life, and in the light of what they saw as their sins. I do not see how a scale could be established. (Christie 1982, p. 9)

Law texts establish when punishments have to be inflicted, while judges decide how long they should last; neither examines their effects on bodies and minds, the suffering produced, how it feels. The belief in slow progressive humanization accounts for the lack of this type of information (Hulsman 1986).

Criticizing the humanization thesis, Hulsman (1986) notes that the overall amount of punishment does not tend to decline, as the number of convicted people per 100,000 of population shows a strong cyclic movement. The trend of convictions, in many countries in the industrialized world, has in fact for some time moved upward. Hulsman finds the assessment of the qualitative aspects of punishment more difficult. It is true that the application of the death penalty has been greatly reduced in recent centuries, and in normal times has been abolished in many countries. The same can be said, he adds, of many forms of corporal punishment. It may also be true that some progress has been made in improving the regime in prison systems. He, nevertheless, suggests caution when judging qualitative amelioration and humanization. The amount of suffering incorporated in legal penalties cannot be measured on a scale of absolute values. "To a large extent it consists of the difference between the normal living situation of people and that which is created by the intervention of the criminal justice system." Hulsman is alluding to the concept of less-eligibility whereby the conditions in prison must be worse than the worst social condition of people in liberty. Because the prison system "has always drawn its clientele mainly from the most disadvantaged sections of the population," conditions in prison will reflect the lowest standard of living experienced by this social sector. Now, as "the living standards of those same sections have in Europe improved considerably in recent years," one may presume that prison conditions have improved accordingly, but the reality is that "improvement inside prisons during the last 30 years do not appear to have kept pace." The conclusion is that "if this supposition is correct, then the degree of suffering from the penal sanction has in a sense increased" (Hulsman 1986, pp. 64–65).

The "evolution" of pain, moreover, is alleged to have rendered physical punishment obsolete, which is far from reality. Prison still entails forms of corporal affliction: it degrades the body, it deprives of air and light, it imposes humiliating sanitary conditions, it causes diseases, and it produces sterile suffering.

> Not all suffering is bad; some is beneficial, in that it makes our consciousness develop while opening up new existential paths, making us better humans and getting us closer to the others. Imprisonment is a type of suffering that does not create anything, that does not generate any meaning. (Hulsman 1982, p. 59)

There are, finally, problems caused by institutional intervention per se: custodial and non-custodial measures alike erect.

> obstacles to the development of social solidarity and respect for differences that manifest themselves in "lived life"... Rather than alternatives to custody we should devise alternative approaches by which information is collected about the needs of those involved in problematic situations. (Hulsman 1982)

Intellectual Biographies

As remarked above, abolitionism does not possess one single theoretical or political source of inspiration, but a composite backdrop from which, wittingly or otherwise, it draws its arguments and proposals for action (Ruggiero 2010, 2011). The intellectual biography of Louk Hulsman, for example, should be related to some crucial passages in the Bible where mercy is advocated while judgment and retribution are rejected. The Gospels of Mark, Luke, and Paul seem to provide an apposite theological underpinning for Hulsman's abolitionism, which can also be assimilated to Saint Francis' ecumenism and his view that thieves are not those who steal, but those who do not give enough to the needy. Radical theology or the theology of liberation also provide significant sources of inspiration. With Bakunin's anarchism, Hulsman shares the belief that the realization of freedom requires that political action be conducted religiously. In some pages of Marx, Engels, Tolstoy, and Hugo an echo is felt of Hulsman's concepts of redemption of punishment, self-government, mercy, and pietas. Hulsman's system of thought, in brief, is shown to display a high degree of syncretism.

An equal if not a higher degree of syncretism shows the intellectual trajectory of Thomas Mathiesen, whose materialist approach is punctuated by arguments for a pluralistic, interdisciplinary, sociology of law. The writings of Marx and Engels constitute an ideal background for an understanding of Mathiesen's work, which on the other hand draws on a number of other theoretical sources. The focus on offenders and prisons, and on social movements traditionally excluded from orthodox notions of class struggle, makes Mathiesen's stance an implicit critique of classical Marxism. What constitutes the originality of Mathiesen's work is the coalescence of research, action, and theorizing that characterizes his entire career, as an academic as well as an activist. Action is inherent in the research method adopted, and those researched are the prime subjects involved in research as well as in action. His radical analysis, therefore, is a tool which constantly translates knowledge about conflict into collective praxis for those producing it.

In his work, Nils Christie stands in favor of simplicity and intelligibility. He says that when we write we should keep our favorite aunt in mind, like Kropotkin said that anarchist literature had to keep in mind the workers to whom it was addressed. Christie's system of thought echoes anarchist theories of law and authority. His critique of legal professionalism is akin to libertarian arguments against the proliferation of laws, while his appreciation of conflict as a resource brings to mind the anarchist idea that problems within communities can only been resolved if those involved possess sufficient autonomous resources to do so. One of Christie's arguments is that communities and groups, irrespective of their dimension, may find abolitionist experimentation possible only if the interactions within them are highly frequent and intense. In this sense, he expresses the purest of anarchist notions, namely, that a better social life is experienced when communities develop social feelings and, particularly, a collective sense of justice that grows until it becomes a habit.

Conclusion

On the nature and concept of crime abolitionism engages in a debate that our ancestors Plato, Aristotle, and Spinoza saw as the distinction between good and evil. Far from exhausted, such debate continues in an array of disciplines ranging from theology to psychology, from political philosophy to social theory. The abolitionist critique of the law contains some Kantian moral principles, in that existing law is seen as using people as an instrument, a chance to signal the strength of transcendental and worldly authority. Abolitionists hold the view that the law performs a transferral of vendetta from the sacred into the judicial system of the state, and that it is mainly addressed to scapegoats, chosen violators among many, who are at the same time "evil" and "sacred," in that they reproduce social life through sacrifice.

In abolitionist analysis, issues such as the designation of what constitutes crime, the intervention of the law, and the infliction of penalties that take place in institutional settings, which are distant from the situations, are addressed. Within such settings, punishment is the outcome of a cognitive process whereby the institutions make sense of events and claim that their response is based on the knowledge of such events. Abolitionists, instead, claim that knowledge is mainly achieved within precise contexts in which problematic situations arise, and it is for those involved to "repair" such situations through the development of restorative collective capabilities.

Penal Justice and Social Injustice

Matt Matravers
Morrell Centre for Toleration,
University of York, York, UK

Overview

The connections between retributive justice, broadly conceived, and distributive or social (in) justice have long troubled criminologists, moral and legal philosophers, and criminal justice practitioners. One reason for this is that the economically deprived make up a disproportionate number of criminal offenders (and victims), a fact made even more striking in many places when overlaid with statistics about race. Another is that inequalities within liberal democratic societies have risen since the 1970s; dramatically in some places such the USA and UK. This rise has accompanied a dramatic rise in punishment and incarceration. Assuming inequality is a proxy for distributive injustice, then, the world is becoming less just and, in some places, more punitive. These facts compel our attention in (at least) two ways. First, there is a practical public policy question. If crime rates are correlated to poverty and/or inequality, then one way to address crime is through social justice and the redistribution of income, wealth, and opportunities. This is no doubt sensible, but it is not the subject of discussion here. Rather, second, juxtaposing criminal and distributive justice brings into focus a normative question of whether social justice is a precondition of legitimate criminal justice, or more minimally, whether – and if so in what ways – social injustice renders the imposition of criminal liability and sanctions morally problematic.

It is this normative issue that is discussed below. Certainly, some philosophers concerned with the justification of punishment have held that conditions of social injustice – such as those prevalent in much of the developed world – render punishment at best problematic and at worst morally impermissible. Thus, Antony Duff (1986, p. 294) argues that punishment "will not be justifiable unless and until we have brought about deep and far-reaching social, political, legal, and moral changes in ourselves and our society". Similarly, Jeffrie Murphy (1973) claims that existing social injustice fatally undermines the only successful theory through which punishment can be made permissible. And David Bazelon (1976, p. 385) that "there can be no truly just criminal law in the absence of social justice."

This entry will consider the arguments for the proposition that social injustice renders the imposition of criminal liability and sanctions morally problematic. It does not deal with the question of whether *lesser* punishments are merited by those who are disadvantaged by injustice, but rather with the moral legitimacy of punishment as a whole in circumstances of distributive injustice. The first set of arguments focuses on theories of punishment; the second on the responsibility of the offender; the third on whether an unjust society has the standing to call offenders to account. In all cases, it is assumed that the background is one in which the law is not egregiously unjust. That is, the discussion does not encompass societies in which, for example, the law formally discriminates against non-white persons with respect to political and property rights. Such societies clearly raise issues about whether obedience is owed by those against whom discrimination is practiced and about the moral and legal liability of those who break the law. However, the assumption here is that the system has no such formal rules, but that the social and economic distribution of goods is unequal and unjust (which will have implications for the value of the formal rights enjoyed by all). In short, the focus is on societies such as the USA and UK, not on those such as South Africa in the era of Apartheid.

Ideal Theories and Actual Practices

There are many theories that purport to justify or render permissible state punishment. Such theories tend to be ideal; that is, they develop philosophical accounts of the justification of punishment assuming certain ideal conditions. The question then arises as to whether those theories remain compelling when applied to the actual world. It is not possible to discuss each and every such theory here, but consider some general approaches and how they might be affected by social injustice.

Consequentialist Theories

Consequentialist theories justify punishment by appeal to its good consequences. A system of punishment is justified if it brings about better overall consequences than any alternative system including the option of doing nothing. In general, consequentialists claim that punishment is justified because it secures good consequences through individual and general deterrence, rehabilitation, and incapacitation. These are empirical claims. If punishment were to fail to realize good consequences, or fail to realize as good a set of consequences as could be attained by an alternative policy, then it is not justified on this basis.

Clearly issues of social justice will as a matter of fact have an effect on any such empirical claims. It may be best to divert resources away from criminal justice and toward social justice if that will be more effective in reducing crime (or realize other good consequences that outweigh any resulting bad consequences). It may be that rehabilitation is better realized by providing social and economic opportunities rather than by punishment, and so on. These matters can only be settled by empirical enquiry, not by philosophical armchair reflection.

Varieties of Desert

According to one variety of desert-based retributive justice, punishment is justified if and only if it restores the fair balance of benefits and burdens that the original crime disturbed. This so-called fair-play theory was pioneered by Herbert Morris (1968) and Jeffrie Murphy (1973).

In Murphy's formulation, the argument relied on a hypothetical social contract. In return for security and assurance, self-interested persons would accept an authority whose purpose was to ensure those goods by upholding and enforcing the agreed rules. That is, the citizen benefits from the rule of law and all that comes with it and in return undertakes to maintain society's rules through his obedience to them. Failure to abide by the rules is a form of "free-riding"; the offender gains the advantages of the system without having to "pay" for them through his own self-restraint. In being punished – in (hypothetically) agreeing to the system of punishment under which he is now made to suffer – the offender pays a different price, one designed to remove the extra benefit he has attained and thus restore the *status quo ante*.

However, as Murphy was quick to point out, the contract here is reciprocal. The authority of the law – and so the duty of obedience on the part of the citizens – stems from its being part of a system of rules to which reasonable self-interested persons could agree. Thus, if the system of rules is unjust – if, for example, it enforces fundamentally unjust distributive arrangements or discrimination between persons on the basis of their skin color – then citizens no longer have a duty of obedience and the state no longer has the moral authority to punish breaches of the rules.

This account of punishment has been subject to criticism and few (even among its early adherents) continue to adhere to it (for a sympathetic contemporary account, see Dagger 1993; for a summary of the main criticisms, see Matravers 2000, pp. 52–72), but the contractualist worry is a genuine one. To the degree that society is conceived of as a cooperative endeavor in which reciprocally agreed rules are enforced and obeyed, there is a concern that the state's failing to keep its side of the bargain, so to speak, renders illegitimate its enforcing of those rules.

A different, but related worry, affects the censure account of retributive punishment that replaced the "fair-play" account as the leading desert theory in the literature. According to Antony Duff and others, the justification of punishment lies wholly, or in part, in its calling the alleged offender to account and, should the alleged offender prove to have performed the wrongful act without excuse or justification, in its expressing censure of the offender on behalf of the polity. In imposing a penal sanction, the polity provides a vehicle for this censure and a potential vehicle for the offender's penitential response.

In his early work (1986, pp. 291–299), Duff is clear that social injustice renders this account inapplicable to the real world. Such injustice is a symptom, and cause, of the absence of a genuine moral community on whose behalf, and in whose name, the offender is called to account. If there are no shared values, then the offender cannot be censured in their name and cannot in turn use punishment to restore herself to those values and so to the community. Like Murphy, Duff argues that the gap between the ideal and the actual is so great as to render the ideal unusable. However, in later writings, Duff becomes less pessimistic although he still poses the question of whether those who have been systematically excluded from their fair shares of society's goods can be thought to be bound by the laws of that society, a question he thinks likely to be answered in the negative for many offenders (2001, pp. 183–184). This motivates a different worry, considered below, which is that social injustice undermines the standing of the society to call the offender to account.

Consequentialist, fair-play, and censure-based theories of punishment, then, are each in their own way threatened by conditions of social injustice. In all these cases, the fact of injustice threatens the viability or applicability of the philosophical theory that purports to justify punishment in the real world. However, desert theorists (in particular) also have a different worry about social injustice; this is not that it renders the theory – that punishment is justified because and to the degree that it is deserved – inapplicable, but that it undermines the deservingness of individual offenders; it renders previously unjustly treated citizens less blameworthy and so less deserving of punishment.

Blameworthiness and Distributive Injustice

The arguments of the section above suggest that social injustice might challenge the legitimacy of the law, the account of political obligation, or the justification of the system of punishment as a whole. A (perhaps) more familiar worry is that in some way or other, defendants from indigent, or unjustly disadvantaged, backgrounds are less to blame than are others. This section considers this worry in relation to cases of excuse and of justification.

Rotten Social Background

Perhaps the most famous debate in relation to doing penal justice in conditions of social injustice arose out of a 1973 case, *US v Alexander*. Two black defendants were charged with the murder of two white victims. The defendants had shot the victims following an altercation at a fast-food restaurant during which the victims had called the defendants "God-damned niggers." On behalf of one of the defendants, who was not mentally ill according to any recognized diagnostic categories, a psychiatrist nevertheless testified that the defendant suffered from an "emotional illness" that was rooted in his upbringing in a very poor and deprived neighborhood. This upbringing had left the defendant with an acute sensitivity to racial discrimination such that when he had been subject to racist abuse, he had felt "an irresistible impulse to shoot" (for useful accounts of the issues here, see Green 2011; Heffernan 2000). The judge allowed the jury to consider the mental capacity of the defendant, but mindful of the possibility that the jury might be moved by pity or sympathy for the defendant given his upbringing, the judge went on to say to the jury that it ought not to be concerned "with the question of whether a man had a rotten social background." The defendants were convicted.

The court of appeals upheld the conviction, but one of its judges, David Bazelon, in part dissented. He argued that there was a relevant causal claim linking the defendant's rotten social background and the defendant having no "meaningful choice when the racial insult triggered" his response in the restaurant (*United States v Alexander*, 471 F.2d 923: 960). The truth of such a causal claim would need to be considered by the jury, but Bazelon wrote confidently of the social science evidence in its support and of the need to consider what to do with such defendants should they prove innocent, but dangerous (holding out the options of therapy or preventive detention).

The idea of a defense of rotten social background was taken up by Richard Delgado (1985). Delgado argued that the law should recognize a new excuse based on extreme poverty and deprivation. As an excuse, the claim would not be that the conduct was justified. Rather, the defendant would have to prove that at the time of acting, her conduct was the result of behaviors shaped by her background such that she met (an extended understanding of) normal excusing conditions: For example, she was unable accurately to understand the nature and consequences of her conduct; she was suffering from involuntary rage; or was otherwise unable to control her conduct.

It is important to note that neither Bazelon nor Delgado argues that the fact of an (unusual) causal history to the agent's conduct is enough to excuse. All actions have causes, some are more unusual than others and some evoke sympathy, but as Stephen Morse insists (2000, p. 130), "causation is neither an excuse per se nor the equivalent of hard choice (so-called compulsion), which is an excusing condition." Rather, the argument is that the particular background of deprivation is such as to render some defendants excused at the time of their conduct because it interferes with those ordinary capacities on which the law depends when holding persons responsible. In this, a defense of rotten social background would come close to the defense of "battered woman syndrome," in which it is argued that a history of violent abuse can render a woman incapable of (legally) responsible behavior even at some later point when her conduct seems otherwise to be chosen.

Justification

Proponents of the excuse of rotten social background accept that the defendant's conduct was wrongful; they merely argue that it may be excused. However, another response to social injustice is to regard some conduct performed by the disadvantaged as justified. Consider a case imagined by Jeremy Waldron (2000, pp. 104–105). A homeless, unemployed, destitute man in a society with little or no welfare assistance scavenges in a park. He comes across a half-eaten hamburger and begins to eat it. However, the person who had bought the hamburger, having eaten half, was planning to feed the rest to the birds. He complains to the police and the destitute man is arrested and charged with theft.

The defendant claims the justification of necessity. Before considering this, it is worth noting how this differs from the claim of excuse in rotten social background. In the case of excuses, the conduct is wrong, but excused. In the case of justification, the conduct itself is not wrongful. Thus, in rotten social background cases, there is no obvious restriction on the possible conduct to which the excuse might attach or on the range of victims of the conduct. As is clear from the *Alexander* case, the excuse potentially covers serious wrongs such as homicide and it would have made no difference to the case whether the victim was poor or rich. In the justification case under discussion, it is clear that the conduct that is justified is severely restricted. The defendant might claim justification for picking up the hamburger, but he could not do so for killing the owner so as to get the hamburger (no matter how hungry he was). Similarly, the agent could not claim justification for taking the last morsel of food from a similarly situated indigent victim. These differences, of course, reflect the different structures of excuses and justifications.

Although Waldron is clear that there is a moral case for the justifiability of the destitute man's actions, he is confident that any legal system dedicated to the protection of property rights will reject the necessity defense in this instance. To establish necessity in the common law tradition, the defendant must show imminent threat; that the conduct would be effective in ameliorating that threat; that no alternative legal means to do the same was available; that the conduct was less harmful than the harm threatened; and that the circumstances that gave rise to the threat are not attributable to her.

The threshold for the use of the necessity defense is very high. To rebut it, the prosecution would only have to show that the indigent eater of the hamburger was not in danger of death or serious injury, or that he could have gone from the park to the local charitable shelter, or that his condition was due to his culpable failure to find work. In short, necessity and long-term poverty do not map easily onto each other. Moreover, as Waldron insists, systems of law protect the orderly and predictable governance of property, an order that cannot be subject to disruption whenever someone feels the need to appropriate something of someone else's.

The arguments in this section demonstrate the difficulties in matching concerns about social justice with issues in criminal justice. In one way, this is right; not all poor people commit crimes (and not all crimes are committed by the poor) and it would be demeaning to large sections of the population to pretend otherwise. If poverty or disadvantage is to be relevant to judgments of the offender's liability, then it has to be shown either that the offender's background relevantly impaired him at the time of acting, or that his actions were legally justified. It is likely that these hurdles will not in fact be often cleared.

However, this seems to leave the issue unresolved. It *does* matter that society is distributively unjust and it does trouble us that those who systematically suffer most from injustice also disproportionately appear in the criminal justice system as victims and offenders.

The State's Standing to Hold the Offender to Account

The focus has so far been on the applicability of theories of punishment to the real world and on the offender. Social injustice raises genuine questions for the first, but the focus on the blameworthiness of the offender seems either to lead in directions covered by the existing criminal law (with respect to excuses and justifications) or to risk widening the scope of the enquiry in ways that potentially demean the poor and disadvantaged. Returning to the original issue, however, suggests an alternative approach in which the focus is not on the offender, but on the state.

Assume – reasonably enough in most cases – that the offender acts culpably. The law prohibiting the conduct is reasonable, the offense is wrongful, and the offender is blameworthy for it. To take an example, a disadvantaged offender defrauds the state by claiming unemployment benefits while working on the black market for cash.

In response to cases like this, Antony Duff asks not whether the offender is responsible, but *to whom* he is responsible. That is, criminal responsibility is a relational concept; an alleged offender is responsible *for* some conduct *to* someone or some institution. Thus, a teacher is responsible for marking her students' essays and that responsibility is owed to her students. Moreover, the teacher can call her students to account for failing to submit their essays, and so on. In short, with respect to essays (and no doubt other things), the teacher has *standing*.

The question Duff poses is whether a state's maintaining of chronic and systematic injustice removes its standing to call offenders to account. As the paper of one of his papers suggests – "'I Might Be Guilty, But You Can't Try Me': Estoppel and Other Bars to Trial" (2003), Duff is skeptical that unjust societies retain the standing to call to account those whom they have treated unjustly.

This is an attractive response to the issues. It does not deny the responsibility of indigent offenders, and it surely captures a plausible intuition (and mirrors many real life situations in which persons may think, "I may be wrong, but who are you to criticize?"). There is surely something wrong in being held to account by an institution that is itself in violation of the values to which it appeals in its calling the alleged offender to answer for her actions (cf Sykes and Matza 1957 on "The Condemnation of the Condemners").

However, as stated, the account is underdeveloped. Two questions arise: First, does the unjust state lose the standing to judge all offenders and offenses (even those unrelated to the injustice)? Second, does the unjust or immoral state lose all standing across all dimensions? To see this, first contrast the unemployed offender mentioned above who defrauds the state by cheating on his social security payments and the same person who beats his wife. It may be thought that the state lacks the standing to call him to account for fraud, given a background of systemic injustice, but why should this affect its standing to call him to account for assault? Second, consider the standing of the UK state to call a well-off defendant to account for insurance fraud, given recent revelations that the same state had deliberately misled its citizens in the run-up to the second Iraq war and had, when fighting terrorists in Northern Ireland in the 1970s, connived in the extrajudicial execution of (at least one) political agitator (for a summary of these criticisms, see Matravers 2006).

In short, the argument from standing seems to do too much. It is in that sense reminiscent of Murphy's argument that legitimate punishment is impossible in a real world in which distributive injustice is prevalent. Yet, it undeniably captures something of the worry that many people have when confronted by the facts of distributive and retributive justice and, if nothing else, it should evoke in all citizens what Duff (2003, p. 259) calls "a properly humble and cautious spirit which recognizes how far from clean our collective hands and consciences are" with respect to penal justice.

Conclusion

Not all the poor suffer from the same injustices, not all of them commit crimes, and not all of those who commit crimes do so in similar circumstances (for a nuanced discussion of a "case-by-case" approach to social injustice in relation to the criminal law, see Green 2011, pp. 364–373). Nevertheless, the poor and disadvantaged are more likely to be victimized by crime, they are more likely to engage in criminal activity, and they appear disproportionately among those arrested and convicted (Green 2011, pp. 354–355; Western 2006). If one were to visit any prison throughout much of the world, one would be confronted with populations predominantly made up of young men from poor and disadvantaged backgrounds (in the USA, young black men from the same) (Wacquant 2009). At the same time across much of the developed world, the inequalities between the richest and the poorest in societies are growing. These facts compel attention not just in themselves, but because in punishing the poor, "we run the risk of compounding the sins of socio-economic injustice with those of retributive injustice" (Green 2011, p. 376).

The purpose of the arguments above is to show that confronting this possible double injustice from within the existing structures of the criminal law is deeply problematic. Some disadvantaged offenders will suffer from "abnormality of mind" (or similar) consequent upon their disadvantage, but this will be a small minority and, even among those, difficult to establish in court. Few, if any, will be able to claim a justification such as necessity. Ideal theories of punishment may not apply to the world we confront, but absent some other form of social organization, the necessity to punish will persist.

Perhaps the route out of these difficulties is to look beyond the resources of the criminal law and of philosophies of punishment and to political philosophy more generally. Much contemporary discussion of justice revolves around the question of how we might distinguish between those things – actions, omissions, character features, and so on – for which the agent is responsible and on the basis of which he might legitimately claim the benefits or be made to bear the burdens and those things that are merely chance or circumstance – things that, so to speak, simply happen to her – on the basis of which she may deserve assistance or compensation. Of course, while in many cases, poverty and injustice simply happen to people, the decision to commit an offense may fall into the category of choice rather than chance. Nevertheless, asking "when is it fair to make people bear the burdens or enjoy the benefits of their conduct?" may open up avenues of enquiry that might inform the criminal law and, if not that, at least our attitudes to those who fall liable to it (for an initial development of such a strategy, see Matravers 2007: Chap. 3; Scanlon 1998: Chap. 6). That said, given the extent of disagreement among political philosophers as to the answers to these questions, criminal law issues such as those discussed above remain both alive and worthy of attention.

Penal Paradigms: Past and Present

Leslie Sebba
Institute of Criminology, Faculty of Law,
The Hebrew University, Mt. Scopus,
Jerusalem, Israel

Overview

Accounts, critiques, and theoretical conceptualizations of penal systems reveal that the characteristics of these systems may vary in very significant ways. Penological histories show how the “classical school” of the late eighteenth and early nineteenth centuries (epitomized in the famous essay of Cesare Beccaria’s *Of Crimes and Punishments*) believed that the primary rationale for the penal system was general deterrence and advocated that this should be reflected in sentences proportionate to the seriousness of the offence. They then describe how this ideology was in the latter half of the nineteenth century replaced by individualized sentencing – which in turn gave way a century later to a “just deserts” philosophy (again proportionate). These successive approaches are sometimes referred to as **paradigms**.

A focus on the discourses prevalent in the literature on contemporary criminal justice, however, indicates that in fact a variety of competing **models** are identified or advocated – perhaps most famously illustrated by Herbert Packer’s seminal article outlining two apparently alternative models – “due process” and “crime control.” This entry will attempt to provide an introductory overview of these developments – both the historical and the contemporary. The usefulness of these approaches will be considered, as well as confusions arising from the terminology employed, given that neither the terms “paradigm” nor “model” are always used consistently.

Introduction

While penal systems, whether formal or informal, appear to constitute an integral part of every society (and thus presumably, as argued by Durkheim, fulfill some significant social function), they differ from each other in almost every conceivable aspect: the forms of conduct punished, the procedures for determining guilt, the aims of punishment, its modalities, and its severity. Moreover, individual penal systems fluctuate and indeed undergo radical changes over time. In elaborating on these characteristics, traditional penological texts (e.g., Barnes and Teeters 1959) presented largely descriptive accounts of the historical development of penal systems, mainly in Europe and the Americas – while there has also been a fascination with ancient and “primitive” systems (Diamond 1971). Social theorists since Durkheim have offered generalized theoretical explanations for the form and severity of punitive practices – a development analyzed by

Garland in *Punishment and Modern Society* and applied to contemporary society in his *Culture of Control* (Garland 1990, 2001). More recently, there has been a wave of research endeavoring to explain the wide differences among nations in the severity of their sanctioning policies (Tonry 2007).

What many of both the descriptive accounts of penal systems and the more critical analyses share in common is that they tend to view the penal system as – indeed – a "system" with a coherent purpose and philosophy, thereby implying a degree of interconnectedness and compatibility among its different component elements and shared values among the various actors. It is also common to identify somewhat dramatic ideologically driven policy transformations believed to have taken place at certain periods of time. Thus, historical accounts will invariably refer to the eighteenth century as the era of classical criminology (and in particular penology), the late nineteenth and most of the twentieth century as the era of positivism, with the 1970s onward as being dominated by the "just deserts" model. The penal systems identified under these different headings are shown to diverge in fundamental ways, in particular having different sentencing rationales, thereby giving rise to their designation as alternative "penal paradigms." One purpose of this entry will be to elaborate on and evaluate such historical presentations.

It is suggested here that such analyses may be viewed as being complemented by contemporary discourses relating to the characteristics and ideologies of the present-day criminal justice system, which sometimes echo the typification of past ideologies but with a tendency to describe a multiplicity of trends or ideologies operating simultaneously or in competition.

Such a connection between past and present is indeed made by Jock Young in his much-cited essays "Thinking Seriously about Crime" and "Incessant Chatter: Recent Paradigms in Criminology" (Young 1981, 1994) which incorporate critiques of the traditional presentation of the historical paradigms while using this concept to analyze a number of more recent theoretical approaches. However, Young also uses the term "model" in this context, and this is the term more frequently adopted in current penological discourse when referring to alternative penal options. Much of the discourse relating to criminal justice models, however, seems to have been inspired by the dichotomy developed by Herbert Packer (1964) in his well-known law review article "Two Models of the Criminal Process," and indeed the relevant literature frequently acknowledges such a debt.

This entry will provide a brief survey both of the historic "paradigms" and of the contemporary "models," followed by some reflections on the nature of their contribution and related conceptual issues. The survey will be preceded, however, by a discussion of the terminology employed here and elsewhere in the literature in this field.

Paradigms and Models in a Criminological-Penological Context

The term paradigm was developed in the context of the hard sciences to denote the prevailing understanding or interpretation of natural phenomena. It was popularized by Thomas Kuhn in his *Structure of Scientific Revolutions* (Kuhn 2012) when analyzing how **changes** come about in such understandings on the part of the scientific community and came to be applied also to the social sciences. While Kuhn's analysis is essentially restricted in its application to phenomena which may be studied empirically and is thus not applicable to many concepts and ideas pertaining to punishment, it has now a more widespread usage, connoting "a cluster of concepts such as assumptions, values, practices and methodologies shared by a community of researchers in a given discipline" (New World Encyclopedia, online). There may, however, be competing paradigms at any given time, where the evidence is equivocal and/or the scientific community divided in their views and interpretations.

In this context it should be noted that while paradigms relate to "scientific findings" and are thus closely linked to positivist conceptions, each paradigm is rather a social construct, describing the collective understandings of a given community as perceived by an observer (or participant). In the social sciences where "evidence" tends to be less hard than in the natural sciences (and the role of values more salient), it is probable that there will be less consensuality, thereby increasing the possibility of "competing paradigms."

The term "model" has similarly acquired a wider usage than its original meaning of a (usually small-scale) replication of a product for the purposes of demonstrating or testing its operation, or "providing insight into the consequences of a decision" (Chaiken et al. 1975: v). It is simply used to describe the main features and mode of operation of a system – whether existing or proposed. Both the expressions "paradigm" and "model" implicitly refer to a system or framework which comprises a number of components operating as a cohesive whole – and, where relevant, sharing the same values and ideology. Only the paradigm, however, has a connotation of exclusivity – although also that such exclusivity may be ephemeral.

Other related terms used in the penological context include *penal strategies* (Garland 1985) and *styles of social control* (Black 1976). Young (1981) not only used both the terms "models" and "paradigms" but also Weber's concept of *ideal types*, which suggests an idealized account of the institution in question which is unlikely to be found in that form in real life. Recent analyses of Packer's models have considered their relationship with Weber's ideal types (see below).

It should also be noted that the first two paradigms to be discussed here, the "classical" and the "positivist" paradigms, have generally been described in the literature as *schools*. Finally, certain distinct perspectives on criminological issues today may be referred to as *criminologies*, such as "feminist criminology" and "green (environmentalist) criminology." The relative significance and usefulness of these terms has yet to be fully explored.

Historic Paradigms

The three historical paradigms to be considered here are set in somewhat different theoretical frameworks. While the classical school, at least as reflected by its most notable representative, Cesare Beccaria, focuses almost exclusively on the formal institutions of the criminal justice system (in this respect resembling the contemporary models to be considered later in this entry), the positivist school is much wider in its concerns, being equally – or indeed primarily – concerned with the etiology of crime. By contrast, the third of our historical paradigms, just deserts, has the narrowest focus, being concerned exclusively with the purposes and procedures of sentencing.

The Classical Paradigm

This paradigm is identified with the European enlightenment movement and the emergence of the ideas which were to become identified with liberal theory and English constitutionalism (Young 1981) as an antidote to the monarchical despotism prevailing in much of continental Europe. Building on Montesquieu's doctrine of the separation of powers and Rousseau's social contract theory, Beccaria (1764/1995) in his seminal essay advocated a strict separation of powers and equality before the law in order to counter the arbitrary practices prevalent in certain contemporary European regimes which occurred as a result of executive intervention in trials and sentencing. Beccaria advocated uniform penalties, proportional to the seriousness of the offence, which would strengthen their deterrent power: rational persons would refrain from committing crimes attracting high penalties, especially if law enforcement was systematic, certain, and immediate. The attribution of free will and rationality to potential offenders and correspondingly the importance of deterrence as the primary aim of punishment are thus perceived as identifying characteristics of the classical paradigm.

This paradigm may also be seen to be linked to the development of the modern prison. While Beccaria was advocating the prison as a more effective deterrent than the death penalty, his contemporary John Howard was documenting the practices of the then local prisons, which led the way to the enactment in 1779 of the Penitentiary Houses Act in order to establish a new and rationalized form of prison – the penitentiary.

As is well known, this system, based upon uniform treatment in identical cells which it was assumed would lead to penitence and reform, was ultimately pioneered in the United States a few decades later. Another key figure identified with this paradigm was Jeremy Bentham, also famous for developing his own "rational" model of prison development – the Panopticon (Semple 1993).

The Positivist Paradigm

Concepts of equality and uniformity in penal policy were challenged during the second half of the nineteenth century by the rise of the social sciences and the claim of Auguste Comte that in the course of human development "metaphysical" or abstract thinking was to be replaced by the "positivist" stage – and the application of purportedly scientific methodology and empiricism. One outcome of this was Lombroso's theory of delinquent man. The focus on human differences resulted in a penchant among positivist criminologists and their disciples in the field for the classification of offenders for treatment purposes. Such techniques derived encouragement from the mid-century experiments with the "progressive stage system" (pioneered in Ireland) whereby prisoners advanced through the prison system and into the community in the light of their conduct.

Under the influence of positivism, the reformation of the offender became the declared purpose of punishment rather than deterrence, and the ideal of standardized penalties proportional to the seriousness of the offence as posited by Beccaria came to be replaced by the individualization of punishment, as expounded in the treatise bearing this name written by Raymond Saleilles (1911). The new approach to sentencing was epitomized by the principle of the indeterminate sentence widely adopted in the USA whereby terms of imprisonment imposed by the courts were open-ended, the actual duration of the sentence to be determined by a parole board in the light of the prisoner's progress.

This "individual treatment model" of sentencing, as it developed towards the end of the nineteenth century and throughout much of the twentieth century, was characterized by the creation of specialized penal and judicial institutions ostensibly adapted to the needs of the offenders in question, such as reformatories and juvenile courts for younger offenders and institutions for dangerous psychopaths, the involvement of behavioral experts such as psychiatrists and probation officers in decision-making, and the increasing recognition of the helping professions as agents of offender rehabilitation in both closed institutions and in the community. Moreover, while the determinist conceptualization of human behavior and the focus on the individual led to the application of more flexible criteria of criminal responsibility, some versions of the Social Defense ideology (a branch of the positivist movement which focused on penological issues) proposed also to dispense with the legal requirement of a "guilty mind" (cf. Ancel 1965). The threshold requirement for treatment would be the personality of the alleged offender – the main criterion being his or her dangerousness.

The Just Deserts Paradigm

The positivist ideology with its emphasis on rehabilitation meshed well with the welfarist ethos that was widely supported during the period following the Second World War. However, if the individualized treatment paradigm was most widely accepted (at least in the prevailing rhetoric) in the USA, it was there too that it was the most forcefully rejected during the 1970s. Critiques of this model focused on the inequality and arbitrariness of the system, in particular in the context of parole decision-making (American Friends Service Committee 1971). Critics included not only radicals and liberals but also conservatives (cf. Blomberg and Lucken 2000). Adding fuel to the fire was the critique of sentencing disparities deriving from the wide discretionary powers held by the judges (Frankel 1973), and – perhaps most influential of all – the empirical claim that the effectiveness of the treatment methods on which the system was based was unproven (Martinson 1974).

The structure which was to take account of these critiques, as formulated most articulately in *Doing Justice*, the report published by Andrew von Hirsch (1976), was a return to fixed and proportional sentencing. While outwardly this bore some resemblance to the system advocated by the Classical School (see above), its underlying philosophy was not deterrence, or indeed any other consequentialist purpose – as none had been shown to be effective by the empirical evaluations, but desert, a contemporary version of the historic aim of retribution. According to this doctrine, the penalty would match the seriousness of the offence as measured by the harm inflicted and the culpability of the offender – and thus become standardized. The mechanism whereby this was to be achieved was the establishment of a sentencing commission which would issue detailed guidelines to the sentencing judges, whose discretion would be severely curtailed. Since sentences were to be for fixed terms, the discretionary power of the parole boards would be abolished.

Support for such reforms in the USA was such that they were adopted in principle by the federal system and around half of the states – as well as some overseas countries, as documented in other entries. The concept of "structured sentencing," whether by guidelines or otherwise, attracted even wider support. The "individual treatment model" as the foundation of the penal system had in general been rejected.

Historical Paradigms: A Critique

The preceding overview suggests that in the context of this entry, the term "paradigm" is most appropriately (or least inappropriately) used in the context of the positivist school, since the policies advocated in accordance with this approach were the most rooted in the empirical understanding on the part of its adherents of the world about them. It was indeed this characteristic that ultimately contributed to the demise of this paradigm when research findings suggested that the ability of decision-makers to make accurate prognoses and identify successful treatments was very limited.

There are, however, other problems with what Young has described as the typical textbook presentation of a linear development of a succession of paradigms. Young is correct in pointing out that despite the enormous impact of positivist thinking on the twentieth century penological discourse, criminal justice structures – particularly in European countries – remained throughout the twentieth century strongly influenced by the tenets of eighteenth century classicism. The nature and seriousness of the offence remained the primary consideration in determining the sentence, with the characteristics of the offender (other than past convictions) playing a secondary role. Contemporaries therefore referred to the model adhered to in Europe during the course of the twentieth century Europe as "neoclassical."

Today too it is hard to identify a dominant paradigm. As noted above, the parameters of the third of the paradigms referred to, the desert paradigm, were somewhat narrowly drawn (being confined to sentencing practices), and in any case, most contemporary western systems have been strongly influenced by consequentialist ideologies – incapacitation, deterrence and even rehabilitation. It should also be recalled that the concept of the paradigm refers in principle not directly to the practices of the actors in the field (in this case the criminal justice agencies) but to the **perception** of these practices – or perhaps of the ideologies which are thought to motivate them – on the part of the relevant disciplinary group. Thus, radical criminologists such as Young, who perceive the criminal justice system primarily in terms of control, if not exploitation, of the powerless by the powerful, have since the 1960s been offering alternative paradigms to explain its operation.

It may always have been the case that it was more problematic to identify monolithic trends (such as are implicit in the concept of the paradigm) in one's own era, when different views or nuances will be more apparent than when looking back in history. However, this problem has surely been aggravated by the dichotomization of social scientists into positivists and social constructivists, further compounded by the fragmentation caused by postmodern developments – leading Garland and Sparks (2000) to opine that further paradigms in the (consensual) Kuhnian sense can no longer be anticipated. These authors point to the salience of crime in the contemporary politics of neoliberal societies. This has had the effect of reducing the relevance of the prevailing views of academia and the professions, which have perhaps themselves become more fragmented and politicized.

Criminal Justice Models

The Legacy of Herbert Packer

Unlike the paradigm, the concept of a model does not imply consensus and exclusivity but rather variation and experimentation. While criminologists have sometimes used them in the context of empirically oriented work (e.g., Feeley 1973; Chaiken et al. 1975), much of the modern discourse on criminal justice models has been devoted to normative and/or ideological issues, having been inspired, as noted above, by Herbert Packer's seminal article "Two Models of the Criminal Process" (Packer 1964 – subsequently expanded into a book – Packer 1968). The article followed a period of activism in the area of civil rights and criminal justice on the part of the US Supreme Court headed by Chief Justice Warren, but Packer was doubtless concerned by the minority dissenting views which were to become the majority in the era of Chief Justice Burger. It seemed to Packer that the Court and indeed other criminal justice agencies were being required to choose (or at least prioritize) between two alternative types of process which he identified as due process and crime control, respectively, representing alternative sets of values and priorities.

A system based upon due process he perceived as being analogous to an obstacle course, in that it sought to ensure protection of the rights of the innocent (and to risk the acquittal of the guilty) by imposing restraints on the prosecution. Under the crime control model, on the other hand, the system was comparable to an assembly line in a factory – designed to maximize the numbers who would be processed through the system to conviction and punishment in minimum time. This was to be achieved by focusing on the investigation stage and offering plea bargains to the "factually guilty." Although Packer did not perceive these models as mutually exclusive, his dichotomization has penetrated deeply into (at least) the academic criminal justice culture.

Critiques of Packer's Models

Packer's Models have been the brunt of a number of critiques, some trenchant, with Griffiths (1970) being a notable early example, and most recently and comprehensively by Macdonald (2008). These critiques have focused on three main aspects of Packer's work: (a) his conceptualization of the model, (b) the validity of the due process and the crime control models and the relationship between them, and (c) the need for additional models having (in the view of their proponents) greater validity or irrelevance.

(a) Conceptualization

The lack of precision in the concept of the model in the contemporary literature of the social sciences – on one view its "indiscriminate use" (Macdonald 2008) – has already been referred to. Zedner (2004: 116) has observed that "It is often difficult to determine whether models are intended as analytical devices or as normative statements of ideals to which the process should aspire" – an ambivalence conveyed by Packer too. In the wake of Damaska's discussion as to whether Packer's models are consistent with Weber's ideal types, Macdonald notes that Weber distinguished between ideal types and ideals, the former constituting an analytical construct based upon accentuated tendencies which was in his view how Packer conceptualized his models, without fully developing them. (Whether in fact the models were quite unconnected with value judgments, as Weber described his ideal types, is another question).

Macdonald sought, as the title of his article indicates, to "learn from Packer's mistakes" and to "succeed… where Packer failed" (Macdonald 2008: 269), for which purpose he found necessary to differentiate between the investigative and the trial stages of the process, while arguing the need for a multidimensional model. On similar grounds Ashworth and Redmayne (2005: 38ff.)

reject the "models" approach as an unsatisfactory basis for the evaluation of the criminal process. These writers find models based on simple dichotomies to be too crude – tending "to reduce the world to black and white" (Zedner 2004: 119–120).

Additional conceptual issues arise in the context of the evaluation of the two models as outlined by Packer, and the relationship between them.

(b) The Two Models and the Relationship Between Them

A number of criticisms have been directed at the specific models described by Packer, as well as suggesting that the dichotomy may be a false one (see, e.g., Macdonald 2008: 264ff.). Both Damaska (1973) and Smith (1997) find fault with due process as an objective (in Damaska's words "obstacles without a course"), rather than a principle imposing restraints on the pursuit of other objectives. In this context Macdonald (2008: 289) refers to the work of the Swedish jurist Jareborg who differentiated between a "defensive model" and an "offensive approach" to criminal policy. Zedner (2004: 118) has pointed out that speed and efficiency – characteristics attributed by Packer to the crime control model – are also important for due process and protection of the defendant's liberty. McBarnet (1981), echoing the literature of radical criminology, has argued that rather than constituting an alternative approach, due process serves to legitimize the goals of (repressive) crime control, thus giving rise to "due process. . . **for** crime control."

(c) Additional Models

With Packer's dichotomy as a "given," other writers have proffered additional (often designated "third") models. Griffiths' "family model" (which clearly falls into Zedner's normative category) was a proposal for a more therapeutic procedure. This, too, has been the direction of at least some of the recent writings seeking to accommodate a role in the system for the victim. Thus, while Beloof (1999) has proposed a Victim Participation Model within a due process framework, Roach (1999) has portrayed the alternatives of a punitive and a non-punitive model of victims' rights, and it is the latter – designated a "Circle Model" and based upon restorative justice – which he seeks to promote.

A unique attempt to incorporate a broader model approach into an empirical analysis of the criminal justice system was undertaken some years ago by King (1981). King identified six alternative models of the system for which accounts could be found – whether by name or implicit – in the criminological or criminal justice literature. To Packer's duo (due process and crime control), King added: the medical (or treatment) model, and three further models deriving from criminological research or sociological critiques – the bureaucratic model, the status passage model, and the power model. He then identified the "features of the court" which one would expect to find under each model. The validity of these models could then be tested (in the instant case, in his study of English magistrates' courts) by observing to what extent these features were actually found in the courts. "As in the physical and social sciences, the term model is used here to denote a hypothetical but coherent scheme for testing the evidence" (p. 12).

There is no doubt that the integration of a multi-model approach into a field study served to enrich this discourse. However, there is a measure of disjuncture here in the construction of the models in that the first three, which King calls "participant" models, reflect the idealized expectations of a certain category of participant (thus, again, falling into the category of normative models), while the other three which he refers to as "social" models are based on academic critiques of the existing system. On the other hand, the attribution to each model of a "social function" bestows upon the models a unifying ideology or rationale such as generally characterized the paradigms discussed in the first part of this entry.

It should be noted that the "penal process" to which the literature reviewed in this section relates is that of common law jurisdictions (primarily the USA). Models relating to other systems will be very different, but some "Packer scholars" have dwelt on the relationship between the common law and developments in continental Europe's "inquisitorial system": see, e.g., Damaska (1973).

Special Categories of Offender

Variations in the manner in which criminal justice systems operate tend to be augmented when dealing with offenders with distinctive traits or pathologies – or whose offences are perceived as particularly threatening or distinctive in some other way. Examples would be sex offenders, offenders against state security laws ("terrorists"), offences related to drug use, minors, or the mentally unstable. In such cases different paradigms or models may be identified. Thus, the modification of human rights protections when dealing with security offences (including punishment without trials) may be such that the "war" model is arguably the most appropriate metaphor to attach in this case.

By contrast, purportedly softer alternatives to the prevailing model(s) may be adopted when dealing with minors. Identifying the optimal policy for his purpose, however, has been the subject of intense debate over the past century. It was in relation to juvenile offenders that the treatment model of the positivist school assumed its most comprehensive application, in particular via the vehicle of the juvenile court, first established (in Chicago) in 1899. The treatment of juvenile offenders became virtually indistinguishable from "welfare" cases such as children in need of care and supervision. They were thus deprived of the guarantees provided under the US Constitution's Bill of Rights. Juvenile courts in other common law jurisdictions, however, retained somewhat more of a rights framework – while the US Supreme Court case *Re Gault* in 1967 (387 U.S. 1) reversed the welfarist trend in the American system. If for some decades the juvenile justice system has seen these two approaches – the "welfare" model and the "justice" or "legal" model – in combat (or fusion), recent decades have seen strong claims, particularly in the antipodes, for their replacement by a system of restorative justice. Three distinct approaches to juvenile justice have thus emerged. As observed by Borowski and O'Connor (1997: 229): "Unlike other aspects of the criminal justice system, it is possible to identify coherent theoretical positions reflected in legislation, policy and practice."

O'Connor's review of these models considers how each model responds to such underlying questions as follows: What is the cause of crime? How should it be viewed? How should it be defined in law? How should the state respond? What is the relationship between the individual and the state? What is the purpose of the sanction? O'Connor's models arguably present both an analytical and a normative framework for the comparison of these three ideologies, while his approach bears a resemblance to Young's analysis of criminological paradigms referred to in the Introduction.

Conclusions

This entry has analyzed the use made of two concepts – the paradigm and the model – in the course of the history of the criminal justice system. It seems to the present writer that the paradigm has been used primarily to describe changes in the main orientation of the system at different periods, while the model has been more extensively used in contemporary settings. Both terms have had a usage somewhat different from their original meaning (in the case of the model, a multiplicity of usages), and partly for this reason, the discourses in which they have been incorporated have been challenged.

The departure point for this entry was the concept of the paradigm – perhaps the more interesting concept because of the connotations conveyed by this term in a penological context of (a) being unequivocally linked to an ideology, (b) indicating an interpretation uniquely accepted by the relevant disciplinary group, and (c) having played a key role in the history of penology and the penal system. Yet while the brief historical overview presented at the beginning of this entry may have been sufficient to indicate the dramatic contrast between the main historic paradigms (in particular classicism and positivism), Young is almost certainly correct in denying the occurrence of a "paradigm shift" as a momentary historical event, the reality having been considerably more complex. Further, the idea that the "community of [criminology] scholars" will identify with a common vision of penal policy has become increasingly unlikely from generation to generation. Even less likely is the prospect of shared perceptions between the "criminology community" and policy-makers, such as Garland suggests may have occurred in the era of "penal welfarism" and "government criminology." As observed by Garland and Sparks (2000), in an era of ideological fragmentation and politicization, paradigms – like cultures – are likely to be multiple.

The relatively fluid concept of the model is free from such connotations, but its conceptual ambiguities have given rise to much confusion. This confusion came to the fore in the aftermath of the publication of Herbert Packer's famous two models of the criminal process – the crime control model and the due process model, and the numerous critiques thereof. Nevertheless, Packer's models have become an inseparable part of the discourse of criminal justice. Indeed, the two concepts considered in this entry are likely to survive and enhance both critical analyses and normative debates on the many facets of penality – while methodological inquiries as to their validity and applicability may serve to clarify underlying epistemological issues.

Penal Philosophy and Sentencing Theory

Matt Matravers
Morrell Centre for Toleration
University of York, York, UK

Overview

Many penal philosophers think that offering a justification of the state's right to punish is particularly urgent (and difficult) precisely because punishment involves doing things to people that would, outside the practice of punishment, be gross rights violations. That is, punishment typically involves imposing some deprivation – for example, the removal of property or freedoms – on a person for committing an offense and this stands in need of justification. Yet, despite this motivation, many theories of the justification of punishment say surprisingly little about the detail of sentencing and penalties. This entry considers the various rationales for sentencing with a view to showing both how different justifications of punishment have different implications for sentencing theory and practice and how reflecting on sentencing matters can shed light on the justification of punishment. The entry considers first consequentialist theories – that is, theories that justify punishment by reference to the net benefits that accrue through punishment in comparison with any other form of social control (or doing nothing) – and then desert-based, retributive, theories. Finally, it considers some questions of the relationship between theory and practice.

Punishment and Sentencing

Punishment

Punishment – or at least state punishment – involves the intentional infliction on an offender by a proper authority of "pain or other consequences normally considered unpleasant" for an offense against legal rules (Hart 1968, pp. 4–5). In addition, it involves the expression of moral condemnation or censure (Duff 2007; Feinberg 1970). When a court passes sentence, it gives shape to the particular consequence to be visited on the offender. In practice, the options available to the court may be limited by guidelines or statute and the court may not be explicit in justifying the use of one penalty rather than another. However, the use of punishment in general, and of particular penalties, requires justification and those justifications tend to fall into two broad categories: consequentialist and retributive.

For consequentialists, punishment is justified because its consequences – specifically, having the system of punishment with its associated penalties – can be expected to yield higher net benefits than having an alternative system of social control or having no such system. This may be because punishment reduces future instances of criminal behavior through deterrence, rehabilitation, or incapacitation.

For retributivists, punishment is justified because it is deserved by the offender for his offense. It may be that good consequences also follow, but the justification of punishment does not appeal to these consequences. What, then, do these broad theories of punishment imply for sentencing theory (insofar as we can distinguish sentencing theory and penal philosophy) and practice?

Deterrence

Deterrence is typically split into "special" and "general." Special deterrence is aimed at the particular offender and is sometimes discussed in relation to the giving of more substantial punishments to repeat offenders. However, it is not advanced as a general theory of sentencing. This is perhaps a reflection of the lack of empirical evidence when it comes to special deterrence and of the fact that a sentencing scheme that was genuinely tied to special deterrence would have to allow specific, individualized sentences for each offender in relation to his particular likelihood of reoffending. Such a sentencing scheme would lack all consistency and would, in any case, be unworkable.

General deterrence addresses not the particular offender in court, but potential offenders throughout the population. If the general justifying aim of punishment is to secure good consequences by reducing criminal behavior, then it is argued that the mechanism by which it does that is general deterrence. The origins of the modern approach are most often associated with the great utilitarian philosopher Jeremy Bentham. Bentham thought the infliction of pain was, other things equal, an evil, but the threat – and where that threat failed, the infliction – of pain could be justified if it secured better future consequences than would be achieved by any alternative action or policy. Assuming that the addressees of the system (that is, ordinary citizens) were motivated by the pursuit of pleasure and the avoidance of pain, Bentham argued that criminal sanctions should be set at just that level required to change the outcome of the "hedonic calculus" for each individual in favor of what would be conducive to the maximization of the general good. Moreover, Bentham went on, penalties should be such as to "induce a man to choose always the least mischievous of two offenses" by ensuring that "where two offenses come into competition, the punishment for the greater offense must be sufficient to induce a man to prefer the less" (Bentham 1970, pp. 168). That is, he developed an account of penalty scales (Bentham 1843).

In thinking of people as rational calculators set on maximizing their own interests and susceptible to changes in the payoffs of different actions, Bentham's theory has much in common with contemporary proponents of the economic theory of law such as Richard Posner (Posner 1985). However, critics of the position have pointed to flaws both in the empirical claims made on behalf of general deterrence and in its normative foundations.

Empirical Questions Around General Deterrence

Empirical questions around general deterrence revolve around the overall claim that the threat of legal punishment reduces offending and the claim that *marginal* changes in the severity of sanctions has an effect on rates of offending. The difficulty with the first of these claims is in establishing that it is the threat of punishment rather than anything else that stops people from breaking the law. Moreover, insofar as the theory posits an effect that happens because people reason about what to do as rational, self-interested calculators, the account may explain some people's behavior and not that of others. It may simply not be true that certain kinds of offenders do accurately balance the factors for and against their offending in advance (even when they know, for example, what penalty they are likely to be given and the likelihood of being caught). In short, general deterrence may be at best a selective explanation of law-abiding behavior because many offenders do not think as Bentham and modern economists believe they think (Doob and Webster 2003).

A similar problem arises with the empirical evidence in relation to the effects of marginal changes in sentencing severity or probability of conviction. In a review of research, Andrew von Hirsch and his coauthors identified the factors that would need to be true for such marginal changes to have an effect on a potential offender's behavior. That offender, they argued, would need to know about the change; he would need to include the increased or decreased risks of suffering punishment in his decision as to whether to offend; he would need to believe in a realistic possibility that he might be caught and that the penalty would be applied to him; and he would need to be willing to adapt his behavior in the light of these new considerations (von Hirsch 1999). The conclusion of the study is that while there is some evidence of a link between offending and the certainty of punishment, there is far less evidence of a link between offending and the severity of punishment (see also Bottoms and von Hirsch 2011).

Normative Questions Around General Deterrence

Insofar as deterrence theories are embedded in, and result from, consequentialist accounts of punishment, they are subject to the moral criticisms that are often leveled at those accounts. The problem is a general one: Consequentialist accounts value the aggregate (sometimes the average) good achieved in the future. We are to do what will, in Bentham's famous phrase, achieve "the greatest happiness of the greatest number." But, in being concerned for the greatest happiness (or utility), the theory leaves out questions of the distribution of utility; it fails to pay attention to what John Rawls (1971, p. 27) calls, "the distinction between persons." For this reason, it is alleged, if the calculation dictates it, it may be not merely morally permissible, but morally obligatory, to frame and punish an innocent person (McCloskey 1968) or to punish an offender far in excess of what is usual to make an example of him.

Consequentialist writers have responded to this kind of criticism by insisting that the theory is best thought of as addressing rules and institutions and not individual actions (Goodin 1995; Rawls 1955/1999). In that case, they argue the system of rules in relation to criminal justice and the range and type of penalties that best promote long-term good will be much the same as is found in current liberal systems. That is, the rule "only punish those (believed to be) guilty and not the innocent" will better promote the good than a rule that allows the innocent to be sacrificed each and every time that particular act will have better long-term consequences than any alternative. However, few have been convinced by this argument in part because of doubts about the claim that the usual procedural rights and protections of (suspected) offenders will ensure long-term utility, and in part because even if it delivers the right answer (not to hang the innocent man), it does so for the wrong reasons. The innocent man deserves to be spared because it would be wrong to kill him, not because a rule against hanging innocents secures better consequences than its opposite (Matravers 2000, pp. 17–23).

The idea that the justification of punishment and of the penalties it imposed must be grounded in the requirement "to preserve and increase the welfare of the state" (Michael and Adler 1933, p. 340) was prevalent for much of the century prior to the 1960s (Tonry 2011b, pp. 14–18). It seemed to some writers to be the only "rational" basis for sentencing (Walker 1969). However, from the 1970s onward, the theory came under sustained criticism. In moral theory from neo-Kantian writers including, and inspired by, John Rawls and in penal theory by the "Just Deserts" movement. Yet, we continue to believe – and to find evidence for – the claim that the whole criminal justice system must surely have *something* to do with reducing future crime rates and that taken as a whole, it does deter crime (Robinson and Darley 2003, 2004). Moreover, statutes and judges continue to refer to deterrence at the point of sentencing. So, whatever its philosophical difficulties, it is clear that deterrence is not yet moribund in practice.

Incapacitation and Rehabilitation

At the high point of utilitarian welfarist thinking about punishment (in roughly the middle of the Twentieth Century), it seemed obvious to writers on the criminal law that a rational approach to punishment would eschew retributivism as "fallacious" (Michael and Adler 1933, p. 341) and barbaric. Instead, it seemed clear that if the welfare of the state was to be increased, then antisocial behavior, and those who committed it, needed to be dealt with "scientifically." Offenders would be "treated" under the careful eye of experts and until "cured" would generally be held away from the general population. For the influential social and legal thinker, Barbara Wootton, the criminal law was irrational in its concern with intentions and mental states prior to conviction. Rather, *mens rea* considerations mattered only "after a breach of law has been proved" because of "the light which they throw on the likelihood of [the offender] offending again, and upon the most hopeful way of dealing with him" (Wootton 1978, p. 224). Sentences should be indeterminate and offenders released when, or if, their individualized treatment plans proved successful.

There were individual voices of dissent. For example, CS Lewis's (1949) "The Humanitarian Theory of Punishment" offered the argument that the treatment model reduced persons from choosing agents to manipulable things. By the late 1960s, those voices had increased and by the 1970s become a clamor (Frankel 1972; Kleinig 1973; Morris 1974; von Hirsch and Committee for the Study of Incarceration 1976). The charge was normative in that utilitarianism treated people as mere objects to be manipulated; political in that indeterminate sentences were racially biased and unfair; and empirical in that increasing doubts were expressed about the efficacy of treatment.

Remnants of both incapacitation and rehabilitation nevertheless remain in contemporary penal philosophy and sentencing theory. With respect to incapacitation, governments (of all persuasions) have responded to the risks created by so-called dangerous persons – often sex offenders – by allowing incapacitative sentences or post-sentence restrictions such as sex-offender registers. However, the policy has largely drifted free of any theoretical foundation in a theory of punishment. Rather, it exists as a bolt-on public policy that philosophers have approached as a discrete problem. The question is, can – and if so, how should – a liberal society restrict the freedoms of some for purely or primarily preventive reasons? The best answer to that is that any such policy is justifiable only if: (1) the potential harm was sufficiently grave; (2) the prediction technology was sufficiently accurate; (3) the preventive response was maximally humane and minimally intrusive under the circumstances; and (4) if the preventive action was preceded by adequate due process (Morse 1999, p. 297). For many critics, condition (2) is seldom met given the unreliability of current predictive judgments (Monahan 2004).

Similarly, rehabilitation is not regarded by most contemporary penal philosophers as providing an overall theory of punishment or criminal justice, but that is not to say that it is redundant in sentencing decisions. Two different motivations have sustained rehabilitative programs: first, a humanitarian desire to help those in incarceration many of whom have mental health issues, drug issues, and basic training needs; second, increased frustration with rates of recidivism that spawned the "What Works?" movement – a political movement keen to subject policy to evidence-based evaluation – which revitalized interest in techniques for anger control, the use of cognitive behavioral therapy, and other techniques of behavioral modification. This focus on the "good done" by legal processes (including arrest, trial, and punishment) has developed into a small but significant movement under the title of "therapeutic jurisprudence", which (as the name suggest) aims to assess criminal justice institutions against a standard of therapeutic usefulness (Wexler 2008; Winick 1997).

In short, incapacitation and rehabilitation remain important parts of public policy and sentencing practice. But, they do so largely as discrete elements and not as the result of an overall theory of punishment in which the welfare of society is the only desideratum.

Retributive Theories

Retributive theories of punishment go back (at least) to the great German philosophers Immanuel Kant and Georg Hegel (see ▶ Traditional Retributivism). Following the assault on indeterminate sentencing in the 1970s, and the more general philosophical critique of consequentialist thinking at around the same time, retributivism came back into fashion for the rest of the century. Retributivists hold that punishment is justified when, and because, it is deserved (although the exact sense of desert is contested (Matravers 2011)). More precisely, the argument is that those who culpably commit criminal offenses deserve censure and that censure should take the form of a penal sanction – so-called hard treatment. Most importantly for the development of a retributive sentencing scheme, that hard treatment must be *proportionate* both in the sense of *cardinal* proportionality (the penalty should be fitting or commensurate with the wrong) and of *ordinal* proportionality (crimes of comparable seriousness ought to receive penalties of comparable severity).

The precise way in which retributivists defend their theories varies. For Michael Moore (Moore 1987, 1997), punishment is good when and because it is deserved and this judgment and the associated penalties are a matter of what is dictated by a correct account of morality. For Antony Duff, it is censure that is deserved and hard treatment is merely the vehicle through which that censure is communicated and through which the offender can show penance (Duff 1986, 2007). For Andrew von Hirsch and Andrew Ashworth, retributivism is a mixed theory in which censure addresses us as moral beings and hard treatment offers a "prudential supplement" encouraging us to keep to the law (von Hirsch 1993; von Hirsch and Ashworth 2005).

Proportionality

The principle of proportionality is very attractive. If punishment is an exercise in blaming, then the penalties must reflect this in the sense both that the penalty must be at an appropriate level and that more serious wrongs deserve more blame and so more severe punishment. This also captures a very important commitment to equality and justice often glossed as "treat like cases alike and different cases differently." That is, if two offenders commit crimes of equal seriousness with equal culpability, then they should be punished equally. Moreover, once an account can be given of the anchoring points of the scales (the least and most serious offenses and the least and most severe penalties), it appears to offer a workable translation of a theory of punishment into a sentencing scheme.

However, the proportionality account of punishment is not without its critics. For "pure" censure-based theorists, the addition of hard treatment as a prudential supplement treats citizens as things to be coerced rather than agents to be reasoned with, and threatens to "drown out" the moral message of the law (see the exchange between Duff and von Hirsch in Matravers 1999). However, even those who accept the necessity of hard treatment as a legitimate part of punishment have queried the usefulness of proportionality as a guiding principle. The criticisms in part focus on the theory's workability and in part on its implications for sentencing practice.

A punishment scheme based on proportionality presumes that we can accurately measure offense seriousness and culpability, and that we can then match that to a point on a penalty severity scale. These things pose a significant challenge to proportionality theorists. In relation to offense seriousness, what is needed is a way to put together on one scale crimes such as assault by an individual and commercial pollution. In relation to culpability, in principle, the theory needs to assess the subjective state of the offender, but in practice may have to rely on objective measures such as the absence or presence of previous convictions. Proportionality theorists are aware of these (and other challenges) and have tried to meet them (Ashworth 2010; von Hirsch and Ashworth 2005), but not everyone is convinced that they have been successful (for a helpful summary of the criticisms, see Tonry 2011b, pp. 224–34).

Perhaps even more significant is the need to anchor the scale of penalty severity. The bottom anchoring point – the penalty to be associated with the least serious offense – may be reasonably easy to fix in that many jurisdictions may have something like a police caution. However, what of the upper anchoring point? Should this be capital punishment (or worse), life imprisonment without the possibility of parole, 21 years, or less?

Without an answer to this question, the scheme is inadequate.

Proportionality theorists have reached for a variety of principled, and socially contingent, ways of fixing the upper anchoring point. As noted above, one might worry, for example, that too severe punishments will "drown out" the moral message conveyed by the law. The problem the account faces is that insofar as the penalty conveys proportionate blame, different societies, with different histories and practices, will think different overall levels of suffering needed to do this accurately.

Parsimony

In contrast to the equality and proportionality required by the proportionality account, Norval Morris (1974) and others have argued for a principle of parsimony. By "parsimony" it is meant that punishment levels ought in general to be set such as that offenders receive "the least severe sentence consistent with the governing purposes of sentencing" (Tonry 1992, p. 81). In developing this account, Morris and others have come to think of desert as a "limiting" principle (Frase 2004) such that offenders should receive the least severe "not undeserved" sanction from a range in which the upper point is consistent with proportionality, but the lower bounds allow for individualization of sentences and parsimony. Such an account is still hostage to a theory of cardinal desert, but its relative vagueness would, its proponents suggest, at least allow greater justice to be done to each particular offender; justice that would be sacrificed by the fetishizing of proportionality. Exactly that discretion, though, is what bothers proponents of proportionality (perhaps mindful of the way it was used to disadvantage minority groups in the past).

Theory and Practice

Following the breakdown of the consequentialist consensus in the final third of the twentieth century, broadly retributive theories of punishment took center stage and, by-and-large, remain there (although see the essays in Tonry 2011a). The associated "just deserts" movement, and its various political analogues like the campaign for "truth-in-sentencing," was dominant, but for a shorter period and not without challenge. Throughout the same period, and in particular after the mid-1980s, many sentencing policies that explicitly violated proportionality were passed. Mandatory minimum sentences for drugs offenses, sexual offenses (particularly against children), and possession offenses (particularly of child pornography) have meant that these crimes attract penalties far above those given for what might be thought of as roughly equally serious violent crimes. Another example is California's notorious three-strikes law, which means that relatively trivial third offenses could attract very severe penalties, and there are many others.

As noted above, other less retributive policies – grounded in therapeutic jurisprudence or restorative justice – also flourished in corners of the criminal justice system often because they were perceived to "work"; in particular to reduce recidivism.

Very few of these policies can be said to flow directly from a fully worked-out philosophical position on the justification of punishment. Yet, it would be absurd to say that "theory does not matter." Policies do change as a result of theoretical reflections and will no doubt continue to do so. However, sentencing – perhaps more than any other part of the criminal justice system – is political and pluralistic. It is political in that it is a highly visible and politically controversial. To be "soft on crime" is, in many political systems, to court political disaster (Lacey 2008). It is pluralistic in that, *at* the point of sentencing, judges in systems where there is discretion will often call upon many considerations (an intuitive notion of desert, the need to express the community's blame, deterrence, the risk posed by the offender, the offender's potential for reform, and so on). Such pluralism can sit ill with philosophers of punishment who seek solutions which are logically consistent and morally coherent and defensible.

That said, precisely because crime is a politically sensitive issue, and because in many jurisdictions, judges are limited in their discretion by mandatory sentences or restrictive sentencing guidelines, it is vital that moral and penal philosophers continue to subject sentencing rationales to critical analysis. And, in doing so, they will inevitably call on overall accounts of the general purpose, and justification, of punishment even if those accounts do not always translate easily into particular sentencing outcomes.

Philosophical Basis of the Forensic Process

Camilla Hald

Research & Development, Copenhagen,
Denmark

Overview

In recent years controversies have arisen over the definition and demarcation of science in relation to forensic science. These controversies are among other expressed in debates following a report from the National Academy of Sciences in the US, questioning the scientific status of forensics and its interpretations of evidence before courts of law. The controversies highlight an apparent incommensurability of the two fields of knowledge straddled by the forensic process: science and law. These controversies are however as old as science and law, respectively, and can be traced in the major philosophical principles' underpinning, shaping, and informing the origins and the characteristics of the forensic process. The philosophical basis of the forensic process consists of a meshwork of ideas. It originates from and is influenced by a range of different disciplines, models of inquiry, and forms of validating truth claims, which have been decisive in bringing the discipline about. Some major ones runs from divination, classical rhetoric, theology, law, philology, philosophy, history and the arts, over the model of Galilean science, medicine, psychotherapy, art connoisseurship, the infant social science and statistics, to natural sciences such as biology and chemistry, and, new philosophies of science born from these disciplines. Following the trajectories of thought illuminates how there is a philosophical basis to the controversies. The forensic process is informed by ideas from two different models of science. One is a model of science based on identifying and interpreting "signs", the other is one based on observation and verification of general facts. Each model plays a significant part in the workings of the forensic process. The lack of acknowledgement of the contributions from each, however, plays a major part in the controversies. Hence the way forward may prove to be related to attaining a more nuanced understanding of the philosophical roots of the forensic process as well as in incorporating each model equally into the theoretical and operational framework of the discipline.

Key Issues/Controversies

The forensic process is the process of inquiry belonging to forensic science. Forensic science is most often defined as an applied science, whose raison d'être is to provide scientific analysis of evidence in the service of law. The forensic process is part of the investigative inquiry carried out within the legal process which is oriented toward providing answers to questions essential to the legal deliberation and arbitration of cases. This however is not a straightforward business, since the questions asked and the methods of supplying answers differ markedly between law and science.

Put crudely, the ultimate goal of legal inquiries is to establish "what happened" (how, when, where, and why) and "who did it" in a given case under scrutiny. The goal of inquiry of the sciences is however rather to establish "what a given phenomenon is" and "how it works." Also the methods of inquiry, and for validating "truth" differ between law and science. Legal inquiry makes use of qualitative methods, testimonial evidence, and a judgment of and deliberation between, probable arguments derived here from, whereas the sciences use observation and experiments, favoring the quantifiable, reproducible, and empirically verifiable.

Differences between law and science are grounded in a difference between the object and goal of inquiry of each discipline. The legal process deals with questions of a social, moral, and cultural kind and in the deliberation of individual cases in which truth is of an approximate kind as versed in the dictum "beyond reasonable doubt." Natural science (with which forensic science is most commonly associated and from which the most influential forensic techniques and forms of analysis originates: physics, molecular biology, chemistry, etc.) deals with questions about nature, its laws, and general characteristics to the point of establishing the truth about it in a more absolute sense. The knowledge sought by science is one which may be reproduced independent of the particular researcher or situation, and from which it is possible to predict results based on true premises. Thus for law the goal of inquiry is the most reasonable explanation for particular events, while the goal of scientific inquiry is the universal truth about "what is." These two fields of knowledge is straddled by the forensic process, in which legal questions must be translated into scientific questions in order to provide scientific answers which may inform legal argumentation and deliberation (see Fig. 1). Forensic science and its role in legal deliberation is in other words a matter of using science in the service of law and legal deliberation, to help establish "matters of fact" which may aid the process of deliberating between "probable arguments".

Evidence produced through the forensic process is thus also submitted to different forms of validation in different contexts and phases of the process. Within the laboratory, evidence is evaluated according to the soundness of analysis and integrity of the process of analysis (an uncompromised chain of custody and accuracy

of instruments and methods applied) in order to assure the scientific "rigor" of the results through recognized methods of analysis and scientific procedures for testing. Within the legal process, the evidence is in addition to the assurance of the integrity of analysis and evidence, evaluated for their *meaning* in relation to the legal argumentation presented before a court of law. The former demands that what is infered from the evidence is verifiable and stand up to tests in accordance with scientifically acknowledged theories and methods. The latter demands that evidence is seen in the context of the case and the circumstances surrounding the actions or event in question and is based on evaluation of possible or probable causes or sources of particular forms of evidence.

The evidential value of the information provided through scientific analysis and the professional judgment of the analyst is, in other words, ultimately decided in the context of the case and the legal process of deliberating between the arguments presented by the advocates of prosecution and defense.

This fundamental condition of the forensic process has resulted in intense debates about the role of the forensic scientist in providing service to law by analyzing and interpreting physical evidence. Questions such as: How this is done; where the boundaries of professional judgments in interpreting the evidence, are set and how far the forensic analyst may stretch in order to help answer the questions of the legal process – and how the authority and integrity of the scientist should be assessed – are however subject to different interpretations. Within forensic science itself, tensions are evident in the way that different schools have arisen, especially within criminalistics, each school emphasizing the role of the forensic analyst differently, as well as the degree to which criminalistics should be defined by the needs and methods of law versus those of the pure sciences (Inman and Rudin 2001).

These inherent tensions have become more obvious in the United States, in the wake of a report from the National Academy of Sciences: *Strengthening Forensic Science in the United States: A Path Forward* (2009), evaluating the field of forensic science. The report raises many issues and questions echoing debates, which have a long history – both within forensic science disciplines and beyond. These are issues such as: that the current forensic science system is not based on science; that the analysis is frequently subjective; and that the same technique used by different analysts can lead to different results, just as the same technique used by the same analyst on the same sample at different points in time and in different contexts can lead to a different result, and that anecdotal information, phrased like "In my training, knowledge, and experience. . . ." makes its way into the courtroom. Reactions to the NAS report have been swift and all across the board from those that deny that there is anything wrong, to those who have adopted the NAS report and endeavored to suggest new modes of operation to improve on the lack of scientific rigor and culture of forensics, especially within criminalistics (e.g., Mnookin et al. 2011).

The report does however not deal with the fundamental philosophical basis of the forensic process, Therefore there is no recognition of the philosophical roots of this debate, and the fact that the issues have existed in different forms since well before the development of the different disciplines of forensic science. In order to understand the controversies a proper historical and theoretical context is needed. The purpose of the entry is therefore to explore the major philosophical principles that have inspired and shaped the forensic process. Given that the word "forensic" in contemporary use has two meanings: (a) as a form of legal evidence and (b) as a short term for forensic science or criminalistics (forensics), this entry will inspect the philosophical history along two trajectories. Firstly, through a visitation of the history of legal rhetoric – the predecessor of modern law – secondly, through the history of the growth of science and the scientific method and the philosophical "goods" being, respectively, embraced and discarded in the process. Ultimately, it is in the combined history of these two trajectories of thought that the philosophical basis of the forensic process is to be found.

Fundamentals of Legal History

The Art of Rhetoric: The Foundation of Modern Law

Etymology is a proper place to start when digging for the roots and the philosophical basis of the forensic process. The word "forensic" originates from the Latin adjective *forensis*, meaning "of or before the forum." In Roman times, a criminal charge meant presenting the case before a group of public individuals in the forum. Both the person accused of the crime and the accuser would be represented by an advocate giving speeches on their behalf, presenting their side of the matter. The individual with the best argument and delivery would succeed. This origin is the source of the modern usage of the word "forensic" to denote a form of legal evidence (forensic evidence) and as a short representation of "forensic science," that is, science related to and of relevance to courts (forensics). Historically, courts of law (forums or public assemblies) were intimately connected to rhetoric. In classical Greece, rhetoric was taught to citizens so that they could defend themselves in the court and deliberate in the assembly. In Rome, advocates (called logographs) used oratory to plead on behalf of their clients before the forum. Law, as a subject of its own, did not emerge until the twelfth century (Schoeck 1983), and law students continued to be educated in rhetoric well into the Early Modern period (Balkin 1996). A key element of the art of rhetoric was how to find and present arguments in a case to be presented before a court of peers. To guide the search for arguments and proofs to their fact, which would persuade the court to find the case presented by the rhetorician the most believable and worthy of support, the Ancient Greeks developed a meticulous system or inventory of possible forms and modes of argument to this end, also known as *topoi* or in English "topics." The following presents a brief history of the origins of the topics and their incorporation into modern legal procedure and the forensic process of which the topics form the backbone.

The Topics of Classical Rhetoric

The first attempts at setting out guidelines for those who were to investigate and present cases before a tribunal of decision makers seems to be dated back to one of the deemed founders of the modern art of rhetoric, Hermagoras of Temnos (300 BC). Hermagoras divided the materials of rhetoric into two parts: *thesis* and *hypothesis*. A *thesis* involves an abstract, general question, whereas a *hypothesis* involves a question concerning concrete particulars. Hermagoras provided a list of circumstances which needed to be addressed in order to form hypotheses and to be able to demonstrate their truth-value, in the form of a list of questions. He contended that no hypothetical question or questions involving particular persons and acts can arise without reference to these circumstances, and no demonstration of such a question can be made without using them.

The questions defining Hermagoras' circumstances are known only in Latin because they arose as part of the theological writings of St. Augustine recognizing Hermagoras as the original source. St. Augustine quoted Hermagoras' questions in Latin as follows: *quis, quid, quando, ubi, cur, quem ad modum, quibus adminiculis* (who, what, when, where, why, how, in what way, and by what means/which aids) (Robertson 1946). Hermagoras' list of questions for producing hypothesis and proof is a mnemonic device intended to provide a systematic methodology to the task of producing rhetorical evidence (proof). This form of mnemonic belongs to a part of the methodology of the discipline of rhetoric, derived from Aristotle, known as *topoi* – or "the topics" – of which he was the first to write systematically about.

The word "topic" originates from the Greek word *topos* (pl. *topoi*), meaning "place," and refers to the "places" (on the mind's horizon) where one can go to look for and discover the relevant arguments (i.e., get ideas for argumentation). In Latin, the topics are referred to as *loci* (places) or *loci communes* – meaning the "common places." The use of the word *topos*/*topoi* may refer to the ancient mnemonic principle of using "spatial locations" or "activities" by which to remember even complex or huge amounts of information. One may for instance remember a long list of dinner guests by imagining them around the table. Generally, the word "topics" is commonly used to refer both to the actual "places" where one can go to find material for arguments and to the methodology of the process of searching these places. The topics have since their very conception in classical rhetorical theory been a very confused concept, not easily defined and incorporating a bewildering diversity of meanings. Initially, "Topics" is the title of a treatise of Aristotle on the art of dialectic – the invention and discovery of arguments in which the propositions rest upon *commonly held opinion* or what he termed *endoxa* (Aristotle 384–322 BC). These commonly held beliefs, the *topoi* or "topics," are not merely popular notions held by any given individual in a city or culture about any and all subjects. Rather, they are elements of reason upon which those who conscientiously dispute agree in principle, i.e., that which is firmly embedded within opinion or belief among those who engage in disputation. The topics belong according to Aristotle to the art of rhetoric, in which they inform the invention and discovery of arguments (Aristotle and Lawson-Tancred 1991).

Aristotle's theory of the topics emphasized a particular aspect of evidence related to forming and proving hypotheses. Hypotheses was thought to belong to the form of inference pertaining to "practical knowledge" (techné and phronesis) which was opposed to "theoretical knowledge" (episteme). Aristotle contended that when lacking the certainty and necessity of the true premises described in the syllogism and logic, one needed to take point of departure in commonly held beliefs which could be viewed as "law-like" in nature because of their general acceptance as "true." The concept of topics to Aristotle was thus *both* (a) a minutely devised inventory or system of cases, in which one might profitably take point of departure when devising the argument and providing for them and (b) the *theory of hypothesis building and testing* within the area of rhetoric, to which they pertained. Thus when a "belief" is considered of a high level of generality, i.e., being "common sense", it belongs to the *topoi*.

The Philosophical History of the Topics

The ideas of rhetoric conceived by the Ancient Greeks were spread and became known to the rest of the European continent up through the Middle Ages and during the Renaissance. They were distributed through the works of Roman advocates and orators and the treatises they drafted in the language of church and scholars: Latin. A key figure in the history of European rhetoric and philosophy, linking Classical philosophy and Medieval and Renaissance thinking, was the Latin rhetorician Cicero (106–43 BC) and his works *Topica, De Oratore* and *De Inventione*.

Cicero divides his work on the circumstances into two parts: attributes of the person (*personae*) and attributes of the act (*factum*). As attributes of the person, he lists *nomen, naturam, victum, fortunam, habitum, affectionem, studia, consilia, facta, casus* and *rationes* as the topics to consider in building a credible statement of the case, but more importantly, to develop the arguments which should make the main body of the text or speech, and according to which the logical arguments of the case should be elaborated. Attributes of the action are of three kinds: those concerning the performance of the action itself, those related to the action, and those consequent upon the action; only the first of these reflects the system of Hermagoras. In relation to the action itself, Cicero names *locus, tempus, modus, occasio* and *facultas* (Robertson 1946).

The most important discussion of the topics, considering their relation to legal rhetoric, is made by Anicius Manlius Severinus Boethius (ca. 480–524 AD) in the early Middle Ages. Boethius, in his influential writings *De differentiis topicus*, makes the seven topics (or circumstances) fundamental to the arts of prosecution and defense. The *loci* proper to rhetoric are confined to the attributes of the person who is called for judgment and those of the act or statement for which he is to be judged. All arguments, either in the defense of the person or for his prosecution, must be taken from these materials. Thus, Boethius associated the topics with the process of determining the extent of guilt of a person accused of violating legal rules or customs, which may be significant to the adoption of these by papal forums and priests in their work with ascertaining as accurately as possible the magnitude of each sin confessed to them.

The topics arise in a new guise in the pastoral and theoretical theology in the thirteenth century, as Mnemonic verses consisting of variations of Hermagoras questions. This is evident in the 21st canon of the Fourth Lateral Council arranged by Pope Innocent III, which stipulated that confessors should diligently seek out *et peccatoris circumstantias et peccati* (the circumstances of the sin and of the sinner) – resembling to no small extent Cicero's *person* and *act personis et negotiis* – in order that they might justly weigh the sins confessed to them and administer suitable remedies. This appropriation of the topics to theological matters and theological inquisitorial processes can be attributed the theological writings of St. Augustine (Augustine of Hippo) and Thomas Aquinas. Verses made of the questions in different variations, afforded a flexible instrument for interrogation. It allowed the priest to associate conventional theological divisions of the sins with the questions so that they afforded a frame of reference against which to place his theological knowledge. In this way they provided a practical device for spontaneous and quick analysis (Robertson 1946, pp. 6–7).

The topics were then revived by Renaissance rhetoricians, such as Thomas Wilson, *The Art of Rhetorique*, who made an English verse of them: *"Who, what, and where, by what helps, and by whose: Why how, and when, doe many things disclose*" (cit. in Robertson 1946, p. 14). A principle of such fundamental importance to both rhetoric and theology soon spread to other areas of literary work and studies. Italian writers adapted them to historiography. One of the important figures in Renaissance rhetoric Giambattista Vico (1668–1744), trained in jurisprudence, but widely read in Classics, philology, and philosophy, all of which informed his highly original views on history, historiography, and culture, revisited the topics in his mature work: *Scienza Nuova* (or The New Science). In this work he argued for a central role of the topics in all disciplines including the sciences – even mathematics.

Vico's point was that "topics" is not to be learned from a book but is more akin to a disposition whereby one has analogies and arguments at one's hand. Thus for the doctor the topics provide ready mental access to the stock of medical precedents that have historically enabled successful diagnosis and treatment, and to the mathematician pressing the boundaries of knowledge further, the topics consist of the accepted theories preceding the development of new hypotheses. Vico found that the principle described in the use of the topics was to be considered a necessary part of making judgments about everyday life in general, and that their cultivation is required for creative discovery and quick action in *all* disciplines, from physics to law.

In his own time, Vico was relatively unknown, but from the nineteenth century onward where the methodology and philosophical content of rhetorics and linguistics converged with other developments in the history of ideas giving rise to new critical theories in the philosophy of science, his views found a wider audience. Today his influence is widespread in the humanities as well as in the social sciences. Before delineating this turn, tying the knot between the two histories of ideas by describing how they inform the growth of forensic science and the philosophical basis of the forensic process as it looks today, a brief history of the fundamentals in the development of science is called for.

Fundamentals of the Philosophical History of Forensic Science

Science and the Conjectural Model: The Foundation of Forensic Science

Forensic science is intimately related to investigative inquiry through the forensic process. Investigation comes from Latin *investigationem* meaning "a searching into, a searching for." The noun stems from *investigare* "to trace out, search after" which again is composited from *in* "in, into" and *vestigare* "to track, trace" from *vestigium* "footprint, track." The etymology of the word "investigate" carries the seed to an understanding of the philosophical roots of crime investigations and the forensic process, by referring to "tracks and traces" and "footprints," since the roots of science and of medical, legal, and forecasting sciences in particular, may well be rooted in the first efforts of interpreting footprints in the sand or the tracks of wildlife in the forests, with the aim to hunt it down and slay it. The point being that the philosophical basis of the forensic process has a deep-rooted connection to semiotics and other sciences informed by what may be termed the "semiotic paradigm" – which we shall get back to shortly. Firstly, let us briefly return to etymology as a starting point for the philosophical basis of the forensic process stemming from the history of science.

The root of the word "science" is the Latin *scire*, to know, and hence *scientia*, or knowledge. Before the late sixteenth and early seventeenth centuries, the word denoted any kind of knowledge, undiscriminating between different forms or types of knowledge. However, with the Enlightenment and the introduction of scientific method plus the resurgence of learning based on classical theory during the Renaissance, the word *scientia* came to mean knowledge of the natural world and became increasingly associated with natural science.

The Italian historian Carlo Ginzburg traces the trajectory of what he terms the "conjectural or evidential paradigm" throughout European history, attempting to excavate the historical lineage of "disciplines based on reading the evidence" (Ginzburg 1980, p. 14). Since this history is rarely researched, the exposition of this part of the philosophical history of the forensic process is resumed from his seminal piece: *Morelli, Freud and Sherlock Holmes: Clues and Scientific Method* (1980). The roots of this paradigm, Ginzburg argues, can be found well beyond the civilizations of Ancient Greece with the earliest hunters and the skills they developed for reading *signs* in nature to track down the game and in the Mesopotamian cultures different forms of divination. These skills he argues, played a significant role in the invention of writing and the capacity for abstract thinking, which is based on the use of purposefully crafted signs to represent inherent meanings. The common characteristics of these roots of skills leading onward to modern science, are that, both traditions, hunting and divination, "require minute examination of the real, however trivial, to uncover the traces of events which the observer cannot directly experience" (Ginzburg 1980, p. 13). The way hunters used their senses – sniffing, listening, and observing – to give meaning and context to the slightest trace, "in the shadowy and treacherous clearing," Ginzburg argues, endowed them with the ability to make complex calculations in an instant. Hunters inferred from part to whole, effect to cause. The Mesopotamian model of divination gradually intensified this tendency to generalize from basic facts, thus strengthening this mode of inferring cause from effect. The model for explanation and divination decipherable in Mesopotamian texts is one which could be oriented toward past, present, or future, depending on which form of knowledge was called upon. Seeking signs to form knowledge oriented toward the future, was divination proper. Orientation toward the past was related to jurisprudence or the body of legal knowledge. Divination oriented towards the past, present, and future in concert was that of medical knowledge of symptoms. The latter contained all of the orientations by way of its double character of diagnosis, explaining past and present, and prognosis, suggesting the likely future following from the illness running its course.

The conjectural paradigm lies at the root of modern science in general. It is, however, the development into scientific disciplines of these original practical *arts* (hunting, divination, medicine, and law) of deciphering various signs and symptoms as well as individual cases to infer generalized meanings, which serves to characterize the philosophical basis of the forensic process in the Modern Age. It is however not well researched nor generally acknowledged how these artistic aspects of producing knowledge inform the growth of science and ultimately forensic science. Retracing this history is however the goal in the following.

Ancient Greek Philosophy: The Cradle of Modern Science

What characterized the Greek culture and the city-states, of which Modern European legal culture and science are heirs, was the emergence of a group of disciplines which all "depended on the deciphering of various kinds of signs, from symptoms to writing" (Ginzburg 1980, p. 14). Passing on to the civilizations of ancient Greece, these disciplines changed considerably, giving rise to new lines of study such as history and philology while acquiring also independence from older disciplines, such as medicine. In and through these disciplines, one finds the seeds of the development of a general scientific stance or method. Through these disciplines the "body" (e.g., medicine), "speech" (e.g., rhetoric, philology), and "history" were all for the first time subjected to dispassionate investigation, excluding the possibility of divine intervention. An important part of this change can, according to Ginzburg, be ascribed to a model of knowledge acquisition based on symptoms and signs – the evidential or "conjectural model" of knowledge.

This development is most evident in the case of Hippocratic medicine. Hippocrates' model of medicine based its central methods on the concept of "the symptom", in Greek *semeion* (hence semiotics). The central tenet in the Hippocratic model was the idea that by carefully observing and registering every symptom, it was possible to establish precise histories of each disease, despite the fact that the disease as an entity would remain intangible. The insistence on the evidential nature of medicine, prevalent with the Hippocratic model, probably stemmed from a distinction between the certainty of divine knowledge and the provisional, conjectural nature of human knowledge, expounded by the Pythagorean doctor, Alcmaeon of Croton in his work *Peri Physeos* (or On nature). This was the first scientific treatise devoted to the art of medicine. The work itself has not been preserved, but its contents and chief findings have been passed on by commentators and collectors of ancient knowledge such as Aristotle, Theophrastus, and Aetius. From these it is known that Alcmaeon held that if reality was not necessarily clear – then by implication – it was right to proceed by building up knowledge of the whole from the parts, using conjecture.

Proceeding by using conjecture was in fact the most common approach in a number of spheres of activity in Ancient Greece, where physicians, historians, politicians, potters, joiners, mariners, hunters, fishermen, and women in general were held to be adept in the vast areas of conjectural knowledge. This conjectural or semiotic paradigm, continued however to be merely implicit up through the ages, since it was completely overshadowed by Plato’s theory of knowledge, holding sway in more influential circles, hence shrouded in more prestige. Plato’s theory of knowledge emphasized the existence of an ideal (i.e., ideational) world of universal untainted truth existing independently of the human species and lost to the human subject. To Plato, knowledge could only be regained or recollected (*anamnesis*) through inspired contemplation and philosophy.

The Science of the Universal and the Problem of the Individual

While Ancient Greece and the developments of disciplines of dispassionate investigation of various subjects and forms, may be the cradle of modern science, the genesis of *scientific method* is generally acknowledged to be the Middle Ages. The emergence of a truly scientific paradigm is commonly associated with Galileo (1564–1642). The scientific paradigm based on, but outliving, Galileo, provided significant changes in the concepts of “rigor” and “science.” The model of Galilean science was fundamentally different from any of the disciplines using conjecture to form knowledge of their subject. None of these would meet the criteria of scientific inference set out by the Galilean approach. The ancient disciplines were concerned with the qualitative, the individual and the case particular, i.e., the individual body, document or situation itself. Galilean physics were altogether different. It used mathematics and experimental method to gain knowledge of the universal order of nature. This was in stark contrast to the conjectural model of the Ancient disciplines in the results of which there was always an element of chance (Ginzburg 1980, p. 15). In the science that grew from the Galilean model, chance was sought tamed by a dependence on measurement and repetition of results. Creating knowledge by induction from experimental design and observation of results, science increasingly became associated with the need to measure and repeat phenomena in order to draw rigorous conclusions about the phenomenal world. Paradigms following the Galilean tradition were concerned alone with knowledge of the universal and generalizable, while being unable to say anything about the individual and particular. The rise of the scientific paradigm resulted in a division of fields of knowledge which would meet the criteria of scientific inference set by and essential to the Galilean approach, and those who could not. A host of the classical disciplines could not meet or make do with the criteria set for science by the new scientific paradigm. However, one discipline in particular diverged from the rest, proclaiming its scientific status while drawing on a model of inquiry stemming from the conjectural or semiotic model – medicine.

The philosophical history of forensic science leads in many ways directly to an origin in medicine. This is generally acknowledged not least in the fact that subjects of medicine such as the autopsy and toxicology are some of the first forms of knowledge enrolled in the service of law to decide on the issues of identifying and discriminating between a criminal act and a legitimate or natural one. However, there are more subtle philosophical roots to be discerned from the relation between medicine and the forensic process as a process of inquiry and theory of knowledge.

The Rise of the Semiotic Model

The trajectories of thought and ideas informing the move from hunter to the scientific detective are manifold and diverse. It is therefore not possible to delineate them in detail here. However, their different results may be indicated by zooming in more directly on the common denominator through which they all at some point pass – medical science and the paradigms informing it. The roots of this paradigm may, following Ginzburg, be traced to the contemporaries of Galileo and described through a historical event in which the medical expertise was enrolled to decide on the nature of a new phenomenon: a two-headed calf born outside of Rome in April 1625. The event became object for discussion among a group of naturalists in the Vatican Belvedere Garden, which was documented in detail by Giovanni Faber (a friend of Galileo and secretary of the Lincei Academy, a center of a thriving intellectual group founded in 1603 by Frederico Cesi). The discussion was attended besides Faber, by another friend of Galileo, a Cardinal, Pope Urbano VIII, and the pope's chief medical man, a physician from Siena, Giulio Mancini (Ginzburg 1980, p. 20).

Mancini was besides being a brilliant diagnostician renowned for his ability to divine the seat of disease by a rapid look at the patient, also a keen intellectual and the author of a book about art recognition titled: *Considerazioni sulla pittura* (or Some considerations concerning painting as an amusement for a noble gentleman and introducing what needs to be said) (Mancini ed. Marucchi 1956–1957 ref. in Ginzburg 1980). Part of this book was devoted to the recognition of paintings, and set out a method for telling originals from copies, by recognizing the particular strokes of the hand of the master in areas of the painting that were swiftly executed. The underlying assumption of Mancini's views, were never stated, but were nevertheless important to the later development of *connoisseurship* in the century to follow and its role in transmitting the semiotic model to other areas of European cultural life and knowledge, Ginzburg argues. The core assumption of deep relevance to the rise of the conjectural paradigm was that there are ineradicable differences between a canvas painted by the hand of Rafael, for example, and any copy of it (Ginzburg 1980, p. 20).

The discussion between the parties participating in the event represents a historical example of differing perspectives of different disciplines on the individual case and its relation to the general, as well as a moment in the history of a converging of differing paradigms, embodied in the practitioner of medicine and art connoisseur Giulio Mancini. The first question addressed by the group was whether the animal should count as one animal or two. For the physicians the feature distinguishing the individual was the brain, whereas for followers of Aristotle it was the heart.

To some extent, Mancini in the discussion of the two-headed calf represents a point of contact between the divinatory approach of the conjectural paradigm (as a diagnostician and a connoisseur) and the generalizing model of the Galilean approach to physics (as anatomist and naturalist). He represents the emergence of a generalizing paradigm within medicine while at the same time being the skilled artistically inclined diagnostician, reading the signs of the disease in the bodies of the patient or identifying the hand of the master versus that of the copyist in a piece of art. By adopting the role of the physician, Mancini was ascertaining the character of the individual as a "type" (i.e., within a scheme of classification) rather than of the character of the individual calf itself. The physician, in other words, participated with a view to arrive at a more accurate definition of what was normal – and therefore *repeatable* for the individual of the species, i.e., establishing the "common character" of it rather than the one peculiar to it (Ginzburg 1980).

The medical paradigm that developed through the eighteenth and nineteenth centuries thus consisted of two paradigmatic models – the anatomical model and the semiotic model (Foucault and Sheridan 1973). The first aspired for a system of knowledge which could be generalized and ascertained through empirical observation and classification (continuing the natural history starting with Aristotle) and making use of the organ associated with the sciences of the time, which could not be reduced to numbers and mathematical calculation: *sight*. Vision and observations became synonymous with "objectivity" – the defining character of empirical science (Daston and Galison 2007).

The second model of medicine aspired for an effective diagnostics which were able to identify and treat illnesses in individual cases (Foucault and Sheridan 1973) and thus keep the subject alive, healthy, and maintain a productive population to the benefit of the state (Foucault and Sheridan 1979).

The conjectural or semiotic model of medicine was, however, intimately connected with knowledge of the general, in the form evoked by the anatomical model. The latter was based on the dissection of corpses and the description of the anatomy of the human body. This practice was used to create knowledge of the general character of the human body, which in turn could be used as a general norm against which pathology could measure the particular body's deviance or abnormalities to achieve new knowledge of pathologies and their effects and signs in the human body. The anatomical model, and its knowledge of the general achieved from observations and generalizations of many individual bodies was promoted and spread through the medical atlases, which became a significant artifact through which medical science flourished (Daston and Galison 1992). It did so in coexistence and mutual development with a semiotic model of medicine, based in the clinic, and the experience and knowledge of the emergence, courses, symptoms, and effects of different illnesses, which arose from the diagnostician's effort to device the proper treatment in each individual case (Foucault and Sheridan 1973). In a similar way, the discussions and the tiny incisions made in the animal to reveal the internal organs representing the roots of the modern scientific autopsy, which developed during the Renaissance, represents the meetings of divination and science in the anatomical model of medicine. In a review article of the history of the autopsy, King and Meehan (1973) find its roots in former practices of divination using animal organs, the so-called *haruspicy*. Autopsy, which literally means "seeing for oneself," reflects the central role of sight referred to above, as the key component of the scientific method of "observation" and scientific objectivity. "Seeing," however, here has roots of a different kind, namely, that of ancient diviners looking for signs to foretell the future by the reading of organs and tissues of dead animals. The medical atlases of the nineteenth century thus also had a predecessor in Babylonian models of livers with diagrammatic markings used for the instruction of diviners.

The predicament of medical science, that is, its apparent lack of absolute scientific rigor and certainty while aspiring to be a science proper, can be said to have two basic reasons. On the one hand, there is a discrepancy between theory and practice. Theoretically adequate descriptions of particular diseases are not necessarily so in practice, where diseases can present itself in different ways in different bodies. On the other hand, knowledge of disease in the *living* body remains indirect and conjectural, since it is per definition out of reach (Ginzburg 1980, p. 21).

Medicine and the Birth of the Detective

It was however from the diagnostic branch of medicine that the ideas giving birth to both detective fiction and forensic science originated. In the late nineteenth century, there was a general upsurge in the semiotic paradigm, giving birth to the practice of art connoisseurship, the theories of psychotherapy, and the detective novel. There are actual biographical and inspirational links between the key figures representing each of the three, in the form of Giovanni Morelli, Sigmund Freud, and Arthur Conan Doyle. The connecting factor between them is *medicine*. Freud was a doctor, Morelli had a degree in medicine, and it is generally acknowledged that the inspiration for Sherlock Holmes was Sir Arthur Conan Doyle's esteemed professor in medical school (he was a doctor before he started writing) Professor Joseph Bell. Bell was renowned for his diagnostic abilities, and there are key passages in the stories of Sherlock Holmes, for example. *The Cardboard Box* (1892), where Holmes uses the actual methods of Morelli. Furthermore the peculiar similarity of the activities of Holmes and Freud have been discussed in literature (e.g., Marcus 1976).

At the same time however, they represent a point in history where the semiotic model (or the conjectural paradigm) resulted in different ideational developments, all however sharing a common feature, namely, that they were based on an interpretive method where one takes the evidence at hand as "signs" which stands for something else otherwise inaccessible for observation. In psychotherapy, art connoisseurship, and detective fiction, methods were devised which made tiny details the key to a deeper reality or knowledge hereof that are inaccessible by other methods. These details may be *symptoms* for Freud, *clues* for Holmes, or *features* of paintings for Morelli, but in all three cases they are seen as evidence to inferences about the nature and characteristics of something hidden to the inquirer: the psyche, the identity of the criminal and the structure of the criminal event, or the identity of the painter and the characteristics of his paintings, behind a given piece of art. Sir Arthur Conan Doyle's character Sherlock Holmes has been deemed inspirational for one or more of the pioneers in forensic science in the area of criminalistics, such as Bertillon and Locard. Whether or not this is a historical fact, we encounter also in the foundation of the field of forensics the medical common factor, as Locard's teacher and mentor was Alexandre Lacassagne, a physician and chair of Médecine Légale de la Faculté de Lyon, and, Bertillon the son of a medical professor.

However, developments within the natural and social sciences occurring at the same time were also influenced by the conjectural paradigm and the problem of the individual. Thus the semiotic or conjectural paradigm generated forensic science from several trajectories of thought, which in concert gave rise to the idea of the scientific detective and the forensic process.

The Social Sciences and the Rise of Technologies of Government

The problem of the individual in the generalizing Galilean model of science was encountered from another field of knowledge, namely, that of the emerging social sciences. During the eighteenth and nineteenth centuries, a tendency evolved for the state to impose a close-meshed net of control on society: one based on knowing its individual members and submitting them to forms of surveillance that became increasingly more subtle and that was based on knowledge of its population, statistical as well as biographical (Foucault 1970; Foucault and Gordon 1980; Foucault et al. 2007, 2008; Foucault and Sheridan 1979).

With the emergence of a capitalist economy based on production in the late eighteenth and early nineteenth century, new concepts of property and the introduction of a still greater number of punishable offenses and punishments of more severity were introduced. Thus, prison systems were built up to contain the resultant growing population of criminals. With the rise in the number and types of crimes came the problem of identifying repeat offenders. This problem became a specific subset of the more general one of keeping a complete and general track on the whole of society, that is, keeping order through knowledge. It also represents the point where the models derived from Galilean physics start to impinge on and interact with the semiotic model of medicine, in the development of new forms of control and methods for identification, devised in the same period of the 1800s as the detective novel, psychoanalysis, and connoisseurship evolved.

This was evident in two competing systems for identification initiated or developed by Francis Galton (1822–1911) and Alphonse Bertillon (1853–1914), respectively. In both cases, however, science meets conjecture to give rise to the methods of scientific investigation based on classifications of the individual and interpretations of effects of specific causes in particular cases.

In the first case, the system of Bertillionage, a classification scheme for identifying repeat offenders through anthropometric measures plus the description and classification of physical characteristics, was based on the idea of probability statistics used within astronomy and physics to get a measure of errors, introduced to the study of society and crime by Adolphe Quetelet (1796–1874) in his conceptualisation of a "social physics". Quetelet's work provided a major inspiration to Bertillon and the anthropometric method, by suggesting that while single measures might be just probative, the higher number of specific measures made per individual the higher the probability of identification.

In the second case, the system of fingerprint identification introduced by Francis Galton, yet not originally discovered by him (for a history of fingerprint identification, see Cole 2001; Sengoopta 2004), was based on the idea that the individual has an identity that may be recognized in his every characteristic, even the most imperceptible and the slightest, and that there will be an internal norm or "typus," which maintains the variety of each species within its limits. The philosophical input, as well as the study of fingerprints as the empirical example of the rule, was made by a physiologist founding the subject of study of organ tissues: Purkyné in a work in 1923.

Bertillon, being the son of a medically educated statistician and inspired by an influential figure in the emerging science of society especially criminology developed by Adolphe Quetelet, represents the meeting point of the conjectural model derived from medical semiotics and that of divining probability through the science developed to this end: statistics. Galton's discoveries of the individuality of the fingerprint and its possible practical implications, on the other hand represent the point of contact between old divinatory traditions; the problem of identification of the complex society and the risks posed by the transgressor of laws and regulations, and the anatomical model of medicine and its attempt at understanding the relation between individual and general type, in order to diagnose individual symptoms and secure the proper treatment in each individual case.

Forensic science arose from the interconnections of these ideas and trajectories of thought spanning detective fiction, graphology, art connoisseurship, statistics, sociology, criminology, administrative practices, psychology, linguistics, history, etc., as they were developed and promoted in the works of Hans Gross, Alexandre Lacassagne, Edmond Locard, Alphonse Bertillon, Francis Galton, and many more in a range of subdisciplines to emerge within the field.

New Philosophies of Science: Conjecture and "The Scientific Man"

In the late nineteenth century and early twentieth century, the philosophy of science saw new developments which were influenced by processes rooted in the conjectural or semiotic paradigm. One of the ways in which semiotics was developed into scientific theories and new approaches to knowledge were through the ideas of American Pragmatism. In addition to being an exemplification of the broader upsurge and explication of *semiotics* as a theoretical discipline, (which itself developed into a range of different philosophical theories, for example, critical theory, post-structuralism, hermeneutics, reflexivity, etc.) this particular theoretical paradigm has overt links to the developments of forensic science. The credited founder of Pragmatism Charles Sanders Peirce (1839–1914) was deeply inspired by the detective figure in his exposition of his thoughts on reasoning and the "scientific man", which again was part of a more general theory of signs and sign processes as a distinct theory of knowledge (Eco and Sebeok 1983). Besides, Peirce was and is generally acknowledged as a natural scientist, above being a philosopher, although his philosophy of science is seminal.

Based among other on the figure of the scientifically reasoning detective fashioned by Conan Doyle, Peirce developed a new concept of inference – abduction – which served to integrate the approach to science initiated with Galileo and the necessity of using incomplete knowledge and conjecture – not least in face of lack of enough data – to form hypotheses and predictive conditionals to be tested as a means of approaching what could qualify as secure beliefs. Abduction is Peirce's designation of an inference which is made from an observation to its possible explanation; that is, from evidence to a hypothesis or conclusion – where the phenomenon to be explained, through the evidence of it observed, itself constitutes a significant part of the reason to presume that the explanation is correct (Lipton 2000).

Peirce held that all inquiry, including science, is to be described as a struggle to move from irritating, inhibitory doubt born of surprise, disagreement, and the like, toward the reach of a secure belief. Belief being defined as that on which one is prepared to act, rather than as the pursuit of truth per se. Scientific inquiry, to Peirce, was thus just one part of a broader spectrum and spurred, like inquiry generally, by genuine doubt, rather than by mere verbal or hyperbolic doubt, which he held to be fruitless. Having grouped all forms of inquiry under the same pursuit, he also devised a theory of inquiry and logic, which introduced a new logic of inference to the description of science.

Peirce held that abduction, induction, and deduction made a complementary whole which together constitute scientific method. None of the modes of inference could be dispensed with – since abduction to Peirce is the only way new knowledge can arise. Logic was based on all the modes of inference, including abduction, which he perceived as a precondition for the development of science. Peirce also replaced the conception of science as a collection of certified truths or systematized knowledge with a definition of science as an inquisitorial attitude, the defining characteristics of science to be found in the approach to inquiry and the controls put on it rather than in the contents of its canons.

Being deeply inspired by Aristotle, whose concept of *apagoge* seems to entail all the things that Peirce describes as retroduction or abduction and who may be the original inspiration for his thinking (Aliseda 2006), he picks up on the same theme that Vico (as mentioned earlier) raised during the Renaissance: that all actions, whether practical decisions, medical diagnosis or scientific inquiry make use of the principle of the topics (i.e., those culturally formed beliefs, habits of experience and expectations to the order and workings of the empirical world) to form judgments and beliefs on which to act whether practically or theoretically (Miner 1998). One can legitimately speak of pragmatism as a reinterpretation of Greek philosophy about knowledge and thus a rekindling with the roots of the development of the sciences and their conjectural roots.

While Peirce is not a prominent figure in the canons of forensic science – if at all present, the practices, which inspire his philosophical positions, are indeed those of the forensic practitioner. It therefore seems in keeping with the micro-history of science and the conjectural paradigm delineated by Ginzburg, to point to the pragmatist philosophy as an example of trends in the philosophy of science, which are informed by the conjectural and semiotic paradigm running from Ancient Greek philosophy to some of the developments in thinking about science making way from the nineteenth century and onward, and which are in keeping – however subtle and mutely – with the philosophical basis of the forensic process.

Conclusion and Further Perspectives

The Forensic Process: Conjecture *and* Science or Conjectural Science?

The philosophical basis of the forensic process is not to be discerned as a linear development of thought but rather as a meshwork of ideas. However, the influence of the ideas delineated is clear considering the principles brought to bear on the forensic process by the founding fathers and key figures in forensic science, for example: (a) the principle of transfer: that two physical objects coming into contact with each other will result in minute traces, imprints or effects of this contact (also known as the principle of exchange) commonly attributed to Edmond Locard (1928, 1930), but by him attributed to the inspiration from Alexandre Lacassagne; (b) the goal of individualization based on the identification and/or classification of the physical or chemical nature of the evidence (Saferstein 1998); (c) the idea of classification/individualization and the attempt to determine the source of evidence (Kirk 1963); (d) the idea of association linking person to crime scene and leading to inferences of source and target (Osterburg 1968), and (e) the purpose of reconstruction of past events (DeForest et al. 1983) (for an overview description, see Inman and Rudin 2001). All the central ideas of forensic analysis are based on a combination of topical inspiration (i.e., attempts at answering the 6W's essential to legal deliberation) and the foundational concepts of the semiotic paradigm that infers causes from effects and which on the basis of classifications of the nature of the physical world discerns individual characteristics of the particular situation, object, or document. Characteristics which in turn serves to discern the history, meaning, and causes of the phenomenon under scrutiny, (i.e., of the physical evidence left over from an event (possibly criminal) passed).

In much the same way as the clinician of early modern medicine, the forensic practitioner may be said to embody a point of contact between two differing yet cognate paradigms – that of semiotics and that of Galilean natural science. Each has differing goals and criteria for valuing truth claims: one related to abstract disinterested truth and one related to practical effects and rationality. Like the physicians of the late nineteenth century, the forensic practitioner is a "diagnostician" and "expert connoisseur" with respect to assisting the investigative inquiry and translating the topics and questions of law into scientific questions. He is also a "naturalist" and "empiricist scientist" with respect to analyzing artifacts believed to adhere to an incident under legal scrutiny and providing conclusions regarding their identity based exclusively on knowledge obtained through observable and verifiable data. The first form of knowledge tends to be unspoken and does not easily lend itself to formalization, since nobody learns how to be a connoisseur or diagnostician simply by applying the rules.

The allusion to one of the key works in Modern scientific philosophy by Karl R. Popper: *Conjectures and refutations: The growth of scientific knowledge* (1963) in the heading above is intended as a pun on words which may serve as the key points of further perspectives, since the question is not whether conjecture is part of what informed the growth of forensics but rather: How much conjecture is allowed and under what circumstances for forensic science to qualify as *science?* The key concern of the forensic sciences and thus the key philosophical problem with which it grapples is that of *individualization* (Kirk and Thornton 1974). Forensic science – arising out of the conjectural paradigm and the semiotic model of medicine – is in many ways the science of the individual *par excellence*. Seeking from beginning to end of the forensic process and through the fields of knowledge informing the practical process of *forensic inquiry* (i.e., the forensic process) answers, which may provide individuation of both people and cases – of "who" and "what" of the Ciceroean topics. In this way, the forensic process is heir not only of the key topics identified by Cicero for the presentation of a legal case but also of the quest of the sciences build on the Galilean model and the problems facing these in their attempt to explain and describe the particular and the characteristics of the individual, and the ways that phenomena known through theoretical classifications may play out in particular situations, hereby ascertaining the span of characteristics to be associated with the phenomena in a given situation and thus ascribed to it.

This problem is becoming increasingly acute to the forensic sciences, due to emergence of debates in scientific circles of is scientific status. Yet in the philosophical history of the forensic process of inquiry, can also be identified ideas and principles stemming from a semiotic paradigm, which has grown large in the human and social sciences, and which holds promise of a new formulation of a model of science, which may provide an alternative route to the problems faced, by introducing a concept of scientific rigor which is more "elastic."

Forensic sciences is finding itself in a position where new developments are imminent, if not already in process. Developments which may prove decisive for the future role and status of forensic evidence, and which springs exactly from the problem having faced sciences developed in the image of Galilean physics, since the beginning of the Modern Era. This dilemma is coined by Ginzburg (1980) as that of choosing between: (a) achieving significant results from a scientifically weak position, or (b) to establish a strong scientific position, but get meager results.

Rethinking and revisiting the philosophical basis of the forensic process, and turning to key thinkers within this paradigm for new approaches to the dilemma may provide an alternative route bypassing the deadlock of the debates. The theories, models, and scientific content of the conjectural model that might inspire new ways of theorizing and conceptualizing the foundational and defining principles of the forensic process are still however largely unexcavated, even though it provides the philosophical basis and seed of development for a broad range of contemporary disciplines in all areas of science.

Overview

In most if not all criminal investigations, the collection, examination, and interpretation of physical evidence plays a major role. Material traces, whether they are of a physical, chemical, biological, or digital nature, may serve to suggest or support plausible scenarios of what might have happened at a possible scene of crime. Ultimately, they may be instrumental in distinguishing between the rival scenarios that the judge or jury will have to consider in arriving at the final verdict: Was the crime committed by the suspect in the way described by the prosecution, was it someone else who did it, or was no crime committed in the first place?

Individualization of physical traces, like DNA, handwriting, or fingerprints, logically amounts to a process of inference of identity of source between a crime scene trace and some reference material whose origin is known. While its aim is to uniquely identify the source of the trace and many criminalists, most notably the dactyloscopists, have long proceeded as though individualization of traces is a routine affair, there is no scientific basis for this claim or for the methods by which individualization or *source attribution* is supposedly achieved. It is largely as a result of the advent of forensic DNA analysis and the conceptual framework associated with the interpretation of DNA evidence that the forensic community has come to appreciate the "individualization fallacy" (Saks and Koehler 2008) and the consequent need to adopt what has come to be known as a logical or Bayesian approach to the interpretation of technical and scientific evidence.

A comprehensive model for the assessment and interpretation of forensic evidence along Bayesian lines was developed in Britain by Ian Evett and colleagues at the Forensic Science Service (Cook et al. 1998a, b; AoFSP 2009; Evett 2011). It defines a hierarchy of propositions to be addressed in casework which is composed of three levels and extends over two domains. The first domain, that of the forensic expert, involves propositions at the level of source and at the level of activity. Propositions at the level of source address the question of the origin of the trace, while propositions at the activity level relate to the question how and when the trace arose. Propositions formulated at the third level, termed the level of offense, belong exclusively to the domain of the trier of fact and relate to the ultimate, legal issue whether an offense was committed and if so, whether it was committed by the defendant.

While the Bayesian approach provides an excellent framework for the evaluation and interpretation of expert evidence in that it helps define the relevant questions and draws a sharp line between the domain of the expert and that of the trier of fact, it is not an intuitively easy approach. A clear and transparent exposition of the method used by the expert to determine the weight of the scientific evidence is therefore of the essence. Recent research as well as court decisions suggest that if this information is lacking judges and juries will be hard put to assess the evidence at its true value.

Criminalistic Processes: Individualization Versus Identification

In order for material traces like DNA to be able to contribute to criminal investigations in the form of technical or scientific expert evidence, there are various questions that need to be addressed. One question seeks to determine the *nature* or *substance* of the trace material. Are we dealing with blood, gunshot residue, MDMA, or hair? The process by which this type of question is answered is called *identification.*

A second process, *classification*, takes the first process one step further. It is undertaken to determine whether the crime scene trace can be assigned to a particular group or class of similar objects or substances. Examples of classification processes in the forensic sciences are: the classification of blood into human versus animal blood; of hair into animal versus human hair and, beyond that, the (sub)classification into body, head, and pubic hair; the classification of fibers into man-made versus natural fibers; the classification of firearms and cartridges in terms of their make and caliber, or that of shoes according to size, make, model, sole pattern, etc.

A third process seeks to identify the *origin* or *source* of the trace material. Is it possible to relate the trace or the carrier of the trace to a particular person or object? This process, the determination of the unique source of a trace, is technically called *individualization* and is often seen as the process that lies at the heart of the criminalistic effort. Although, in common parlance, the term "identification" may also be used for the process of source determination, as in a phrase like fingerprint identification or indeed in the title of this entry, the proper technical term for this process is individualization.

A fourth question concerns the relation of the trace material with the crime by trying to establish *how* and *when* the trace was generated. This process, which focuses on the nature of the *activity* by which the trace material arose, is often referred to as *association.*

All four processes, identification, classification, individualization, and association, are essential elements of the larger process of *reconstruction* (Inman and Rudin 2000): the attempt to create coherent scenarios of the chain of events that constitutes the incident under examination on the basis of the available evidence.

Particularly in the context of DNA evidence, both "source level" questions of the type "Whose DNA is it?" and "activity level" questions of the type "How and when did the cell material get there?" are of paramount importance, as it is only on the strength of the combined answers to these questions that a link can be established between a particular person or object and a possible crime.

Conclusions in Individualization

> Criminalistics is the science of individualization (Kirk 1963, p. 235)

Individualization may be defined as the process undertaken to establish the unique source or origin of a particular material trace. Put simply, it tries to answer questions like "Whose DNA/handwriting/fingerprint, etc. is this?" According to Paul Kirk (1902–1970), one of the founding fathers of criminalistics, it is individualization that marks off criminalistics as a science from other sciences.

While the goal of criminalistics is always the same, there are considerable differences in the methodology used and the conclusions formulated by the practitioners of the various forensic disciplines to achieve this aim. By and large, three groups may be distinguished in terms of the way in which the conclusions of a comparative trace examination are expressed. First, the conclusions may directly address *the probability of the source hypothesis* given the evidence. This tends to be the case in dactyloscopy and typically also still holds for most other types of source level trace examinations. An important exception is DNA, where the conclusions expressed relate to *the probability of the evidence* under a particular hypothesis rather than to the probability of the hypothesis given the evidence. Second, unlike dactyloscopists, who will generally express their conclusions in categorical terms, forensic experts in most other fields of trace examination will tend to express their conclusions in probabilistic terms, in either a verbal format or in a quantitative format, as in DNA typing.

Schematically, where C stands for categorical, P for probabilistic, E for statement of the probability of the evidence, and H for statement of the probability of the hypothesis, the following distinctions may be noted:

Dactyloscopy (fingerprints)	C	H
Other physical traces (e.g., *handwriting, fibers, shoe prints, tool marks)*	P (and verbal)	H
DNA (biological traces)	P (and quantitative)	E

For example, the dactyloscopist will conclude that a finger mark does or does not originate from a particular (person's) finger, thereby making a categorical statement of the probability of H, the source attribution hypothesis. But the handwriting expert will – traditionally anyway – typically conclude that the questioned writing *probably/very probably/with a probability bordering on certainty* does – or does not, as the case may be – originate from the writer of the reference material, thereby making a (verbal) probabilistic rather than a categorical statement of H, the source hypothesis.

By contrast, the DNA expert will first determine whether the source material *could* originate from the person whose reference profile is being compared with that of the crime scene sample. If the profiles of the crime scene material and the person under investigation match, the expert will state that the crime scene material *may* originate from this person. To indicate the significance of this finding, the expert will add how likely the evidence, i.e., a matching profile, is if the crime scene material originates from the "matching" person under investigation as opposed to a random member of the population. Alternatively, the expert may report the estimated frequency of the profile in the relevant population. A third way to report the weight of the evidence is in terms of the so-called random match probability of the profile: The probability that a randomly chosen member of the population who is not related to the donor of the cell material or the matching suspect will match the crime scene profile.

It appears therefore that while the experts in the diverse fields are answering the same question, that of the origin of the trace, they will tend to use different conclusion formats to express their findings. The notions underlying these differences are explored below.

The Classical Approach to Individualization: The Underlying Principles

The traditional forensic approach to trace individualization is based on four – partly implicit – principles:

1. The principle of transfer of evidence
2. The principle of the divisibility of matter
3. The uniqueness assumption
4. The individualization principle

The Transfer Principle: "*Every Contact Leaves a Trace*"

The first of these, the *transfer principle*, is captured in the phrase "Every contact leaves a trace." It expresses the notion that in the commission of criminal acts, invariably some traces will be left on the scene. It provides a theoretical basis for the generation of traces and a principled argument for the examination of the crime scene for traces. This insight was formulated most clearly by the Frenchman Edmond Locard (1877–1966), who was the first director of the *Laboratoire de Police Scientifique* in Lyon, France, in 1912 and is universally acclaimed as one of the fathers of criminalistics. While Locard was primarily thinking of the transfer of microscopic traces like dust, dirt, nail debris, or fibers, as left in the commission of the more violent type of crime, Locard's exchange principle, as the principle is also commonly referred to, is also applicable to traces that arise in the context of less violent crimes as well as to latent (hidden), patent (visible to the naked eye), or plastic impression evidence, such as finger marks, tool marks, footwear marks, or striation marks on bullets and cartridge cases. In the latter case, it is not so much the physical matter that is deposited at or taken away from the crime scene that is of interest but the patterns or shapes that are transferred from donor (object) to recipient (object). In addition, the principle increasingly applies to so-called *contact traces*, as in DNA evidence. Here, terms like "trace DNA" or "touch DNA" are used to refer to cell material and debris transferred through skin contact, which may arise as a result of regular use, as on a watch, from a single, firm contact, as on a tie wrap or strangulation cord, or from a single touch, as on a glass surface (Raymond et al. 2004).

As Locard observed at the time, transfer may go either way. Traces like glass fragments, blood stains, hairs, or fibers are left at the crime scene by a *donor* and may be picked up from there by a *receptor*. If (part of) the material collected is subsequently left by the receptor and picked up by a second receptor, we speak of *secondary transfer*. For example, fibers or DNA material picked up by A from B's clothing may be transferred from B's clothing to chair C, and eventually end up on the clothing of D. In principle, forms of tertiary and quarternary transfer might also occur.

The Divisibility of Matter: *"Matter Divides Under Pressure"*

The second underlying principle of criminalistics, that of the *divisibility of matter*, was explicitly defined only relatively recently by the American DNA experts Keith Inman and Norah Rudin (2000). It explains *why* transfer can play such an important role in the generation of traces. Although the principle as such is fairly obvious, it is of considerable importance for a proper understanding of the relation between the way traces arise and their interpretation. In an article entitled "*The origin of evidence*," Inman and Rudin (2002: p. 12) describe the process of the division of matter and its results as follows:

> Matter divides into smaller component parts when sufficient force is applied. The component parts will acquire characteristics created by the process of division itself and retain physico-chemical properties of the larger piece

This mechanism has important implications for the relation between traces and their sources. They are:

> *Corollary 1* Some characteristics retained by the smaller pieces are unique to the original item or to the division process. These traits are useful for individualizing all pieces to the original item.
>
> *Corollary 2* Some characteristics retained by the smaller pieces are common to the original as well as to other items of similar manufacture. We rely on these traits to classify them.
>
> *Corollary 3* Some characteristics from the original item will be lost or changed during or after the moment of division and subsequent dispersal; this confounds the attempt to infer a common source. (Inman and Rudin 2002, p. 12)

While the two principles discussed so far relate to the creation or *generation* of traces, the following two principles are central to the *interpretation* of traces, as viewed in the traditional approach to trace individualization.

The Uniqueness Assumption: *"Nature Never Repeats Itself"*

The first of these is the uniqueness assumption. It is nicely captured in the phrase "Nature never repeats itself" and essentially simply states that no two objects are identical. Or, as Kirk and Grunbaum (1968, p. 289) put it:

> Now most students believe that all items of the universe are in some respect different from other similar items, so that ultimately it may be possible to individualize not only a person but any object of interest. This effort is the heart of criminalistics.

The uniqueness assumption was probably most vigorously championed by the fingerprint fraternity. However, before the fingerprint was discovered as a means to verify a person's identity and subsequently came to be used for forensic purposes, the same principle provided a basis for forensic anthropometry, which was developed by the Frenchman Alphonse Bertillon (1853–1914).

Anthropometry. Anthropometry was developed by Bertillon primarily to identify repeated offenders. The method is based on an assumption derived from the Belgian astronomer and statistician Adolphe Quetelet (1796–1874) that no two human bodies are equal. A founder of modern quantitative sociology, Quetelet is not only believed to be the inspiration for the frequently cited phrase that nature does not repeat itself but must also be credited with the definition of the Quetelet index, which, since 1972, has come to be more widely known as the BMI or Body Mass Index.

The anthropometric method consisted in recording the dimensions of an arrestee's body in terms of seven and later 12 measurements of a fixed set of parts of the body, including total physical height, the length and width of the head, the right ear, and the left foot, which were believed to be constant for adult members of the human race. In 1883, Bertillon succeeded in identifying a repeated offender by comparing his measurements with anthropometric data recorded earlier. Later in his life, Bertillon was the first to make a fingerprint identification in a murder case on the European Continent (Thorwald 1965, p. 83).

The assumption of uniqueness, together with the temporal stability of fingerprints, or friction ridge patterns as they are more technically called, is often adduced as a theoretical ground for the justification of the use of categorical conclusions of origin, as has typically been common if not universal practice in dactyloscopy. However, as Saks and Koehler (2005, p. 892) put it, in formulating these categorical conclusions, dactyloscopists in fact rely on a flawed notion of "discernible uniqueness." The real issue in source attribution is not whether all possible sources can be distinguished from each other in principle, which is what the uniqueness assumption – presumably correctly – implies. The crucial question is whether a trace, which, due to the factors described under the divisibility principle, will inevitably differ to some extent from its particular source, can be attributed – with certainty, or, failing that, with any reliable degree of probability – to that source.

The Individualization Principle: *"That Can't Be a Coincidence"*

The fourth principle in the traditional approach to trace individualization states that a conclusion of (probable) common origin of a trace and reference material – as in a comparative examination of a questioned handwriting sample and a reference sample from a known person – may be arrived at if there are so many similarities of such significance that their occurring together by chance may be practically excluded. As the American handwriting expert R.A. Huber (1959–1960, p. 289) put it in his definition of what he called "the principle of identification":

> When any two items have characteristics in common of such number and significance as to preclude their simultaneous occurrence by chance, and there are no inexplicable differences, then it may be concluded that they are the same, or from the same source.

The suggestion here is that a criterion, i.e., "of such number and significance," may be defined which will provide a principled and objective way to determine that the possibility (or probability) that two objects meet this criterion by chance can be excluded. Such a criterion is not only not feasible in practice, as it begs the question what number and what degree of significance is required, but it also lacks a theoretical basis in that it ignores the essentially inductive nature of the individualization process.

The reason why individualization is problematic from a theoretical point of view is that any attempt to identify the unique source of physical, biological, or pattern evidence like finger marks, footwear marks, DNA, or handwriting is typically frustrated by the induction problem. We cannot, solely on the strength of even an extreme degree of similarity between trace and reference material, conclude that a particular trace must have originated from some specific reference material to the exclusion of all other possible sources, unless we have been able to examine all these alternative sources and eliminate them categorically.

To begin with, the population from which a finger mark or a questioned handwritten text actually originates is typically indefinite in size and frequently largely unavailable for examination. But even if it were possible to examine a large number of potential writers or fingers, we could not exclude finding one or more whose reference handwriting or fingerprint would show a similar or even greater degree of similarity with the questioned handwriting or finger mark than did the reference sample of the suspect. Since this possibility cannot be excluded, the individualization problem tends to be impossible to solve and in that sense is strongly reminiscent of that of Popper's white swans: We cannot conclude that all swans are white unless we have been able to examine all swans (Popper 1959). Nor for that matter can we conclude that the trace *probably* originates from the reference material with which it shares many features. Indeed, although the observed degree of similarity between trace and possible source will tend to make the hypothesis of identity of source *more probable* in relative terms than it was before the comparative examination was carried out, similarity is neither a sufficient nor even a necessary condition for identity of source in absolute terms.

It is interesting that the individualization criterion as captured in the phrase "That cannot be a coincidence" is essentially similar to that used in traditional, standard textbook statistical significance testing. In this approach, the result of a hypothesis test is termed significant if it is unlikely to have occurred by chance. More specifically, the so-called null hypothesis that the result is due to chance may be rejected if the obtained result is less likely to occur under this hypothesis than a predetermined threshold probability of – frequently – 1 or 5 %. Like the traditional identification paradigm, this approach is also coming in for more and more criticism, partly because it also fails to take account of the probability of the result under the alternative hypothesis.

Class Characteristics Versus Individual Characteristics

In an attempt to overcome the induction problem traditional forensic identification, experts frequently rely on the distinction between class characteristics and individual characteristics. For example, all firearms of a particular make and caliber may leave the same markers on a cartridge or bullet, thereby making it possible to identify the type of weapon on the basis of the class or system characteristics that the particular type of firearm is known to leave. However, a certain configuration of striation marks left on a bullet may be distinctive for a particular weapon. As Thornton and Peterson (2002) put it:

> Class characteristics are general characteristics that separate a group of objects from a universe of diverse objects. In a comparison process, class characteristics serve the very useful purpose of screening a large number of items by eliminating from consideration those items that do not share the characteristics common to all the members of that group. Class characteristics do not, and cannot establish uniqueness.
>
> Individual characteristics, on the other hand, are those exceptional characteristics that may establish the uniqueness of an object. It should be recognized that an individual characteristic, taken in isolation, might not in itself be unique. The uniqueness of an object may be established by an ensemble of individual characteristics. A scratch on the surface of a bullet, for example, is not a unique event; it is the arrangement of the scratches on the bullet that mark it as unique.

Unfortunately, the definition of individual characteristics is circular. They are defined as characteristics that are – collectively – capable of establishing uniqueness. But whether an ensemble of individual characteristics is unique is itself an inductive question: We can never be sure that a feature or combination of features is unique, until we have observed all relevant objects, which is impossible.

What practitioners of traditional forensic identification sciences really do is perhaps best described by Stoney (1991), who used the image of the "leap of faith" as the mechanism whereby the forensic scientist actually establishes individualization, as in dactyloscopy:

> When more and more corresponding features are found between the two patterns scientist and lay person alike become subjectively certain that the patterns could not possibly be duplicated by chance. What has happened here is somewhat analogous to a leap of faith. It is a jump, an extrapolation, based on the observation of highly variable traits among a few characteristics, and then considering the case of many characteristics. [] In fingerprint work, we become subjectively convinced of identity; we do not prove it.

Ultimately then, in traditional identification disciplines, in reaching a conclusion about the probable or categorical origin of the trace material, the expert delivers an essentially subjective opinion. When informed by adequate levels of training, experience, and expertise, this conclusion will frequently be correct, but it must be clear that the expert becomes convinced of the (probable) origin of the trace. He does not "prove" it: There is no logical basis for the conclusion.

The Logical Approach to Individualization: The Concept of the Likelihood Ratio

By contrast, in the logical approach, the expert does not primarily seek to determine the probability of the source or activity hypothesis. Instead, the purpose of the comparative examination is to determine the likelihood of the evidence under two mutually exclusive propositions or hypotheses. Suppose we find a size 14 shoeprint at a crime scene and a suspect emerges who takes size 14. It will be clear that the shoe size information by itself gives us insufficient basis to say that it was the suspect who left the print rather than one of the other shoe size 14 wearers in the area (or beyond). The mere fact that the suspect wears size 14 shoes does not make him more suspect than anybody else with this size shoes. At the same time, it is clear that the finding looks incriminating. Or is it a mere coincidence?

The likelihood ratio (LR) provides a principled way to address this question. To calculate it, we need to determine the ratio of the likelihood of a size 14 turning up at the crime scene under two rival hypotheses: (1) The shoe mark was left by the suspect versus (2) the mark was left by a random member of the relevant potential donor population. We know that the likelihood of finding a size 14 mark if the suspect left it (and assuming he does not occasionally or otherwise wear a different size shoe) is 1, or 100 %. To assess the likelihood of finding a size 14 shoe mark under the alternative hypothesis that a random member of the relevant population left the print, we need to know what percentage of that population takes a size 14 shoe. Suppose we know this figure to be 4 %. We can now calculate the likelihood ratio of the evidence under these two competing hypotheses, which in this case would amount to 100/4 = 25.

We can paraphrase this result by saying that the footwear evidence is 25 times more likely if the suspect left the mark than if a random member of the population left it. We can also say that the evidence makes it (25 times) more likely that the suspect left the mark than we believed was the case before we obtained the evidence. But we cannot on the basis of the shoe mark evidence alone pronounce upon the probability of the hypothesis that the suspect left the mark in absolute terms. Alternatively, what we can say in a case like this is that an LR of 25 reduces the group of potential suspects by a factor 25, leaving just one potential suspect on average for every 25 potential suspects considered before the shoe print evidence became available.

Similarly, when applied to DNA evidence, the likelihood ratio is a measure of the weight of the evidence and may be seen as an indication of the extent to which the uncertainty about the source hypothesis is reduced by the evidence. If, for example, the matching profile is known to have a frequency of 1 in a million in the relevant population, the LR of the matching DNA evidence may be reported as one million: It is the ratio of the likelihood of the evidence under the hypothesis that the person under investigation is the donor of the DNA material, i.e., 1 (or 100 %) divided by the likelihood of the evidence under the alternative hypothesis that the DNA originates from a random member of the population, i.e., 1/1,000,000. The conclusion implies that the evidence is a million times more likely if the crime scene sample originates from the donor of the reference material than if a random member of the population were the donor of the crime scene sample. It is only if there is no match that the DNA expert may make a – negative – categorical statement of the probability of the hypothesis.

Discrete Versus Continuous Variables

In the examples involving DNA and shoe sizes discussed above, the variables of interest are discrete or categorical in nature and the similarity between trace and reference material could be said to be either complete or to be entirely absent: The DNA profiles and the shoe sizes are the same or they are different. If they are different, the suspect's shoe or body can be eliminated as the source of the trace. However, in many cases, the correspondence between trace and source will not be perfect. Many variables are not discrete (like DNA markers or shoe size) but continuous. Examples are quantitative variables such as length, weight, or shape. For these variables, there will always be a difference between trace and reference materials because in both cases, we are dealing with samples that will at best only approximate the "true," i.e., average, population value for the feature of interest.

Again, handwriting analysis may serve as a case in point, but the same holds for any other type of trace with continuous properties like tool marks, fibers, speech, glass, or paint. Both the questioned writing and the reference writing must be seen as samples taken from the indefinitely large population of handwriting productions that the writers of these samples are capable of producing. This means that any marker that is examined, like the shape and execution of the letter *t* or the figure *8*, will exhibit a certain degree of variability even within samples originating from the same source. However, traces originating from a single source will typically show a relatively small degree of *within-source* variation, while samples of material originating from different sources will typically show a relatively larger degree of *between-source* variation. As a result, in these cases, the numerator of the likelihood ratio will not be 100 % or 1, but say 80: A degree of similarity as great as that found between trace material and reference material will then be found in 80 % of cases if both originate from the same source and in say only 10 % of cases if trace material and reference material originate from different sources. The likelihood ratio would then be 80/10 = 8.

If, however, the degree of similarity found would be expected in only 20 % of cases under the hypothesis of common origin and in 40 % of cases under the hypothesis of different origin, the likelihood ratio would be 20/40 = ½, and the evidence would actually weaken the common source hypothesis rather than strengthen it. In the first instance, the likelihood ratio would exceed 1 and the evidence would (weakly) support the hypothesis of common origin; in the second instance, the likelihood ratio would be less than 1 and the evidence would – again weakly – support the alternative hypothesis, that the trace did not originate from the same source as the reference material.

The Likelihood Ratio and the Diagnostic Value

The concept of the likelihood ratio is similar to that of the *diagnostic value*, a measure which has found wide acceptance in fields like medicine and psychology as a way to express the value of a diagnostic test result. It is arrived at by dividing the relative number of correct (positive or negative) results of the test in question by the relative number of false (positive or negative) results of the test. In more technical language, by dividing the sensitivity of the test by (1 – the specificity). The sensitivity of the test is the percentage of correct positives it produces, the specificity the percentage of correct negatives. Applied to an HIV test, if the sensitivity of the test is 98 % and the specificity is 93 %, this would mean that 98 % of those infected would (correctly) test positive and 7 % of those not-infected would (incorrectly) also test positive. The diagnostic value of a positive result for the test would then be 98/(100 − 93) = 14 and the probability of the patient being infected would be 14 times greater now that the test result is known than whatever it was estimated to be before the test result was known. The diagnostic value of a negative test result would in this case be 93 (the relative number of correct negatives) divided by (100 − 98) = 2, the relative number of false negatives, i.e., 93 divided by 2 or 46.5.

Scientific evidence may be said to have *diagnostic value* in much the same way as a medical test such as an HIV test, which will not provide absolute proof of infection or otherwise but, depending on the result and its diagnostic value, will make infection more or less probable. Similarly, evidence may be more or less likely under one of two rival hypotheses. To the extent that the evidence favors, or better fits one hypothesis rather than another, it may be said to lend more support to that hypothesis.

Bayes and the Prior Probability

The likelihood ratio may be seen as a measure of the extent to which the hypothesis of interest is more probable or less probable after the scientific evidence is known than it was before the evidence was known. Another way of putting it is to say that we can update what we saw as the prior probability of the hypothesis with the evidence that has become available to arrive at the posterior probability of the hypothesis, in which the weight of the new evidence has been taken into account. By means of the Bayes' Rule, the odds form of Bayes' theorem, so called after the Rev. Thomas Bayes (1702–1761), we can calculate the posterior probability of a hypothesis by multiplying its prior probability with the likelihood ratio:

$$\begin{aligned}&\text{Prior probability} \times \text{Likelihood ratio}\\&= \text{Posterior probability}\end{aligned}$$

A simple example may illustrate the application of the rule. Suppose a prisoner is found dead and we may safely assume that one of the 99 remaining fellow prisoners in the ward is the perpetrator. As it happens, one of these 99 prisoners, S, admits to being the killer. His DNA profile is obtained and found to match with a partial profile obtained from the nail debris secured from the victim. The estimated frequency of the partial profile in the relevant population is 1 in 1,000.

If the cell material in the nail debris originates from S, the likelihood of the evidence, i.e., the matching profile, would be 1, or 100 %. If, on the other hand, the cell material belonged to a random member of the population, the likelihood of a match would be 1 in 1,000 or 0.001. The likelihood ratio of the DNA evidence would therefore be 1 divided by 0.001 = 1,000.

To determine the prior probability, we assume that all 99 remaining prisoners are equally likely to be the perpetrator. In that case, the prior probability of any one of them being the donor is 1/99, or, expressed in odds, 1 to 98. We can now calculate the prior probability of S being the donor of the cell material in the nail debris by applying Bayes' rule:

$$\begin{aligned}&\text{Prior probability} \times \text{LR} = \text{Posterior probability}\\&(1 \text{ to } 98) \times 1,000 = 1,000 \text{ to } 98.\end{aligned}$$

The odds form of the posterior probability may be converted to a fraction, i.e., 1,000/1,098, and from that into a percentage, i.e., 91.1 %. This means that on the basis of the DNA evidence alone, the probability of the suspect being the donor of the cell material is 91.1 %, assuming that the donor is one of the remaining 99 prisoners.

Of course, apart from the DNA evidence, the fact that S admitted to killing his fellow inmate is also relevant to the determination of the ultimate issue whether S is the perpetrator. However, this type of evidence as well as possible eyewitness accounts from fellow prisoners or prison staff, and any other non-DNA evidence, clearly extends beyond the domain of the DNA expert. Other experts might be able to assign a particular weight to a spontaneous confession or an eyewitness identification, in the form of a likelihood ratio. For example, empirical research may be available on which an estimate may be based of the diagnostic value (= likelihood ratio) of a confession. This could take the form of a statement that a confession is on average seven times more likely if the suspect is the perpetrator than if he is not. This evidence in turn could then be used to further update the hypothesis of guilt.

When Numbers Are Lacking

It is worth noting that the concept of the likelihood ratio may also be applied to evidence types where the frequency of relevant markers cannot be estimated in numerical terms, for example, because there are no suitable reference databases.

This would in fact hold for many types of trace evidence, including handwriting, glass, paint, fibers, toolmarks, and firearms. The logical framework may then be applied to the verbal statements that are used in these fields. In response to the logical objections raised to the use of traditional probability scales in forensic identification, various proposals have been made in recent years for the introduction of logically correct verbal probability scales. One such format, developed at the Netherlands Forensic Institute (NFI) and used primarily in the various forensic identification disciplines, looks as follows:

> The findings of the comparative examination are
> equally likely/
> more likely/
> much more likely/
> very much more likely
> under the prosecution hypothesis that the suspect is the source of trace material as/than under the defence hypothesis that a random member of the population is the source of the trace material

Note that, true to the logical format, it is the likelihood of the evidence that is addressed. While the verbal phrases used clearly have a probabilistic basis, the probabilities are not based on quantitative empirical data but informed by the analyst's experience and may be seen as internalized frequency estimates.

In those exceptional cases where the forensic scientist arrives at a subjective conviction that the trace material originates from a particular source (as in physical fits of torn paper, or qualitatively superior shoe prints or tool marks), he or she might express his or her subjective conviction, emphasizing that this is precisely that – a subjective conviction, not a scientific fact.

Words Versus Numbers

In the United Kingdom as well as in some Continental European countries, conclusions in forensic identification are increasingly expressed in a slightly different logical format. According to the "standards for the formulation of evaluative forensic science expert opinion," compiled by the Association of Forensic Science Providers (AoFSP 2009), "the evidential weight (...) is the expression of the extent to which the observations support one of the two competing propositions. The extent of the support is expressed to the client in terms of a numerical value of the likelihood ratio (where sufficiently robust data is available) or a verbal scale related to the magnitude of the likelihood ratio when it is not." (AoFSP 2009: p. 63) For this purpose, the following scale is used:

Value of likelihood ratio	Verbal equivalent
>1–10	Weak support for proposition
10–100	Moderate support
100–1,000	Moderately strong support
1000–10,000	Strong support
10,000–1,000,000	Very strong
>1,000,000	Extremely strong

In the case of the DNA evidence with a likelihood ratio of 1,000, the expert would either report the numerical value of the likelihood ratio as such or would report that the DNA evidence provides "moderately strong" to "strong" support to hypothesis 1 (the suspect is the donor). The decision to use the numerical or the verbal form would depend on the extent to which the expert considers the data underlying the calculation of the likelihood ratio to be robust. This sounds like a sensible criterion. However, there are those who advocate the blanket use of verbal terms, i.e., even if perfectly valid qualitative empirical data are available, arguing that the use of a uniform reporting format is vastly preferable and adding that quantitative data are generally too complex for nonscientists to grasp.

The Prosecutor's Fallacy

Regardless of the use of words or numbers, statements of the probability of the evidence under a particular hypothesis, as made in the Bayesian approach, are often prone to misunderstanding and may strike the recipient as counterintuitive. The finding that the similarities observed between the handwriting of the writer of an anonymous letter and the reference material produced by the suspect are *much more likely if* the suspect wrote the questioned sample than if it was written by a random member of the population is often taken to mean the converse: that it is *much more* *likely that* the suspect wrote the questioned handwriting sample than that it was written by a random member of the population.

However, if we do this, we are guilty of making a fundamental logical error which, in the judicial context, has come to be referred to as the prosecutor's fallacy (Thompson and Schumann 1987). Although the term would seem to suggest that prosecutors are particularly prone to this fallacy, it is in fact an example of a more general type of error that is often made in the context of probability statements or inverse reasoning, where it is known as the "fallacy of the transposed conditional." In its simplest form, it is easily spotted: if an animal is a cow, it is very likely to have four legs. However, the converse clearly does not hold: if an animal has four legs, it is not very likely to be a cow.

Transposed conditionals or prosecutor's fallacies are very frequently encountered in the context of DNA evidence. Suppose a partial profile is obtained from a crime scene sample whose frequency in the relevant population is estimated to be smaller than 1 in 100,000. If the expert subsequently reports the probability that a random member of the population has the same profile as the crime scene sample as being smaller than, say, 1 in a 100,000, this statement is frequently understood to mean that *the probability that* the DNA does not originate from the suspect is smaller than 1 in a 100,000. However, the former is clearly a statement of the probability of the evidence (i.e., a match with the partial profile), while the latter is a statement of the posterior probability of the source hypothesis. Mathematically, the latter statement would be correct in a situation where the prior probability was set at 50 %, or 1 to 1. This would be the case if, in addition to the matching suspect, only one person would equally qualify as a possible donor, which will not frequently be a reasonable assumption to make. If, for the sake of the argument, the prior probability were set at 200,000 (e.g., the size of the adult male population of a large town), application of the odds form of the Bayes' rule would yield a posterior probability of 33.3 %: (1 to 200,000) × 100,000 = 1 to 2, or 33.3 %.

Transposed conditionals may also occur in the context of cause and effect arguments. While it is correct to say that the street will be wet if it has been raining, the converse is clearly not necessarily true. The single observation that the street is wet does not allow us to infer that it must have been raining, or even that it has probably been raining. Alternative explanations are possible: The street may have got wet when the police used water cannon to break up a demonstration, or it is wet because somebody has just been washing his car. So we can make a statement about the likelihood of a particular finding (e.g., a wet street) under a particular hypothesis ("it has been raining") but not about the probability of this same hypothesis merely on the basis of the finding that the street is wet. To determine the posterior probability that it has been raining, we need to combine the evidence of the wet street with the prior probability of rain. In England, the prior would be high, but in a country like Dubai, it would presumably be very low. The same evidence combined with vastly different priors may lead to very different posterior probabilities.

Controversy

The Bayesian approach is not uncontroversial. Its opponents frequently view its advocates as "believers" (Risinger 2012). More specifically, critics of the Bayesian approach object to the subjective nature of the prior probability, as well as to the use of likelihood ratios which lack an empirical basis. While the former criticism is clearly valid, it might be argued that the explicit consideration of the prior probability and the formulation of alternative hypotheses is a virtue in that it helps identify the relevant questions and prevents tunnel vision. The conclusion format propagated by the predominantly British Association of Forensic Science Providers is not unproblematic either, in that a phrase, like "the examination provides strong support for the proposition that X originates from Y," will almost invariably be interpreted to mean that it is very likely that X originates from Y. Without due warning, logically correct conclusions of this type will almost inevitably tend to be mistaken for the logically flawed ones they are meant to replace.

A further problem is highlighted by a decision of the English Court of Appeal in R v T (2010). In it, the judges express sharp criticism of the report of a footwear expert, who, quite in line with the policy of the (now defunct) UK Forensic Science Service, had phrased his conclusion in verbal terms without making it clear to the judge or the jury that the verbal conclusion was based on a quantitative estimate of the frequency of the characteristics size, pattern, and wear as exhibited by the shoe mark found at the crime scene. The expert's conclusion was formulated as: "(. . .) there is at this stage a moderate degree of scientific evidence to support the view that [the Nike trainers recovered from the appellant] had made the footwear marks." However, as later appeared from case notes that were not added to the original report, the expert had calculated a likelihood ratio of 100, which number he had subsequently converted into the verbal phrase "moderate support," in accordance with the scale presented above. In addition, counsel for the appellant pointed out to the Court of Appeal that in his testimony in court in response to questions by the defense, the expert had mentioned estimates of the relevant characteristics of the shoe mark which, when combined, would lead to a likelihood ratio of no less than 26,400, in which case the footwear evidence would have been much more incriminating (in verbal terms expressed as "very strong support"). The Court of Appeal's judgment is perfectly clear:

> The process by which the evidence was adduced lacked transparency. (. . .) it is simply wrong in principle for an expert to fail to set out the way in which he has reached his conclusion in his report.

The Court of Appeal continues:

> (. . .) the practice of using a Bayesian approach and likelihood ratios to formulate opinions placed before a jury without that process being disclosed and debated in court is contrary to principles of open justice.

The ruling in R v T has led to various reactions, many (Berger et al. 2011; Evett 2011; Redmayne et al. 2011) but not all (Risinger 2012) in defense of the Bayesian approach. While one may disagree with some of the views expressed in the Court of Appeal judgment, recent research conducted in the Netherlands suggests that there is at least one other problem with the use of these "logically correct" conclusion formats. It appears that evaluative opinions expressed in the Bayesian format are likely to be misunderstood not only by defense lawyers and judges but also by forensic experts themselves. Participants in the study were asked to indicate for a variety of statements whether they were correct paraphrases of the Bayesian style conclusions that were used in a fictitious report. The study shows that a proper understanding of statements involving likelihood ratios by jurists is alarmingly poor. In order to be able to compare actual versus supposed understanding, participants were also asked to indicate how well they understood the Bayesian style conclusions of the reports on a scale from 1 (*"I do not understand it at all."*) to 7 (*"I understand it perfectly."*). The most worrying finding to emerge from the study is no doubt that not only did judges, defense lawyers, and forensic experts alike tend to interpret the conclusions of the submitted reports incorrectly but they combined their lack of understanding with a high degree of overestimation: They believed they understood the conclusions much better than in fact they did. This suggests that the continued use of Bayesian style conclusion formats or likelihood ratios requires a major educational effort if structural miscommunication between experts and triers of fact is to be avoided. Aitken et al. (2010) and Puch-Solis (2012) may be seen as attempts to meet this demand.

Conclusion

The findings of a comparative examination undertaken with a view to establishing the source of a particular trace or set of traces do not strictly allow the type of probabilistic source attributions, be they of a quantitative or verbal nature, that until recently were used by the vast majority of forensic practitioners. With the advent of forensic DNA analysis over the last decades and the widespread use of the conceptual framework associated with the interpretation of DNA evidence, awareness among forensic practitioners of other identification disciplines of the inadequacies of the traditional evidence evaluation paradigm has grown rapidly. Increasingly, this is leading to attempts to apply a logically correct way to express the value of the findings of a source attribution examination of trace material other than DNA by expressing the weight of the trace evidence in a way similar to that used in forensic DNA analysis. This takes the form of a so-called *likelihood ratio*. The concept is similar to that of the *diagnostic value*, a measure which has found wide acceptance in fields like medicine and psychology as a way to express the value of any diagnostic test result.

The concept of the likelihood ratio requires the consideration of the probability of the evidence under two competing hypotheses, one based on a proposition formulated by the police or the prosecution, the other based on an alternative proposition which may be based on a scenario put forward by the defense. As such, the Bayesian approach may be seen as a remedy against suspect-driven investigations, in which the police tend to focus on collecting evidence that will confirm the suspect's involvement in the crime and ignores alternative explanations. By contrast, in a crime-driven investigation, the investigators base the direction of the investigation on the clues provided by the crime rather than by the person of the suspect and develop one or more scenarios based on the evidence rather than make the evidence fit a particular scenario.

Technical or scientific evidence derived from material traces such as DNA, finger marks, handwriting, fibers, footwear marks, or digital data derived from a harddisk or a mobile telephone may be incompatible with a particular hypothesis that is central to a larger scenario and then effectively eliminate that scenario. More frequently, scientific evidence may be more or less likely to be found in one scenario than another and in this way may help discriminate between various scenarios. It is the consideration of the totality of evidence, both direct, witness and scientific evidence if available, which forms the basis for the ultimate decision made by the trier of fact.

Overview

Place-randomized trials are an important vehicle for generating evidence about "what works" in criminology. Place-based randomized trials are a form of cluster randomization that involves identifying a sample of places (for instance, crime hot spots) and randomly allocating these locations to different police or community interventions. Random allocation assures a fair comparison among the interventions, and when the analysis is correct, a legitimate statistical statement of confidence in the resulting estimates of their effectiveness can be made.

This entry provides basic definitions and practical counsel about the use of such trials in generating evidence in crime prevention. It also identifies issues, ideas, and challenges that might be addressed by future research. Finally, it discusses the special analytic difficulties that may occur in the development of place-randomized trials as opposed to more traditional trials where individuals are the units of allocation and analysis.

Places that Are Randomized: Theory and Units of Randomization

Place-randomized trials depend on a clear understanding of the role of place. A place can be an entity in itself; for instance, a business establishment that has a legal status separates from that of owners or employees. Or a place can be an organizational convenience for smaller units within it. One may, for instance, become interested in the effect of neighborhood context on the likelihood of individual victimization. Inasmuch as individual habits can also contribute to risk of victimization, attention may also be directed toward both the attributes of neighborhoods as well as to the individuals who live within the neighborhood.

Whether the place is an entity per se or a receptacle for lower-level observational units can dramatically affect how the randomized trial is designed and analyzed. The key definitional point in a "place-randomized trial," however, is that the random assignment occurs at the place level. The implication is that the methodological benefits of random assignment are realized across places, not the units within them. Statistical analysis at the place level therefore conforms to well-understood and accepted statistical practices. Analysis attempted at the level of the nonrandomized units which are nested within places can be complex and controversial.

The "units of randomization" in a place-randomized trial may vary considerably. Weisburd and Green's (1995) study, for instance, operationalized "drug hot spots" as street segments rather than institutions such as housing developments, schools, or business units. The broad theory underlying the trial posited that focusing police and other resources on these hot spots would reduce crime, rather than leading to no effect or a migration of criminal activity into other areas. An earlier crime hot spot trial by Sherman and Weisburd (1995) in Minneapolis similarly defined the unit of analysis as a single street segment from intersection to intersection.

Other places have been targeted for different types of interventions, such as saloons in the context of preventing violence and glassware-related injuries (Warburton and Sheppard 2000). Private properties, including apartment houses and businesses, have been targeted in a study of the effects of civil remedies and drug control (Mazerolle et al. 2000). Convenience stores, crack houses, and other entities have also been randomly allocated to different interventions.

These examples invite a number of basic questions. How can such trials be deployed well? Can better theory be developed about what should happen as a consequence of an intervention at high levels of units: province or county, city or village, institution or housing development, or crime hot spot? Can theories be developed to guide thinking about change or rate of change at the primary aggregate level – the places – and below it? What new statistical problems emerge from randomization of places? These examples also invite questions about how to learn about other trials of this sort, involving yet other units of allocation and analysis.

Relationships and Agreements

People get place-randomized trials off the ground through agreements between the trialist's team and prospective partners in the place-based trial. Here, "partners" mean individuals or groups whose cooperation and experience are essential in deploying both the intervention and the trial. Weisburd (2005) emphasizes the need to develop personal relationships that lead to trust and willingness to experiment on innovations that might work better than conventional practice. In his Jersey City experiment, for instance, the strong involvement of the senior police commander as principal investigator in the study played a critical role in preventing a breakdown of the experiment after 9 months.

In Jersey City, the Deputy Chief who administered the interventions was strongly convinced of the failures of traditional approaches and the need to test new ones. The commander took personal authority over the narcotic unit and used his command powers to carefully monitor the daily activities of detectives in the trial. This style of work suggests the importance of integrating "clinical" and research work in criminal justice, much as they are integrated in medical experiments. It also reinforces the importance of practitioner "belief" in the necessity of implementing a randomized study. The Kingswood experiment described by Clarke and Cornish (1972) illustrates how doubts regarding the application of experimental treatment led practitioners to undermine the implementation of the study.

Place-randomized trials do not only involve the practitioners and researchers who are directly involved with implementation and analysis. For instance, in policing, federal funding agencies, such as the National Institute of Justice and the Bureau of Justice Assistance; accreditation agencies; and professional organizations such as the International Association of Chiefs of Police, the Police Executive Research Forum, or the Major Cities Chiefs Police Association can all influence the willingness of individual police departments to adopt place-based practices and implement place-based trials. The capacity of researchers and practitioners to carry out place-randomized trials is therefore often influenced by the preferences and priorities of these institutional stakeholders.

Developing relationships in place-randomized trials as in many other kinds of field research depends on reputation and trust, of course. The topic invites attention to questions for the future. How can better contracts and agreements in networks of organizations, public and private, ones that permit us to generate better evidence about the effects of an innovation, be developed? How can "model" contracts and memorandums of understanding be developed and made available to other trialists and their potential collaborators?

Justifications for a Place-Randomized Trial

For many social scientists, an important condition for mounting a randomized trial on any intervention that is purported to work is that (a) the effectiveness of a conventional practice, policy, or program is debatable and (b) the debates can be informed by better scientific evidence. In the crime sector, police of course are local theorists, and they often disagree about what could work better. Crime experts have also disagreed about what approaches might be effective in high-crime areas. More generally, of course, people disagree with one another about what might work in the policy sector, and there is, at times, some agreement that better evidence would be helpful.

For instance, Weisburd (2003) points out that one of the major justifications for random trials is disagreement among experts about the effectiveness of an intervention. This is an important factor in justifying a randomized trial using individuals or places as the units of random allocation. For instance, the Cambridge-Somerville Youth Study, one of the most famous experiments in youth crime prevention, illustrated that even well-planned and implemented intervention programs may have no effect on offending behavior or even have a "backfire" effect (McCord 2003). Experimental studies of the effectiveness of random beat patrol and foot patrol likewise provided surprising results regarding the effectiveness of widely accepted standard practices in criminal justice in reducing crime (Kelling et al. 1974). In these cases, experimental research concerning the effectiveness of commonly accepted practices spurred criminologists and criminal justice agencies to revise and improve intervention strategies.

The scientific justification for place-randomized trials is the assurance that if the trial is carried out properly, there are no systematic differences between groups of places randomized, which in turn carries a guarantee of statistically unbiased estimates the intervention's effect. It also assures that chance and chance imbalances can be taken into account and that a legitimate statistical statement of one's confidence in the results can be made. Further, Weisburd (2005) and others have pointed out that the simplicity and transparency of the idea of fair comparison through a randomized trial has a strong appeal for policy makers and practitioners who cannot understand and do not trust complex model-based analyses of data from nonrandomized studies. For the abiding statistician, the crucial aspect of simplicity is that the statistical inferences as to the effect's size relative to chance need not depend on econometric, statistical, or mathematical models. The randomization feature permits and invites less dependence on such speculation. And modern methods permit the use of randomization tests.

The empirical evidence on the vulnerability of evidence from nonrandomized trials in comparison to the evidence from randomized trials has been building since at least the late 1940s. Assuring that one does not depend on weak and easily assailable evidence when stronger evidence can be produced is an incentive at times in parts of the policy community. Assuring that one does not needlessly depend on heroic assumptions to produce good estimates of effect, assumptions often required in the nonrandomized trials, is an incentive for the scientific and statistical community. Boruch (2007) summarizes these concepts in the field of health care, employment and training, and economics.

Shadish and colleagues (2008) provided a persuasive illustration that is especially compelling because comparisons between a randomized experiment and an observational study were anticipated as part of their research design and before the data were collected. Their results suggest comparability, as opposed to major differences, if the quasi-experiment is designed well in a particular domain. Theirs is an interesting and potentially important specific case. More generally, the biases in estimating an intervention's effect based on the quasi-experiments can be very large, small, or nonexistent (Weisburd et al. 2001). The variance in estimates of effects appears to be typically larger in the quasi-experiments than in the randomized tests. So far, and with some narrow exceptions, there is no way to predict the directionality or magnitude of such biases or in the variances of the estimates of the intervention's effect based on a nonrandomized trial.

It remains to be seen whether similar methodological studies on aggregate level analyses using randomized versus nonrandomized places, clusters of individuals, or groups yield similar results, that is, uncover serious biases in estimating effects or the variance of the estimates or both. But it is reasonable to expect biases here also. Bertrand, Duflo, and Mullainathan (2002), for instance, focused on biases in estimates of the standard error of effects assuming no effect at all using conventional difference in differences methods and found type I error rates that were nine times the error rate presumed (0.05) in using conventional statistical tests. This was partly on account of serial correlation. More methodological research, however, needs to be done on the quasi-experimental approaches to aggregate level units so as to understand when the biases in estimates of effect appear, when the biases in estimates of their standard errors appear, and how large the mean square error is, relative to place-randomized trials.

It is important to identify dependable scenarios in which bias and variance of estimates generated in nonrandomized trials are tolerable. Doing so can reduce the need for randomized trials (Boruch 2007). It is also not easy, as yet, to identify particular scenarios in which bias in estimates of effect or variance will be small, as was the case in some work by Shadish et al. (2008). Berk's (2005) more general handling of the strengths and weaknesses of randomized controlled trials at the individual level is pertinent to the analysis of data generated in place-randomized trials also.

The scientific justifications that are identified here are important in the near term. In the long term, it would be good to understand what other incentives are and to make these explicit at different levels, for example, policy, institution (agencies), and individual service-provider levels. Incentives for better evidence may differ depending on whether the stakeholders are members of the police force at different levels, the mayor's office, and the community organizations that have a voice, and so on. Many police executives, for instance, want to improve policing and produce evidence on whether things do improve and also usually want to keep their jobs. The two incentives may not always be compatible if a city council or mayoral preferences are antagonistic toward defensible evidence generated in well-run field tests. Sturdy indifference to dependable evidence of any kind is, of course, a problem in some policy sectors.

Deploying the Intervention: Implementation, Dimensionalization, and Measurement

Justifications and incentives are essential for assuring that places, and influential people within them, are willing to participate in a randomized trial. Understanding how to deploy a new program requires expertise at a ground level, as well as substantial cooperation between researchers and mid- and upper-level management. It also requires constant communication between researchers and street-level practitioners to ensure that their daily practices conform to the treatment that they intend to occur.

The Drug Market Analysis Program, which fostered a series of randomized experiments on crime hot spots, suggests that "ordinary" criminal justice agencies can be brought on board to participate in experimental study if there is strong governmental encouragement and financial support that rewards participation (see Weisburd et al. 2006). A similar experience in the Spouse Assault Replication Program (SARP) reinforces these observations. Joel Garner (2002), who served as program manager for SARP, noted that he knew that the program was a success the "day that we got 17 proposals with something like 21 police agencies willing to randomly assign offenders to be arrested" (Weisburd 2005, p. 232).

Day-to-day implementation of place-randomized trials also requires significant forethought on the part of both the researchers and middle managers who are involved with the experiments. For instance, during Lum and colleagues' (2010) trial of the effectiveness of license plate recognition systems, the research team made an effort to directly involve both the officers who would be implementing the intervention and the middle managers who would be responsible for directly supervising the officers in the process of identifying hot spots, developing mechanisms for reporting officer patrol, and overseeing implementation. Given that the intervention involved the participation of two separate police departments, it was also important to understand and account for different practices in supervising officers, in the responsibilities of officers to continue to respond to calls for service, and other functions. Gaining an understanding of the experience and obligations of these practitioners allowed the researchers to revise plans for patrol deployment and ensure that the experiment could realistically be implemented given the normal practices of the two police departments.

The reports on deploying programs and the randomized trials that are published in peer-reviewed journals can be excellent, but they are typically brief. The brevity invites broad questions about how the authors' experience *in detail* can be shared with others, that is, through web-based journals, reports without page limits, workshops, and so on. It invites more scientific attention to the question of how one can dimensionalize implementation and the engineering questions of how to measure or observe implementation level inexpensively and how to establish a high threshold condition for implementation.

Resources for the Trial's Design, Statistical Problems, and Solutions

Some of the important technical references for trial design and model-based data analysis include Hayes and Moulton (2009) on cluster-randomized trials in different countries, mainly in the health arena. Murray's (1998) book on group-randomized trials focuses more on individuals within groups and considers diverse applications in the USA. Bryk and Raudenbush's (2002) text considers in detail model-based statistical analyses of multilevel data that may or may not have been generated in randomized trials. The models are complex and entail assumptions that the analyst may not find acceptable.

In the context of place-randomized, cluster-randomized, or group-randomized trials, there are few publications covering the simplest and *least* model-dependent approaches to analyzing data from such a trial. Such approaches fall under the rubric of randomization tests or permutation tests. A simple randomization test, for instance, involves computing all possible outcomes of the trial, ignoring the actual allocation to intervention or control conditions, and then making a probabilistic judgment about the dependability of the effect detected based on the distribution of possible outcomes so generated. There is no dependence on linear or other parametric models.

Given the relatively small sample sizes involved in place-randomized trials (typically less than 200 are allocated to one or another intervention) and given contemporary computing capacity, generating the distribution of possible outcomes in these approaches is relatively straightforward. The basic concepts were described by Sir Ronald Fisher in the 1950s for trials in which individuals or plants were the independent units of random allocation and analysis. The idea is directly relevant to trials in which places are randomly allocated and inferences are made about the effects of intervention in places.

The Campbell Collaboration organized conferences on place-randomized trials in 2001 and 2002 to update researchers on the design and conduct of place-randomized trials. A special issue of the *Annals of the American Academy of Political and Social Sciences* (Vol. 599, 2005) resulted from these. After 2002, the William T. Grant Foundation funded workshops and software development to enhance the technical capacity of researchers to design such trials and analyze results. At the time of this writing, there was no information on more specialized efforts sponsored by the National Institute of Justice or private foundations in criminology.

One of the major scientific challenges in designing a place-randomized trial is assuring that the size of the sample of places is large enough to detect the relative effects of interventions. A statistical power analysis is essential to this planning process and allows the researcher to determine the number of places that are needed given assumptions about the expected effect size, randomization levels, and specific statistical tests of hypotheses and related procedures. User-friendly software for estimating the model-based statistical power of a trial under various assumptions about sample size and other factors is available on the William T. Grant Foundation's website (http://www.wtgrantfdn.org).

There are a number of common mistakes made during analysis of place-randomized trials. First, researchers have often wrongly employed the number of people in places for hypothesis testing and power analysis *rather* than employing the number of places randomly allocated (see, e.g., Kelling et al. 1974). Second, simple linear regression models are often used to analyze data even though many of the modeling assumptions are not necessarily true, as the "uncertainty" in randomized trials stems from the assignment process, rather than unobservable disturbances that are assumed to be the source of variation in regression models (see Freedman 2008). It is very difficult to determine how misleading the results of such regression analyses are likely to be in multilevel contexts. Analyses based on regression models with categorical, count, or time-to-failure outcomes create additional problems (Freedman 2008).

Place-based trials often involve the study of people within places, and thus, a very small number of independent units (places) may be present at the randomized level and a large number of related units (people) may be nested within each place. A key issue in this scenario is that individuals or other units within a place were *not* randomly assigned to the intervention or control conditions. Randomization at the place level ensures that preexisting differences between treatment and control groups in the study are not systematic; this is due to the matching and subsequent randomization process. However, since all individuals within each place are automatically assigned the same condition, intervention, or control, the analysis is riskier to carry out at the individual level (Raudenbush and Bryk 2002; Spybrook et al. 2006).

Prior techniques for clustered data involved either aggregating all information to the group level as in a randomization test or a "t-test" of mean differences between place level outcomes or have involved disaggregating all group-level traits and confining attention to all the individuals within the intervention and control conditions. For Raudenbush and Bryk (2002), the problem with the first method is that all within group information is wasted; it is omitted from the analysis. The problem with the second method is that the observations are no longer independent, as all individuals within a certain intervention or control condition will have the same value on a certain variable and will not be independent from one another on account of the intra-class correlation among people within place. To account for the dependence that arises when using samples of individuals nested within places, researchers can use several statistical methods to correct for clustering, such as hierarchical linear modeling techniques (i.e., HLM) and generalized least squares estimation techniques with robust standard errors.

There are several options for analyzing the results of place-based randomized experiments in a largely model-free manner. Small and colleagues (2008), for instance, emphasize randomization/permutation tests with different kinds of adjustments for covariates, not relying on any form of HLM. Imai, Kind, and Nall (2009) advanced the state of the art by showing how matched pair designs in place-randomized trials can often enhance precision in estimates of the effects of interventions, increase statistical power of analysis in detecting effects, and better assure unbiased estimates of variability of the effect with a small number of places. Matched pair designs can also be used in this context, but the concern is that matching may unnecessarily reduce degrees of freedom and statistical power of the studies.

As a practical matter, the work by Imai and his colleagues (2009) shows that the number of units within a place are an important matching variable that can reduce costs and increase statistical power in a trial. Bloom and Riccio (2005) advance the state of the art in another important respect by coupling conventional comparison of randomized places in a time series analysis of data from places. While the coupling of randomized and nonrandomized approaches to estimating effects of interventions is not a new concept (see, e.g., Boruch 1985), incorporating these ideas thoroughly into design and analysis is unusual.

Another novel contribution relating to designing place-randomized trials lays in the idea of "step wedge" and "dynamic wait list" designs. The wait list design assigns a random half sample of eligible places to the intervention for some period of time. The remaining half sample receives the intervention after this period has ended, under the assumption that all units will eventually receive the intervention. While this approach satisfies ethical concerns that may arise if a beneficial treatment is not administered to certain places, it may be problematic if there are treatment consequences for a delay in treatment. To address such concerns about the sequence of treatment, places may also be divided into subsets which are periodically given treatments of a given intensity at a given time period. In a related area of work, Hussey and Hughes (2006) develop the idea of step wedged designs, with the "steps" being a point at which a subset of places is randomly assigned a treatment.

The step wedge and dynamic wait list designs are innovative and have attractive features. However, the power and design analysis of these approaches have relied on hierarchical linear models with unusual and sometimes untestable assumptions. There may be alternatives that are less model dependent.

Registers of Place-Randomized Trials

Learning about place-randomized trials can be difficult. Reports may be published in a variety of scientific journals and may appear in unpublished (gray) literature. Relying on web-based searches may not be as effective as hand searches in terms of locating randomized trials in social sciences. Taljaard et al. (2009), for instance, found that fewer than 50 % of published place-randomized trials in health are appropriately classified in titles and abstracts.

There are a number of data sources concerning randomized trials that can help to reduce these difficulties. For instance, the Cochrane and Campbell Collaborations, which are concerned with the fields of health care and social sciences, respectively (including psychology, education, criminal justice, and sociology), publish reviews of results of randomized trials in which references to original sources can be accessed through their websites. In the United States, one can learn about trials in the health sector, including place-randomized trials, at http://www.clinicaltrials.gov. Often the interventions tested or the outcome variables examined in these trials are pertinent to criminologists as well as health-care researchers and practitioners. Finally, in 2007 David Greenberg and Mark Schroder developed a new register of randomized trials oriented toward tests of economic interventions under the auspices of the Social Sciences Research Network (SSRN).

Standards for reporting randomized trials where individuals are the unit of allocation were the product of the late 1990s. The Consolidated Standards of Reporting Trials (CONSORT) statement, which provided guidance on the composition of a report on randomized trial in health care, has been modified to provide guidance on reporting place-randomized trials. For instance, studies should provide information on the rationale for a randomized design and measure outcomes on all levels of sampling and statistical inference. As of this writing, there are no uniform standards for reporting randomized trials in criminal justice. These problems have been raised by scholars of criminology who have emphasized that "reporting validity" is critical for the development of experimental science in criminology (Perry et al. 2009; Gill 2009; Farrington 2003). A lack of clear and uniform standards in this area of research means that reanalysis of experimental studies is difficult and often impossible. While some funding agencies have tried to make policy to assure that independent analysts have access to record data in research that they sponsor, clear criteria such as that included in the CONSORT statement are critical for advancing experimental criminology.

Ethics and the Law

As of this writing, no professional society or government agency has promulgated explicit statements about the ethical propriety of place-randomized trials. Applying contemporary standards to place-randomized trials can be awkward and imperfect (see, e.g., Boruch 2007), and at times, standards of ethics and government regulations are not clearly relevant to place-randomized trials (see, e.g., Taljaard et al. 2009, for a discussion of these issues in health care). For instance, ethical standards established for the treatment of human subjects are arguably inappropriate for randomly allocated treatment in a city's crime hot spots. The ethical issues surrounding place-based trials in criminology are complex. For instance, researchers may confront concerns about equality of treatment, as in research surrounding hot spot policing, wherein residents were concerned that concentrated patrol in one area would result in reduced services in other locations (see Weisburd 2005). Or officers could feel that sitting for extended periods of time reduces their capacity to protect the public (Weisburd et al. 2006). Finally, residents of areas that are designated as crime hot spots may feel as if they are being unfairly targeted by the police. In these cases, the implementation of a place-randomized trial can undermine the relationship between the practitioners involved in the trial and the clients whom they serve (see also Clarke and Cornish 1972).

Regardless of the ethical dilemmas engendered by place-based trials over the last decade, there appear to have been no serious challenges in the US courts to the conduct of place-randomized trials. For instance, the former director of the Institute for Education Sciences (IES), Russ Whitehurst, reported in a personal communication (2008) that he had encountered no court challenges as a consequence of the IES's sponsoring many such trials in education during 2002–2008. Similarly, we are aware of no judicial challenges in the context of place-randomized trials in the crime sector, such as the trials on crime hot spots, bar room violence, convenience store vulnerability to holdups, and so on.

Conclusions and Implications for the Future

Place-randomized trials have become important not only in criminology but also in a broad range of other disciplines because they employ substantive theory about the effects of intervention at the place level. The experience of people who have been involved in the design, execution, and analysis of place-randomized trials is an important source of intellectual and social capital. This experience must be exploited by future researchers and incorporated into graduate and postgraduate education, as should the knowledge of researchers in disciplines such as medicine and education who have substantially advanced the state of knowledge about more generally cluster-randomized trials. The statistical armamentarium for design and analysis of place-randomized trials is fundamental and lies on the simple idea of randomization rather than complex statistical models. Future development of place-randomized trials should better explore the implications of randomization of different interventions when the expected effects of the interventions are in "equipoise" and advance investigations into the ethics of this type of research. Further, standardized reporting of design, execution, and analysis of place-randomized trials should be advanced in criminology to allow for reanalysis and secondary analysis, particularly of controversial studies.

Walter Lippmann, an able social scientist and newspaper writer, had a strong interest in cops and crimes by adults and adolescents and was familiar with political ambivalence about or opposition to sound evidence. He was a street-level criminologist, remarkable writer, and good thinker. In the 1940s, Lippmann said: "The problem is one for which public remedies are most likely to be found by choosing the most obvious issues and tackling them experimentally...the commissions of study are more likely to be productive if they can study the effects of practical experimentation." Nowadays, trialists in criminology would have little difficulty in subscribing to Lippmann's counsel.

Negotiated guilty pleas

Overview

As criminal justice systems increase in volume, they turn to negotiated guilty pleas as a primary method to dispose of cases. The prosecution offers reduced sentencing risk to defendants in exchange for more certain and inexpensive convictions. Although such negotiated outcomes are unpopular with the general public, the full-time practitioners who operate the system think of plea bargains as a necessary practice in busy courts. Negotiated guilty pleas have become by far the most common disposition of criminal charges in the United States, and similar practices are becoming more prevalent in other countries. Plea bargains create some uncertainty about the accuracy of convictions in the system and alter the balance of power among criminal justice actors by making judges and juries less influential by comparison to prosecutors. While external legal limits on plea bargains have mostly proven ineffectual, prosecutor offices routinely place internal administrative limits on the use of plea bargains.

Introduction

Criminal defendants in the United States usually decide to plead guilty. Very often, defendants negotiate with the prosecution to receive particular benefits as a precondition to entering a guilty plea – so often, in fact, that these so-called plea bargains have become more common and more important than criminal trials. In the United States, more than 9 out of every 10 felony convictions (and more than 99 out of every 100 misdemeanor convictions) derive from guilty pleas, and the overwhelming majority of guilty pleas occur after the parties negotiate the terms of that plea. Plea negotiations have been slower to arrive in other countries, but criminal court systems around the world often deal with increased volume by allowing some form of discounted sentence in return for a negotiated settlement. Plea bargains, in some form or another, are critical to the operation of high-volume criminal justice systems around the world today.

The dominance of plea bargaining has predictable effects on the institutions of criminal justice in the United States. Most immediately, it makes criminal juries less influential. Negotiated pleas also shift power away from the trial judge toward the parties; they particularly strengthen the hand of the prosecutor. The prosecutor does not merely present legal and factual arguments to the judge on an equal footing with the defense attorney. Instead, the prosecutor hears arguments from the defense and then selects from the available charges and evidence thus substantially impacting the ultimate sentence. The judge, in effect, reviews these prosecutor decisions for possible error in exceptional cases. This shift of power in favor of prosecutors is more pronounced in "guideline sentencing" states that link the sentence more closely to the charge of conviction and to particular factual findings about the crime.

Plea bargaining also affects outcomes in the criminal courts. For one thing, system volume goes up. A system that relies heavily on negotiated pleas can process more cases than a jurisdiction that resolves more of its cases through trials. Negotiated plea bargains also probably trade the quality of convictions for a higher quantity of cases. As systems get busier, the risk of erroneous convictions increases.

External limits on the terms of negotiation between prosecution and defense are available in some systems but are still unusual and have shown only limited practical effects. Internal limits on bargaining practices imposed within the bureaucratic hierarchy of the prosecutor's office are still the most common limits on individual sentencing discretion of a prosecuting attorney.

This entry begins with a review of the most common topics for bargaining between the defense attorney and the prosecutor in criminal cases. It then discusses the prevalence and systemic effects of those party negotiations, both domestically and internationally. The entry closes with a review of the external and internal controls that legal systems use to structure prosecutorial discretion.

Topics for Plea Negotiations

During plea negotiations, the prosecution can offer the defendant two categories of benefits in exchange for a plea of guilty. First, under a "sentence bargain," the prosecutor agrees to recommend to the judge a sentence below the maximum available, without amending the charges. A variation on this type of agreement involves a "fact bargain." In this situation, the prosecution and defense agree to represent to the court that certain facts were either present or absent in a case. Under the sentencing rules of some jurisdictions, these facts trigger specific sentencing consequences.

The second major category of negotiated plea aims for a "charge bargain." In this situation, the prosecutor agrees to reduce the most serious charge to some lesser offense or to reduce the total number of counts in the indictment or information. The effect of amending the charges is to reduce the defendant's potential exposure to more severe sentence outcomes.

Sentence Bargains

The parties develop detailed knowledge about the strength of the evidence, the expectations of the victims, the most likely outcomes of any legal issues presented, and the normal sentences imposed in similar cases. The judge, meanwhile, does not get involved in the details of the case as early as the parties and never becomes as familiar as the parties with the specifics of the crime and the offender's background. When the court faces a crowded docket and the parties assure the judge that a given sentence is appropriate – particularly if that recommendation falls roughly into a normal range of sentences for this crime – the judge usually accepts the recommendation (Scott and Stuntz 1992).

Sometimes the parties want a level of certainty about the sentencing outcome that is not possible based on sentencing recommendations alone. The criminal procedure rules in some jurisdictions allow the defendant to enter a plea of guilty conditioned on the judge's acceptance of the agreed-upon sentence. In other words, the defendant may withdraw the plea of guilty if the court later rejects the specified sentence. Some scholars favor sentence bargains that give the judge something more than a "take it or leave it" option; more substantial input for the judge in the selection of the sentence leads, according to this view, to a more balanced sentencing system (Alschuler 1976; Wright and Miller 2002).

Before accepting a plea of guilty, the trial court judge must be convinced that the defendant's plea is "knowing and voluntary" and that the prosecution holds a sufficient "factual basis" to prove each element of the crime beyond a reasonable doubt. Other facts may be relevant to the sentence, as well, even if they are not elements of the offense. For instance, in the federal system, a defendant who plays a "minimal role" or "minor role" in a group offense receives a lower sentence.

Given this opportunity to control the available sentence through the facts they plan to present, the parties naturally turn to negotiations about the proof of these non-element facts; they agree in some cases to tell the judge that the fact is present or absent from the case. The parties cannot lie to the judge and cannot compel the judge to make the factual finding that forms the basis for their agreement. But the prosecutor and defense attorney do exercise serious practical influence when they present a united front to the judge.

This subtype of sentence bargaining is sometimes known as "fact bargaining." It is especially pertinent in jurisdictions with sentencing guidelines or other statutes that attach specific sentencing consequences to particular facts. For instance, some state codes authorize a 5-year increase in a sentence based on the use of a weapon during commission of the crime. The prosecution and defense might negotiate an agreement to stipulate to the judge that no weapon was used during the crime.

The prosecutor sometimes goes beyond the role of advocate and plays a strong gatekeeper role for some non-element facts. In these special situations, the prosecutor does not merely request a factual finding from the judge; instead, the prosecutor herself exercises the power to increase or decrease a sentence automatically. For example, in the federal system (and in some states), the offender is eligible for a sentence discount after cooperating in the government's investigation of further crimes only if the government certifies that the defendant provided "substantial assistance." The government's willingness to file such a motion is one of the important bargaining chips available to the prosecutor. Some states give the prosecutor a similar gatekeeper function over certain sentencing enhancement facts, such as the proximity of a narcotics sale to school grounds or the fact that a defendant's prior record makes him or her a "habitual felon." The defense attorney and prosecutor routinely bargain to determine whether the prosecutor will file the allegations that trigger such a sentencing enhancement.

Charge Bargains

Criminal codes in both the federal and state systems give prosecutors a generous menu of options in the selection of charges. Many common fact scenarios could support criminal charges under multiple sections of the criminal code, each leading to different potential sentencing outcomes.

After the initial filing of charges and the assignment of defense counsel to a case, the parties often negotiate over possible amendments to those charges. The defense attorney might request a dismissal of the most serious charge to be replaced by a less serious charge (a "vertical" charge bargain). Alternatively, the defense lawyer might ask for a dismissal of some charges in a multi-count indictment (a "horizontal" charge bargain). Both types of amendments reduce the maximum sentence that a judge could legally impose on the defendant.

Negotiations between the parties about revised charges take on even greater importance in the context of more highly structured sentencing systems. Sentencing laws that structure or reduce judicial discretion, including "mandatory minimum sentences" and "presumptive sentencing guidelines," make the charge of conviction a more important predictor of the sentence. Once the defendant is found guilty of a particular crime, these highly structured sentencing laws give judges relatively few options for how to sentence the defendant (and perhaps no options at all). Because a structured sentencing environment makes visible the sentencing consequences of charging decisions, the parties can isolate the impact of a charge reduction and negotiate based on a more certain prediction of the outcome.

Mandatory minimum sentencing laws offer a clear-cut example of the impact of charge bargains on sentencing outcomes. These laws create "cliff effects" that dramatically affect the potential sentence, depending on whether the parties agree to the mandatory sentence versus a similar crime with no mandatory penalty attached. Mandatory penalties could lead to wholesale increases in sentence severity in a jurisdiction. Empirical studies confirm, however, that prosecutors selectively mitigate the impact of specific mandatory sentencing laws by dismissing or reducing charges in some cases (Bjerk 2005).

Presumptive sentencing guidelines tie sentencing options to the charge of conviction, much like mandatory minimum sentencing laws do. Systems that link the charge of conviction to a narrow range of sentence outcomes limit the options for the sentencing judge and empower the prosecutor, who controls both the filing of charges and the proof of the defendant's conduct.

Empirical studies have examined what prosecutors in guideline jurisdictions actually do about charge reductions. For the least serious cases, studies found only small shifts from sentence bargains to charge bargains. Apparently, busy prosecutors in high-volume systems do not change their customary negotiation practices across the board.

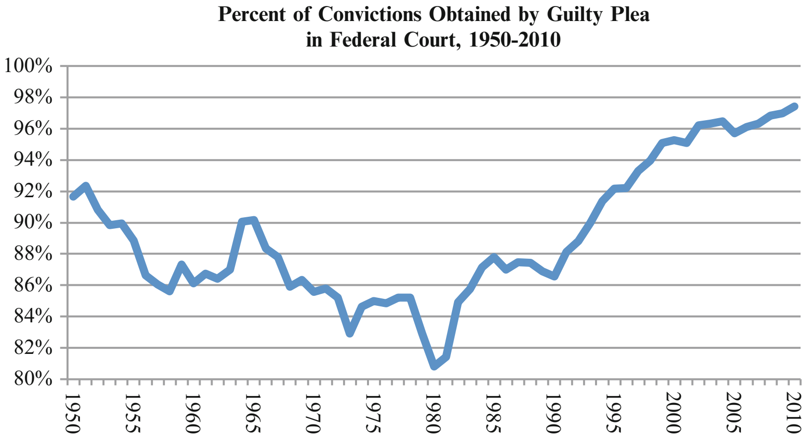
Charge bargains increased more markedly, however, in more serious cases. In cases where conviction on the original charge would result in a presumed prison sentence and conviction on a lesser charge would allow probation or a shorter jail sentence, charge bargains happened more often after the arrival of sentencing guidelines in a jurisdiction. The amended rules gave the parties greater control over the sentencing outcomes in those cases, and they took advantage of that new power (Miethe 1987; Frase 2005). Research on the charging and plea bargaining practices of federal prosecutors under the federal sentencing guidelines also suggests that prosecutors frequently exercise their charge bargaining discretion to reduce sentences, particularly in drug and weapon possession cases (Bowman and Heise 2001). On the whole, the empirical evidence suggests that sentencing guideline systems make charge bargains somewhat more attractive than they are in discretionary sentencing regimes.

There are also questions about the equal distribution of charge bargain benefits. The presence of legally relevant facts is the most important determinant of the charge of conviction (i.e., the charge that ultimately forms the basis for the conviction). Some nonlegal factors, however, also have some effect on the charge of conviction. Factors such as the race of the defendant appear to have a relatively small but persistent impact on the outcomes (Steffensmeier et al. 1998).

Defense Concessions

While the prosecutor can offer reduced sentences to the defendant, the defense attorney also holds certain bargaining chips during plea negotiations. Each of the defendant's concessions involves the removal of procedural hurdles from the prosecutor's path.

The defendant's power to make the government's work easier begins with the investigation. If the defendant cooperates in an ongoing investigation, the government might be able to convict additional defendants. This form of assistance is especially important in the federal



Plea Bargaining, Fig. 1 Percent of convictions obtained by guilty plea in federal court, 1950–2010

system. The discounts available for "substantial assistance" lead to some difficult anomalies in the sentences among defendants who commit their crimes as part of a group, with the largest discounts awarded to the most blameworthy (and knowledgeable) organizers of the criminal enterprise (Maxfield and Kramer 1998).

Another procedural hurdle that the defendant can remove for the prosecution is discovery and disclosure. The prosecution has a constitutional duty to disclose all material exculpatory information in its possession and a duty under state statutes or procedural rules to respond to any discovery requests for certain types of inculpatory evidence. The defendant, however, can remove most of those obligations from the prosecution by pleading guilty.

The most valuable concessions that defendants make in plea negotiations are waivers of pretrial hearings and the trial itself. These waivers might extend to all the procedural rights at trial, including the right to a jury, confrontation of adverse witnesses, counsel, and so forth. In some jurisdictions, defendants can obtain some benefits by offering to waive the jury trial in favor of a bench trial (Schulhofer 1984).

The defendant can also offer the government certainty and finality of outcomes by waiving the right to appeal or to file post-conviction collateral attacks on the conviction. Most state and federal courts have concluded that a defendant may explicitly waive the right to appeal a conviction as part of a plea agreement. One empirical study of federal cases found that nearly two-thirds of the cases settled by plea agreement included a waiver of appeal rights and three-quarters of the defendants who waived appeal also waived collateral review (King and O'Neill 2005).

Prevalence of Plea Negotiations

The concessions that the prosecutor and the defense attorney offer each other during plea negotiations have become the norm in criminal justice: plea agreements account for the great majority of convictions in every jurisdiction in the USA. The proportion of negotiated pleas changes over time and across different systems. Negotiated outcomes were not at all common in the mid-nineteenth century in state systems (Fisher 2003). In the federal system, less than 8 % of convictions were obtained through guilty pleas in the early 1970s; that number rose inexorably through the decades to reach the current level, above 97 % (Wright 2005). See Fig. 1.

A high volume of cases within a court system – both the civil and criminal dockets – creates the conditions for plea bargaining to thrive (Bibas 2012). Courts that resort to plea bargaining, in turn, increase their caseloads even further. Routine practices and expectations also play a role in sustaining the institution of plea bargaining: some courts with relatively uncrowded dockets still depend almost entirely on negotiated pleas.

The United States is unusual in an international context in its heavy reliance on party negotiations to resolve criminal proceedings and the tight connection it promotes between plea negotiations and sentencing outcomes. For example, only a generation ago, Germany was known as the "land without plea bargaining" (Langbein 1979). Over time, however, many European nations have faced a higher volume of criminal cases; crowded court dockets have led to various innovations that allow the prosecutor to designate some cases for summary treatment.

In some countries, party negotiations to achieve these more streamlined criminal adjudications have become more common. Parties not only negotiate guilty pleas but also dismissals and diversion into alternative punishment or restitution programs (Jehle and Wade 2006; Luna and Wade 2010). In the past, these negotiated summary dispositions were restricted to less serious cases, but that limitation is disappearing over time (Langer 2004). Plea bargaining is somewhat more prevalent in Israel, Canada, Australia, England, and Wales than in European Continental countries.

Negotiation Effects

It is difficult to say whether plea bargains reduce the typical sentence imposed on a defendant over the long run. On the one hand, defendants who plead guilty to a crime receive a definite "discount" for waiving trial rights, when compared to defendants facing the same charges during the same time period. On the other hand, as the courts rely more heavily on plea bargains and prosecutors file more charges, the legislature tends to pass new criminal laws that increase the risk for defendants who refuse to plead guilty. That is, the new laws authorize higher sentences that defendants potentially face if they insist on a trial and lose. Over the long run, reliance on plea bargains does not correlate with reduced sentences (Pfaff 2011).

Other potential effects of plea bargains go beyond the sentences imposed, raising issues about the accuracy of system outcomes and the influence of different system actors.

Questions About Accuracy

Established constitutional doctrine declares that the courts may not punish a criminal defendant simply for exercising the constitutional right to a trial. Daily practice in every American criminal court, however, contradicts this doctrine. It is clear that defendants routinely receive more severe sentences after trial than they would receive if they were to plead guilty (Brereton and Casper 1981). Judges resolve this apparent conflict between constitutional doctrine and daily reality by declaring that they reduce sentences in guilty plea cases based on the defendant's cooperative attitude and prospects for rehabilitation, and not based simply on the fact that the defendant waived trial rights.

The exact size of the "trial penalty" – or to put it more politely, the "guilty plea discount" – is difficult to measure. Studies of the trial penalty that attempt to control for the seriousness of the offense and other variables find a substantial gap between posttrial sentences and post-plea sentences. One study found a wide range of differences – between 13 % and 461 % – depending on the crime and the jurisdiction involved (King et al. 2005).

When defendants face such a large trial penalty, concerns start to mount that some defendants with valid defenses nevertheless plead guilty. Although there is a reasonable prospect that such defendants would be acquitted at trial, they dare not risk the large increase in the sentence that happens after a conviction at trial (Wright 2005). Behavioral economics offers some reasons to believe that defendants will undervalue the long-term impact of a felony conviction, leading defendants to accept a guilty plea too easily (Bibas 2004). On the other hand, there is evidence that some innocent defendants resist highly attractive plea offers, even when it might be rational to accept the offer in light of the risk of a wrongful conviction (Gazal-Ayal and Tor 2012).

The risk of coercing innocent defendants into pleading guilty is built into some basic structural features of American criminal justice. Criminal codes that offer more bargaining options to the prosecutor make it possible to increase the trial penalty and to pressure some defendants into waiving potentially effective defenses. The same holds true for increased sentence severity. When the law authorizes higher maximum sentences for a wide range of offenses and retains low potential sentences for lesser-included offenses, defendants face an enormous range of risk. Particularly in those states with sentencing guidelines or other limits on judicial sentencing discretion, the defendant can control some of that risk through a charge bargain. It would be an overstatement to claim that sentencing guidelines lead directly to more inaccurate convictions. They can, however, contribute to a coercive environment for defendants.

Finally, the structure of criminal justice institutions increases the risk of coercive and inaccurate guilty pleas. The public does not invest in enough judges, courtrooms, prosecutors, and public defenders to try a substantial proportion of the cases filed each year. The "working group" dynamic that develops in most courtrooms places the highest value on agreements that will move cases more quickly through the system (Nardulli et al. 1985).

Balance of Power Among Sentencing Actors

Sentencing guidelines and other structured sentencing laws that began to proliferate in the 1970s were designed to regulate judicial discretion in sentencing. As a result, some critics of these laws expressed concern that the reforms would transfer power from judges to prosecutors. Compared to traditional indeterminate sentencing schemes, the more structured systems would concentrate sentence authority in one branch rather than allowing one institution to check and balance the other (Alschuler 1991).

The transfer of power hypothesis finds some tentative empirical support. For instance, studies of guideline systems confirm that charge bargains become more common for at least some crimes, and charge reductions determine an important component of the sentence actually served (Frase 2005). But this shift in charging practices may not result in a provable transfer of authority from judges to prosecutors since judges might find other methods to influence sentences (Engen 2008).

At the very least, fears that prosecutors would entirely usurp the judge's sentencing authority in presumptive guideline jurisdictions appear to have been overstated. For one thing, judges in an indeterminate sentencing system do not, in reality, control the sentence that an offender actually serves. The judge announces one sentence, but parole authorities could later reduce that sentence. Since the judge in an indeterminate system never held actual power over the sentence to be served, guidelines do not take that power away from the judge. It is also true that presumptive sentencing guidelines leave important zones of discretion available to judges in the selection of sentences.

Limits on Prosecutorial Discretion

Legal institutions place some controls on the negotiation of guilty pleas. Those constraints originate both from outside the office of the prosecutor and from the internal workings of a local prosecutor's office.

External Constraints

If the legislature defines crimes narrowly and sets penalties at modest levels, it reduces the risks of inaccurate convictions and increases the power of different sentencing actors to check each another. This approach to crime legislation, however, does not thrive in the American political climate. Voters expect prosecutors to take the lead in addressing crime, and they expect legislators to give them the legal tools to do the job. Legislators respond with broadly worded criminal laws and multiple statutes (each with a different corresponding punishment) that could apply to a single common factual scenario.

Although legislators do not seriously constrain prosecutors through the terms of the substantive criminal law, statutes in a few jurisdictions do limit the timing of plea negotiations or limit the size of the charge reduction that a prosecutor can offer to dispose of a case (at least for some high priority categories of crime). While these legislative directives can be meaningful, their current impact is small. Statutory limits on the timing of negotiations simply push plea bargains into earlier phases of the proceedings.

Judges also refuse, for the most part, to monitor and control the negotiation of guilty pleas. Granted, judges hold the power to accept or reject guilty pleas, along with the plea agreements that the parties present to them. These judicial powers, however, operate within a system of mass justice. The caseload would become overwhelming if judges balked regularly at proposals to remove a case from the trial docket, or even took the time regularly to investigate this possibility.

The law in some jurisdictions also limits the role of the judge during plea negotiations. Statutes, rules of criminal procedure, rules of judicial ethics, and judicial opinions in more than half of the states instruct the judge not to "participate" at all in the plea discussions. The judge's only role is to evaluate the legitimacy of the guilty plea after the parties finalize their agreement. A smaller number of states discourage judges from participating in plea negotiations, but they do not ban the practice outright. The laws in these states allow the judge to comment on the acceptability of charges and sentences that the parties themselves propose or to participate in the negotiations only upon the invitation of both parties.

The rules of professional responsibility as enforced by state licensing authorities are also a potential source of limits on the plea bargaining behavior of prosecutors. For instance, a prosecutor who withholds discoverable information from the defense during plea negotiations might violate the specialized ethical obligations of prosecuting attorneys. Again, however, we get limited accountability from these regulators. State bar authorities rarely discipline prosecutors, and the penalties are usually not severe (Zacharias 2001).

Although institutions external to the prosecutor's office do not exert much power over the discretion of line prosecutors, the chief prosecutor is directly accountable to the voters. Prosecutors in the United States are normally elected. Given the distaste among voters for the practice of plea bargaining, elections in theory should limit the prosecutor's ability to reduce charges or to recommend lower sentences as part of a plea negotiation. In practice, however, the influence of voters over the plea bargaining policies of the prosecutor's office is limited. The heavy advantage of incumbents in prosecutorial elections makes this a weak accountability mechanism (Wright 2009).

Internal Constraints

While legal institutions outside the prosecutor's office do not fully meet the need for checks and balances, internal regulation has a substantial constraining effect. Forces within the prosecutor's office can produce plea policies that remain true to declared sources of law, in keeping with current public priorities in the enforcement of that law, applied with reasonable consistency across cases (Bibas 2012; Miller and Wright 2008).

These internal regulations take several forms. First, the managers in a prosecutor's office sometimes arrange the flow of cases to encourage line attorneys to interact dispose of cases through plea negotiations. This might involve the use of "horizontal" prosecution for some crimes, with different attorneys or units in the office making decisions as a file moves up through the system. It is also common, particularly in larger offices, to require supervisor approval for any plea agreement that dismisses a charge in priority cases, such as homicide and domestic violence.

Second, chief prosecutors can promote consistency and fidelity to public values among their line attorneys by creating *written* guidelines for the disposition of cases (Podgor 2012). The United States Attorney's Manual is one such resource. The guidelines typically declare that they do not carry the force of law and are not enforceable in judicial proceedings, but they nevertheless exert some control over the behavior of prosecutors (Abrams 1971). Through the use of such guidelines, prosecutors have from time to time banned the use of plea bargains for certain classes of cases, although such guidelines require serious monitoring and enforcement to remain effective.

While there is much promise in the power of chief prosecutors to hold their line prosecutors accountable, the system also depends on professional tradition, informal office culture, peer pressure, and individual conscience to achieve just results. At the end of the day, each prosecutor must remain individually committed to the ideal of responsible prosecution.

Policy Challenges

The most significant checks on the use of plea bargains come from inside prosecutors' offices. Prosecutors in the United States are profoundly decentralized: the state courts operate over 2000 separate prosecutors' offices, with no effective hierarchical control over the local offices in most states. As a result, the internal controls on plea bargains are often nontransparent and inconsistent from place to place. Policy makers who hope to promote enforcement of the criminal law that is consistent with legal values and with current popular priorities must find ways to make these local internal policies and practices more visible and subject to evaluation by the public and by other legal actors. A balance of power, in a transparent environment, would lead to the most responsible use of negotiated guilty pleas.

Overview

The excessive use of force by police is often a difficult phenomenon to identify, as well as a difficult concept to define. Unlike corruption that is motivated by profit – which is generally impermissible by its very nature – excessive use of force often resides at the marginal end of the *acceptable* use of force continuum. That is, because society authorizes the police to use physical coercion to carry out their mandate, it is often unclear when, along the use of force continuum, the acceptable use of force becomes excessive. Perhaps this is why excessive force, or brutality, often seems to occur unchecked in communities that are unable to advocate for themselves, making it difficult to hold police officers accountable for the use of unauthorized violence.

Several classic police scholars have developed occupational templates to help describe the circumstances under which some police officers engage in brutality. These perspectives try to account for police-suspect interactions, the police working environment, and dangers therein; while others locate the causes in the personalities of the officers, or the agencies in which they work. By understanding some of the causes of police brutality, society and policy-makers have a better chance of developing prevention strategies that can minimize the use of excessive force, particularly in the most vulnerable communities. Currently, these prevention strategies are rooted in the areas of recruitment and training, as well as the proper supervision of officers in the field.

Introduction

When two officers of the Los Angeles Police Department were shown on tape beating the motorist Rodney King with batons – after their field supervisor had already exposed King, with little effect, to the Taser, a conductive energy device designed to "stun" suspects into submission – even while he was rolling on the ground and seemingly defenseless – few observers were left with any doubt that they had just witnessed an example of police brutality. Some experts (e.g., Skolnick and Fyfe 1993; Toch 1996), however, who viewed the entire tape – as opposed to simply its last 7 s – saw a more nuanced escalation of force that ultimately became excessive. Rodney King had broken a primary subcultural rule in policing: When initially contacted by the team of California Highway Patrol officers who attempted to stop his vehicle for speeding on Interstate 210 in the San Fernando Valley area of Los Angeles, he failed to pull over for them. Indeed, King would later report that he fled from the CHP cruiser because he was driving while intoxicated and feared that an arrest would violate the provisions of his parole (the result of an earlier robbery conviction) (Skolnick and Fyfe 1993). For his failure to submit to police authority in ways that satisfied the five LAPD officers at the scene, King was "Tazed" once, struck with police batons 56 times (several of which were blows to the head), and kicked six times by officers (Independent Commission 1991). To date, the beating of Rodney King represents the archetype of police brutality, and it encapsulates multiple conceptual perspectives – from the levels of the social interactionist, workgroup, and cultural – aimed at explaining why some police officers resort to excessive force during their encounters with members of the public.

Excessive use of force by police is a tricky phenomenon to identify and explain. Even in the most "obvious" and infamous examples of police brutality, it is frequently the case that at some point during the violent encounter, some force on the part of police was justified – perhaps even necessary – to preserve officer and/or public safety. As such, excessive force by police is substantively distinct from other forms of misconduct, such as profit-motivated corruption because, while the later is usually wrong on its very face (e.g., police officers are not permitted to extort money from drug dealers or motorists; and they are not permitted to steal jewelry off corpses they encounter during health-and-welfare checks), they are allowed, and in many cases even expected, to use coercive force as part of their role in society. In fact, it as a virtual axiom in policing that the use of force is a "tool," whose use should be regulated but not taken away.

Several leading scholars have developed frameworks to explain *why* the excessive use of force occurs and *how* it may foster in some police departments. Van Maanen (1978) identifies the "asshole" as one lens through which to view the use of force encounter. He argues that when a suspect commits an "affront" to a police officer's authority, the officer – under certain circumstances – may respond with violence as a way of (re)establishing control over the police-suspect event. Muir (1977) takes a more individualistic approach, observing that some police officers have an "enforcer"-type personality borne out of their inabilities to (1) empathize with people whom they contact under the worst of circumstances, and (2) communicate in ways that may de-escalate potentially violent encounters. Skolnick and Fyfe (1993) view the excessive use of force from an organizational-level, noting that certain police departments develop and foster a so-called "siege mentality" in which officers are made to feel outnumbered, outgunned, and unwelcome in the communities they serve. Indeed, the siege mentality – which stems from the top levels of police department administration – views officers as a collective occupying force deployed in dangerous communities inhabited by dangerous people. As a result, officers in such locations are often made to believe that the only way for them to maintain order is through the use of highly aggressive enforcement strategies that may translate into excessive force.

This entry examines the use of excessive force by police through the perspectives offered above while also noting the difficulty and complexities involved in defining police brutality. As alluded to above, identifying excessive force is made all-the-more difficult by virtue of the use of physical coercion that is a large part of how the police fulfill their mandate in society. In addition to discussing these conceptual issues, the entry also describes how legal mechanisms, such as judicial review and the US Code, have made the excessive use of force difficult to prove at an acceptable legal standard, which may inadvertently stifle efforts to redress abusive police practices and reform police departments in need of reforming. The entry closes with a discussion of how to prevent and control the excessive use of force.

The Excessive Use of Force Prism

Before trying to define the *excessive* use of force by police, the reader might first start with a more fundamental question: *Why do we have the police in our society?* It is common knowledge that at times, some police officers use more force than is necessary on suspects they encounter; some engage in profit-motivated misconduct and then lie on the witness stand to protect their corrupt enterprises; and these practices often take place in the most socially and economically vulnerable communities (Kane 2002). So, again, while most people understand that some police officers, as well as some departments, have the propensity to engage in brutality, the question is again begged: *Why have the police in the first place?*

American citizens enjoy – perhaps more than those of other developed nations – almost unfettered access to their court system. They have the ability to report crimes directly to their local District Attorney's Offices, and they have the right to request protective orders and other forms of injunctive relief directly from magistrates in open court. In short, American citizens under the best of circumstances have the ability to mobilize government on their behalf in ways that could theoretically bypass the police entirely, and yet, most Americans – even those who have had bad experiences with them – would scarcely advocate dissolving the police as a public institution. Why? As cited by Klockars (1985), we maintain a collective police force because of what Egon Bittner wrote in 1970: "something-ought-not-to-be-happening-about-which-something-ought-to-be-done. . .*NOW!!*" That is, although it is *possible* to mobilize the government without using the police, it is often not *feasible* to do so. In highlighting this reality, Klockars (1985) notes that if a crazy resident goes into the yard of his neighbor to chop down a prized apple tree with an axe, seeking an injunction against such an intrusion likely will not prevent the destruction of the apple tree. In such events, therefore, the point of the police is to stop – or at the very least – freeze a moment in time in order for the courts to gain the opportunity to properly adjudicate the case. The police accomplish this mandate by exercising their "general right to use coercive force" (Klockars 1985) – a right bestowed upon them by the American public through the Executive Branch of government. And it is this general right to use coercive force that makes possible both the best and worst practices of policing. At their best, the police use their coercive authority to improve the life chances of people they contact – often under the most abject social and economic conditions imaginable. At their worst, police use their coercive authority in ways that abuse, denigrate, and otherwise "tread on the human dignity" (Carter 1985, p. 322) of people they encounter.

Although the American public grants police the general right to employ coercive force, it does so with few guidelines as to the boundaries of its proper use, making it difficult for evaluators of police behaviors to determine – for example – when appropriate force may have become excessive, or when excessive force was used when no force was necessary. The following serve as instructive examples:

- **Incident 1**: Two police officers on foot see a man on a public sidewalk who matches the description of a robbery suspect. They attempt to contact the man, but as they summon him their way, the man turns and runs. Both officers engage the suspect in chase. The man leads them on a 5-min foot pursuit through alleys, over fences, and across a vacant lot until they finally catch him in an open field. At the point of contact, the man physically resists the officers' efforts to subdue and handcuff him. He swings and kicks at them, making glancing contact, until one of the officers makes two baton strikes to the man's body, sending the suspect hard to the ground. One of the officers is bleeding slightly from a scratch on his face, the other suffered a hyperextended knee. As the suspect writhes on the ground from the pain of the baton strikes, one of the officers kneels to handcuff him, while the other officer kicks the man twice in the ribs. Even after the suspect is securely cuffed and clearly incapacitated, the other officer punches him with a closed fist in the kidney two times just after the other officer pulled him from the ground.

- **Incident 2**: A police officer working traffic duty sits in his marked cruiser at mid-day. The car is parked in a somewhat concealed position relative to the corner of an intersection governed by a four-way stop. When he observes a pickup truck roll confidently through the intersection without stopping, the officer ignites his engine, activates the light bar, and pulls quickly away from the curb to initiate a vehicle stop on the truck. After a few hundred yards, and two siren "chirps," the driver of the pickup truck finally pulls to the curb. The officer exits his vehicle, walks to the truck, and instructs the driver to put down his window. The officer observes that the driver and his one passenger are teenage boys, most likely between the ages of 16 and 18 years. The officer waits with expectancy while the driver – who is wearing a smirk on his face – finally begins to slowly roll down his window. The officer, losing patience, asks for the driver's operating license. After a pause, the driver says, "Why do you need that? I am just taking my buddy home." The officer again requests the young man's license, and although the driver complies, he does so slowly. Suddenly, the officer reaches in through the window, grabs the young man by the hair, and swiftly pulls him through the window and out onto the street. The officer then drags the young man – still by the hair – around the front of the truck to the sidewalk, where he slams the young man's head against the hood of the truck. The young man screams in surprise and pain, while the officer repeats the motion of bashing his head against the hood. The officer then drags the young man back around the front of the truck, opens the driver's side door, and roughly deposits the young man back into the truck, slamming the door closed. The officer then advises, "The next time a police officer asks for your driver's license, I suggest you give it to him the first time." Then officer then turns, walks back to his patrol car, enters, and drives away.

The above scenarios indicate two types of situations during which excessive force may be used by police, and both have their own definitional difficulties associated with them. In the case of incident #1, it is clear that the two officers involved in the foot chase were justified – even compelled – to use force in the apprehension and control of the suspect. The suspect, in fact, used physical force to prevent his apprehension, swinging, kicking, and striking the officers as they attempted to subdue him. The officers were probably justified in the use of their batons while the suspect was fighting them, but what about the subsequent kicks and blows once the suspect was handcuffed and effectively restrained? At what point did the appropriate use of force by the police become excessive? Different people – e.g., police officers, police administrators, community residents, and promoters of law and order – may have different answers to this question. For some, the baton strikes may have been regarded as excessive, considering there were two officers and the suspect was not at all armed with a weapon. To others, the kicks and punches delivered by officers at the conclusion of the encounter were not excessive, but rather "just desserts" visited upon a "victim" who should have cooperated with the police in the first place.

The events described in incident #2 suggest perhaps a less ambiguous evaluation of the use of excessive force. Although the driver of the pickup truck was not physically combative with the officer who stopped him, he was defiant, and he failed to comply with the lawful order of police officer, namely, to produce his operator's license. In doing so, the driver of the pickup truck left the officer with two categories of choice: (1) make a tactical retreat, perhaps to his vehicle where he could have radioed for a supervisor to join him at the scene in an effort to avoid the use of force; and (2) increase the dosage of coercion in order to secure the driver's compliance. From the description of events in incident #2, the officer clearly chose the latter by using physical coercion to neutralize the young man's defiance. And again, commentators of police behaviors may disagree as to the appropriateness of the officer's actions. Some would conclude that the force used by the officer was unnecessary, excessive, and perhaps even illegal; others may conclude that the officer rightly punished a smart-aleck kid who needed to be taught to respect authority.

Despite potential differences in assessments of the excessive use of force across incidents 1 and 2, the hypothetical events share a common link: From the perspective of responding officers, both victims may have "deserved" it. That is, in both cases described above, an argument can be made that both suspects-turned-victim forced a confrontation with the police, which led to the excessive force. This is another feature of many use of force incidents that makes identifying brutality or excessive use of force difficult. As Walker (2010) has argued in his criticism of drug-war policing, when police officers use excessive force during their encounters with the public, they usually do so on socially marginalized and/or otherwise "undesirable" suspects, often rendering it unlikely that the victim of brutality can successfully hold officers accountable for their actions. Thus, despite the procedural and legal constraints (discussed in the following section) placed on officers' authority on the use of physical coercion, the sociology of use of force encounters often challenges society's definition of the excessive use of force, particularly when the force may have been used on someone who at least initially defied the police.

The following section discusses several of the legal issues associated with defining the excessive use of force, which adds further difficulty of successfully defining excessive force and brutality.

Excessive Force Through Legal and Social Lenses

Moving more thoroughly into an evaluation of the excessive use of force by police requires some definitional clarity. In general, police use of force can be categorized into four types: (1) appropriate, (2) deadly, (3) excessive, and (4) unnecessary. Once these types of force are defined, the entry focuses on excessive force, also commonly referred to as police brutality (e.g., Skolnick and Fyfe 1993).

The appropriate use of force occurs when police officers use physical coercion that is proportional to a suspect's resistance to gain compliance and/or diffuse a violent or potentially violent encounter. Though perhaps commonly believed, police officers are not required to match a suspect's resistance incrementally with force that follows a use of force continuum (*Graham v. Connor* 1989). Rather, police officers are legally (and usually administratively) permitted to "skip" steps on the use of force continuum in order to overwhelm a suspect – within reason – to achieve custody. Society and the courts do not require police officers to engage in fist fights with suspects in order to gain compliance. Indeed, most police officers are trained to control many suspects – whether armed or not – from a safe distance, often via the threat or use of chemical spray, a conductive energy device (e.g., Taser), or a firearm. To provide a framework for assessing the appropriateness of the use of force, the Supreme Court applied an "objective reasonableness" standard (via the Search and Seizure Clause of the Fourth Amendment) in the case *Graham v. Connor* (1989), holding that the legality of the use of force must be evaluated based on the judgment of a "reasonable" officer at the scene of the event rather than through a "retrospective" lens. The Court reasoned that when police officers become involved in violent or potentially violent encounters, they frequently have just seconds to decide how to apply coercion, often in self-defense and/or in the defense of others. As such, the fairest assessment of the legality (and administrative permissibility) of the application of force must be made from the perspective of someone at the incident who would have had to make a force decision in the heat of the moment – just as the actual officer did.

Deadly force – i.e., "force that kills or is likely to kill" (Fyfe 1979) – and which is usually, but not always, the result of a firearm discharge – is governed largely by the same objective reasonableness standard as nonlethal force (the standard appears to change to a test of "deliberate indifference," as governed largely by the Eighth Amendment, if deadly force is used on a suspect while in a custody facility), though with an extra restriction. In the case *Tennessee v. Garner* (1985), the Supreme Court abolished the common law custom that had historically allowed police officers to use deadly force against fleeing suspects who posed no threat to life. In abolishing this practice – which was known as the "fleeing felon rule" – the Court reasoned that using deadly force to apprehend a person suspected of having committed a felony, but who seemed to pose no imminent threat to life – constituted an unreasonable seizure of the person under the Fourth Amendment. Despite this landmark decision that made the "defense of life" standard the law of the land, the Court in *Garner* failed to outline circumstances under which deadly force *was* permissible. Thus, *Garner* allows officers to determine the meaning of "life" threatening: The risk to life need not be *real* at the time of the incident; it must be *apparent*.

Among all the dimensions of the use of force construct, "unnecessary" force is perhaps the most difficult to assess and the most controversial to condemn. Unnecessary force usually represents the proper use of force at the immediate moment of application, but which could have been avoided had officers not allowed, or caused, the incident to escalate (Fyfe 1986). Thus, rather than representing the product of malice or the inclination to "punish," unnecessary force generally results from police officer's professional incompetence. A typical example of this occurs when police respond to a man with a gun call. They might arrive on the scene to find an agitated man pacing in his front yard with a pistol in hand. Because officers neglected to find cover and concealment (i.e., failing to position themselves behind parked cars or out of direct line of fire), they shoot the man when he makes a furtive movement. When focusing on the last point in the encounter – i.e., the instance immediately preceding the shooting – the force used may be justifiable since the police were compelled to protect their lives and perhaps the lives of bystanders. When considering, however, the events that led to the shooting, professional incompetence left the officers at risk of being shot in the first place. Had they found proper cover, they might have been able to wait and persuade the man to drop the gun, which would have averted the use of violence. Although the examination of unnecessary force is largely beyond the scope of this entry, it is important to at least identify because (1) it represents a component of the overall use of force construct, and (2) likely happens more frequently than does excessive force, often without the subsequent application of accountability remedies (Fyfe 1986).

As the above discussion should suggest, police brutality is physical force that breaches the confines of legally permissible physical coercion. Because police brutality is often committed out of malice, disrespect, and/or officers' desires to reassert their authority over a suspect (e.g., Skolnick and Fyfe 1993), several academic researchers often regard excessive force as an example of police abuse of authority (e.g., Carter 1985) rather than a mere "excess" of force. This is because police brutality often stems from the same theoretical processes that lead to verbal chastising and psychological abuse during police interrogations (e.g., Carter 1985) – both of which are abusive but not physical.

Although most state criminal codes in the United States include statutes that specifically make police brutality under "color" of state authority illegal, the most common legal remedy for parties attempting to redress the alleged excessive use of force by police is Title 42, Section 1983 of the US Code. This is the Federal civil rights statute that allows persons alleging harm by police (and any representative of the State who may have acted under color of authority) to seek damages from both the individual officer(s) and the government agency that employed them. The reason why Section 1983 is likely the most common legal mechanism invoked in excessive use of force claims is because the statute relaxes the usual requirement placed on plaintiffs that they exhaust all lower administrative and legal outlets before filing a claim in Federal court. Although the statute does not require proof that a police officer intended to harm the victim (that is, the plaintiff need not prove an officer's psychological state of mind), it does require the plaintiff to successfully demonstrate that the government entity (e.g., municipal police department) that employed the officer maintained official policies and directives that directly resulted in the harm caused, or that the entity had established informal customs and practices that led to the harm. For this reason, Section 1983 lawsuits are often colloquially referred to as "patterns and practices" suits and generally allege that the brutality (or other problematic behaviors) occurred because the police agency failed to train and/or supervise the officers properly and/or negligently retained the officers as employees.

Thus, integrating the Section 1983 statute with Supreme Court decisions results in plaintiffs gaining ready access to Federal court for the purposes of attempting to hold police officers and the agencies/governments that employed them accountable for brutality, though trial courts must adhere to *Graham's* "objective reasonableness" requirement of evaluating the use of force from the standpoint of a reasonable officer at the scene. The net effect has been that, while it is relatively easy to sue police officers and police departments, it is highly difficult to win such cases due to the "reasonable officer at the scene" requirement (Skolnick and Fyfe 1993). Moreover, as research has shown, even when plaintiffs are generally successful in proving police brutality at an acceptable legal threshold, juries historically have been reluctant to decide against police officers due to generalized public support for the police, and the fact than many plaintiffs who allege brutality occupy dubious social positions relative to the officers they are accusing. Perhaps the best example in modern history was the Rodney King case in which all officers accused of brutality were found not guilty in the first trial.

Classic Templates to Explain Excessive Use of Force

As noted in the opening pages of this entry, police brutality – or excessive use of force – occurs for myriad reasons across multiple levels of analysis: the psychological, sociological, social contextual, and organizational. Since William Westley (1970) published his classic ethnography of police in Indiana (which was actually published 20 years after his dissertation work that produced the findings) in which he described for the first time the importance officers and police organizations placed on making felony arrests, several researchers have replicated Westley's methodology in an effort to highlight several aspects of the police occupation that previously had been generally unknown. The result was the publication of classic statements on police coercion that described the processes by which police officers may commit, and why police departments sometimes attempt to hide, police brutality. This entry considers these perspectives as occupational templates and describes the most important of these below.

Starting at the individual-level, in his largely ethnographic study of the police in "Laconia" (a pseudonym), Muir (1977) interviewed and then observed a group of police officers in an effort to understand how they responded to "critical" incidents in their work settings. It is now commonly known that "Laconia" was Oakland, CA, a large city that employed 800 police officers at the time of Muir's research, and which was characterized by high levels of racially concentrated economic resource deprivation and crime. During his research, Muir observed four police officer personality "types" that were differentiated by two elements: the abilities to (1) empathize with those whom they encountered on the street, and (2) morally reconcile need to use force in certain circumstances. For example, the archetypal officer in Muir's typology was the "professional" – i.e., a collective group of officers who could place themselves psychologically in the life circumstances of the suspects they encountered, and although professionals did not care to use force to resolve most conflicts during their engagements with members of the public, they used force when necessary to stop conflict, protect lives, and restore order. Once the situational exigencies were neutralized, professionals ceased their use of physical force. A key attribute of professionals was their ability to communicate effectively with suspects in ways that often minimized, de-escalated, or even eliminated the need to use force during many incidents.

In contrast to the professionals were the "enforcers:" Officers who had the highest propensity to use excessive force against suspects because they (1) generally lacked the capacity to fathom the often "tragic" conditions that characterized the lives of many people they encountered, and (2) were quick to resort to violence when they perceived minimal threats to their safety or when they felt compelled to assert police authority. Muir (1977) noted that, unlike the professionals, enforcers usually lacked the communication skills necessary to de-escalate and/or otherwise avoid the need to use force in certain circumstances. As a result, enforcers often created situations where other officers near them were forced to use violence against suspects because of the degree to which enforcers provoked violence during their contacts with the public. Thus, and as Muir notes, enforcers were problematic to police workgroups partly because they frequently engaged in excessive force, and partly because they often caused *potentially* violent encounters to escalate into *actual* violent encounters.

Perhaps the most interesting and important element of Muir's (1977) typology was the recognition that officers might slide between one personality type and another based on cues in the social environment. For example, officers regarded as professionals – and who usually conducted themselves appropriately during most police-citizen encounters – sometimes became enforcers during certain incidents. Muir, for example, identified one "professional" officer among those he studied who was highly communicative and restrained in virtually all street encounters except when he responded to sexual or domestic assaults against female victims. These events tended to trigger an uncharacteristic response in the officer – perhaps due to family history or other personal experience – leading him to take on the attributes of the enforcer: He was quick to use violence as an initial response when contacting an alleged domestic or sexual assault offender. Thus, although Muir's typology was largely psychological, it recognized the importance of social context when analyzing street-level behavior of officers.

Although no identified studies have found reliable empirical support for Muir's typology (see, for example, Hochstedler (1981)), none has tested the typology in a setting that replicates that in which Muir conducted his research. It may be that Muir's findings hold primarily for postindustrial port cities with large urban African-American populations that live predominantly in poverty conditions, socially isolated from the larger urban matrix. Such are the conditions that most often allow officers to engage in abuse of authority – including excessive force – with little fear of recourse (e.g., Kane 2002; Kubrin and Weitzer 2003). Moreover, despite scant support for the typology itself, at least one study has found that – like Muir's findings – officers who exhibit certain personality characteristics (diffuse though they may be) often "slide" between profiles as the social contexts in which they work vary (Hochstedler 1981). This finding supports Muir's observation that even so-called professional police officers may become "enforcers" under the circumstances that elicit particularly strong responses, and perhaps where local social constraints are wanting. Such findings demonstrate the importance of the social ecological contexts in which officers work as determinants of their behaviors. At the very least, Muir's typology provides a useful taxonomy for efficiently describing certain officer characteristics that are easily recognized – i.e., enforcer.

Residing one level up from Muir (1977) on the social ecological progression is Van Maanen's (1978) "asshole" perspective. This framework is so-named for the colloquial usage of the term by police officers as a shorthand for suspects who – through speech or gesture – "deny" a police officer's "definition" of the power structure that characterizes their interactions with the public – namely, that officers are in charge. Van Maanen argued that the line officers he studied tended to classify members of the public into three groups: "suspicious persons" (suspected criminal offenders), "assholes" (people who challenge police authority), and "know nothings" (people who do not fit the previous two categories and who are also not police officers). Whereas police officers usually have little or no cause to use coercion against know nothings, and they generally use coercion only as necessary to control and/or gain the compliance of suspicious persons, they may use coercion – i.e., force – against those labeled assholes as a retaliatory mechanism to redress an affront to an officer's authority (Van Maanen 1978).

Van Maanen (1978) observed that a suspect's initial response to a police officer's inquiry determined the officer's categorization of him (Van Maanen never clarifies as to whether the template applies to female suspects), as well as the subsequent police reaction. Suspects who appeared to reject the officer's definition of the situation – thereby challenging the officer's authority and legitimacy – were labeled assholes and were often subjected to a violent response as a form of punishment or reassertion of authority. From an officer workgroup standpoint, police officers who labeled a suspect an asshole were justified, and perhaps even expected, to use violence to reestablish control.

Recall Incident #2 – the dramatized use of force scenario – in the "Excessive Force Through Legal and Social Lenses" section of this entry. The officer's response to the youthful driver's verbal resistance was a quintessential example of how a person may become labeled an asshole under Van Maanen's model. Importantly – and as shown in Incident #2 – when officers label a suspect an asshole, and to the extent that the officers use brutality to redress the affront, they often do so to impose police authority typically at the expense of formal sanctioning (e.g., arrest). As such, some suspects – particularly those engaged in illegal behavior when contacted by the officer – may accept the brutality in lieu of a formal sanction because if they reported the brutality, they would also have to report their activities that led to their initial contact with the police.

Though it is the case that occupational templates-perspectives often fail to yield empirical support, at least one recent study has offered some empirical validation of Van Maanen's (1978) "asshole" thesis. In a study of how the occupational goals of police may sometimes conflict with rule of law practices, Kane and Cronin (2011) examined the extent to which police officers used force in situations that may have been characterized by the "asshole" process. Through the use of discriminant function analysis, Kane and Cronin reported that during coercive exchanges with suspects (i.e., situations that ultimately ended in arrest), suspects who demonstrated "verbal antagonism" toward officers – but not physical resistance – were likely to be "punched" and "kicked" during the incident. Interestingly, when suspects demonstrated physical resistance, but not necessarily verbal antagonism, they were usually subjected to more "normal" types of force, such as chemical sprays, baton strikes, or basic joint locks (Kane and Cronin 2011). Verbal antagonism appeared to elicit "asshole" responses in the form of punches and kicks – use of force techniques that usually do not exist on a police use of force continuum.

Whereas Van Maanen (1978) operationalized the "asshole" perspective as one rooted primarily in the social interactionist tradition, there is evidence that the asshole process also may be driven in part by police subcultural pressures. In his observational study of how the Los Angeles Police Department controls space within its vast jurisdictional boundaries, Herbert (1998, p. 347) adds a conceptual dimension to Van Maanen (1978) with his identification of normative orders: a collective subcultural belief system "…oriented around a common value." Herbert argues that police officers working in small groups develop informal work and productivity standards within the context of six normative orders that include law, bureaucratic control, adventure/machismo, safety, competence, and morality. Herbert (1998, p. 347) observes that officer workgroups place differential values on the normative orders in ways that "provide guidelines and justifications for" workgroup enforcement activities. For present purposes, Herbert notes that normative orders – such as law and safety or law and competence – may conflict with one another as officers use their coercive authority to satisfy one normative order (e.g., competence), perhaps at the expense of another (e.g., law or bureaucratic control).

Herbert's normative order system, which he referred to a police subculture, may be integrate with occupational templates because it explains how situational circumstances may trigger police responses designed to satisfy occupational goals. For example, officers confronted by a suspect they label as "dangerous" will likely invoke the normative order of *safety* to minimize the threat of violence. Similarly, officers who enter into a coercive encounter with a bellicose suspect – an "asshole" in Van Maanan's (1978) taxonomy – may seek to demonstrate their *competence* to other officers in their workgroup by using excessive force or brutality, which may be regarded as situationally justified to reassert police authority over a noncompliant suspect. Again, such an application of coercion may conflict with rule of law orders, but may be regarded as occupationally necessary if officers achieve the objectives of their primary normative value.

Finally, to understand how police agencies themselves may create a culture that fosters, if not encourages, the excessive use of force by their officers, it is important to consider the research on police organizations. In Los Angeles, the Christopher Commission assigned to investigate patterns of excessive violence in the LAPD in the wake of the 1991 beating of motorist Rodney King identified a "siege mentality" that was prevalent among officers of that department (Independent Commission 1991, p. 95). This siege mentality, the Commission argued, led officers to view their relationship with the community at large as adversarial (the "us vs. them" perspective) and appeared to legitimize the excessive use of force by police against suspects in an environment that all but guaranteed immunity from accountability (Skolnick and Fyfe 1993). The confidence that officers placed in their ability to freely "punish" suspects who committed affronts against police authority was perhaps best illustrated by the routine exchanges among officers via their mobile data terminals in which anecdotes describing violent activities – often in racist terminology – were openly exchanged (see: Independent Commission (1991)).

Appealing to occupational templates to help explain the processes by which excessive force may be used and legitimized by police officers is instructive because they offer a social ecological context within which to interpret police brutality that is often absent from the empirical literature that examines excessive force. Templates, such as Muir's (1977) extortionate transaction model, Van Maanen's (1978) "asshole" perspective, Herbert's (1997) identification of workgroup "normative orders," and Skolnick and Fyfe's (1993) elaboration of the "siege" mentality, show that police brutality may be influenced at every level of a police officer's contextual occupational life. Moreover, they offer insight into how some officers who may be disinclined to use brutality on suspects may operate in layered contexts that favor, or even expect, them to use excessive against certain suspects under certain circumstances.

Some Consequences of Police Brutality

Perhaps the most obvious consequences of police brutality are the direct effects endured by victims. Although there are no national data on the subject, it seems clear that people who experience police brutality can suffer physical harms ranging from minor aches and pains to serious injury, and in some cases, death. It is also likely that people who experience physical abuse at the hands of police may suffer emotional trauma. In the United States, however, police agencies are not required to report use of force – let alone excessive force – incidents to any centralized authority, leading researchers and policy-makers to make guesses about the frequency and severity of police brutality. This problem could be ameliorated by the implementation of a national reporting system on the police use of force.

In addition to the direct effects of police brutality to those who experience such abuse, there are often broader sociological consequences that may result when police engage in the excessive use of force, particularly when the force is systemic in nature and occurs in communities whose residents perceive that they have been socially and legally marginalized by their municipal governments. Among these, perhaps the gravest consequence is the loss of legitimacy police forces can experience when officers are viewed as brutal or abusive, and when community residents perceive little or no recourse to control them.

Tyler (1990) has argued that societies are more likely than not to comply with the law when they believe in the morality of the law and in the legitimacy of the government making the law. For a society to accept law as moral and the government as legitimate, its members must believe in the fairness of the law-making process (Tyler 1990). This model of procedural justice generally argues that the way a state achieves and maintains legitimacy is by distributing its authority through consensus-based processes without regard for the social and economic statuses of societal subgroups. If the public becomes polarized over issues related to the distribution of legal authority, the government may lose legitimacy and find it difficult to fulfill its “regulatory role” in society (Sunshine and Tyler 2003, p. 515) without having to resort to the frequent use of physical coercion. This issue is important for municipal authorities, as some members of the public, particularly those residing in communities characterized by racial segregation and/or systemic economic resource deprivation, may perceive inequities in the distribution of police resources in violation of procedural justice expectations (Jacob 1971).

Kubrin and Weitzer (2003) were among the first researchers to find social scientific evidence supporting the above arguments. In their study of retaliatory homicide in St. Louis, Kubrin and Weitzer found that certain types of homicides predicted subsequent homicides in the form of retaliation, suggesting that, had the initial homicide been stopped, the net reduction in many cases would have been two, given that the retaliatory homicide also would have been negated. In the qualitative portion of their study, Kubrin and Weitzer found through unstructured interviews that the initial homicides were allowed to occur in large part because community residents refused to share information related to criminal activity with the police due to their distrust of law enforcement authorities. This distrust stemmed from perceived abuses – including brutality – of community residents by police over a number years. Kubrin and Weitzer’s (2003) findings were largely consistent with Anderson’s (1999) observations of the so-called Code of the Street. Anderson argued that the Code – in which respect was valued as a social good, earned and maintained by the threat and/or use of violence – prevailed in the north Philadelphia community he studied in part because the police had virtually no legitimacy due to their perceived abuses of authority.

Kane (2005) made similar findings in New York City in his examination of the consequences of “over-policing” and police misconduct (including violence) on violent crime. For present purposes, Kane found that in economically stable communities, police misconduct had no effect on violent crime. In economically disadvantaged, and “extremely” economically disadvantaged, communities, police misconduct (including violence) led to subsequent increases in violent crime. Kane attributed this relationship to the same processes driving Kurbin and Weitzer’s (2003) findings: As residents of socially/economically marginalized communities perceived increases in police abuses, they likely ceased sharing crime-related intelligence with authorities, allowing violent crimes to occur that may have been otherwise prevented.

In his classic lecture, "Politics as a Vocation," Max Weber (see: Weber et al. 2004, pp. 78–79) argued that because the State "claims the monopoly on the legitimate use of force" to enforce its laws, politicians who hope to gain the "obedience" of those whom they govern need not simply *do* the right thing; politicians must *appear* to do the right thing. Weber's arguments are made salient by Kubrin and Weitzer (2003) and Kane (2005): Failure of the police to "govern" effectively the territories they serve may lead to noncompliance on the part of people who reside in communities characterized by the perceptions of police abuse of authority. In the "everyday" sense, citizen's noncompliance may manifest in the form of people failing to readily yield to police authority during traffic stops and stop-and-frisk events – both of which may create a context of hostility and distrust on the part of the police and members of the public. In the broader and more extreme sense, generations of police abuse, including unchecked or redressed brutality, may lead to urban violence. Indeed, two of the most destructive urban riots in American history have been attributed to long-standing patterns of police abuses, including unchecked brutality.

On August 11, 1965, a white California Highway Patrol officer stopped an African-American motorist in the Watts section of Los Angeles for suspected Driving While Intoxicated. Even at that time, Watts was an area of Los Angeles, characterized by racially concentrated economic resource deprivation, which had a difficult history with the police. The motorist – Marquette Frye – resisted being taken into custody, which led to an escalating confrontation with police (Barnhill 2010). As more officers arrived on scene, the crowd of bystanders also grew until someone finally began throwing bottles and other objects at the officers, who continued their struggle to subdue Frye (Barnhill 2010). In the process of taking Frye into custody, officers also arrested his mother and brother for unlawfully interfering with the arrest, which led the crowd to switch from throwing bottles to throwing rocks and other large items at police (Barnhill 2010). This inciting incident led to 6 days of rioting in Watts, leading to 34 deaths, 1,032 injuries, and over 3,000 arrests (Barnhill 2010). Although post-riot analyses generally concluded that poor living conditions and the social marginalization of African-Americans in Los Angles represented the root causes of the Watts riot (e.g., California Governor's Commission on the Los Angeles Riots 1965), some researchers concluded that years of police abuse and brutality in Los Angeles – particularly during the tenure of Police Chief William H. Parker, during which the LAPD transformed into highly aggressive paramilitary police force – was largely responsible for the riot (Skolnick and Fyfe). Indeed, the McCone Commission, empanelled just a few months after the riots and charged with identifying the causes, noted from its many interviews of African-American Watts residents:

> "Police brutality" has been the recurring charge. One witness after another has recounted instances in which, in their opinion, the police have used excessive force or have been disrespectful and abusive in their language or manner (Governor's Commission 1965, p. 40)

The social and economic costs of the 1965 Los Angeles riot were eclipsed only by those of the 1992 Los Angeles riot, which occurred in the immediate aftermath of two white police officers being acquitted for beating motorist Rodney King. During the 1992 riot, the LAPD and the California National Guard killed 53 people. More than 2,000 people were injured, and over 1,000 buildings were destroyed by fire (Wood 2002). The fact that both riots occurred in Los Angeles was no surprise to Jerome Skolnick and James J. Fyfe – two of the nation's leading scholars of police authority and accountability – who argued that since William Parker was appointment police chief of Los Angeles in 1950, the LAPD became increasingly insular, aggressive, and unaccountable to the mayor and city council (Skolnick and Fyfe 1993). The unaccountability was particularly pronounced under Chief Daryl Gates, who enjoyed civil service protection and indemnity from lawsuits (Skolnick and Fyfe 1993).

It seems clear that, while people subjected to direct forms of police brutality suffer the most immediate harm from such abuse, those residing in communities – even cities – in which the police engage in the excessive use of force with little accountability also experience the resulting harms. Violent incidents in Los Angeles (1965 and 1992), Detroit (1967), Chicago (1968), Liberty City-Miami (1980), Cincinnati (2001) – even Tulsa in 1921 – were not so much riots as they were urban rebellions. In each event, the triggering incident was related to some form of police abuse, and all post-riot analyses identified abusive police practices, largely in communities characterized by racially concentrated economic resource deprivation and social marginalization, as major causal factors (see: Independent Commission 1991; Kerner Commission 1968; Skolnick and Fyfe 1993).

Preventing Excessive Use of Force

As previously alluded to, people who experience police brutality or the excessive use of force have recourse through the conventional mechanisms of police accountability: the citizen complaint process, mediation, and the courts. Each of these avenues of recourse has varying chances of success, depending on the several factors related to the event, including the social desirability of the accuser, the degree to which the incident occurred in the public realm and/or in view of credible witnesses, the extent to which the accuser may have attempted to initially evade or who otherwise resisted police officers, and in many cases the quality of the accuser's legal counsel. While individual plaintiffs may prevail in their attempts to hold police accountable for the use of excessive force, most would probably argue that best recourse would be the prevention of police brutality before it occurs. The most immediate methods by which to control and/or prevent the excessive use of force by police are probably rooted in the recruitment of police officers, training and supervision, and the establishment of organizational cultures within police departments that value the protection of life over the enforcement of law as a primary function.

The personnel processes police departments use to recruit and hire officers play a crucial role in shaping subsequent organizational behavior, but in ways that are perhaps more subtle than they are apparent. Police department hiring practices are generally designed to screen out undesirable applicants, which is substantively different from trying to screen *in* desirable applicants. These so-called screening-out practices are rarely evidence-based; and they are often not followed consistently over time or across police recruiters or background officers. Moreover, to the extent that the excessive use of force is a relatively rare event within police organizations, it is difficult to accurately predict who might have become "problem" officers over the course of their careers were they allowed to join the force. Although emerging evidence supports the practices of screening out applicants on the basis of employment and criminal histories to prevent general misconduct (see: Kane and White 2012), there is virtually no evidence that "violence-prone" (Toch 1996) police officers can be identified and effectively screened out through the normal recruiting process.

Screening methods that favor recruits whose education, experience, cultural identities, and world views would create police department cultures not dominated by a single gender or ethnic group, and it would raise the possibility that members of all subgroups would contribute to the development of a sensitive workforce tolerant of people across race and class. Empirical findings support this claim: In their study of career-ending misconduct in the New York City Police Department, Kane and White (2012) found that from 1975 to 1998, as the NYPD became increasingly racially and ethnically diverse, it also became better behaved. Rates of misconduct decreased as diversity increased, independent of external factors that often influence organizational rates of misconduct. Although the NYPD over that time period may not have systematically recruited persons with diverse characteristics or personal histories, the results of bringing diverse pools of recruits into policing are clear: Organizational misconduct declines.

In addition to recruitment, supervision of police officers is also critical in preventing excessive use of force – particularly in communities that historically have had difficult access to the conventional mechanisms of police accountability. For example, in a study of police misconduct in New York City police precincts, Kane (2002) found that the traditional antecedents of social disorganization – particularly, structural disadvantage – predicted increased rates of career-ending police misconduct. Precincts characterized by the highest rates of racially concentrated structural disadvantage also had the highest rates of police misconduct. This finding led Kane (2002, p. 891) to conclude that, "The very communities likely in need of the most protection by the police. . .(are also) in need of the greatest protection from the police. . ." One way to offer that protection is through the supervision of officers.

In many American police departments, the average staffing ratios call for one sergeant for every nine patrol officers (Walker and Katz 2010), and while scant research highlights what supervisors actually *do*, at least one study suggests that low spans-of-control (i.e., high ratio of supervisors to officers) decreased excessive force (Terrill 2001). Although modern organizational police theory generally argues that low spans-of-control are inefficient to the administration of police departments (making the assumption that "flatter" organizations function more efficiently than "tall" organizations) (e.g., Walker and Katz), in communities where the risk of misconduct may be higher than average, it seems that lower spans-of-control would reduce the risk of brutality as supervisors have more contact with line officers in the field. Indeed, under such conditions, what may be sacrificed in terms of organizational efficiency may be gained in effectiveness.

Finally, recruitment and supervision to limit police and the excessive use of force seem to have their highest probabilities of success if the overall police department culture supports the structural efforts in place to guard against brutality. The tone must be set at the top through the implementation of progressive policies that strive for transparency in the disciplinary review process and promote model tactics and strategies. In addition, evidence suggests that when line officers are involved in the development of use of force policies and field tactics designed to reduce police officer violence (i.e., Fyfe 1997), then the use of force within departments tends to decrease, partly because police officers view themselves as contributors to the policy development process, rather than simply as people who need to be controlled.

Once the chief administrator implements an infrastructure of progressive policy and gains the "buy-in" of line officers, the message of progressive policing must filter through all layers of the police organization. One method by which to accomplish the process of communicating the department's value system is via the field training officers (FTOs). Toch (1996) argued that for the purposes of controlling police violence, field training officers were instrumental in bridging the gap for new officers between the messages they received in the training academy and the messages they received from their peers once on the street. Toch argued that FTOs serve a crucial organizational role because, among other functions, they help probationary police officers practice their recently acquired skills in live settings while under highly structured supervision. During this formative period in a police officer's career, FTOs can help new officers interpret street encounters in ways that allow them to learn and practice good policing through the metaphorical lenses of a protection of life mandate. Once they complete their field training programs, police officers may continue to practice good policing and the protection of life in both patrol and specialized settings.

Successfully preventing the use of excessive force by police likely requires a multilayered approach that considers the social ecology of the total police organization. While the chief administrator is an important part of the process within the organization, it must be noted that the chief also represents the will of the community. Chief administrators for police departments are usually chosen by the elected bodies of local governments (e.g., city councils, county boards of supervisors, etc.), often for their stated positions on certain issues, such as violent crime, fear of crime, urban disorder, etc. Excessive use of force will be minimized only if governing boards select chief administrators who are actively interested in controlling and preventing excessive use of force. Moreover, the governing boards themselves need to share the same commitment to police accountability if excessive force is to be controlled and prevented in a police organization.

Conclusions

Evaluating the use of excessive force by the police tends to be much more difficult than other forms of misconduct, such as profit-motivated corruption. Unlike other forms of police deviance, which tend to be wrong by their very occurrence, the roots of police brutality reside in the legitimate use of force – a tool society gives police to accomplish its mandate. Therefore, when an officer is accused of brutality, it is often difficult, if not impossible, to determine where the justified use of force may have become excessive. Even in the infamous, and unquestioningly brutal, Rodney King case, the police officers who contacted King had cause to use some physical coercion in their initial attempts to bring him into compliance. This entry identified classic occupational templates of the police use of force in an effort to identify context within which the excessive use of force may be considered. Although these templates have received little empirical validation, they are meaningful because in many cases, they offer a shorthand for describing the conditions under which police officers may resort to brutality. Although police departments can use recruitment as a tool to prevent the excessive use of force by their officers, the best prevention is likely based on a multi-level approach that involves local governing bodies selecting chief administrators with strong commitments to transparency and the virtues of "good" policing.

Police and the Military Nexus

Otwin Marenin
Department of Criminal Justice and
Criminology, Washington State University,
Pullman, WA, USA

Synonyms

Constabularization; Militarization

Overview

The police and military (armed forces), the two coercive agencies of the state, are restricted by law, tradition, and policy to two domains in which they exercise authority. The police protect the domestic order against risk, threats, and crimes by persuasive communications, the enforcement of laws, and, ultimately, force (or its potential use), while the military defends the nation and the state against aggression from without. These analytical and policy distinctions between two agencies (or systems of agencies) which are authorized to employ legitimate internal and external use of force to deal with threats have become blurred in practice (Easton et al. 2010). The argument and worry that the police in the USA and other democratic countries are increasingly becoming militarized, hence will loose the civil and democratic orientation to their work, the use of force, and the collections of intelligence, has been raised by a number of scholars who study the police and by the police themselves (Kraska 2001, 2007; Kraska and Kappeller 1997).

Much of the concern that the blurring of distinctions between the policing and the military work will undermine civil and democratic policing rests on two limited understandings about the police, namely, that policing has never been militarized to any degree and by comparing two "ideal types" (yet legitimate conceptions) of both the police and the military rather than their historical configurations, relationships, and work.

The blurring of policing and military work and tasks is not new; it only has increased and taken many new forms in recent times, specifically by recent domestic and international developments (transnational crime, fears of terrorism, civil violence in failed states, peacekeeping and peacebuilding interventions, the weakening of border controls, technological advances in information acquisition, processing, and distribution). The distinctions drawn between military and police forces have always been blurred in practice. Police and military have worked in the same occupational space – the protection of society against threats; they have been bestowed by their societies with the right to use force, and the core values enshrined in their occupational cultures (internal authority, discipline, closed ranks, loyalty, courage, masculinity) are similar (den Boer et al. 2010, 225–226).

Ideal Typing the Police and the Military

Ideal Typing Democratic, Civil Policing

The classic image of the democratic police officer is the patrol officer, the constable walking the beat, known by and knowing the community and the village; approachable, protective, and friendly when encountering citizens in need; committed to service, the protection of human rights, and the rule of law; doing her/his work with integrity; and ensuring the effective protection of public order and the security of property and lives of the populace against threats and crimes. Democratic, civil police retain substantial domains of discretion in how to respond and to adjust their decisions to situational exigencies, guided by law, professional norms, public demands, and democratic political oversight (OSCE 2006). Since full service tasks are most common work done by police in democratic countries, this image is not a false one.

The essence of democratic policing is captured in six aspects of their work: authority to control and suppress illegal conduct is limited by and large to the domestic arena; the composition of police personnel should approximate the distribution of salient identity groups in society; orientation to public service; the constrained use of force; transparency in actions; and accountability to civic society by various mechanisms.

The occupational culture of democratic police officers and the organizational policies which shape their work and guide their discretion stress that policing is a service to the public and not to the state. Their use of force should be strictly limited by law, professional norms, and organizational directives and used only as a last resort when dealing with all people they encounter. The police have a responsibility to explain when asked, and the public has a right to know what the police are doing (except for legitimate secrecy in pending cases and investigative aspects of their work). The police cannot hide behind the shield of expertise and secrecy related to their general work, nor deny the media, the public, and the political leaders' access to the information in their possession, unless legitimately protected. Lastly, if allegations of misconduct, abuse of power, or corruption are made against them, the police have an obligation to submit to external oversight, and the public has the right to require their submission to civic reviews. They do not have the exclusive authority and power to investigate allegations of misconduct in their ranks by themselves and take corrective actions. As government officials having great power over the routines of living in society, they cannot claim impunity for their conduct.

Ideal Typing the Professional Soldier

The military are an armed, professionally trained, and hierarchically controlled organization in which lower ranks are expected to respond quickly and without questioning to commands from the top. The military protects the nation, its people and territory, and the "national interest" by using its ability to detect and suppress external threats. It uses its capacity to exercise force to capture, disable, or kill enemies of the nation in an efficient, fast, and effective manner. The military collects information in secret via sophisticated and complex technologies and human spies and evaluates and distributes information as "intelligence" which is typically kept secret by national security justifications and tactical contingencies. Transparency is severely limited by the need to keep the country safe from aggression which, were the nature of the intelligence and the means by which it was collected be known, would jeopardize the ability to plan and execute the collection of information. Accountability of the military for its strategic and tactical conduct is first to itself, with civilian oversight by elected leaders the last overriding democratic option. By law and tradition, the military in democratic societies only intervene in domestic security when national and local policing systems are unable to maintain control.

Distinctions

In short, ideal-type descriptions of police and military emphasize fundamental distinctions between the two security agencies authorized to use force in order to protect the nation-state, its government, its economic and political ways of life, and its people and properties against domestic and external threats.

Specifically, the police see the people they have to deal with primarily as customers, innocents, and suspects, while the military sees real and potential enemies. The police are committed to maintaining public order, provide services, and enforce domestic laws while the military seeks the defeat of enemies and victory. The police use force only as the last resort in encounters, while the military resorts to force immediately to disable, capture, or kill enemies. The police tend to work as individuals (or limited teams) while teamwork is essential to the military. The police at the lowest ranks of the organizational hierarchy have substantial discretion in specific actions and encounters, a discretion that is circumscribed by situational exigencies and the best judgment of the officers on what is the appropriate, effective, and balanced action in the situation they are faced with. The military limits discretion at the lowest ranks through intensive training, a commitment to authoritative interpretations of what needs to be done in a situation ("that's an order, soldier"), and loyalty to group. The discretion of the police is influenced by personal morality and ideological beliefs, while the military seeks to socialize new recruits and experienced soldiers to an ideology that eliminates personal views as guides to actions.

The police are accountable to public oversight and the courts; the military has its own legal system, code of conduct, and "criminal justice" institutions (military police, administrative tribunals and courts, investigative units). Civilian law enters only at the appeals level, after military institutions have reached a decision on alleged criminal misconduct or violations of the code of conduct. Control over actions by a professional military in a democracy is exercised largely internally, supported by professional norms which accept that the military is ultimately subject to civilian leadership (by the "Commander in Chief," or some such term). Unlike the police, which are always guided and judged by laws made through an open, participatory political process external to the police, the military judges itself by its own laws and rules with external domestic political oversight and international conventions on the conduct of war as the ultimate backstops.

The argument predicts that the "militarization" of the culture, policies, and actions of police – that is, the adoption by civilian police forces "of militaristic practices, hardware, technology, values, language, and ideology" (Kraska 1997: 299) – will be a danger to democratic norms and professional ethics of the police. Rather than follow the rule of law, professional codes of conduct, or commitment to public service and the protection of human rights, the police will drift toward a professional ideology which stresses the need to protect national and local security against threats and risks without interference or oversight by legal institutions, political oversight, or public demands. The necessary democratic balance between the rights of people and the practical need for security will tilt strongly toward security.

This argument rests on four main assertions. First, the police will alter their orientation to the use of force and the identification of categories of people against whom force can and should be used quickly and easily, justified by appeals to an "enemy" and "threat" language. Second, the police will shift from an orientation to public service toward a suppression of crime and disorder mentality and compliance with political definitions of threats to public order and safety. Third, the police will be drawn into the secretive collection of intelligence and categorical risk assessments which invade the privacy of people and assume threats, risks, and criminal intentions based on an individual's membership in categories of persons (e.g., young male members of minority or ethnic groups, bikers, Roma, Muslims, travelers from certain countries) as these categories are defined by the police and intelligence agencies. Perceived threats and risks will have to be deterred and prevented by proactive police and intelligence collection policies before they can be executed. Fourth, transparency will decline. The police will become less accountable via civic oversight of their actions.

There is evidence to support these arguments but less support for the conclusions that democratic policing is threatened and may be replaced by new forms of aggressive, forceful policing which undermine basic privacy rights and equal treatment of people and communities.

Beyond Ideal Typing: Existing Overlaps in History and Space

The reality is that the police have always done a variety of work in nondemocratic ways and that the military has always worked with the police on specific security and order maintaining tasks. In practice, historically and currently, the police and the military have exhibited overlapping characteristics and work habits.

Varieties of Policing

Being visible, available, and responsive to the needs of people, though crucial to any conception of democratic policing, is not the only type of work done by any police force. Tasks specified for the police have always included multiple goals and roles ranging from civil policing to state security policing (Brodeur 1983). All police forces anywhere include functional specializations which approach military-style tactics and mentalities: riot control, specialized units confronting dangerous situations (armed response teams, paramilitary police units), border policing, state security police protecting the political regime against threats to its rule, and the complete exception to democratic norms of colonial policing. Specialized police agencies and units tend not to share the mentalities, priorities, and practices which are claimed to be the defining traits of civil, democratic, and accountable police force.

Control of riots and demonstrations is not targeted primarily against individual malfeasance but is deployed as an organized, forceful police response to public, frequently violent, disorders (Della Porta and Reiter 1998). In most countries, should the police fail to control disorders, the military (e.g., the National Guard in the USA) stands in the background ready to enter the fray and restore order.

Distinct units trained in and employing military-style tactics (PPUs, Paramilitary Police Units) have infiltrated normal policing, a process which Kraska and Kappeller (1997) have argued is expanding. PPUs are expensive; not using them wastes public money; they have high status within the police profession; hence, their arms, group cohesion, and tactics are attractive to other police.

Persons entering a country at recognized border crossing points, whether legally or illegally, have restricted democratic rights based on the overarching need to keep the country secure against threats and risks. Seeking to cross outside of legal control points will bring swift and forceful reactions from border guards who can be police, military, or integrated units (Andreas 2009; Caparini and Marenin 2006).

At the US land borders, Marine units are deployed along the Mexico-US border, nominally for exercises but also to occupy and preempt territory through which threats and illegal migrants might enter the USA (Dunn 1996). At the Canada-US border, IBETs (Integrated Border Enforcement Teams), which include Canadian and US police, military, and intelligence agents, are a more recent development dealing with security threats (IBETs, web). Also, at that border, military drones have been called upon to assist local law enforcement in detecting fleeing felons and have responded successfully. The Coast Guard, an arm of the armed forces, has been responsible for the protection of sea borders. In most countries, including the European Union member states, border control is shared with police agencies or done exclusively by the military.

State security police tasked with protecting the state, the ruling regime, and the powerful against challenges to their rule and status have few qualms about abiding by legal and democratic norms, nor do state security police take their orders from or are responsive to public concerns. Their job is to keep those in power safe. This is true in democratic countries and even more so in authoritarian, transitional, or military states. The prototype of state security police agencies were the KGB in the Soviet Union and other socialist and authoritarian countries, but they can also be found in democratic countries, as during the Franco dictatorship in Spain when the Guardia Civil (a constabulary force) was the tool used to terminally eliminate political and intellectual opponents of the regime, or in lesser and more benign forms, such as transnational threat assessment and anti-terrorism units in police departments or specialized security agencies, to arrest suspects before they can act (Brodeur 2000).

In the history of state development (Bayley 1985; Tilly 1990) and the creation of security forces, there has always been a significant overlap between police and military work. That overlap has been strengthened in recent years by the shift in organized violence from traditional forms of aggression (requiring a military response) toward diffused, asymmetrical, nonconventional, substate forms – civil wars, guerilla insurgencies, identity group-based riots, and killings; the emergence in many parts of the world of powerful organized transnational crime groups who exert influence on states and societies by corruption, fear, and violence; and the growth in privatized policing and international policing and security providing companies. These developments have been enabled and smoothed by new technologies for sharing information and intelligence on a (almost) real-time basis. This new world (dis) order (Kaldor 2001; Oakley et al. 1998) has led to a transformation in how all state-based, and even non-state, actors (e.g., private risk assessment and security companies) can be engaged in an integrated manner against new threat and risk dynamics.

This convergence is most apparent in internationally sanctioned peacekeeping and peacebuilding operations. Police in UN and regional peacekeeping interventions, where local security forces have collapsed (e.g., Haiti, Timor Leste, Kosovo), have had to assume semi-military suppression and control functions as well as “normal” policing operations (Bayley and Perito 2010; Goldsmith and Harris 2010; Greener 2009).

The biggest exception to democratic, nonmilitarized policing have been colonial policing systems. When European colonial powers developed police organizations for their colonies, they did not export policing systems deemed appropriate for their own, that is, civilized people, but constabulary forces to protect their economic, political, and “civilizing” interests in their colonies. As the majority of the world’s territories and states are former colonies, at independence they inherited nondemocratic and militarized policing systems which since have been quite resistant to changes, despite massive efforts to make them more democratic in their performance.

Constabulary forces are semi-militarized police units created in different political, organizational, and cultural forms. In France, the gendarmerie developed as an occupying force in outlying areas of what is now France, in regions which opposed the imposition of central rule from Paris. In consequence, until very recently, the gendarmerie was located within the Ministry of Defense, even though it had become the police force which protected small towns and rural areas in France.

British policy on policing England versus policing the colonies exemplifies the use of constabulary forces. The British practiced how to control restless populations during their centuries-long and brutal rule of the Irish. After Irish independence, policing in Northern Ireland, which remained part of the United Kingdom but was beset by ethnic, religious, and political violence and conflicts, continued the constabulary tradition via the Royal Ulster Constabulary, which was used to protect Irish loyalists in Northern Ireland often in cooperation with the British military. The lessons learned by the British in their colonial rule of Ireland became the model for policing their colonies (Brogden 1987).

The Spanish and Portuguese colonizers exported their security systems to Latin and Central America which closely combined military and policing functions under one overarching organization. The police in most Latin American countries remained part of the military until fairly recently but still retain their titles (e.g., the *Policia Militar* in Brazil) and their outlook on citizens and criminals, captured nicely in the title of Husain's (2007) study of police reform in Rio de Janeiro, "Those Who Die in War Are Not Innocent."

The USA established constabulary forces in Central America and the Caribbean to help protect American investments and personnel against "revolutionary" agitations. The constabularies became converted into (para)military forces once local control took over. In Nicaragua, the armed forces of the Somoza government, which engaged in a protracted war with the Sandinista Revolutionary Front to try to keep the government in power, were drawn mainly from that constabulary and were supported by illegally funded paramilitaries (the contras) by the USA. US police assistance under the aegis of OPS (Office of Public Safety), in the late 1960s and early 1970s, stressed counterinsurgency over democratic norms and roles which were easily picked up by local police forces in Southeast Asia and Latin America, the recipients of the majority of OPS funding and mentoring (Huggins 1987).

Colonial policing had few attributes that one would characterize as civil or democratic policing. The police in colonies were used mainly by the colonial administrators to "pacify" the restless native, engage in military-style campaigns to punish local groups which resisted the imposition and demands (pay taxes, conscripted work) of colonial rule, protect tax collectors and the persons and property of commercial enterprises and missionaries, and suppress local riots and sabotage. There was no pretense that the police were to serve the population in any meaningful way; their job was to enable and protect colonial rule and all its activities, privileges, and laws.

The modification of imposed policing system after decolonization has been slow and incremental, and much of the occupational cultures and priorities of the police have not been responsive to demands for reforms. For example, the most populous democracy in the world, India, still uses the colonial Police Act, passed in 1861, as the basis for defining the jobs of the police which, despite numerous constitutional, ideological, and legal statements, still shape the way in which state and federal police understand their job (Verma 2011). In Morocco, military officers still occupy the commanding positions in the gendarmerie, the police force which patrols the roads and services the rural areas of the country.

In short, democratic policing, operationally defined as being available and willing to be of service to people in need, has been a rare policing model in history or is currently across the globe. Still, democratic policing as practiced by developed countries, currently in the guise of some form of community policing, has become the goal of police reforms promoted through international assistance programs. Militarization is seen as threatening progress toward that goal.

Reforms of policing systems in countries where policing and justice systems have collapsed increasingly include the institutional separation of the police from the military and argue for the demilitarization of the occupational culture of the police. For example, the Chapultepec Peace Accords, signed in 1992, which ended the civil war in El Salvador, dissolved the National Police, then under the control of the military, and reconstituted a National Civil Police with detailed instructions on the organization, tasks, recruitment, training, and democratic responsibilities. Reform and democratic governance were deemed not possible unless the police were reconstituted and removed from the organizational authority of the military.

Yet one must be careful when drawing a distinction between the organizational home of "policing agencies," such as the gendarmerie, which are housed within the armed forces, and organizational and occupational cultures. Being under the administration of the military does not prevent democratic policing, nor does removing them from military administrative oversight create more democratic policing. The police can be quite forceful and abusive whether they work under military or civilian organizational umbrella. What matters are the organizational and occupational norms and cultures which are the guiding doctrines and "recipe rules" for the police.

Constabularization of the Military

The military, in its various institutional divisions, has been increasingly drawn into what used to be considered "policing" work in a variety of ways: assisting in border controls, intelligence sharing with domestic law enforcement agencies, counter-insurgency strategies to reach the hearts and minds of local populations, United Nations or regionally authorized peacekeeping operations which include military and police contingents, and "nation-building" after multilateral and regional interventions in failed and conflicted-ridden states. These trends undermine the traditional restrictions of the armed forces to war-fighting and war-ending work by involving them in tasks for which they have little training, few skills, and limited willingness (Friesendorf 2010; Friesendorf and Kempel 2011; Perito 2011).

Training for military and police being deployed in international interventions, and increasingly for public order policing domestically, is conducted in a language which blurs traditional lines, which has led to both the constabularization of military goals and cultures and the paramilitarization of policing ideologies (Moelker 2010), and which will continue to undermine the bright line between police and military organizational cultures and practices and the distinction between domestic and external authority to exercise coercion.

This convergence is not by design but forced by the nature of current international and domestic security climates. For example, the explosion of transnational crimes which affect domestic security (drugs, human trafficking, arms trade) requires that police now work in other countries, in cooperation with local police, militaries, and intelligence agencies to control crime. Preventing convergence, or alternatively ensuring a continued separation and distinction between police and military work, will be difficult to maintain.

Beyond Dichotomies: Theorizing the Police-Military Nexus

How to theorize the new security structures? The most promising theoretical approach is the notion of a security sector or system (SS) and corresponding conceptualizations of reform (SSR) and governance (SSG). The security sector, in its leanest definition, includes the armed forces, police, border guards/police, and intelligence agencies as the core state security providers. In more expansive conceptions, the SS includes the criminal justice system, legal aspects of security, and non-state providers (Bryden and Hänggi 2004; OECD Organization for Economic Co-operation and Development 2007).

Security sector theorizing stresses the interconnectedness of the four core state security agencies. Reforms of the security sector, or specifically the police, to establish more democratic professional and accountable norms and actions cannot be simply focused on the police but must take their connections to other state-based security and private security providers into account. Security is provided by many actors, and that requires that they cooperate and work together domestically and internationally.

The political nature of policing, and other security policies, is central to the notion of a security sector and its governance. In addition to demilitarizing the police, reformers argue that the police be de-linked from centralized, political control of operational policies and tactics.

Concluding Comments

Concerns about militarizing the police are not illusory. Civil policing would change significantly if military cultures, norms, and practices began to infiltrate democratic cultures and styles of policing.

At the same time, militarization is not the greatest threat to democratic policing. More serious is the involvement of the police in secretive intelligence gathering, often along stereotypical categorizations of terrorist, transnational crime groups, or local "troublemakers," such as "suggestions" from the FBI to local police to map the distribution of mosques in their communities or efforts by the antiterrorist unit in the New York Police Department to infiltrate and keep tabs on Islamic leaders. The police who conduct such secret invasions and information gathering of people's normal, and legal, activities by the justification of local and national security will loose, once their police activities become known, political support and legitimacy.

The secret gathering of intelligence is just as likely to change the norms and cultures of policing as does militarization. The loss of transparency in collecting intelligence about normal activities disconnected from actual criminal threats and the convergence of domestic and international work from both the police and the military perspectives, both driven by political and national security justifications and the changing global world, are the historical and current reality which will not disappear. For example, President Reagan declared, by his authority, international drug trafficking a national security threat, not just a crime, thereby authorizing crime control and intelligence collecting actions which were legally prohibited to domestic police.

The militarization of the police happens for diverse reasons, be it by the promotion of that style of defining their work by police themselves; by the acceptance of a frustrated public fed up with disorder, crime, and fears which beset their lives and willing to give up some rights for greater protection; by depictions in the mass and entertainment media which portray armed police tactics as the normal response to increasingly dangerous situations in normal police work; and by the exploitation of risks and threats by political polemicists.

The issues are whether the militarization of policing and the constabularization of the military will become dominant norms and ideologies and whether the in-creeping of military styles into democratic policing will move that style permanently way from its service and order protection goals. It seems an unlikely possibility, as democratic policing is promoted worldwide, as part of larger political changes, by reformers, police officials, and progressive political leaders and also demanded by populations, as long as effectiveness levels are maintained sufficient to keep populations willing to grant legitimacy to democratic styles which balance crime control with justice. In the end, the greater threat to democratic policing is not militarization but the politicization of policing even in democratic countries, of which militarization is only one piece of evidence, and the increasing closure of the police to public knowledge and oversight linked to an increasing disregard for the rights of people and due process.

Police Corruption

Sanja Kutnjak Ivković
School of Criminal Justice, Michigan State University, East Lansing, MI, USA

Overview

Police corruption is a form of police misconduct or police deviance typically defined through the motivation to achieve personal gain. Police corruption includes many heterogeneous forms of behavior that could be classified on the basis of several criteria, including the motivation for corruption (i.e., economic corruption v. noble-cause corruption), regularity of payments (i.e., pads v. scores), consequences (i.e., distortive v. non-distortive corruption), and the level of aggressiveness (i.e., grass-eaters v. meat-eaters). Barker and Roebuck developed a typology of police corruption which recognizes corruption of authority, kickbacks, opportunistic theft, shakedowns, protection of illegal activities, the fix, direct criminal activities, and internal payoffs. Punch added flaking (i.e., planting of evidence) or padding (i.e., supplementing of evidence) as the ninth type of corruption.

Theories explaining the causes of police corruption could be classified into four larger groups: (1) theories oriented toward individual police officers and their characteristics (i.e., "individualistic theory" or "rotten apple theory"), (2) theories examining the relation between opportunities for corruption and police corruption ("occupational theories"), (3) theories focusing on the relation between the characteristics of a specific police agency and police corruption ("organizational theories"), and (4) theories concerning the relation between the society at large and police corruption ("social structure theories"). Despite the existence of extensive literature on the theories of police corruption, research that tests the theories is very limited. Police corruption could be measured using several different methodologies. A relatively simple, yet very inaccurate way of measuring corruption is through the official data such as the arrest rates, complaint rates, and conviction rates. Somewhat more promising attempts to assess the actual level of corruption are public opinion surveys, police officer surveys, field studies, and investigations by independent commissions.

Police Corruption

Definition

Police corruption is a form of police misconduct or police deviance typically defined through the motivation to achieve personal gain (e.g., Barker and Carter 1986; Goldstein 1975; Klockars et al. 2000; Kutnjak Ivković 2005; Sherman 1974). The definition contains several essential elements.

First, corrupt behavior could be defined as a violation of the penal codes, administrative agency rules, or the codes of ethics. Like other citizens, police officers could violate norms of federal and state criminal codes. In addition, federal and state codes establish certain crimes which only public officials can commit (e.g., bribery of public officials and witnesses, Title 18 of the U.S. Code, Chapter 11, Section 201, 1999; extortion by public officials, Title 18 of the U.S. Code, Section 872, 1999; deprivation of civil rights, Title 18 of the U.S. Code, Section 242, 1999). Police agencies, particularly large municipal agencies, have administrative rules and policies compiled in the standard operating procedure manuals. These administrative rules channel the use of discretion, describe appropriate conduct of police officers, prohibit inappropriate conduct, instruct officers to complete written reports after critical incidents, and require supervisory oversight (see, e.g., National Research Council 2004). Even in the agencies with extensive rules, the rules could be ambiguous or fail to regulate certain aspects of corruption. Lastly, the International Association of the Chiefs of Police has developed the code of ethics for the US police officers, which explicitly asks of police officers to promise that they would not engage in corruption, bribery, or gratuities themselves nor condone such conduct by their fellow police officers.

Second, while corruption is typically viewed as corrupt behavior (thus suggesting that something is being actively done), corruption can include both active (i.e., act) and passive (e.g., omission) forms. A police officer who fixes a felony ticket in exchange for a bribe provides an example of an action, while a police officer who does not write a ticket in exchange for a bribe from a motorist caught speeding provides an example of omission.

Third, various definitions discuss the gain resulting from corrupt activities in terms of explicit personal gain (e.g., Goldstein 1975; Kutnjak Ivković 2005; Moore 1997) or implied personal gain (i.e., the definition rests on the idea that the money/goods from the corrupt act are to be consumed by the individual officers; e.g., Barker and Wells 1981; Roebuck and Barker 1974). Several authors (e.g., Bracey 1995; Carter 1990) included organizational gain in their definitions as well.

The goal typically has a monetary value; it typically involves "some tangible object, either cash, services, or goods that have cash value" (Barker 1996, p. 25). However, it is also possible that the gain is nonmonetary. While monetary value could usually be attached to, or calculated for, most of the items, in some instances it is difficult, or borderline impossible, to determine it. For example, fixing a speeding ticket for a sergeant's niece could have different price tags attached to it, depending on the extent of sergeant's gratitude and the ways in which he is ready and willing to express them. It can potentially lead to preferential treatment by the sergeant and the early promotion, thus yielding thousands of dollars in gain.

The size of the gain may be an important factor. The discussion in the literature about the minimum amount, that is, the amount below which the gifts of this value would not be considered as corruption, is intense. The Code of Ethics is explicit in prohibiting the acceptance of gratuities ("...never accepting gratuities"; 2011). Although the value of these gratuities may be small in each individual case, if such gifts are given on a regular basis (e.g., Ruiz and Bono 2004) and/or to a large number of police officers (e.g., Pennsylvania Crime Commission 1974), their total value vastly increases their individual value. Furthermore, the purpose of the gratuities may be to influence the police officers' decisions, as was illustrated on the examples uncovered by independent commissions (e.g., Knapp Commission 1972; Mollen Commission 1994; Pennsylvania Crime Commission 1974). Barker and Wells (1981, p. 11–12) argue:

> Police corruption for many officers often begins with the shared belief among the police peer group that "policemen have a right to a break," and the progression along the continuum of corruption is often so gradual that an officer is deeply involved before he realizes it.

The acceptance of gratuities could start "the slippery slope of corruption," leading from the less serious forms of corruption toward the more serious ones; "... [i]t is claimed that the acceptance of small gratuities such as free cups of coffee by police officers will increase the likelihood of, or lead by degrees to, or is not significantly different from, corruption of the worst kind (Kleinig 1996, p. 174). There are several steps in the process of "becoming bent," as Sherman describes it (1985), from the acceptance of minor "perks" and free drinks to regular payoffs and the involvement in the distribution and use of narcotics. As Michael Dowd (a former NYPD police officer who stole money and drugs, participated in larger drug rings, became a drug dealer, and was eventually caught, tried, and sentenced to 14 years in prison) emphasized in his testimony before the Mollen Commission, he would test the new officers with initial temptations which were but trivial violations of the NYPD's policy (Mollen Commission 1994). Once the officers crossed the line between the allowed and the forbidden, it was easier for them to continue and justify to themselves their further involvement in various violations of the Department's policy.

Proponents of the acceptance of gratuities (e.g., Kania 1988, 2004) argue that the acceptance of gratuities contributes toward the development of a friendly bond between the police and the citizens. Kania (1994, p. 2) continues that, although the "cheerful waves, warm greetings and welcome smiles," and letters of appreciation may result in better service just as likely as may the free drinks, police administrators obviously do not want to discourage such friendly gestures.

Typology of Police Corruption

Police corruption is a group of heterogeneous activities, from the acceptance of a bribe for not issuing a speeding ticket to leaking the information about the upcoming raid to the drug dealers. Literature has used several different ways of classifying these diverse activities.

Economic v. Noble-Cause Corruption

Corruption described in this entry is economic corruption or material-reward corruption. Its primary motivation is the material reward, be it in the form of money or other goods and/or services. Noble-cause corruption is different; it is defined as "corruption in the name of the moral rightness of good ends" (Crank and Caldero 2000, p. 5). When police officers behave in a manner consistent with noble-cause corruption, their actions are no longer regulated by the law; instead, they "act if they *are* the law" (Crank and Caldero 2000, p. 75). Police officers attempt to rationalize this "noble-cause corruption" as follows (Moore 1997, p. 63):

> I did something wrong, but justice demanded it, not tolerated it but demanded it, because I could put the guy away who otherwise wouldn't be successfully prosecuted. I, the police officer, wouldn't gain personally from it; I didn't get anything from it. I only acted for the community in the community sense of justice to accomplish this goal.

The relation between the police and the law changes in the case of noble-cause corruption (e.g., Crank and Caldero 2000). Police officers violate the law to achieve higher purposes or ends of policing. The causes of economic corruption and noble-cause corruption are different, as are the efforts used to control them.

Pads v. Scores

In terms of the regularity of the payments, corrupt activities could be divided into "pads" and "scores." If the payment takes place just once, as the opportunity presents itself, it is called a "score." The Knapp Commission (1972, p. 66) described the "score" as "a one-time payment that an officer might solicit from, for example, a motorist or a narcotics violator. The term is also used as a verb, as in 'I scored him for $1,500.'" On the other hand, if there is an established arrangement between a citizen and a police officer and the payments occurs on a regular basis, they are called "pads." The Knapp Commission (1972, p. 66) described "pads" as "regular weekly, biweekly, or monthly payments, usually picked up by a police bagman and divided among fellow officers. Those who make such payments as well as policemen who receive them are referred to as being 'on the pad.'"

Distortive v. Non-distortive Corruption

This classification focuses on the outcome of the police officer-citizen interaction. If, compared to the interaction without corruption, the outcome of the interaction with corruption is different, then such corruption is called "distortive corruption." For example, a police officer stops a motorist for speeding and wants to write a speeding ticket. If the citizen does not offer a bribe, the police officer will write the ticket. If, on the other hand, the citizen offers a bribe and the police officer accepts it, the police officer will not write the ticket. Thus, the outcome of the interaction (i.e., ticket v. no ticket) is different, depending on whether the bribe was offered and accepted. In cases of distortive corruption, the police officer does something that he was not supposed to do (e.g., revealed an undercover operation to a drug dealer, issued a permit to a nonqualified applicant) and does not do something he was supposed to do (e.g., did not arrest a citizen caught violating the law, did not issue a license to a qualified applicant).

If the outcome of the interaction is the same, regardless of whether the bribe was given or not, then such corruption is called "non-distortive corruption." For example, a police officer issues a passport or a liquor license to a qualified applicant. The police officer does what he is supposed to be doing or does not do something that he is not supposed to be doing. The reason for the bribe is that the citizen wants to secure something that he has a legal right to but may need to speed up the bureaucratic machine (hence the "grease money" term used for this type of corruption).

Grass-Eaters v. Meat-Eaters

According to the Knapp Commission (1972, p. 4, 65), dishonest, corrupt police officers can be classified as either "grass-eaters" or "meat-eaters." "Meat-eaters" are police officers who aggressively misuse their police power for personal gains, while "grass-eaters" simply accept the payoffs the circumstances of police work throw their way (Knapp Commission 1972, p. 4). A police officer like Michael Dowd who beats up drug dealers and steals their money and drugs (e.g., Mollen Commission 1994) would be a clear example of a "meat-eater." A police officer who is on the pad and who accepts the money that the bagman is giving him every 1st of the month (see, e.g., Knapp Commission 1972) would be an example of a "grass-eater."

A strong support of the code of silence and reluctance of honest police officers to report their corrupt colleagues, on the one hand, and an aggressive misuse of police powers by "meat-eaters," on the other hand, provide an atmosphere in which it is very easy and natural for "grass-eaters" to accept payoffs. The Knapp Commission (1972, p. 65) suggested that "grass-eaters" continued to accept the gain from corrupt activities out of their feeling of loyalty to their fellow officers and that the "grass-eaters" are "the heart of the problem" since "[t]heir great numbers tend to make corruption 'respectable'" (Knapp Commission 1972, p. 4). According to the Knapp Commission (1972, p. 65), unlike "meat-eaters," "grass-eaters" are not willing to take considerable risks in order to obtain illegal gains, and their behavior is considerably more likely to be affected by a change of atmosphere/attitudes in the department.

Barker and Roebuck's Typology

The most frequently used typology of police corruption has been developed by Barker and Roebuck (1973; Roebuck and Barker 1974). In their joint work, Barker and Roebuck (1973; Roebuck and Barker 1974) point out that corruption takes many forms. Based on several dimensions (e.g., acts and actors involved, norms violated, support from peer group, organizational degree, police department's reaction), they specify eight types of corruption: corruption of authority, kickbacks, opportunistic thefts, shakedowns, protection of illegal activity, the fix, illegal criminal activity, and internal payoffs.

The first type involves cases of **corruption of authority**. Barker and Roebuck (1973, p. 21) describe it along the following lines: "the officer's authority is corrupted when he receives officially unauthorized, unearned material gain by virtue of his position as a police officer without violating the law *per se*." Thus, the actions are not violations of criminal law, but they do violate departmental policies. Examples of such activity would include acceptance of free drinks, free food, discounts on merchandise, or providing property protection for a fee. According to the findings of the Knapp Commission (1972) and Barker and Roebuck's study (1973, pp. 22–23), the practice seemed to be widespread (31 % of the businessman in a study *openly* acknowledged providing favors to the police), and the corruptors, typically respectable citizens, according to Barker and Roebuck, give these gifts for a reason. Police officers perceive these gratuities as informal rewards and approve of and support them within the peer group; police officers who refuse such gifts are perceived by their fellow officers as deviant.

The second type of police corruption involves **kickbacks**. They are defined as the acceptance of goods, services, or money for referring business to various businesses and service providers, including towing companies, ambulances, garages, lawyers, and doctors (Barker and Roebuck 1973, p. 24). These activities do not violate criminal laws, but they do violate departmental policies. According to Barker and Roebuck (1973, pp. 24–25), the corruptors are legitimate businessmen and professionals whose purpose is to develop and maintain a good working relationship with the police. These payments are perceived by police officers as clean and are, therefore, supported by the peer group (Barker and Roebuck 1973, p. 25), whereas the departments typically either condone or overlook these kickbacks, provided that they are made by legitimate businesses discreetly. In the case of goods and services, the department's reaction ranges from acceptance to mild sanctions, with cash rewards resulting in a more severe punishment.

The third type of police corruption involves **opportunistic theft** from arrestees, victims, crime scenes, and unprotected property (Barker and Roebuck 1973, p. 26). These behaviors violate both the departmental rules and the criminal rules. The disciplinary measures vary from mild to very serious (including criminal charges and dismissal).

The fourth type of police corruption involves **shakedowns**. Shakedowns occur upon the police officer's discovery of both the criminal violation and the violator, and they result in the police officer's acceptance of a bribe in exchange for not making an arrest (Barker and Roebuck 1973, p. 27). One of the characteristics of shakedowns is that the victim is rather unlikely to complain, because the victim and the police officer could be found guilty of another crime – bribery. These actions are, of course, violations of both the departmental rules and the criminal codes.

The peer culture and the department itself may react differently to the "clean" money than to the "dirty" money, which are distinguished by the source of the money. Officers who are publicly exposed receive severe punishment, including potentially dismissal, and may face a criminal prosecution (Barker and Roebuck 1973, pp. 28–29).

The fifth type of police corruption involves **protection of illegal activities**. Individuals involved in illegal activities reward police officers in order to be able to operate without police harassment (Barker and Roebuck 1973, p. 29). The corruptors may be citizens with long criminal records, as well as legitimate businesses operating illegally. Some of the activities protect the illegal services and goods which citizens desire or perceive as necessary. This form of police corruption involves a high degree of organization; police members must be coordinated and know which places enjoy police protection. Departmental reaction depends on the "degree of its own involvement with criminal organizations or legitimate businesses that operate illegally, informal definition of *clean* money, identity of the corruptor, and whether or not there is public disclosure of flagrant violations" (Barker and Roebuck 1973, p. 33).

The sixth type of police corruption involves **the fix**. The fix may include "the quashing of prosecution proceedings following the offender's arrest and . . .the taking up (disposal of record) of traffic tickets" (Barker and Roebuck 1973, p. 34). The corruptors are arrestees who want to avoid the court action in their case, and the police officer involved typically "fails to request prosecution, tampers with the existing evidence, or gives perjured testimony" (Barker and Roebuck 1973, p. 34). The peer approval depends on whether the case to be fixed is a felony, misdemeanor, or a traffic case. Departmental reaction to the fixing of criminal cases is generally severe (Barker and Roebuck 1973, p. 35).

The seventh type of police corruption is the police officers' involvement in **direct criminal activities**. Barker and Roebuck (1973, pp. 35–36) argued that "policemen directly commit crimes against the person or property of another for material gain, acts which are clear violation of both departmental and criminal norms." Because the profit coming from this transaction is perceived to be "dirty" money, the fellow police officers would typically provide very little support for this type of police corruption and even the departments that may tolerate other forms of police corruption, will react severely by firing the police officers and pressing criminal charges (Barker and Roebuck 1973, p. 36). Some organization is typically required for this type of police corruption to be carried out, and it involves small groups of police officers.

The last, eighth type of police corruption involves **internal payoffs**. In the case of internal payoffs, both the corruptors and the corrupted are police officers who sell or buy assignments, off-days, holidays, promotions, etc. (Barker and Roebuck 1973, p. 36). Peer groups either do not support this type of police corruption or perceive it as necessary and inevitable if they are engaged in other forms of police corruption (Barker and Roebuck 1973, p. 37). In the departments in which other forms of police corruption flourish, this form exists as well and is highly organized. Possible reactions by the departments may range from informal approval to dismissal and pressing criminal charges (Barker and Roebuck 1973, p. 38).

Punch (1985) added **flaking** (i.e., planting of evidence) or **padding** (i.e., supplementing of evidence) as the ninth type of corruption. According to Punch (1985), this type of corruption is particularly evident in drug-related cases.

In a nationwide study of more than 3,000 police officers from 30 diverse US police agencies, Klockars and colleagues (2000) found that shakedowns and opportunistic thefts were evaluated to be the most serious types of corruption in all 30 agencies, while the acceptance of gratuities – be it on a regular basis or only for the holidays – was viewed as the least serious form of corruption in all 30 agencies, with the cases of internal corruption and kickbacks lying somewhere between these two extremes. These results are very consistent with results of surveys of police officers from 13 other countries as diverse as Croatia, Finland, Japan, Pakistan, and South Africa (Klockars et al. 2004).

Causes of Police Corruption

The National Research Council (2004, p. 271) points out that "[t]he research literature [on causes of police corruption] is long on theory and short on evidence about what causes police corruption." The existing literature proposes several different approaches toward understanding why police officers engage in corrupt behavior, ranging from police officer individual characteristics to characteristics of the police agency itself and its larger social environment.

The first group of studies focuses on individual police officers and their characteristics (e.g., Muir 1977). The literature in this area tries to ascertain the features which make police officers prone to corruption, such as their prior criminal record and weak moral values. The Knapp Commission (1972) called this the "rotten apple approach." Over time, scholars discovered that psychological screening tests, traditionally used to prevent future "rotten apples" from entering the police organization, are not accurate predictors of future behavior.

The second group of studies examines the relation between opportunities for corruption and police corruption. By its nature, policing is viewed as an occupation rife with opportunities for corruption (Klockars et al. 2000). Crank and Caldero (2000, p. 63) provide an example:

> When we think of police corruption, graft typically comes to mind. The police, in their day-to-day pursuits, are exposed to great temptations, and there are few observers to watch what they do. Imagine this. You're a street officer. You've just made an incredible drug bust. Your reputation in the department is assured, and you're feeling charged! There's a pile of money on the floor. All you have to do is reach down, scoop up a handful, and put it in your pocket, and you can put your kid through college.

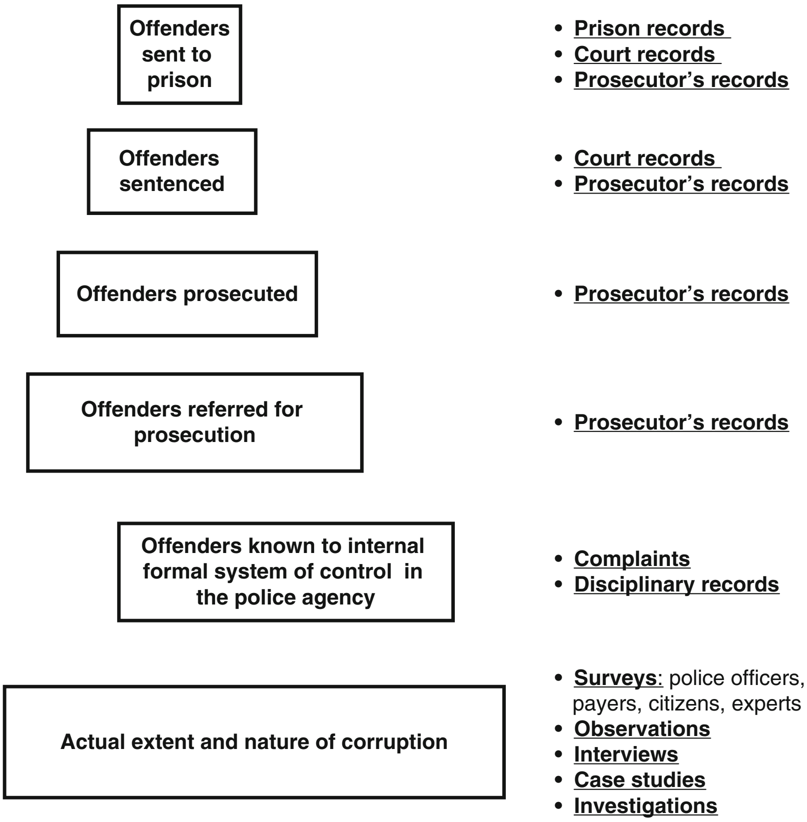
The opportunities for corruption vary assignments, ranks, units, and police agencies. Detectives, particularly those assigned to narcotic units, have especially extensive opportunities for corruption (General Accounting Office 1998), as do police officers in charge of laws without moral consensus and vague-defined laws (Knapp Commission 1972).

The third group of studies analyzes the relation between the characteristics of a specific police agency ("rotten barrels" or "rotten orchards," Punch 2009) and police corruption. This approach argues that police agencies have the dominant role in addressing police misconduct by creating systems that establish rules, enforce rules, detect corruption, and control the code of silence (e.g., Klockars et al. 2000; Kutnjak Ivković 2005; Sherman 1974; 1978). The police chief and his top administrators have critical roles (e.g., Goldstein 1975; Knapp Commission 1972; Kutnjak Ivković 2005; Pennsylvania Crime Commission 1974), while the roles of first-line supervisors (e.g., Knapp Commission 1972; Mollen Commission 1994) and peers (e.g., Chen 2003; Klitgaard 1988; Kutnjak Ivković 2005; Stoddard 1974) are not negligible either.

The fourth group of studies examines the relation between the society at large and police corruption. The police agency is part of the larger environment and is influenced by the legal norms (e.g., Knapp Commission 1972) and public expectations (e.g., Goldstein 1975; Sherman 1977). Sherman (1977) proposed that communities differ greatly in their expectations, from "communities with a more public-regarding ethos" (like Charlotte, North Carolina, Kansas City, Missouri, and Portland, Oregon) to communities with more "private-regarding" (like New York City and New Orleans, Louisiana). The same argument could be used to explain differentiation in corruption rates across the world; in the study of International Crime Victim Surveys, Kutnjak Ivković (2003, p. 612) reveals that "the countries with the reputation in the international business community of being more corrupt, as indicated by a low score on the 1999 Corruption Perception Index (CPI) . . . appear also to have a higher percentage of the respondents who said that they had been asked to pay a bribe to a police officer last year."

Measuring the Extent of Police Corruption

The measurement of the extent of police corruption could be attempted at different levels (Fig. 1).



Offenders sent to prison
Offenders sentenced
Offenders prosecuted
Offenders referred for prosecution
Offenders known to internal formal system of control in the police agency
Actual extent and nature of corruption
• Prison records
• Court records
• Prosecutor's records
• Court records
• Prosecutor's records
• Prosecutor's records
• Prosecutor's records
• Complaints
• Disciplinary records
• Surveys: police officers, payers, citizens, experts
• Observations
• Interviews
• Case studies
• Investigations

Police Corruption, Fig. 1 The funnel of police corruption and the data collection methods. source: Kutnjak Ivković 2003

The data sources seeking to assess the actual level of police corruption include citizen and police officer surveys. The results of citizen surveys portray a heterogeneous picture of the extent of police corruption across the country; in the 1960s, fewer than 2 % of Caucasian respondents nationwide perceived that most of the police were corrupt (President's Commission on Law Enforcement and Administration of Justice 1067b), in contrast to 93 % of New Yorkers in the 1990s who perceived corruption to be widespread (Kraus 1994).

The public opinion surveys indicate that, on the one hand, the public tends to have a relatively positive opinion about police honesty, while, on the other hand, the public perceives that police officers frequently engage in corruption. A 1987 survey of Philadelphia citizens (Moore 1997, p. 62) revealed that the public provided very positive ratings of the police service, although one-third of the respondents thought that police officers *often* took bribes. Similarly, a 1994 survey of New York citizens showed that, while 93 % of the surveyed citizens perceived that corruption is either "widespread" or "limited," about one-half of these same citizens estimated that the police are doing a "good" or an "excellent" job (Kraus 1994).

On the comparative front, the International Crime Victimization Survey asked the respondents whether they have paid a bribe and, if so, who the recipient of the bribe was. About one percent of the respondents or fewer from Western democracies, including the USA, reported paying a bribe to the police, while the corresponding percentages were dramatically higher (between 10 % and 20 %) in some East European, Asian, and Latin American countries (Kutnjak Ivković 2003). In addition, the Gallup International 50th Anniversary Survey (1996) reports that approximately one-third of the respondents in the West European countries and Israel, and more than two-thirds of the respondents in the East European countries, the Far Eastern countries, and the

Central and South American countries assessed that police corruption was widespread in their countries.

According to the results of the police officer surveys, it seems that the perceived frequency of occurrence of corruption was negatively related to perceived severity of corruption. In the 1994 Illinois study (Martin 1994, p. 33), fewer than 0.4 % of the respondents said that they saw a police officer accepting a bribe, stealing property, or purchasing stolen merchandise in the past year, while 81 % of the police officers said that they saw a police officer accepting free coffee or food from a restaurant. Similarly, Ohio police officers participating in the 1996 survey (Knowles 1996) reported observing serious types of police corruption (acceptance of a payment to overlook illegal activity, purchase of stolen merchandise for personal use or gain) very infrequently (less than 0.6 % observed it last year; less than 4.7 % observed it during their careers), while they reported observing police officers accepting free coffee or food from restaurants quite frequently (71 % observed it over the course of the last 12 months; 87.3 % observed it during their careers).

Surveys of citizens and police officers alike are burdened with the methodological problems (see, e.g., Kutnjak Ivković 2003; National Research Council 2004, p. 269). For various reasons, neither police officers nor citizens (participants or potential witnesses) have motives to report a corrupt transaction; in fact, they have motives *not* to report it (e.g., Klockars et al. 2000; Kutnjak Ivković 2003; Kutnjak Ivković 2005; Stoddard 1974). In addition, most of the existing surveys focus on one country and are conducted locally, usually with the purpose of surveying the population of a particular city.

Another source includes independent commission report. While providing the results of an in-depth investigations, these independent commissions are limited because they refer to a specific police agency, time period, and are bound by the resources and powers granted to the commission. The Knapp Commission (1972) and the Pennsylvania Crime Commission (1972) find widespread corruption in the NYPD and Philadelphia Police Department, respectively, and the presence of a strong code of silence. In contrast, the Mollen Commission (1994) reports that most police officers in the NYPD are honest but still found pockets of police officers aggressively seeking opportunities to obtain money and drugs.

A potential source of information about corruption includes field studies of the police. Typically, they focus on a small number of police agencies and involve a combination of methods (e.g., observation, interviews, analyses of documents). The President's Commission on Law Enforcement and the Administration of Justice made a push for field studies of the police in the 1960s. Reiss's study of the police (1971), originating as one of the studies submitted to the President's Commission on Law Enforcement and the Administration of Justice, also contained the data about the frequency with which police officers engage in police misconduct. The rates of corrupt behavior per 100 police officers, based on the observations by the researchers, self-reports by police officers, and allegations of misconduct by others (calculated from the data provided in Reiss's study 1971) were 22.8 in City X, 20.5 in City Y, and 15.6 in City Z (see Kutnjak Ivković 2003).

Another level of measuring corruption is through the official data, be it arrest rates or the complaint rates. At the federal level, there were between 83 and 150 officers convicted annually in the period from 1993 to 1997 (General Accounting Office 1998, p. 11). A comparison of the official data with the reports by independent commission implies that official data may be just the tip of the iceberg. When the Knapp Commission (1972) reported widespread corruption n the NYPD, the prosecutors filed charges in only about 30 cases of corruption annually (Kutnjak Ivković 2003). Similar problems could be expected for the police agency's internal records of corruption complaints. At the same time when the Knapp Commission (1972) discovered widespread corruption in the NYPD, the complaint rate in the NYPD was less than 1 per 100 officers.

The most novel approach is to measure the extent of police integrity instead. Developed by

Klockars and Kutnjak Ivković (Klockars et al. 2000), it measures the level of police integrity and avoids the methodological problems associated with the direct measurement of police corruption. A study of 30 police agencies (Klockars et al. 2000) revealed that police agencies varied considerably in the contours of their police integrity.

Police Culture

Eugene A. Paoline III
Department of Criminal Justice, University of Central Florida, Orlando, FL, USA

Synonyms

Occupational culture; Organizational culture; Police styles; Police subculture

Overview

The job of a police officer can be both mentally and physically exhausting. As such, officers rely on one another for emotional and physical support. Terms like *brotherhood*, *thin blue line*, and *blue code of silence* are common illustrations of the cultural bond that officers share. Most often connotations of police culture (or police subculture to some) are negative. For example, when officers misuse their coercive power, it is often police culture that gets blamed (for endorsing a no nonsense aggressive approach to dealing with citizens). When organizational reforms, like community policing, are met with officer resistance, the culture is cited as the primary barrier to soft policing innovations brought on by "out of touch" administrators. At the same time, police culture can operate as a powerful positive mechanism in helping officers mutually buffer the various tensions of their job.

Unfortunately, a great deal of vagueness comes with the concept of police culture. That is, if you asked people to define and explain it, you are liable to receive 100 different responses from 100 different people. The most popular depiction of police culture views it as an occupational phenomenon shared by all police no matter where (or for whom) they work. As such, there is more of a focus on the commonalities across police personnel over the differences. Even among those who endorse the occupational view, there is a great deal of variation in describing the facets of police culture. Cumulatively, this is problematic because it limits our ability to fully understand, and comprehensively research, this important aspect of policing.

In illustrating the ways of conceptualizing police culture, consider the occupation of criminal justice professor. Undoubtedly, across the various universities that house professors, there are commonly shared cultural ways of handling the work-related strains created by students as primary clientele (e.g., class size and preparation, advising, grade appeals, plagiarism) and administrative supervisors (e.g., expectations for peer-reviewed publications, procuring funded research, service). At the same time, it is reasonable to expect that such demands, and subsequent ways of coping, vary depending on the type of institution where one works (e.g., large research-oriented university versus small private teaching college). Moreover, these strains might be met differently based on the working style of the professor (e.g., pro-research versus pro-instructor). Even among criminal justice professors housed within the same institution, concerns and demands might be interpreted differently across the ranks of assistant, associate, and full professor. Relatedly, for those in the upper tiers, cultural variation might also be a function of changing assignments (e.g., research coordinator, departmental chair, associate dean, dean). One's background (e.g., gender, race, educational experiences) might also work to produce differences in the ways in which criminal justice professors deal with the pressures of their work. If one could effectively tease out the various influences, across these divergent conceptualizations, it would undoubtedly produce a deeper comprehension of criminal justice professor culture(s). A similar approach is taken in this chapter in understanding police culture.

The Occupational Culture of Policing: The Monolithic Model

The foundation for understanding police occupational culture dates back to the seminal work of William Westley (1970) who, in the 1950s, conducted one of the first sociological studies of policing. In doing so, Westley highlighted important themes of the police occupation. More specifically, he found that the police he studied were a secretive tight-knit group that often faced violence on the streets in performing their duties. In detailing these informal aspects of policing, Westley was painting the first picture of its kind. In essence, the message delivered was that cops believed they have to stick together in their interactions against potentially dangerous and hostile citizens.

The other significant contribution to our initial impressions of police culture was the research of Jerome Skolnick (1966), who explained how the occupation actually worked to shape a distinct police personality. Similar to Westley (1970), Skolnick detailed life on the streets for the police officer as a dangerous endeavor, one where officers wield a tremendous amount of authority over citizens. Skolnick also tapped into a third primary feature that helped form the police personality, the need to appear efficient to superiors, which introduced an equally dangerous and hostile work environment – the police organization.

Both of these ethnographic accounts of police work highlighted many of the informal aspects of the job while also providing a loosely defined template for scholars in comprehending the occupational culture of police. More specifically, these two studies started the process of thinking about the ways in which police officers *collectively cope*, *via their attitudes*, *values*, *and norms*, *with the strains created by their work* – which is precisely what defines an occupational culture (Paoline 2001). Unfortunately, unlike foundational explanations of crime causation that tended to clearly (and parsimoniously) posit sets of interrelated propositions, full accounts of police occupational culture have been as vague as the concept of love. That is, you tend to know it when you see it but can mean different things to different people. From a theoretical and empirical standpoint, this can be both confusing and frustrating.

The works that followed Westley (1970) and Skolnick (1966) described and analyzed several different components of culture that tapped various dimensions of the street and organizational environments. What was lacking though was a clear comprehension of how these individual elements, that research identified, contributed to an overall understanding of the police culture process. That is, what exact features are police dealing with in their primary work environments that are in need of occupational collectiveness? In addition, what are the so-called collective responses that officers utilize to manage the strains of these environments? Finally, what are the consequences of the strains of the work environments and the coping mechanisms that are used to deal with such concerns? While the elements for such an understanding were present in the volumes of research (e.g., an explanation of police loyalty, the crime fighting mandate, citizen danger), a concise roadmap of these correlates, in explaining exactly what a police culture entails, was not readily existent. The monolithic model of police culture, presented by Paoline (2003), helped clarify these concerns.

Paoline's (2003, p. 201) description of the monolithic occupational culture of policing presents, based on extant research, a way to conceptualize the stressful factors of the work environments that operate to produce collective coping mechanisms and outcomes. In a path-like presentation, he identifies interactions on the street with citizens (i.e., *occupational*) and those with supervisors in the department (i.e., *organizational*) as the two primary work environments of the police. As a starting point for understanding what produces the coping mechanisms of the monolithic culture, the occupational street environment is described as *dangerous*, with the defining mandate to display one's *coercive authority* over citizens. The model also details the organizational environment as being characterized by uncertain *supervisor scrutiny* of police decisions (i.e., watchful and punitive superiors) and *role ambiguity* whereby officers are expected to perform all police functions equally yet really only recognized for crime fighting duties. Both the occupational and organizational environments produce equally intense stress and anxiety that is relieved through the collective coping mechanisms found within the occupational police culture.

In illustrating the second principal feature of the monolithic police culture model, Paoline (2003) identifies *suspiciousness* (in dealing with danger) and *maintaining the edge* (in properly displaying coercive power) as the primary coping mechanisms that officers employ in handling the strains created on the street with citizens. In terms of dealing with supervisors within the equally hostile organizational environment, the culture prescribes that officers *lay low/c.y.a.* (from watchful and punitive superiors) and embrace the *crime-fighter orientation* (in minimizing role ambiguity). These prescriptive coping mechanisms of the police occupational culture are transmitted across officers via a socialization process that begins in the training academy and continues throughout one's career (Van Maanen 1974). The final stage of the model highlights the consequences of the strains of the work environments and the coping mechanisms prescribed by the culture, which include a *socially isolated* occupational group that is extremely *loyal* to one another.

Collectively, the work that helped produce this model paints a caricature sketch of police as a socially isolated group that are distrustful and suspicious of their primary clientele, as they continually attempt to maintain the upper hand in utilizing their coercive authority. Moreover, officers approach police work solely in crime fighting terms while laying low from supervisors, choosing to only trust their immediate peers. While this is the dominant portrayal of police culture, other research points to important ways in which the occupational group may be fragmented.

Sources of Variation in Police Culture

The preceding discussion regarding *a* police culture rests on the assumption that the strains that police face on the streets and within the department are the same across the United States and therefore officers' responses should be similar as well (Crank 1998). By contrast, there are other lines of research that cast doubt on the notion of homogeneity among police by pointing out important sources of cultural variation and segmentation.

Organizations

Although often used synonymously, occupational and organization cultures are not the same phenomenon. As opposed to a universally shared set of responses to the internal and external strains of the job (for all police) that make up occupational accounts of culture, organizational cultures represent ways that police deal with specific concerns from the various places where they are housed. A principal difference between occupational and organizational accounts of police culture lies within the locus of influence. Occupational cultures are usually formed and maintained by lower level personnel (Van Maanen and Barley 1984), while organizational cultures are created by upper level management and imposed downward through the ranks (Schein 1992). Irrespective of such nuances, this suggests that police organizations, embedded within the overall occupation, exert cultural influence over police officers. James Q. Wilson's (1968) seminal study accentuates such points.

Wilson's (1968) examination of organizational culture, which he believed was indicative of a departmental style, was based on research conducted in eight communities. Wilson identified three organizational styles that differed in terms of their priorities toward core role orientations of enforcing the law and maintaining order. The author asserted that it was the top police administrator that defined the given style of the department based on their interpretation of the primary needs of the community being served.

According to Wilson (1968), some departments are situated within urban environments characterized by greater crime concerns, and thus the agency will embrace more of a formal crime fighting detached approach to police work. In such *legalistic* style departments, arrests and tickets will be more frequent compared to other organizational styles. By contrast, Wilson's *watchman* style departments are more common in low crime rural areas, focusing primarily on maintaining public order. Watchman style departments are less likely to formally respond to citizen transgressions unless they are serious in nature. Wilson asserted that the relational distance between the police and the public in watchman areas would be much smaller than that found in legalistic style departments. Finally, *service* style departments are described by Wilson as those where law enforcement and order maintenance is not an overall priority, but would be handled as needed. These departments focus on providing assistance and are more likely to be situated in suburban areas with less crime and disorder. Wilson explained that service style departments are closely connected with citizens, choosing to intervene frequently (when needed) but not formally (i.e., arrests and tickets).

Wilson's (1968) research suggests that organizational environments vary, and as such, it highlights the fact that individual police responses to different work conditions might also vary. Interestingly, the legalistic style department he identified comports closely to the organizational environment found in explanations of the monolithic occupational culture. By contrast, the watchman and service style organizational environments represent vastly different internal work arenas where intense supervisor scrutiny and role ambiguity (noted in the occupational account) would be much less common. Likewise, Wilson's work also points out rather stark variation in the occupational/street environments, as watchman and service style areas are not characterized as overly hostile and crime ridden. As such, cumulative coping mechanisms where officers are suspicious of (and maintain the edge over) citizens, strictly endorsing the crime-fighter image, while covering their ass from supervisors might be functional in a legalistic style department but certainly would be out of place (and probably not tolerated) in both watchman and service style agencies.

Recent empirical inquiries have provided additional support for the ways in which policing functions and philosophies differ across organizations embedded in urban, rural, and suburban contexts (Crank 1990; Liederbach 2005). This line of research casts doubt on occupational accounts of culture that suggest that all organizations are the same while also acknowledging that management can impact police culture.

Rank

Occupational accounts of police culture focus heavily on the homogeneity of officers' attitudes, values, and norms. The socialization process transmits the culture across occupational members and is often described as intense, especially for new personnel (Van Maanen 1974). Because all police at some point in their career are assigned to patrol functions, the supposition is that culture originates at the lower ranks. This is understandable given that patrol officers are those most likely to deal with citizens on the streets and with supervisors in the department. What is much less clear is the role that culture plays in officers' lives once they move beyond entry level positions. Does the occupational culture still buffer the strains of the work environments for sergeants, lieutenants, captains, majors, deputy chiefs, and chiefs the same way(s) that it did when these officers were assigned to patrol, or does culture change by rank? The works of Reuss-Ianni (1983) and Manning (1994) help answer such questions.

Reuss-Ianni (1983), based on research conducted in the NYPD, asserts that there are two distinct cultures in policing. The *street cop culture*, which Reuss-Ianni delineates in a series of codes, concentrates on the "here and now" in policing and embodies many of the values outlined previously as part of the police occupational culture. Street cops are found at the patrol level and tend to rely on their developed craft, as well as their loyal peers, in surviving on the street and controlling crime at the local level (i.e., beat and precinct). By contrast, *management cop culture* focuses on city-wide long-term concerns (e.g., crime control, citizen responsiveness, organizational efficiency), taking into account political, social, and economic factors. Importantly, Reuss-Ianni believes that temporal changes in the dynamics of policing (e.g., officer composition, resource competition, accountability concerns) have contributed to a weakening of the street cop culture of the "good old days" when organizational leaders could still utilize the codes of the street in running police departments.

The importance of Reuss-Ianni's (1983) work lies in her recognition that rank contributes to differences in police culture. This makes sense given that duties and concerns do change as one moves upward from patrol with the organization. This might also help explain some of the tension noted between officers and their supervisors in the occupational account of police culture. While it is clear that street cop culture originates and protects occupational members at the patrol level, the author fails to inform the reader exactly when police enter management cop culture. That is, it is easy to deduce that top commanders are embedded in the management cop culture, but what about ranks like sergeants and lieutenants (i.e., middle managers), who are in organizational limbo between the very bottom and the very top. Manning's (1994) work helps alleviate such concerns.

Manning (1994) agrees that police culture is hierarchically segmented, although he differentiates rank in a three-tiered manner based on a series of themes and meta-themes. At the first tier are *lower participants* (i.e., patrol and street sergeants) whose culture, like Reuss-Ianni's (1983) street cops, focuses on the immediate aspects of "real" police work. The author's second tier of culture focuses on *middle management* (i.e., some sergeants up to department brass) who emphasizes supervisory control but also concentrates heavily on buffering concerns of line members of the street (i.e., the first tier) and top police officials (i.e., the third tier). Finally, *top command* culture (i.e., commanders, superintendents, deputy chiefs, chiefs) represents the third tier. Here, there is a concentration on dealing with the politics of running a police department internally while also buffering the organization from external audiences.

Interestingly, in terms of middle managers, Manning (1994) points out that sergeants assigned to street functions can rest within the first tier (i.e., lower participant culture), while middle managers with other responsibilities beyond patrol may be part of the second tier. Here, the author allows for behavioral freedom for sergeants who, as supervisors, might still align more with the line level versus management. Although not addressed by Manning, the same argument can be made for first tier lower participants, who depending on their assignment (or aspirations) might differentially align with police culture(s). For example, those who have jobs with duties that are based on more traditional aggressive crime fighting mandates (e.g., criminal investigations, tactical, K-9, anti-street crimes, SWAT, emergency response units) might be more apt to orient themselves with the lower participant culture. By contrast, those in positions that focus more on long-term solutions to controlling crime with increased officer participation (e.g., crime prevention, community outreach, school resource, community policing, victim advocate, homeland security, tourism units) might orient themselves more like upper ranking officials.

Both Reuss-Ianni (1983) and Manning (1994) highlight the dynamic nature of police culture as changing and adapting to insulate group members' issues and concerns unique to their position in the organizational hierarchy. As such, their work suggests that police culture is not monolithic, but instead comprised of multiple cultures based on rank.

Style

Yet another way that police culture can be segmented is by the style of the officer. In a series of studies published in the 1970s, researchers constructed typologies of the police based on their orientations toward various features of their occupational/street and organizational environments (Broderick 1977; Brown 1988; Muir 1977; White 1972). Of interest is the fact that these researchers were utilizing different dimensions to construct their typologies and were working independent of one another across various departments, areas, and time – yet they concluded with almost identical types/styles of officers. This was evidenced by Worden's (1995) synthesis of American police typology research into five distinct officer styles. Reiner (1985) also summarized typology research, utilizing some of the studies that Worden (1995) included (i.e., Broderick 1977; Muir 1977), although he incorporated work done on British and Canadian police. Interestingly, both authors concluded with very similar syntheses of officer types.

Worden (1995) provides a thumbnail sketch of the five primary styles of police officers. Worden's *tough-cop* approaches police work in a cynical fashion, often conflicting with citizens and supervisors in their aggressive approach to selectively fighting serious crime. These officers do not want to be bothered with trivial police matters (e.g., maintaining public order or providing service), and they place a premium on their street experience over formal college education. This style of officer would be your stereotypical gruff "cop's cop" that is often portrayed in television and movies, as one that is not afraid to push (or perhaps even exceed) the limits of police power if deemed necessary.

A second style, *clean-beat crime-fighter*, resembles the tough cop in their cynical approach, strong orientations toward crime fighting, and conflicting relationships with supervisors. What separates this style of officers from the former is their undying pursuit of enforcing all laws, not just the serious ones (in keeping a clean beat), and their belief that police should follow the procedural rules (i.e., not violate citizen rights).

Avoiders are described as a cynical group that, as their name implies, avoid as much work as possible. This style of officer has a very narrow approach to police work, as they take "laying low" to extremes. Their orientations toward all aspects of the job are rather detached, as they attempt to just do their time.

Problem solvers are those officers with very favorable attitudes toward citizens and the service style of policing. Problem solvers are the group that is least oriented toward crime fighting and aggressive policing tactics. As opposed to traditional ways of handling situations, problem solvers focus on outcomes, desiring to see the problems they are called upon to deal with through to their resolution. To many traditional police officers, the approaches endorsed by the problem solver would appear as "soft."

Professionals embody the values of the professional reform movement and are characterized as the most positive of the five policing styles. Officers in this group hold favorable orientations toward all aspects of their street and organizational environments. Professionals are portrayed as the most well-rounded group in terms of performing multiple functions (i.e., broad role orientation) in a manner in which citizens are not treated aggressively and where supervisors are pleased.

Police typology research illustrates that there are a variety of ways in which officers cope, via their style, with the demands of their job. Interestingly, Worden's (1995) tough-cop orientation comports closely to the attitudes and values associated with occupational accounts of culture, as well as Reuss-Ianni's (1983) street cop culture and Manning's (1994) lower participant culture. The other four styles summarized by Worden suggest the type of ideological differentiation that forms the basis for occupational subcultures (Van Maanen and Barley 1985). While research has yet to empirically validate these working styles, one thing is clear – there is more than just a single way for officers to deal with the strains of policing.

Officer style research illustrated cultural fragmentation among police during a time when officers were relatively demographically homogenous (i.e., White males with a high school education). Changes in the overall composition of police (i.e., more females, non-Whites, and college educated), as well as policing philosophies (i.e., community policing), in recent decades prompted reexaminations of police culture(s) (Paoline et al. 2000). Moreover, recent empirical approaches have utilized advanced statistical classification techniques, such as cluster analysis and discriminant function analysis, to examine more than the two or three attitudinal dimensions that were used for previous police typology inquiries (Cochran and Bromley 2003; Jermier et al. 1991; Paoline 2001). Similar to the research that produced evidence of policing styles, studies that utilized quantitative classification schemes also found multiple groups of officers with varying alignment to a single occupational culture. Because much of this (and typology) research is based primarily on officers' attitudinal orientations, it begs the question as to the applicability of such approaches on explanations of officer behavior. The age old attitude-behavior link has stymied social scientists for decades, as empirical connections have failed to verify intuitive expectations that one's attitudes affect one's behavior (Frank and Brandl 1991). Paoline's (2001) classification scheme provides one of the few exceptions.

Paoline (2001) utilized survey data collected as part of the Project on Policing Neighborhoods (POPN) to analyze several prominent attitudinal features of prior police culture research. Paoline identified seven groups of officers with varying cultural orientations. Five of the groups very closely resembled those Worden described in the framework he presented in 1995: tough cops (i.e., *traditionalists*), clean-beat crime-fighters (i.e., *law enforcers*), avoiders (i.e., *lay lows*), problem solvers (i.e., *peacekeepers*), and professionals (i.e., *old pros*). The other two officer groups were *anti-organizational street cops*, who were distinguished in terms of their strong negative views of supervisors and their strong favorable views of citizens, and *dirty harry enforcers*, who were distinguished in terms of their strong beliefs in aggressively fighting crime and disorder, even if it meant violating the rights of citizens.

Although Paoline's (2001) seven groups were attitudinally and empirically distinguishable from one another, there was no genuine way to rank order them (for comparison purposes) in terms of a continuum of police culture commitment. The groups did provide the author with a conservative manner in which to categorize them in terms of positive orientations toward culture (i.e., pro culture), negative outlooks or antithesis of cultural expectations (i.e., con culture), and those that fell somewhere in the middle of the two extremes (i.e., mid culture). Paoline's trichotomized classification scheme of police has been utilized to empirically examine the connection between cultural attitudes and theoretically related behaviors of citizen searches (Paoline and Terrill 2005) and the use of force (Terrill et al. 2003). In both instances, statistically related differences were noted between officers' cultural alignment and their behavior. More specifically, those who held attitudes that were strongly congruent with the traditional police culture (i.e., pro culture) or mixed (i.e., mid culture) searched citizens more often during traffic stops and used force more frequently (and at higher levels) than those who ardently resisted cultural attitudes (i.e., con culture).

Background Characteristics

Besides the organization, rank, and policing style, officer background represents another potential source of cultural variation. As previously mentioned, the foundation for understanding the monolithic occupational account of police culture was built during a time when policing was largely a demographically homogenous occupation (i.e., made up almost exclusively of high school-educated White males). Researchers have detailed the integration struggles and resistance that female (e.g., Martin and Jurik 1996), non-White (e.g., Bolton 2003), and gay/lesbian (e.g., Miller et al. 2003) officers have faced in a male-dominated masculine occupation. To a lesser extent, college-educated officers have been chided for their "book smarts" over the preferred "street smarts," in learning the craft of policing (Fielding 1988). The idea here is that those with different backgrounds from the modal officer are excluded from the broader occupational culture.

As departments continue to diversify their personnel in terms of their individual characteristics (Hassell and Brandl 2009), it is certainly reasonable to expect that these previously excluded policing members will, in some manner, contribute to a less cohesive occupational group. To date, we lack a concrete understanding of how such advancements in officer diversity affect police culture(s). That is, despite qualitative (and detailed case study) accounts of cultural dissociation, background characteristics of police provide limited power in explaining cultural perceptions among police (Paoline et al. 2000). In fact, the impetus for some of the recent officer classification schemes, in revisiting working styles, was built on the notion that diversification of personnel should produce differences in cultural alignment (Paoline 2001). Even among these studies that utilize advanced statistical techniques with larger sample sizes, there is little (if any) systematic connection between officer background characteristics and their group membership. In the end, such work suggests that cultural variation may have little to do with one's background.

The lack of a strong empirical connection between officer characteristics and alignment with police culture(s) could be a function of a couple of factors. It could be that demographic changes that are occurring are still too recent, and thus, we have yet to see the full cultural effects of such transitions in membership. A second explanation could be that the forces of cultural socialization as so strong, as some traditionalists would assert (Van Maanen 1974), that individual differences (via one's sex, race, education, sexual orientation, etc.) are washed away as officers collectively deal with the strains of the occupation. As such, the primary environments of policing are what shape the culture or subcultural styles, irrespective of what officers bring to the job.

Conclusion and Future Research

Police culture has been a topic of study for over half a century. Although the monolithic depiction still tends to dominate popular conceptions, this chapter illustrates that police culture is a multidimensional concept that is molded and shaped at various levels (i.e., organization, rank, style, assignment, background). Police scholars, in attempting to understand this police phenomenon, have wrestled with such complexities. At the same time, police culture is not just an academic concept, as practitioners recognize its power, vagueness, and malleability. As noted by the Community Relations Service of the United States Department of Justice's (2002, p. 9) handbook on "Police Use of Excessive Force," in order to change police culture, "one must analyze and understand the currently existing culture." While this chapter summarizes many of the advancements in detailing the pathways and contours of police culture, much more work is needed. As Fielding (1988, p. 185) accurately contends "if occupational culture is to serve as an empirically satisfactory concept as well as theoretically necessary one, the sense of its internal variations and textures must be brought out in the same fashion as have conceptions of culture in relation to delinquency." What follows are a few suggestions for future research inquiries.

Ideally one would want a totally comprehensive study, which would require starting at the occupational level and working through differences between and among organizations, ranks, styles, assignments, and backgrounds. Simply put, this may be asking way too much at this point. A more reasonable request starts by considering the various sources of influence on police culture.

The monolithic account of *the* police culture was created based on early ethnographic studies interested in capturing themes across officers. It is not surprising then that cultural similarities were the focus over cultural segmentation. Even if we acknowledge the sources of cultural variation, typology (and recent officer classification scheme) research did find one style of officer that deals with the strains of the primary work environments in the same manner presented by monolithic characterizations. Paoline (2003) presented a model for understanding this monolithic version of culture, and while parts of it have been researched, the entire model has yet to be empirically tested. As a logical starting point, it would be interesting to gather baseline data regarding the extent to which this traditional culture model is endorsed among contemporary police. This is especially salient given that policing philosophies are revisiting more bottom line crime fighting goals (e.g., COMPSTAT) at the cost of many community policing initiatives that have permeated agencies for the last 20 years. At the occupational level, we still do not have a firm empirical grip on the things that officers might share versus the exact points where they might be divided.

Regarding the influence of the organization, researchers should continue efforts aimed at examining departmental style as it impacts police culture(s). In doing so, empirical work can be done to deduce whether organizational environments, via agency style, are similar or dissimilar from that noted by Wilson (1968). For example, the rural and suburban areas that made up the smaller watchman and service departmental styles might be organized and operating in different ways today as criminogenic forces (e.g., gangs, unincorporated areas for producing and distributing drugs) are not just reserved for legalistic urban areas. As such, the directives and goals espoused as part of today's watchman and service organizational styles may look more similar to the legalistic style than that noted in the 1960s.

With respect to officer styles, efforts should be made to examine the connected (or disjointed) way(s) in which individual level approaches to dealing with the strains of policing operate within organizational level, top command-driven, styles. Jermier et al. (1991) found differences between subcultural groups of officers and the legalistic style crime fighting official organizational culture. This begs the question – what about other departmental styles and potential organizational survival of officer styles? For example, the crime fighting approaches of Worden's (1995) "tough cop" and "clean-beat crime-fighter" would certainly seem out of place compared to a "problem solver" or "professional" in a service style suburban department, as opposed to a legalistic style organization where the former would be more of a fit than the latter.

Regarding rank-related sources of variation, disentangling officer assignment and formal designation within the police hierarchy would be useful in understanding how culture(s) differ across Manning's (1994) three primary tiers. For example, can lower level participants, with assignments that call for increased officer participation and long-term orientations, align more like middle managers and their culture than their own? Conversely, can captains that are assigned to aggressive crime fighting street duties orient themselves more like lower level participants? In addition, do officer styles differ across the three tiers or is the culture monolithic by rank? If policing styles, as proxies for subcultures, develop at the patrol level, how and when do they change as one advances through the organizational hierarchy? In what way(s) do supervisory styles impact the development and maintenance of subordinate styles? These are but a few questions whose answers would add greatly to our police culture knowledge base.

Finally, despite the lack of consistent statistical associations, the demographic changes that have occurred in policing should continue to be part of police culture research. In doing so, racial (and ethnic) groups other than dichotomous White and non-White (predominantly comprised of African Americans) classifications should be part of such inquiries (e.g., Hispanic, Asian, Pacific Islander, American Indian, Alaskan Native). As such, previously excluded groups continue to populate police organizations, especially above the patrol level, cultural (and sub cultural) differences might be more visible. The same holds for those with divergent educational backgrounds and sexual orientations that differ from the traditional blue-collar aggressive crime fighting officer depicted in characterizations of the police culture "brotherhood." Moving beyond descriptive accounts of the struggles of those with divergent backgrounds and focusing on quantitative multivariate modeling will enhance our understanding of the potential independent effects of such factors on police culture(s).

The individual pieces of the multidimensional puzzle have been presented here in an attempt to detail the various intricacies of police culture. If scholars, practitioners, and funding agencies are serious about the overall importance of understanding (and possibly changing) police culture, it is high time to devote the empirical effort required to fully comprehend the way(s) in which officers deal with their work environments.

Police Discretion and Its Control

Gary Cordner[1] and Michael S. Scott[2]

Overview

Police officers exercise a tremendous amount of discretion in carrying out their functions. That is, they make many choices from a range of possible actions or inactions available to them, and their choices are not specifically prescribed by law, policy, procedure, or rule. This simple notion, which seems self-evident to some and controversial to others, lies at the heart of many issues of policing in democratic societies.

That the police do exercise discretion was only recognized and openly acknowledged beginning in the 1960s (J. Goldstein 1960; H. Goldstein 1963; LaFave 1965; Davis 1969). The conventional view prior to that time, and persisting among some long thereafter, was that the police function was entirely a ministerial one: that the police only took actions that were specifically authorized or mandated by legislative bodies. Under this view, policing was understood to be simply a matter of enforcing the laws on the books. But a number of pioneering research studies of policing in action found that the law was silent on many important matters involving police action and ambiguous on others, and police officers did not always adhere to what the law prescribed, even where the law was clear and specific (Banton 1965; Skolnick 1966; Wilson 1968; Westley 1970; Reiss 1971; Brown 1981).

The exercise of discretion is nearly inevitable in policing (H. Goldstein 1977). Some laws are practically unenforceable because they are outdated, or widely unpopular, or unconstitutional, or lack enforceable sanctions. Legislatures pass laws, and fail to abolish others, for a variety of purposes, only one of which is to establish clear expectations and guidelines for enforcement through police action. Moreover, the police seek to achieve various objectives in carrying out their duties, and at times, those objectives conflict with one another. In such instances, the police must decide which objectives take precedence over others. For example, during a public demonstration held in the streets, the police may find that the objective of keeping traffic avenues clear conflicts with the objective of safeguarding citizens' rights to peaceful protest.

Even absent conflicting objectives, police and other criminal justice resources are far too limited to allow the police to enforce all laws exhaustively. Most communities would not tolerate full enforcement of the law, even if resources would allow it, preferring a degree of police tolerance, especially for minor legal transgressions. The very capacity of the criminal justice system to continue functioning in many communities depends to a great extent on the police not fully enforcing the law. Sudden increases in police arrest activity can seriously challenge the capacity of the legal system to process the resultant cases.

Discretion is exercised in policing at all levels of the police hierarchy. In contrast with other occupations and professions, the greatest amount of discretion in policing is exercised at the line level by patrol officers and detectives, but supervisors and policy makers also exercise large amounts of discretion.

Fundamentals of Police Discretion

Perhaps the most profound types of discretionary decisions made in policing are the decisions to use force and to arrest. In regard to the use of force, Bittner (1970: 46) famously described the core of the police role as "the distribution of non-negotiably coercive force employed in accordance with the dictates of an intuitive grasp of situational exigencies." What Bittner meant is that the police are regularly called to the scenes of trouble and sometimes find it on their own. These situations are often confusing, if not chaotic. In these situations, police officers are authorized to use reasonable force, if necessary, in order to quell the trouble. The decision about whether the use of force is necessary, and if so, how much force to use, is discretionary. The decision is made by the officer or officers on the scene, based on their "intuitive grasp" of the circumstances (the "situational exigencies") as they unfold.

Police decisions about whether to arrest are discretionary too. Generally, the police are authorized to arrest (1) with a warrant issued by a court, (2) whenever a person commits any crime in their presence, and (3) whenever they have probable cause to believe that a felony (serious) crime has been committed and that a particular person has committed it, even if the probable cause is based on secondhand or thirdhand information. In regard to warrantless arrests (types 2 and 3 above), which are the most commonplace arrest situations, law and official policy rarely say that the police *must* arrest. Most often the law says, or is interpreted as meaning, that the police *may* arrest, leaving discretion in the hands of ordinary police officers.

Perhaps the most ubiquitous discretionary situations encountered by the police are the decisions whether to stop drivers who violate traffic laws and, when traffic stops are made, whether to cite the drivers and, further, to search the vehicle for evidence or contraband. Many observed traffic violations are minor in nature (such as driving 1 mile over the speed limit) and therefore frequently ignored by the police or, at most, addressed with a warning. By the same token, poor driving causes many deaths and injuries every year and a huge amount of property loss, so traffic policing, and its associated discretionary decision making, should not be dismissed as a trivial matter. As well, when officers decide to issue citations to drivers, fines are routinely in the hundreds of dollars today and can result in the loss of driving privileges, which in turn can have serious consequences for employment and income. Moreover, the police commonly engage in traffic enforcement as a method of more serious crime control: to locate illegal guns and drugs, to locate persons with outstanding arrest warrants, to disrupt illegal drug and prostitution markets, to deter burglars and thieves from prowling neighborhoods, and so forth.

There exists some research data about the frequency of these three major discretionary situations – use of force, arrests, and traffic enforcement. Clearly, the police frequently choose not to use force, or have no justification to do so – estimates are that the police use physical force (beyond handcuffing) in only about 20 % of all arrests (Terrill et al. 2008), in only 2–3 % of all encounters with the public (Friedrich 1980), and in less than 1 % of all traffic stops (Eith and Durose 2011). Similarly, the police often choose not to arrest – one study estimated that the police make arrests in about one-half of situations when it would be lawful to do so (Black 1980), and another study found that arrests are made in only 5 % of total police encounters with the public (Whitaker 1982). This still results in a large number of arrests though – 13 million in 2010, of which 2.2 million were for violent or property offenses, 1.6 million for drug offenses, and 1.4 million for drunken driving (FBI 2011). The picture is similar regarding traffic enforcement, with just over half (55 %) of 18 million drivers stopped in 2008 reporting that they were given a citation (Eith and Durose 2011).

Beyond use of force, custodial arrests, and traffic citations, the police make many other types of discretionary decisions, including decisions about which laws to invoke when an arrest or other form of detention is made (e.g., whether to add a charge of resisting arrest when an offender does not come along peacefully); whether to refer matters to other agencies; what tactics to adopt in mounting proactive operations; what conduct to investigate, what investigative techniques to apply, and how intrusive those techniques are; what level of resources to commit to various activities, places, and problems; whether to secure prior authorization for certain actions (e.g., whether to apply for search warrants or other court orders); what level of urgency to give to various duties; whether to grant permission for certain activities to take place (e.g., where the police are responsible for issuing parade permits); and so forth. Many of these discretionary decisions are made by patrol officers and detectives, but some are also made by supervisors and commanders.

Variations in Discretion

The range of choices open to police officers varies in different types of situations, as does the degree of latitude that they have in making those choices. So, for example, if an officer is dealing with a person experiencing a mental health crisis, it matters if there is a specialized unit that can respond and take over, or if there is a mental health crisis center to which the person can be taken, or a psychiatric unit within the local hospital. If none of those options is available, then the number of choices open to the officer is more limited – to perhaps not much more than curbside counseling or an arrest for disorderly conduct.

In some jurisdictions, while the law may authorize the police to arrest for certain offenses, that option may not really be available. For example, the county jail may be completely full, causing the jail administrator or sheriff to advise local agencies not to make any arrests except in extreme cases. In this situation, police officers may still have the option to issue a citation to an offender, but the option of physical or custodial arrest would be severely curtailed. In another scenario, it is common for prosecutors to inform police departments that, because of heavy caseloads facing the court, arrests should not be made for particular categories of minor offenses. This situation would discourage even the issuance of a citation, unless the accused had the option of paying a fine in lieu of trial, thus preventing any additional workload burden on the court.

Another real-world constraint on police discretion is the number of police officers available to handle other police matters should an officer take some action that removes him or her from the streets for an extended period. Whether in small agencies where there is only one police officer on duty or in larger agencies where police reinforcements are a long distance away, an officer might have to weigh the benefits of making an arrest against the costs of being tied up for several hours processing the arrestee, leaving no or few other officers to police the area. Both the public's and any remaining officers' safety must be taken into account. An added dimension could be that the county jail, hospital, or other facility is many miles away, building even more processing time into the detention and literally taking the officer out of the jurisdiction. These kinds of practical constraints may narrow the real range of choices available to officers when handling various situations, thereby further constraining their discretion.

In regard to the use of force, not all police officers and police departments have the same equipment available to them, which can affect their range of options in some situations. For example, conducted energy devices (e.g., Tasers) have become commonplace, but some officers do not have them and thus do not have one of the more effective less-lethal weapon options in confrontations with combative subjects. Similarly, when a high-speed pursuit is underway, the range of options is affected by whether the officers out ahead of the pursued vehicle have stop sticks or similar technology. Likewise, in a hostage or barricaded-person scenario, some police officers might have sophisticated communications, eavesdropping, or breaching technology available, while others might not, affecting the tactical choices open to them.

From a comparative perspective, the 18,000 chief police executives in the United States probably have broader discretion than their counterparts in most other countries, because of the highly decentralized structure of American policing. A US police chief has the authority to choose the type of pursuit-driving policy to implement, whether to place a higher priority on drug enforcement or traffic enforcement, whether to require applicants to have a college degree, how to address various types of policing incidents and problems, and so forth. In a country with a unitary (national) police system, these and other decisions are usually made at the national level, leaving much less discretion in the hands of local commanders. Sheriffs in the United States may have the broadest executive-level discretion of all, since they are locally elected and are primarily accountable to the electorate rather than to other government executives.

Differing legal systems may also affect police discretion. Within the United States, local and state police officers generally exercise wider discretion than do federal law enforcement officers, whose investigations, in particular, are guided to a larger degree by prosecutors (US attorneys) than is common at the state and local levels. Similarly, in countries that have civil law or inquisitorial legal systems, judges and/or prosecutors often direct investigations, reducing the degree of discretion available to police. In some countries, frontline police personnel (the equivalent of patrol officers in the United States or constables in the UK) do not have the same broad authority or discretion in the use of force, arrest, and investigation described in the previous section. The actual legal authority of ordinary police officers is more restricted, or organizational rules and procedures require them to get permission from superior officers before taking significant actions. Of course, it is also true that in some countries the authority of the police to detain, search, and interrogate is even broader (under the law or simply in practice) than discussed here, effectively increasing the amount of discretion available to those permitted to exercise the authority, whether it is frontline police personnel or superior officers.

Factors That Affect Police Use of Discretion

An important theme in police research has been the study of police decision making. Besides documenting the existence of discretion, as described above, many studies have looked for patterns and correlations in police decisions to use force, stop vehicles and pedestrians, make arrests, issue citations, and conduct searches. Factors affecting police decision making and the use of discretion by police officers fall into four general categories: situational characteristics, police officer characteristics, police organization characteristics, and neighborhood/jurisdiction characteristics.

Consistent with the finding that the police exercise broad discretion and also consistent with Bittner's (1970) argument that police behavior is guided by "situational exigencies," characteristics of the situations in which the police encounter the public have been found to have the greatest influence on police decisions to arrest, cite, and use force (Skogan and Frydl 2004). Among these, studies have found that the most influential are legal factors – the seriousness of the offense committed by the suspect, the suspect's previous offending history, the amount of evidence available, and the degree of threat posed by the suspect toward the officer. This finding – that police use of discretion is affected more by legal factors than any others – is reassuring. A related quasi-legal factor that also has some influence is the stated preference of the victim, especially when the victim asks the officer not to arrest the suspect.

Compared to these legal factors, a variety of extralegal situational factors have been found to have mixed and inconsistent effects on police use of discretion. These extralegal factors include the demeanor of the suspect and the suspect's race, sex, and social class. Each of these factors has been found to influence police decision making in some studies, but not always in the same direction, plus many other studies have found no effects. Of these factors, the one that has gotten the most empirical support, especially in more recent studies, is race (Kochel et al. 2011). Studies of so-called racial profiling consistently find that people of color are disproportionately stopped by the police, whether as drivers or as pedestrians, and once stopped are more likely to be searched. The key question, of course, is whether these police decisions to stop and search people of color are made based on the extralegal factor of the race of the person, or whether they are based on legal factors such as the seriousness of the person's behavior and the amount of evidence that is available. Unfortunately, research on racial profiling has not generally been able to answer that key question.

Police decision making and use of discretion might also be influenced by the personal characteristics of the police officer, such as his or her race, sex, and level of education. However, the cumulative findings from many studies indicate that these factors do not have large or consistent effects on police officer behavior. Similarly, neither police officers' general orientations toward their role nor their levels of authoritarianism, cynicism, or job satisfaction have been found to have any consistent influence on their use of discretion.

A third set of factors that might affect police officer decision making is organization-level characteristics. For example, officers in small police departments might use their discretion differently than officers in larger departments, officer decision making might vary between different types of agencies (e.g., municipal police departments versus sheriff's offices), or decision making might be influenced by the degree to which a police organization is centralized, specialized, or formalized. The internal climate or culture of a police organization might also lead to variations in police behavior, including decision making. While a good case can be made that organizational characteristics such as these ought to affect the use of discretion by organization members, the kinds of multiorganization studies that would be needed to verify such effects have simply not been conducted.

It has also been argued that police use of discretion varies according to characteristics external to the police, such as between rural, suburban, and urban communities, or between poor neighborhoods and affluent ones. Once again, a theoretical case can be made that community characteristics should influence police behavior, including decision making in discretionary situations, but relatively few studies have been able to incorporate multiple neighborhoods and/or multiple jurisdictions, and the results from those few studies have not been consistent (Varano et al. 2009). As was true for officer characteristics and organizational characteristics, community characteristics have not been found to have as much impact on police officers' use of discretion as situational characteristics, and within the latter, legal factors seem to have the greatest influence.

Consequences of Police Discretion

As discussed above, police discretion seems inevitable given the broad mandate of the police, the incredible variety of situations that the police encounter, the tendency of legislatures to pass laws that no one expects will be fully enforced, the limited capacity of jails and courts, and numerous other philosophical and practical considerations. So the police have broad discretion, though more in some situations than others. Also as noted, studies indicate that situational legal factors affect police officers' decisions more than any other factors, although future studies using better methodologies may reveal that extra-legal factors (such as the race of the suspect) and the characteristics of police organizations and communities have more influence than can presently be demonstrated.

Given the existence of police discretion, what are its consequences? The most obvious immediate result is that the police often choose not to enforce the law, thus softening the impact of the criminal law on people's lives. With discretion, officers get to choose how to handle various situations, and at least half the time when an arrest could be made or a citation issued, they choose under-enforcement or some other version of leniency. Because of discretion, officers' actions can be affected by sympathy and empathy, and officers have the opportunity to choose what they consider to be the most fair or just resolution of the situation, even if that entails not enforcing the law. Discretion enables the police to treat people *as people*, taking into consideration a person's circumstances, motives, intent, remorse, and promises – many would say that discretion allows the police to humanize the application of the criminal law.

This phenomenon of under-enforcement enabled by discretion might be a cause for more serious concern if it reduced the deterrent effect of arrest and punishment, emboldening potential offenders and creating a sense of impunity within society. Such a concern is less warranted though, since the police exercise their discretion mainly in response to minor crimes and disorders. It is generally the person caught drinking in public, driving 10 miles over the speed limit, or shoplifting a small item who benefits from an officer's decision to handle a matter informally, not the burglar, robber, or murderer. With that said, however, it is also true that detectives and prosecutors have discretion in making "deals" even with serious crime suspects, as when they offer to reduce or drop charges in return for confessions, incriminating evidence or testimony against codefendants, and other types of cooperation. The exercise of discretion by detectives has not been studied as closely as the discretionary arrest and use of force decisions made by patrol officers.

Concern about the consequences of under-enforcement and leniency cannot be ignored, despite the evidence that the police have been making lots and lots of arrests. "Zero tolerance" campaigns remain very popular, at least in the United States. It is not usually necessary to declare zero tolerance for murder or robbery – rather, zero tolerance campaigns usually target such lesser offenses as street prostitution and panhandling, or else they define a specific geographic area within which all criminal laws will be enforced, no matter how minor. In the public forum and in police strategy circles, zero tolerance is most commonly presented as a strict crime-control policy, leading to debates about whether it is fair, sustainable, and effective in reducing crime. However, zero tolerance is also a direct assault on police discretion. A zero tolerance policy takes discretion away from police officers since it eliminates every option other than enforcement.

In light of the concern that police discretion might result in too much leniency, it is ironic to note that, at least in the United States over the last 20 years, jails and prisons have been full, if not overflowing. In other words, the police have had broad discretion, and the evidence indicates that they have regularly used it to avoid making arrests – and yet, court dockets are crowded and jails are full. One might wonder what the situation would be if not for police discretion.

There is one aspect and consequence of this discretion/leniency phenomenon that deserves special consideration. Police discretion sometimes extends to deciding whether a reported event counts as a crime, whether to record it as a serious crime or a lesser crime, whether to thoroughly investigate it, and whether to recommend it for prosecution (Lum 2011). If the victim of a reported crime is perceived by an officer as unworthy of serious concern, the crime might be discounted or ignored. For example, this might occur to a woman domestic violence victim or sexual assault victim if the police officer identifies more with the other party involved, or if the officer believes that the victim somehow contributed to her own misfortune. Similarly, an officer might fail to act in response to a reported crime if the victim is someone whose status is not fully respected, such as a recent immigrant or a person whose sexual orientation is considered deviant by the officer. In these examples, discretion allows the police to act leniently toward offenders in situations in which their victims are held in low regard. It can be argued that these are simply more examples of discretion enabling the police to pursue justice and fairness rather than mandatory enforcement, but it is at least equally possible that, in these types of cases, discretion allows officers to act on the basis of their own stereotypes and biases to the disadvantage of deserving victims.

Another potential problem with discretion and under-enforcement/leniency arises if the police are more lenient toward majority groups and higher-status individuals than others. The police might seem lenient if they only arrest 30 % of the people they stop for drinking in public, or if they only conduct searches in conjunction with 10 % of their traffic stops. Analyses often indicate, however, that members of minority groups are disproportionately arrested for minor offenses and disproportionately subject to searches following traffic stops. In other words, the overall picture is one of under-enforcement, but often the enforcement that *is* undertaken is differentially applied to persons of color. As explained above, this pattern of police discretionary decision making, often called racial profiling, might still be accounted for by situational legal factors, but it might also be a reflection of conscious or unconscious bias.

The inherent and most fundamental challenge associated with discretion is simply inconsistency. Discretion gives police officers leeway in deciding how to handle encounters and confrontations based on an "intuitive grasp" of each situation. Ultimately, some people caught with a marijuana cigarette get arrested and some do not; some drivers who fail to signal their turns get citations and some do not. This brings into focus two competing conceptions of justice and fairness – one perspective says that fairness is treating every rule breaker the same, while the other perspective says that fairness is treating each person *as a person*, according to their unique circumstances. Many of us subscribe to the first viewpoint as long as it is applied to others, but want the second approach taken when we are the ones against whom the rules and laws might be applied.

Guiding and Controlling Police Discretion

While police discretion may be inevitable, it is widely accepted that it should not be unfettered: that it needs to be guided and controlled in order to avoid the kinds of negative consequences discussed above, including inconsistency, undue leniency, and discrimination. State statutes and local laws can and do guide police discretion to a certain degree. For example, some legislatures have sought to restrict police discretion in specific types of cases, notably in the realm of domestic violence through laws mandating arrest of offenders (Phillips and Sobol 2010). Such efforts sometimes merely shift the locus of discretion, however. If the law requires the police to arrest whenever they have probable cause to believe that a domestic assault has occurred, but officers in some situations do not think that arrest is the best response, they may become more likely to decide that the evidence falls short of probable cause, or that no crime has occurred at all. In some cases this kind of decision making may also be driven by a victim's stated preference for no arrest or by knowledge that the prosecutor is only willing to take certain kinds of cases into court. This is not to say that mandatory laws have no impact on police discretion and decision making, but it is important to recognize that the police and other criminal justice decision makers tend to react in ways that preserve their discretion (Green and Kelso 2010).

The supervising authority of the courts, including specific court rulings and the risk of civil liability, also has the potential to influence the exercise of police discretion, at least at the margins. The US Supreme Court's *Tennessee v. Garner* (1985) decision is a case in point. Prior to *Garner*, the police had the discretion to use deadly force in situations in which a fleeing or escaping felon could be captured only by shooting them as they fled. The Supreme Court ruled that this authority was too broad and effectively revoked the "fleeing felon rule," thus narrowing police discretion in the use of deadly force.

By themselves, however, laws and court decisions are generally inadequate for guiding and controlling police discretion. As noted, often they merely shift the locus of discretion to another point in the process. Also, court decisions typically resolve one specific issue but leave others unaddressed. The *Garner* case, for example, eliminated one ancient common law justification for police use of deadly force, but did not posit a new rule in its place or seek to clarify other justifications for police use of deadly force. Moreover, one of the key legal principles underlying police use of force, including deadly force, is "reasonableness" – the police can use any level of force that is reasonable to defend themselves or others from serious threats of bodily harm or to carry out their other lawful responsibilities, such as enforcing the law. While the *Garner* case ruled that deadly force was *un*reasonable in one particular set of circumstances, the reasonableness standard remains and it is inherently vague and subjective. An inevitable consequence is that the police have significant discretion in deciding whether to use force and how much force to use.

In large part because of these limitations of the law, written policies and procedures are increasingly used by police agencies to set out the parameters of officers' discretion in certain types of cases and to provide contextual guidance for the proper exercise of it. In the case of domestic violence, for example, police department policies often reinforce and tighten legal requirements by (1) articulating limited exceptions to mandatory enforcement, (2) requiring written justification whenever nonenforcement is chosen in an applicable situation, (3) identifying decisions that require supervisory approval, and (4) specifying penalties for failing to adhere to legal and policy mandates. Similarly, in the case of deadly force, police department policies frequently define an even narrower range of justifications than anything found in the law, they usually caution officers about the sanctity of human life, and they invariably specify elaborate processes that must be followed in the aftermath of any incident in which the police exercise force that could lead to death, regardless of whether anyone dies or is even injured. In neither case, domestic violence nor use of force, do written policies completely eliminate discretion, but they constrain and guide it more thoroughly than is accomplished by law alone.

Somewhat less common, but no less important, are written policies that provide guidance for the exercise of discretion in general. One example policy identifies factors that officers should and should not take into consideration when deciding whether to make an arrest (Scott 1995):

> In general, police officers, using sound professional judgment, may take the following factors into consideration when deciding whether or not to arrest a citizen: (a) the seriousness and nature of the offense (generally, the more serious the offense, the more likely arrest is the preferred course of action); (b) the potential that arrest will effectively resolve a conflict; (c) the availability of legal alternatives to arrest that would adequately resolve the conflict or problem; (d) the likelihood that the citizen will be deterred from future violations by warning and education; (e) the officer's belief that the citizen made an honest mistake in violation of the law; (f) the victim-witness's interest in prosecution; (g) the likelihood of formal prosecution of the offense; (h) the potential that arrest will create more serious breaches of the peace or other problems (e.g., inciting riot); (i) legitimate competing priorities for police resources.
>
> The following factors are among those that are improper for a police officer to consider in deciding whether or not to make an arrest: (a) the citizen's economic status, race, ethnicity, gender, or other status for which the law prohibits legal discrimination; (b) the revenue likely to be generated by fines or penalties imposed upon conviction; (c) the personal or professional relationship that the citizen has to the police officer or to other influential citizens; (d) the personal advantage to the officer for processing or avoiding processing of the arrest (e.g., overtime compensation, desire to finish tour of duty, avoidance of paperwork, etc.).

Police organizations utilize several other methods of guiding officers in the exercise of discretion. Police agency accreditation standards, while not typically dictating the substance of most discretionary judgments, can help create an organizational structure that supports administrative rule making. Police training programs are essential for improving officers' decision-making skills in the application of policies and procedures. The development of a body of professional and scientific knowledge, grounded in research and practice, about how the police can effectively and fairly address public safety problems also holds promise for shaping important discretionary decisions (Weisburd and Neyroud 2011; Center for Problem-Oriented Policing 2012). In addition, many police agencies are increasingly looking to citizens to provide them with guidance on a range of discretionary matters, from what public safety problems to focus on to what means to use in addressing them. Citizen input can be provided at the policy-making level as well as through systematic input to line officers (Livingston 1997).

Years ago, Jerome Skolnick (1966) observed that the police, like members of most organizations, are affected by the need to appear productive. Thus, officers' discretionary decisions about whether to arrest or issue citations may be influenced by supervisory or command-level expectations about how much "activity" a productive officer should generate. While not new, these pressures seem to be greater today in the era of "metrics" and heightened accountability. Many police departments now use some form of Compstat, a system designed to help top-level executives use crime analysis and statistics to hold mid-level commanders accountable for targeting and reducing crime in their areas of responsibility. These mid-level commanders often press their subordinates to increase enforcement in order to show that they are doing everything possible to reduce crime. The net effect is to reduce discretion at the lowest levels in order to satisfy pressures from above. Another effect, perverse and unintended, may be to encourage officers to use their discretion to downgrade or ignore some reported crimes, thus making it appear that crime reduction is occurring even if it is not (Eterno and Silverman 2012).

Modern technology is also affecting police discretion. Thanks to mobile radios, cell phones, in-car computers, and automatic vehicle locator systems, today's police supervisors and commanders can keep track of their subordinates more closely than was the case a decade or two ago. Even more intrusive are in-car cameras and body cameras (not to mention the ubiquitous cell phone cameras in the hands of the public) that record everything that police officers do, thus magnifying the potential for after-the-fact review. While these surveillance technologies may not directly narrow the discretion that officers have in making their decisions, they probably have a substantial indirect effect, since officers must give more consideration to how their decisions will look and be judged in retrospect. In the near future, this technological impact is likely to be magnified further when the feeds from in-car and body cameras go "live" back at police headquarters. When that time comes, supervisors and commanders will have a greatly expanded opportunity to direct officer decision making in the field. This is likely to shift the locus of some discretionary decision making away from police officers and onto the managers back in the electronic control room. This kind of technological breakthrough could produce a fundamental change to our traditional understanding of police work and the centrality of street-level police discretion. It will be quite interesting to see whether it actually does have this profound effect, or if, once again, it merely causes some shifting in the forms and locus of police discretion.

Overview

Coercive authority is central to the police role, and the discretionary use of police authority is a decision-making process, as officers evaluate the situations in which they intervene and choose a course of action from among a set of alternatives. This entry approaches the study of police discretion from this decision-making perspective. It is concerned with several forms of authority: stops, frisks and searches, arrests, tickets, and the use of physical force.

Police authority is infrequently invoked, as a proportion of all police-citizen contacts. Officers consider their authority as a resource in "handling" situations, and often they are able to handle situations without resorting to the use of formal authority. Research has illuminated to a degree the circumstances under which authority is used, from which inferences are drawn about the influences on police decision-making, but research has not for the most part formed the basis for normative judgments about the discretionary use of authority – when it has been used well or poorly.

Explaining the police decision-making process can be approached like any decision-making process. Behavior can be predicted or explained when the premises for decision are known. Police officers' decisions turn on factual premises, which concern the consequences of alternative police actions and the nature of the situation from which the consequences can be projected, and value premises, about the goals of police intervention and the desirability of alternative sets of consequences. Explaining police decision-making is, however, complicated by the ambiguity and uncertainty of police officers' task environments.

Many different elements of police-citizen encounters have been analyzed as hypothesized influences on police behavior, but only a few of them have been consistently found to affect the use of police authority. Several of those are legal factors: the seriousness of the offense, the strength of evidence, and the preferences of complainants for disposition. Among extralegal factors, only the demeanor of suspects has emerged as a fairly consistent predictor of police action.

The discretionary exercise of police authority varies across individual officers. It is fairly clear that this variation is patterned by officers' length of service and also by officers' outlooks and personality traits. The influence of other individual factors, such as educational background, is undetermined.

The use of police authority is subject to regulation by departmental policies, but the circumstances under which policy regulation can have maximum impact are seldom realized in policing. The use of deadly force can be successfully restricted. Other uses of police authority are probably less susceptible to policy guidance.

Among the many open questions about police use of their authority are three addressed in this entry: the influence of citizens' race, modeling police decision-making, and how research might contribute to improvements in the quality of police decision-making.

Introduction

Coercive authority is central to the police officer's role; it is a unique occupational prerogative that enables police to "handle" urgent situations. The situations may be crimes, with clear and serious violations of criminal law, the response to which is the apprehension of perpetrators, or the situations could be disorders, with ambiguities stemming from whether the law applies, who bears how much responsibility for the situation, and what should be done about it. But all of these situations share an element of urgency, in that prompt action is needed, whether it is a burglary in progress, a drunk driver, a loud party, a domestic conflict, or a blocked driveway (see especially Bittner 1974; Muir 1977).

In each instance, police exercise discretion, which is the capacity to choose among courses of action based on one's judgment. Police officers typically work outside of direct supervision and often in private settings in which only the officer(s) and the parties directly involved have knowledge of the circumstances and the actions, if any, that police take. So while thick books of policies and procedures exist in many agencies, in practice, officers are left to define the situation and fashion a response, thus determining whether and, if so, which policies and procedures apply.

The exercise of police discretion is a decision-making process, as officers evaluate the situations in which they intervene and choose a course of action from among a set of alternatives; if their involvement is not at the request of a citizen, they also make decisions about whether to intervene. This entry approaches the study of police discretion from this decision-making perspective. In the next section, the entry discusses the forms of authority that police exercise and how they have been analyzed; then it explains how a decision-making framework can be applied to police discretion in their use of authority. In the following section, the entry summarizes what is known about the explanations of officers' discretionary choices. Then several open questions are addressed.

Police Authority and Discretionary Decision-making

Police Authority

Police exercise several forms of authority. An officer may stop and detain someone when he/she has reasonable, articulable suspicion that the person has committed, is committing, or is about to commit a crime. An officer may frisk, or pat down, an individual if she/he has reasonable suspicion that the person might be armed. An officer may conduct a more extensive search of a person incident to that person's arrest and may conduct a warrantless search of a person, a vehicle, or even a building under some other circumstances. An officer may take someone into custody for the purpose of charging them with a crime; if the suspected offense is a felony, an officer needs only probable cause to believe that a crime was committed, while for most offenses of lesser seriousness, the officer may act only if she/he witnesses the offense or a citizen signs a complaint. For some types of offenses, officers may issue a summons that directs the alleged offender to appear in court, rather than make a custodial arrest; this is of course common for traffic violations and also for some other less serious offenses (such as public drinking). Finally, police may use the physical force that is reasonably necessary to perform their duties; the US Supreme Court ruled in *Tennessee v. Garner* that police may even use deadly force if an "officer has probable cause to believe that the suspect poses a threat of some physical harm, either to the officer or others." The forms of physical force that police may use has multiplied with the development and adoption of less-lethal weaponry, such as pepper spray and conducted energy devices, in the last 10–20 years.

Social science has focused mainly on the exercise of authority by patrol officers, and it has normally conceived, measured, and analyzed these forms of police authority one by one – that is, some studies examine arrest, while others analyze the use of physical force, and still others analyze stops, etc. In most instances, officers' use of police authority consists of a discrete act – making an arrest, conducting a search; the main exception is the use of physical force, which is commonly broken down into forms of force that vary in their seriousness, such as physical restraint, impact methods (punches or kicks), and the use of weapons. These are not mutually exclusive forms of behavior, of course; to the contrary, an officer might well stop and detain, frisk, arrest, and physically restrain an individual in a single encounter. One effort to form a single scale of authority weighted the individual components, but empirically it was not much different from an arrest/no arrest dichotomy.

In general, police authority is infrequently invoked, as a proportion of all police-citizen contacts. Many years ago, James Q. Wilson (1968) observed that the tendency of the police is to *underenforce* the law, declining to take legal action even when the circumstances authorize them to take legal action. Thus it was not uncommon for police to release in the field offenders about whose culpability police had evidence sufficient to warrant arrest. Wilson pointed out that police see their authority as a resource in accomplishing their objectives, such that the application of their authority is not an end but a means, and in many instances their objective is merely to "handle the situation" – that is, to restore order and to prevent immediate violence. When an arrest was made, the "formal charge justifies the arrest but is not the reason for it" (Bittner 1974, p. 27); the reason for such an arrest is that the situation could not be handled in some other, informal fashion. Similarly, studies of the use of force have found that police seldom use physical force, and some research has found that police frequently refrain from using physical force when they could legally do so or use less physical force than the citizen's resistance would justify. Sometimes police presence by itself is sufficient to restore order. And even if presence alone is not enough, police may be able to resolve matters by talking: persuading, cajoling, exhorting, negotiating, or mediating.

Since Wilson made his observation, with changes in the (semiprofessional) status of police, criminal procedure, and civil liability, the view of the police may be somewhat different, but not dramatically different. Even far into (and perhaps beyond) the "community era" of policing, authority is central to the police role. Police may now supplement their use (or threatened use) of authority with other approaches, but even when they perform problem-oriented policing, authority remains a resource on which they can and often do draw. In addition, the difficulty of reorienting police to a more community- and problem-oriented role – getting officers to think in terms of groups of related incidents rather than individual incidents and to consider unconventional solutions to those problems – suggests that the use of coercive authority has not changed dramatically in the last 40–50 years. Arrest and physical force remain infrequent acts. Police proactivity – contacts with citizens initiated by the police – is almost certainly at a higher level now, however, and it has occasioned some controversy about its benefits and the social distribution of its costs.

Another change over time might lie in the public's expectations for police effects on social conditions. In the early 1970s, Egon Bittner could say that police are "empowered and required to impose or . . . coerce a *provisional* solution upon emergent problems . . ." (1974: 18; emphasis added), suggesting that the solution extended no further than the immediate situation. Yet we evaluate the police in terms of more – for example, research on policing spouse assault assessed police interventions in terms of recidivism by assailants over a 6-month post-intervention period, not in terms of more "provisional" solutions.

Aside from hypothesized biases in the use of authority, to be discussed below, research has tended *not* to address the normative dimensions of police authority, that is, whether an arrest or the use of physical force was a good choice or a bad choice. The situations that police handle are complex, and so a normative judgment about the use of police authority is contingent on many factors. Moreover, the criteria against which such a judgment should be made are not at all clear. Officers' choices could be judged in terms of immediate outcomes, such as whether agitated citizens are calmed, or in terms of longer-term outcomes, such as whether a domestic assailant recidivates. None of these have been much considered in research on police use of authority.

Another potential criterion is a professional one of "workmanship." Bittner (1983) distinguishes legality from workmanship as standards against which to judge police performance. The former involves the application of "explicitly formulated schemes of regulation," while the latter is concerned with officers' "ability to call upon the resources of knowledge, skill, and judgment to meet and master the unexpected within one's sphere of competence." Bittner goes on to explain that the standard of workmanship would subject officers' performance to the scrutiny and critique of others authorized to assess their work after the fact: peers, who are subject to the same review, and the community, on whose behalf the work is done. Similarly, Klockars (1996) proposes a "craft standard" against which the use of force could be compared, that is, what a skilled police officer would have done under the circumstances. A skilled police officer would take all possible steps to structure the situation into which she/he intervenes in such a way that either resistance will not be offered or the resistance can be overcome with a minimum of force. Few efforts have been made to develop such standards conceptually or empirically, however.

As a general proposition, social scientists seem agreed that authority is a resource that police should use sparingly. Muir (1977) describes a "good" officer as one who is morally comfortable with the use of coercive power as needed but who uses it *only* as needed. Moore (2002) allows as how police are more efficient when they use a minimum of authority. The use of police authority, he points out, depletes the "stock of private liberty" (2002: 26) that the public enjoys, and the "net value" of policing must take account of not only the crime and disorder that police prevent but also the costs of policing, one of which is the use of authority.

In the last 10 years or so, research has reflected a better appreciation for how the quality of police performance might have as much (or more) to do with *how* authority is exercised as it does with what form of authority is exercised. Surveys of citizens have repeatedly shown that they are more satisfied with their contacts with the police when they believe that police treated them with dignity and respect, gave them an opportunity to explain their situations and listened to what they had to say, and explained what police have done and/or will do, so that it is clear that officers are taking account of people's needs and concerns and basing their decisions on facts. Moreover, these patterns hold even for people who experience unfavorable outcomes, such as being ticketed. Unfortunately, however, research on police behavior has only scratched the surface in its examination of the behavioral manifestations of procedural justice.

Decision-Making

The discretionary use of police authority is a decision-making task, as officers must make choices – numerous choices – in their encounters with citizens. Among their choices, the uses of their authority are prominent: to stop and question, to frisk or search, to arrest, to cite, and to use any of a variety of forms of physical force. As an encounter with a citizen unfolds over time, the choices may recur.

Explaining this decision-making process, and the behavior that ensues therefrom, can in principle be approached like any decision-making process. Behavior can be predicted or explained when the premises for decision are known. Police officers' decisions turn on factual premises, which concern the consequences of alternative police actions and the nature of the situation from which the consequences can be projected, and value premises, about the goals of police intervention and the desirability of alternative sets of consequences (see Worden and Brandl 1990, pp. 302–303). Most research on police behavior has, in effect, treated as hypothesized decision premises the characteristics of police-citizen encounters, such as the nature of the offense, the demeanor of suspects, and the preferences of complainants for a disposition. Several studies have also examined as potential influences the characteristics of police organizations; organizational policies, procedures, and informal norms may serve as decision premises. Some research has, in effect, allowed for variation in decision-making among classes of decision-makers, for example, male and female officers, novice and experienced officers, and college-educated and less-educated officers.

Explaining police decision-making in terms of situational and organizational cues is complicated by the ambiguity and uncertainty of police officers' task environments. Situational cues are ambiguous in that the meaning or significance of any cue, or set of cues, is subject to different interpretations. The credibility of citizens' testimony (which often is contradicted by other citizens' testimony), the severity of injuries, the degree of citizens' sobriety, and many other features of police-citizen encounters are all matters of officers' judgment, and these judgments can vary from situation to situation and from officer to officer. The same cue can be interpreted differently across multiple events or even ignored as irrelevant in some of them. The meaning and significance even of readily recognizable cues is ambiguous, subject to different interpretations by different officers. Similarly, organizational policies and group norms are ambiguous, requiring that officers interpret them as they are applied in individual cases.

Explanation is further complicated by uncertainty about cause-and-effect relationships. Once an officer interprets the meaning of situational cues and the applicability of organizational policies, she/he must choose a course of action based partly on the projected consequences of those alternatives, but no body of scientific or other technical knowledge guides officers in making such projections, and even if there were, they would be in any case only probabilistic. Officers may be socialized into some common working rules, but they also learn through their own idiosyncratic experiences, drawing from them some equally idiosyncratic lessons for practice. Thus we can posit that the meaning and also the implications of situational and organizational cues are heterogeneous across officers, which would attenuate the explanatory power of situational and organizational variables.

Prior research on police decision-making, for the most part, takes one of two approaches: ethnographic inquiry and quantitative analyses of decision outcomes (e.g., police decisions to arrest or to use force) in terms of situational factors that are the hypothesized stimuli to which decision-makers respond. The former have been very illuminating, though they are limited in their generalizability. The latter are scientifically rigorous, exploiting numerical data on the characteristics of the immediate decision task to estimate (often through regression analysis) their independent effects on decision outcomes. Researchers draw inferences about the forces that shape decision-making from the regression coefficients, treating the process by which informational inputs are interpreted and judgments are made to reach decisions as a "black box." But these analyses are limited in their explanatory scope to factors that are of a priori significance, and we know that these factors fall far short of explaining police decisions.

Moreover, much of the research has been oriented not to explaining discretionary decision-making as such, but rather to determining whether and to what extent the application of police authority is influenced by "extralegal" factors, such as race, sex, and age. Thus, the analyses seek to control for the legal factors that legitimately shape police behavior, whereupon a determination can be made about whether residual variation is related to extralegal factors.

Influences on Discretionary Decision-Making

Most of the factors that have been analyzed as parts of an explanation of discretionary decisions by police have been classified into one of several sets, each a different level of explanation. As noted above, some of these factors, and those at the lowest level of explanation, are features of the police-citizen encounters in which the discretionary decisions are made; these are often referred to as situational factors. A second set, and the next higher level of explanation, are comprised of the characteristics and outlooks of individual officers. A third set, and a still higher level of explanation, are characteristics of the neighborhoods that form the immediate social context of police-citizen encounters. The fourth set include characteristics of police organizations, including both the formal, structural features of police agencies – rules, regulations, and specialization – and the informal organization: the peer culture(s) and norms. Finally, some research has attended to another, still higher level of organization: the requirements and constraints of the law, especially that of criminal procedure. This entry concentrates on three of these sets: situational, officers, and organizational.

Situational Factors

Situational factors are external to the decision-maker and form the immediate decision environment. The most succinct statement of this explanatory perspective is Bittner's, who asserts that "the role of the police is best understood as a mechanism for the distribution of non-negotiably coercive force employed in accordance with the dictates of an intuitive grasp of situational exigencies" (1970: 46). Situational factors represent these exigencies. A more conventional sociological formulation is that of Black and Reiss (1967), who posit that police action turns on the social status, situational status (e.g., as complainant, suspect), and "subversive capability" of citizens. Most research of this genre, however, has been less theoretically driven in its assessments of situational exigencies.

Many different elements of police-citizen encounters have been analyzed as hypothesized influences on police behavior, but only a few of them have been consistently found to affect the use of police authority. Several of those are legal factors: the seriousness of the offense, the strength of evidence, and the preferences of complainants for disposition. Among extralegal factors, only the demeanor of suspects has emerged as a fairly consistent predictor of police action; the estimated effects of sex and age have been mixed, as have those of race, to which the entry returns below.

It should come as no surprise that the use of authority by American police is affected by legal factors, but research confirms that police are more likely to use their authority when they have evidence of criminal offending – and the stronger the evidence, the more likely is the use of authority – and when the offense is more serious. It is perhaps remarkable, however, that the effects are not stronger still. Certainly, police use of authority is not *determined* by legal factors; as noted above, police often do not take legal action even when they have grounds for legal action.

Furthermore, when complainants articulate a clear preference for or against legal action, police tend to comply, especially when the preference is for lenience. This tendency "gives police work a radically democratic character," as Black (1971) points out, and as a result, police apply a standard of justice that varies with the moral standards of complainants, not a uniform standard of justice. However, as Mastrofski et al. (1995) observe, the cooperation of complainants is likely to affect prosecution, and so when complainants prefer that police not take legal action, police might reasonably treat that as an "instrumental" legal consideration. The frequency with which victims of domestic violence are reluctant to cooperate has, given concerns that these complainants are not exercising choice freely, prompted changes in laws and policies that are intended to attenuate the effect of complainant preference in such cases.

Both qualitative and quantitative studies have found that police are more likely to respond punitively to suspects who display disrespect toward the police. Empirical support for this relationship is nearly uniform in research on police behavior, even in the absence of a single, widely accepted definition and operationalization of demeanor, and notwithstanding whatever random measurement error has been contained in indicators of demeanor. This relationship is open to one or both of two interpretations: police penalize people who flunk the "attitude test" with arrest, ticketing, or a "thumping" (Van Maanen 1978), or police often give "breaks" to deferential suspects but seldom to those who are hostile or disrespectful. Some support can be found for both of these causal mechanisms.

Klinger (1994) questioned this "criminological axiom", arguing that demeanor had been improperly conceived and measured in previous research and also that previous research had failed to control (adequately or at all) for crime committed by suspects during their encounters with police, including especially assaults on police officers. However, reanalyses of then-extant data, using measures that took account of Klinger's critique, affirmed the previous conclusions, and other elements of Klinger's argument have also been disputed (Worden et al. 1996). But Klinger's critique surely revealed shortcomings and inconsistencies in the conceptualization and measurement of demeanor, and subsequent studies have exhibited the greater care that Klinger's critique demanded.

Even so, theoretical ambiguity remains. Research now differentiates "resistance" from "demeanor," yet many forms of (especially passive or only verbal) resistance are entirely legal, and we have reason to believe that many forms of (both legal and illegal) resistance are interpreted by police as failures of the attitude test, such that we should interpret their effects as the effects of demeanor (see Worden et al. 1996). So long as research is interested in explaining the discretionary use of police authority, and not merely in forming post hoc judgments about its propriety, conclusions about the effects of demeanor must turn on how officers interpret the various manifestations of disrespect.

More generally, the theory (such as it is) and much of the empirical analysis of situational effects has been based on a sociological framework, and one that makes an implicit assumption that the effects are not contingent on the backgrounds or outlooks of individual officers. This assumption is not entirely without merit, inasmuch as early research on police emphasized the shared working conditions, experiences, values, and norms among police; hence assuming (albeit implicitly) that officers attend to the same cues, interpret them similarly, consider the same set of alternative courses of action, and choose based on the same criteria is not unreasonable. Furthermore, some results seem to suggest that, on some dimensions of decision-making, officers approach their choices similarly: the arrest decision is shaped by the seriousness of the offense, the strength of evidence, the preferences of complainants, and the demeanor of suspects, and while there may be individual differences on these scores, the differences are not stark, and across the board it appears that these variables have a substantial degree of explanatory power. In other choices, especially choices among informal responses, however, the effects of situational factors have not been so robust (Worden 1989), and the use of authority other than arrest may be more susceptible to individual differences. Several qualitative studies in the 1970s (e.g., Brown 1981; Muir 1977) showed that officers do not all see their occupational environment the same way and that they develop distinct "operational styles"; different studies using different frameworks nevertheless described a set of officer types that were broadly congruent

Officer Characteristics and Outlooks

While it is clear that officers' discretionary choices are structured by the characteristics of the incidents that they handle, it is also clear that these situational elements do not completely determine officers' responses, as much of the variation in their behavior is unexplained by situational variables. Because officers' decisions are of "low visibility" to their superiors and to the legal system, scholars have sometimes speculatively attributed the unexplained variation in behavior to officers' attitudes and values. This perspective directs attention to factors internal to decision-maker, which might affect how situational cues are interpreted and evaluated and how options are assessed. For example, Toch (1980) found that violence-prone officers are especially sensitive to citizens' challenges to their authority. Such an account has intuitive appeal, and it is of more than theoretical significance, inasmuch as it underlies initiatives to change the composition of or otherwise "upgrade" police personnel, since it is supposed that minority officers, female officers, or college-educated officers have different outlooks and therefore perform the police role differently. It also underlies efforts to inculcate different outlooks through training.

Systematic research has not always confirmed these intuitive propositions. One of the earliest and most striking findings from observational research on police was that, while many officers professed to be prejudiced against African-Americans, officers did not act on that prejudice in their encounters with citizens (Reiss 1971). A later and more general examination of attitude-behavior consistency (Worden 1989) found only weak relationships between officers' occupational attitudes (for example, their conceptions of the police role, attitudes toward citizens, and attitudes toward legal restrictions) and their behaviors (for example, proactivity in field interrogation and dispute resolution). Such results perhaps should not be surprising, in view of the ambiguity and uncertainty of police work. The ambiguous situations into which police intervene are subject to different interpretations, and they are not governed by well-established cause-and-effect relationships between police actions and desired outcomes, so officers' choices among alternative courses of action may be only loosely structured by their attitudes and values. Officers with the same occupational outlooks might judge a situation differently, reading the informational cues in a situation in different ways, or perceive different ways of reaching the same objectives.

Be that as it may, analyses in several agencies have shown that small numbers of officers account for disproportionately large fractions of citizen complaints and use-of-force reports. Furthermore, Brandl et al. (2001) found that less experienced officers are disproportionately represented among officers with multiple complaints about the use of excessive force. Scrivner (1994) discovered five groups of officers among those referred to police psychologists due to their use of excessive force, including officers with personality disorders; officers whose job-related experiences – for example, traumatic incidents such as police shootings – put the officers at risk for abusing force; young and inexperienced officers who were also "highly impressionable and impulsive"; officers who develop inappropriate patrol styles; and officers with personal problems. Harris (2010) showed that officers differ in their career "trajectories" of misconduct.

Further, more recent findings have provided more support for the hypothesized effects of officers' outlooks, mainly because it has analyzed attitudes as bundles in terms of which subsets of officers can be differentiated, rather than estimating the additive effects of attitudes one by one. For example, Terrill et al. (2003) found that officers whose occupational attitudes conform more closely to the tenets of the traditional police culture are more prone to the use of their coercive authority. Similarly, Paoline and Terrill (2005) found that such officers are more likely to conduct searches during traffic stops. Cuttler and Muchinsky (2006) found that personality traits and work history predict "dysfunctional job performance." Other characteristics of officers – their race, sex, and educational background – have all been hypothesized to affect how officers do their jobs, though the evidence on these hypotheses is mixed and inconclusive (National Research Council 2004).

Thus it is fairly clear that the discretionary exercise of police authority varies across individual officers. It is also fairly clear that this variation is patterned by officers' length of service and also by officers' outlooks and personality traits. The influence of other individual factors, such as educational background, is undetermined.

Organizational Factors

The hypothesized effects of organizational factors, and particularly the formal, structural characteristics of rules, regulations, standard operating procedures, and the hierarchical chain of command through which they are enforced, are central to common ideas about police accountability. Police departments are widely known as quasi-military organizations, with many of the trappings of such organizations (such as ranks and insignia), as well as the aura of a tight chain of command. The nature of police tasks, however, which makes discretion an inherent element of police work, also circumscribes the effects of these organizational factors on the use of police authority.

One mechanism by which police departments might influence the use of force by their officers is, of course, through rules and regulations that set limits on when police may use force and how much force they may use. Research on the use of deadly force suggests that this mechanism can be effective, under some circumstances. In 1972, well in advance of the *Garner* ruling by the Supreme Court (in 1984), the New York City Police Department (NYPD) modified its policy about the use of deadly force, imposing much tighter restrictions, providing that "every other reasonable means will be utilized for arresting, preventing, or terminating a felony or for the defense of oneself or another before a police officer resorts to the use of his firearm" (quoted in Fyfe 1979). A study of the effects of this policy change showed that it had a substantial effect on officers' use of their firearms (Fyfe 1979). The policy had an especially pronounced effect on what Fyfe (1988, p. 185) characterized as "elective" shootings, that is, situations in which officers could have chosen not to shoot at no risk to themselves or other parties. Furthermore, the reduction in shootings was achieved with no increase in officer injuries or deaths. The effectiveness of this policy almost certainly turned to a large extent on its enforcement. The NYPD established a Firearms Discharge Review Board to investigate and adjudicate all firearm discharges, holding officers accountable for their use of deadly force. Other research also found that restrictive deadly force policies are effective only if they are vigorously enforced.

No one should suppose that departmental policies that regulate the use of nonlethal force are or can be equally effective, however. The circumstances under which nonlethal force is justified are more heterogeneous and also more ambiguous; thus policy prescriptions concerning nonlethal force cannot achieve equivalent clarity. Use-of-force continua and matrices specify different kinds and degree of force, and (sometimes) the degrees of citizen resistance to which forms of force correspond, but the resistance can take widely varied forms and the behavioral lines that conceptually demarcate different levels of resistance are far from clear in practice; ambiguity is inescapable. Moreover, the use of nonlethal force is probably less reliably reported by officers, and even if such force is infrequent as a proportion of police-citizen contacts, it happens with sufficient frequency that police superiors may not be able to routinely investigate every use of nonlethal force in order to determine officers' compliance with policy. Furthermore, even when investigations can be conducted, one can anticipate that many will be inconclusive, with evidence limited to the contrasting accounts of the officer and the citizen against whom force was used. Thus the enforcement of such policies would almost inevitably lack the teeth associated with NYPD's reviews of firearm discharges (where, as Fyfe points out, the population density is so high that one might reasonably suppose that few firearms discharges could be safely concealed). This is not to imply that policies would be altogether ineffective in limiting and guiding the use of nonlethal force, however; one recent study suggests that some types of policies are more effective than others – and presumably, better than no policy at all – in promoting the use of force that is proportional to citizen resistance (Terrill et al. 2011).

Similar expectations might be formed with respect to policies that are intended to promote or even mandate arrest in cases of domestic violence. The situations are ambiguous, and so the applicability of policy is subject to officers' interpretations in the field, and enforcement of policy requirements would be hindered by the cost and difficulty of determining whether officers complied with the policy in individual cases, which are numerous. Even so, some research indicates that pro-arrest policies yield increases in arrests in domestic assault cases, though examples of resistance and noncompliance can be found.

Open Questions

The open questions about police use of their authority are far too numerous to even list here, much less consider them. Three questions are addressed: the influence of citizens' race, modeling police decision-making, and how research might contribute to improvements in the quality of police decision-making.

Research on the police consistently finds that African-Americans are disproportionately represented among the people against whom police use their authority. It has inconsistently found that, other things being equal, race affects at the margin the application of police authority. The question of racial (and ethnic) bias in policing dates to at least the 1960s, when the grievances of urban minority populations against the police were cited as contributing factors to civil unrest. It has been especially salient in the aftermath of incidents in which police have been suspected of abusing their authority in their treatment of minority citizens, of which the Rodney King incident in 1991 may be the most widely known example. But since the mid-1990s, concerns about racial profiling by police – that is, the use of a drug courier profile that included race as a feature, and more generally stopping and searching African-Americans and other people of color based on their race or ethnicity – have been prevalent and sustained, even prompting many states and localities to mandate that police departments track the race of the people who are stopped. Unfortunately, the volume of analysis on this question has not been matched by its theoretical sophistication, and bedeviled by what is sometimes known as the benchmarking problem, the studies can seldom provide persuasive evidence about whether the disparities are or are not attributable to legitimate practices, and moreover, they are not oriented toward explanation and offer little insight into the role of race in police decision-making.

The mixed findings on the role of race may reflect the complex, contingent nature of the effects of race, but they might also be symptomatic of drawbacks to the conventional approach to analyzing police decision-making. This approach, described above, rests on an assumption that police decisions, like structural regression models, are a weighted sum of the postulated decision cues: legal seriousness, strength of evidence, complainant preference, suspect demeanor, and the like. It is unlikely that the process of police decision-making resembles this computational model, however. And the regression models seldom explain more than a small fraction of the variation in behavior. Different kinds of data and a different kind of model might yield deeper insights into the forces that shape police decisions.

A different approach, that of "protocol analysis" or "process tracing," promises to shed further light onto decision-making by opening the black box of police officers' cognitive processes (see Worden and Brandl 1990, and the sources cited therein). For research based on protocol analysis, decision-makers are asked to think aloud as they perform decision tasks, or they might be asked to recount their thinking as soon as possible after performing a decision task. Research subjects' verbal reports of their thinking are data on their decision processes. Protocol analysis of police has not been conducted often, but several studies demonstrate that it is both feasible and illuminating. For example, Stalans and Finn (1995) discovered that the perceptual and cognitive processes that officers apply in interpreting and evaluating domestic violence incidents vary by experience: less experienced ("novice") officers tend to evaluate domestic violence situations in terms of blame, while their more experienced colleagues are more pragmatic, putting more emphasis on the sparing use of arrest (and their time) and on an assessment of the immediate potential for further violence and the prospects for prosecution. Both novice and experienced officers, however, tended to assess situations as typical or atypical. Stroshine et al. (2008) enumerate informal "working rules" that serve to guide officers in performing their jobs, and they observe that "different officers look for different things and respond to suspects and situations differently" (2008: 335). They describe the cues to which officers attend in forming suspicion (e.g., time and place, and citizens' appearance and behaviors), the rules of thumb that they apply (e.g., with respect to the seriousness of violations, or the citizen's demeanor), and more general approaches that they take to their work (seeking out or avoiding opportunities for traffic enforcement). The potential of protocol analysis might be best realized through the construction of process models, which resemble flow charts. Compared to the structural models that are normally estimated, process models are probably more accurate representations of how people make complex decisions, especially under conditions of ambiguity and uncertainty.

Finally, an overriding question revolves around the normative dimensions of police decision-making and the use of police authority. Research has little to say about the extent to which, and the circumstances under which, police use their authority well. Even research on the use of physical force has, for the most part, lost a focus on the improper use of force. Research will be far more useful if and when it can draw empirically grounded conclusions about when police should use what authority and why. Research will also be more useful if and when it can establish the connections between what the police do – what authority they exercise and how they exercise it – and how it is subjectively experienced by citizens; survey research has dwelt on citizens' perceptions, but it has not estimated the relationships between citizens' perceptions and overt police acts.

Police Discretion in Providing Services and Assistance

John D. McCluskey
Department of Criminal Justice, Rochester
Institute of Technology, Rochester, NY, USA

Overview

Consideration of police discretion as it relates to the provision of services to the public is an area of much speculation but little hard data. It is widely recognized that police are called upon to do much more than fight crime and enforce the law (e.g., Cumming et al. 1965; Guyot 1991). Patrol officers, for example, spend little time arresting individuals for crimes in any given work shift and are often observed not arresting under circumstances when authorized to do so by the law. Nevertheless, the academic literature focuses heavily on the decision to arrest and the decision to use force, because they address issues that are at the core of democratic governance: How does the state use its coercive power? This leaves a substantial gap in understanding what police choose to with regard to offering help and assistance as necessary and as directed by the public. The gap is especially apparent with regard to enumerating and explaining the actions police undertake outside the scope of their legally mandated and more clearly authorized law enforcement duties (Skogan and Frydl 2004).

The issues surrounding police discretion in helping and serving the public will be discussed along several dimensions. First, the history of police and their role, particularly in the United States, will be considered. The mandate of police, as a social control mechanism, offers an opportunity to understand broader patterns of police behavior over the long term and how police relate to and define their work. Second, service and helping behaviors will be defined. Since service and helping constitutes, in the most rigorous analysis, a variable, it is necessary to locate reasonable boundaries and dimensions upon which service and helping can be arrayed. No precise definition will be offered, as technological changes and task requirements continuously shape police work, but a set of considerations will be explored. Third, measurement of service including attempts and future directions will be considered. Fourth, a set of preliminary propositions regarding police exercise of discretion in allocating or engaging in helping behaviors will be outlined. Fifth, the transformation of the police mandate toward recognition, if tacit, of the importance of service activity is examined in light of problem-oriented policing and the community policing movements and the influence on discretion regarding helping behaviors. Sixth, the service and help behaviors of police will be related to the specific client population of mentally ill citizens whom which they very frequently encounter. Finally, the entry is summarized and future directions for consideration in the areas of service and helping behavior and police discretion are offered.

History

US municipal police forces, according to some historians, were established as general service provision agencies and had wide-ranging responsibilities including dealing with lost children, inspecting boilers, and feeding and housing the homeless. Lane (1967) documents the primary role that the Boston police, for example, played in running soup kitchens and providing temporary lodging for the homeless. This service was based on the observation that "misery bred crime and soup helped to prevent it" (Lane 1967: 193). Data gathered by historians also indicate that activities involving lost children, for example, were recorded with some care, thus illustrating the important nature of that task. Monkonnen (1981: 119) argued that the centralized communication capacity of the police made them the primary agency in assisting citizens with their problems. Others have argued, more cynically, that police were more easily understood as paid agents of the dominant order than a public agency aimed at help and service (Harring 1983).

Historical analysis derived from a Boston, MA police officer's diary entries in the year 1895 indicates the panoply of service provided to constituents and the rarity of activity that explicitly involved legal channels (Von Hoffman 1992). Rather daily work would more closely resemble regulatory attention to maintaining social order and largely via service. Even crime-related entries represented mobilizations by citizens who desired the service of the officer in maintaining security or apprehending wrongdoers. The focus on service is likely due in part to some problems not being easily defined as legal or criminal problems and the cost that is borne, in terms of time lost, when an officer has to take the time to invoke arrest, especially on foot. Nevertheless it is imperative to recognize that police have traditionally been asked to address a wide variety of problems as a general service agency, which was probably cast best by Egon Bittner's (1990) hyphenated summary of what becomes police business: "something-that-ought-not-to-be-happening-and-about-which-someone-had-better-do-something-now." Thus, there is an expansive definition, broadly shared among the public, of what constitutes a situation that police ought to handle, even if among the police some of those tasks are seen as not police work or treated with disdain.

Kelling and Moore (1988) make a cogent argument that three eras of US policing, the political, the reform, and the community problem-solving eras, can be mapped to changes in the authorization and the function of the police. In the political era, in which municipal police agencies were formed, the police derived their legitimacy from the community and their function was to serve that community's needs. In the reform era, the authorization of the police was narrowed to matters of law, and the police function was dominated by formal law enforcement. In the community and problem-solving era, which Kelling and Moore were forecasting, it was expected that there would be a return to service in the community and recognition of community needs as authorizing police actions. Clearly, service and helping is at the root of much police work, but its emphasis has undergone dynamic change as agencies have grappled with the role of police in a changing society. In some ways, these differing emphases of police agencies represent discretion writ large, as managers have defined, refined, and redefined "what police do" over time. Such institutional variation over time foreshadows contemporary interorganizational differences in coming to grips with what services should be provided to the public.

Fundamentals

Definition: What Is Service, Help, and Assistance?

How to define police service and helping behaviors is a fundamental question that confronts police researchers and police managers alike. Perhaps it is useful to consider what is not service: Arresting a wrongdoer or using force against a suspect, for example, do not appear to be service. However, under careful scrutiny, this quickly turns on an issue of perspective. If police are acting at the behest of another when applying an arrest or forcefully evicting an agitated spouse from a household, then clearly such actions constitute service, at least from the perspective of the requesting citizen. Mastrofski and colleagues (2000) did much to outline police helping behaviors, especially those in which police were mobilized to use their legal powers against another citizen. Furthermore, arrests of individuals who may injure themselves (e.g., the intoxicated or mentally ill) might, broadly defined, constitute service and help.

The definition of service and help would seem to hinge on *using police power or expertise to advance the well-being of a citizen or a community through formal and informal mechanisms*. Service and help should not be understood as a strict and formal application of the law, law enforcement, or deterrence powers police possess. Rather service should be considered to be dominated by, but not exclusively, the informal application of police power. As noted above, however, helping and service is dependent upon perspective and can occasionally emanate from arrests, citations, and other enforcement actions.

A second approach to defining police service and helping behaviors is to generate illustrations by way of examples. Police researchers, for example, have engaged in studies of how police spend their time and document what police do *for* citizens. These actions include taking reports; providing assistance to motorists; making referrals to agencies (such as a juvenile in need of supervision, mentally ill person in need of psychiatric care, victim in need of counseling, or other person in need of assistance outside of the police expertise), transportation (e.g., for juveniles out after curfew), and directed actions (banish, counsel, arrest) on behalf of a requesting citizen; attending to traffic accidents and directing traffic; counseling citizens about self-protection or self-help actions for crime prevention; and providing comfort and first aid to victims. The list is extensive, illustrates great variety, but it is certainly not exhaustive. Police agencies, however, spend little time measuring or systematically rewarding the extent to which police engage in such activities. Thus, little is known about the extent and variety of ways that the public engages the police in service.

A national snapshot, derived from the National Crime Victimization Survey's sampling frame, has been collected periodically in the form of the Police Public Contact Survey (PPCS). The PPCS contacts approximately 60,000 citizens over age 18 and asks them about contacts with the police during the previous year. The survey has been administered most recently in 2008, where it was determined that police had approximately 40 million contacts with citizens aged 16 and older. Three categories of contact have broad overlap with police service activities: police response to a traffic accident (12 % of total), police contact involving the reporting of a crime or problem (21 % of total), and police contact emanating from a request for assistance (6 % of total). In all these, three contact types represent almost 16 million or 40 % of the police-citizen contacts estimated from the survey results (Eith and Durose 2011). Though ill-defined, these contacts represent a substantial proportion of the public investment in public safety, yet little is known about the content of these contacts.

Measuring Service and Help

What can be measured regarding police service and helping behaviors? This question requires a commitment to a level of analysis, and for current purposes, it would be prudent to consider face-to-face contacts between citizens and the police as the unit for consideration. This allows for aggregation to higher levels, such as neighborhoods and organizations for comparisons, and allows for a more thorough consideration of the encounter between police and the client as the unit of work or service delivery.

This level of analysis leads to consideration of two aspects of helping behavior, one quantitative, the other qualitative. With respect to quantitative help, clearly one is required to count the presence or absence of a report taken, a referral made, a citizen given first aid, or a child given transportation to his family's home. The quality of help (service with a smile?) is less amenable to counting but perhaps more influential in how citizens experience police service. That one aspect of service is amenable to counting makes the complex appear deceptively simple. What should be counted? Mastrofski and colleagues (2000) examined how police respond to requests for help in terms of not fulfilling, partially fulfilling, and completely fulfilling requests by citizens asking police to control another person. Thus an enumeration of requests and whether they are fulfilled could be a measure of police *reactive* service to the public. However, much of what police do may in fact be *proactive* or at least self-directed service to, or in consultation with, the public. For example, police may follow up a case and refer a domestic violence victim to a legal service, a shelter, or some other services as necessitated by situational dictates, victim preferences, and available resources. This proactive approach to service speaks to both counting as something done in a particular case and also the variety of actions that an officer may take.

Capturing variety requires deeper consideration than can be accommodated here, but knowing the possible referrals, resources available to be accessed, and the needs of the individual would be a useful starting point. Thus, accounting for individual instances of services rendered would require attention to both possibilities (referrals to agencies is a good example, since the proliferation and quality varies across cities and even neighborhoods) and appropriateness. Such an approach to measurement would depend on a needs assessment among the service population under study and would be onerous except in the most narrowly conceived execution, such as the services provided by a crisis intervention team to mentally ill individuals encountered. As a general approach to measuring service, it would appear to be too cumbersome to match what police did with what they should have or possibly could have done. Thus, only in specific and well-defined incident or client population types (e.g., the aforementioned provision of service to a mentally ill citizen) would this be a feasible approach. In most efforts to measure the quantity of help, it would appear that counting actions by the police (referrals, assistance offered, aid given) would be the extent to which help could be quantified. Questions of appropriateness and whether needs were addressed become value questions, which would require researchers to know more about what a person needs than may be possible except in all but a few research settings.

As Mastrofski (1999) has noted, the *quality* of service delivery is often as important as the outcome itself. A larger body of procedural justice literature points to quality of treatment and quality of decision-making as being vital elements for understanding police-citizen contacts as antecedents of legitimacy and cooperation. Thus quality of service delivery is separate from whether requests are fulfilled or appropriate referrals are made. Comfort of victims (Foley and Terrill 2008), for example, could be considered a qualitative aspect of the service that police offer to victims of crime. Similarly, respectful treatment of citizens (Mastrofski et al. 1996) is an important part of the quality of service delivery. Measurement of the quality of police-citizen interactions (whether police listen to citizens, whether they inform them of their decision-making thought process, whether citizens are allowed to participate in police decision-making, whether police are fair in their decision-making, and so on) has been conducted both via in-person observations and through post contact surveys. The burgeoning literature on the quality of treatment during police-citizen contacts, even when restricted to service type activities, indicates that more just treatment yields citizens who cooperate and comply with the police. Thus, although service contacts are little studied, they represent an important interface where quality policing can have substantial consequences for future support and cooperation with the police.

Clearly there is variation in the nature, extent, quality, and variety of services that police can offer to citizens in their everyday encounters. The simplest way to conceive of the encounter is that a person was in need of something and police either did nothing or they did something to ameliorate the situation. As the preceding considerations illustrated, measuring help or service is more complex and opens questions of appropriateness, alternative courses of action, extent of help offered, and the manner in which services are delivered. These dimensions should be considered when the measurement of service is undertaken. One may surmise that measuring service, at the encounter level, is difficult to do well and impossible to do perfectly. However, the challenge should not inhibit researchers or police managers, since this aspect of police work is extensive and a deeper understanding would aid in recognizing it, targeting it, explaining it, and making it a more productive aspect of policing.

Explaining Service and Helping

If one had a measure of service and help directed toward citizens, what might explain the choices police make in the delivery of services and help? Since the allocation of services by police, in some sense, represents a legal (if informal) intervention, the literature on how police allocate legal outcomes such as arrests or tickets will be considered as a background for understanding discretionary decision-making in the allocation of service. Service could then be understood as an extension of this behavior, and hypotheses developed to explain arrest, use of force, or police issuance of citations would provide a useful framework when extended to service. Thus, the discussion below adopts the following distinctions drawn from this more general literature: need, legal factors and situational factors, officer characteristics and attitudes, neighborhoods, and organizations. These are arrayed from proximal (at the encounter level) to the distal influences (neighborhood routines, organizational resources) and discussed below.

Need

Mastrofski and colleagues (2000) conducted an analysis involving 396 police-citizen encounters in which citizens requested police help dealing with another person at the scene. An important area of consideration, regarding whether police took actions, was the perceived need of the citizen. This research focused on youthful or elderly status, gender of the requestor, gender of the target, whether the target was intoxicated, and seriousness of the situation as indicators of need. Interestingly, in the analysis of citizen-directed police assistance, only whether the target was intoxicated had an impact on whether police fulfilled a citizen's request.

Regardless of these initial empirical results, several elements of need are considered here as imperative for discussing, generally, what may influence an officer's decision to help a citizen. The seriousness of the situation has dual meanings as a motive for police helping behaviors. One is the seriousness related to legal standards, treated below. The second meaning of seriousness would entail the social or physical consequences or harms facing a citizen, which may have no relation to legal seriousness. Not precisely a "legal" variable, the police would likely tend to ameliorate serious problems via helping. Intoxication of citizens and apparent mental illness are thus likely indicia of need that would motivate help or service from the police.

The mobilization of the police may be aligned with need as well and may be important for predicting the level of service received in an encounter. Predictions of greater service in proactive encounters or reactive encounters, holding other elements constant, are not straightforward. Where police are mobilized by citizens (i.e., reactive encounters), their presence has greater legitimacy for intervention, especially legal intervention (e.g., Reiss 1971). The reactive encounter may also signal a greater need for resolution in the form of help or service to the citizens. There does not appear to be a clear foundation for whether this legitimacy translates into more formal solutions or more service solutions. Proactive encounters, in contrast, may be more likely to yield services as police initiate such encounters to help, assist, or otherwise provide service to citizens in need. More simply, mobilization of police is likely linked with need, but it is unclear if mobilization has a clear relationship to whether police provide service.

Legal and Situational Factors

Several legal and situational factors likely shape whether police engage in helping or service behaviors in a particular instance. First, to the extent there is more evidence of wrongdoing, police likely feel activated and obligated to demonstrate a response. In work by Mastrofski and colleagues (2000), when there was greater evidence of wrongdoing, police tended to respond to requests made by citizens desiring a consequence for the wrongdoer. Second, with regard to more serious legal implication, police are likely to help, to a point, and at the highest level of seriousness, they are likely to have less discretion to bring informal sanctions or solutions to bear on the problems they confront. Thus one may speculate an inverted "u" response shape, whereby at low and very high seriousness police have little discretion. In the middle ranges where discretion is high, they likely would engage in more helping and assisting behaviors. Similarly, the prior history of an individual, in terms of misbehavior, would likely influence whether police engage in helping behaviors or revert to more formal handling of situations. In the modern age of technology, the requestor is likely to be "run" against computerized files and evaluated in terms of history as well, both as a complainant and as a potential target against whom which help is mobilized.

Situational factors cover a wide variety of variables which may influence discretion. For purposes of this discussion, three are considered: race, social class, and demeanor of the target.

Race and ethnicity may be linked with whether police offer more services or help to citizens. Research on arrests, for example, indicates that minorities are more likely to be arrested. In light of those findings, one might expect that minority citizens will receive less informal help and service from the police.

Social class is also linked to criminal justice outcomes, and as such, we might expect that lower social class individuals are less likely to receive services relative to their more well-off counterparts. Clearly neither race nor class should matter, but research on other facets of discretionary police decisions lead to hypotheses regarding race and class influencing decisions to give services to individuals.

Demeanor of the citizen who is seeking or is in need of service is likely more important than either race or social class. Demeanor refers to whether a citizen is respectful or disrespectful toward the police. In many settings, across eras, demeanor has shown to be a relatively consistent and moderately strong predictor of what legal agents do, in the sense that those citizens with disrespectful demeanors tend to get more negative outcomes (more disrespect from the police, more likely to be arrested, and so on). Thus it is expected that citizens with disrespectful demeanor will receive less service from the police, especially if that service is conceived of as a reward such as provision of service or help.

Individual Officer Characteristics

Evidence regarding the effect of officer characteristics on discretionary decisions is mixed but certainly it points to no more than a modest to weak effect on legal outcomes. With regard to how officer discretion might be influenced by personal characteristics, we focus on four: education, experience, gender, and officer's attitudes. Officer education has been shown to have limited effect on performance. With regard to service, it might be expected that officers with greater educational attainment might be more inventive and expansive in their approaches to problems requiring help or service as a possible solution. Research examining whether officers comfort citizens indicates, however, that officers with college degrees provided significantly less comfort to victims when compared to those without college degrees (Foley and Terrill 2008). Similar to the prediction regarding college education, experience, which is arguably the best teacher, should allow for more inventive and helpful behaviors to be routinely developed. These would manifest as possibilities for solving presenting situations and become routine for officers with longer times on the job. Again, however, the research of Foley and Terrill (2008) found officers with more experience less likely to comfort victims. Gender is controversial, in the sense that associating female officers with a greater capacity for helping appears, on its face, sexist. However, Foley and Terrill (2008) found that female officers were no more likely to comfort victims than their male counterparts. Nevertheless, gender may be a proxy for attitudes regarding the expansiveness of the police mandate and reflect both socialization and attitudinal patterns.

Officer attitudes toward work vary and would appear to be important for determining how individuals choose to execute facets of their work. For example, Michael Brown (1988) argued that selectivity and aggressiveness were two key dimensions for typifying officer styles. Among these styles some officers would be much more likely to narrowly define the appropriate tasks for "police work." In fact, Brown argued that there was an identifiable "service style" in which some officers adopted a more helping role rather than strictly law enforcement roles. Similarly, William K. Muir's observations of officers' orientations toward service and helping, in the 1970s, found officers who defined some work as civil issues (e.g., landlord-tenant disputes) and explicitly sought to avoid such situations. The emergence of the community policing model in the 1980s and 1990s more broadly defined police mandates and thus provides cover for officers to adopt more helping orientations toward their work.

Neighborhood Context

The neighborhoods in which police encounter citizens provide the backdrop or setting for face-to-face interactions. Aspects of neighborhoods have been shown to influence what police do during encounters. Those neighborhoods that are characterized by higher poverty, often measured by researchers as concentrated disadvantage which combines indicators of race, poverty, and employment, have been linked with greater likelihood of police arrests and use of force against citizens in prior research. These same neighborhoods are likely to demand greater service from the police. In the aggregate they may receive greater numbers of police helping services. However, at the level of individual interactions between police and citizens, it is likely that those in disadvantaged neighborhoods receive less service relative to those in wealthier or more advantaged neighborhoods. In part this could be a consequence of police formal authority undermining many of the sources of local social regulation. Or it could be that there is an absence of collective efficacy, upon which police can draw informal solutions that can be enforced by informal social control networks in these neighborhoods. In either scenario the literature leads to the prediction that police will, when confronted with similar situations, exercise less helping behavior in the more disadvantaged neighborhoods.

Organizational Context

In a classic study of police at the organizational level, James Q. Wilson's *Varieties of Police Behaviors* examined how departments molded their responses to the political environment. It is telling that in low-crime, more wealthy locales, the police were considered primarily a service function. Though the research is more than 40 years old, the contrast between Oakland, CA, and Nassau County in Long Island and the legalistic style (defining work in terms of application of the law) and the service style (defining work in terms of what the police can do for the public and what the public wants) anticipated the movement toward community policing and the explicit recognition of "what the public wants." This research also indicates that organizational commitment to service likely influences officers' discretion in their day-to-day work.

Contemporary organizational adaptation to servicing public needs may be most comprehensively studied in Chicago, IL, (Skogan 2006) where neighborhood policing was specifically aimed at understanding community needs and trying to accommodate them. The Chicago Alternative Policing Strategy (CAPS) explicitly tapped the community to assess needs and targeted police activity toward problems such as graffiti abatement projects and efforts at removing abandoned cars from neighborhoods. This menu of responses is a far departure from the strictly conceived law enforcement mandate and illustrates how variation at the organizational level is likely to influence police discretion. The mechanism by which this operates is the expanded mandate of what police should do coupled with an effort to understand community needs. Officers working under such regimes are likely to develop a larger palette of helping responses when compared to those working in more legalistic environments.

At the organizational level, one could thus measure variations in how organizations array themselves across a legal/service continuum. Organizational commitment to service could be measured in a variety of ways including information sources collected in assessing needs, varieties of services offered by police, interfaces by police agencies with other service agencies, and the extent to which performance measures are guided by service roles of the agency (i.e., does the agency count "problems solved").

It should be clear that police managers and researchers alike have little direct experience in measuring service and predicting "who gets what." For example, among those variables considered to be important characteristics of officers, experience and college education are both hypothesized to relate to greater levels of helping. However, at least with respect to comfort to victims, Foley and Terrill (2008) drew the opposite conclusion. In more recent research, Rossler and Terrill (2012) examined police responses to citizen requests to file reports, act on their behalf with an agency, provide information, or provide physical help. In these analyses, officers' college education had no impact on whether or the extent to which officers fulfilled the request. But college-educated officers were less inclined to provide an explanation when denying a request. This is a sign that caution should be exercised in forecasting how police may exercise their ability to help in face-to-face encounters and a clear indicator for more data collection, measurement, and theory development. Although some propositions are introduced here regarding need, situational and legal factors, officer characteristics, and neighborhood and organizational context, none of them have been sufficiently tested against observations to a point where one could make statements of any empirical regularity with confidence. The absence of this knowledge is welcome territory for future scholarship but currently a barren landscape from which to make suggestions for police managers, policy for organizations, or to yield strong theory from which to begin analyses.

Current Issues

Considering Problem-Oriented Policing, Community Policing, and Service Responsibilities

Herman Goldstein (1990) observed that when the unit of work patrol for patrol was defined as a "case," then police often missed larger problems that are frequently the underlying generator of calls for service. Such an underlying problem can generate many cases which are resolved by a response, a report, and perhaps an arrest. A drug market, for example, might generate calls of nuisance behaviors and police may respond and disperse suspected dealers, take a report from a complainant, or perhaps make an arrest of an individual for possession, then return to duty. If the unit of work is the call, then this call is satisfied. If the unit of work is defined as a problem, then the problem has not been addressed by the actions described. The problem-oriented policing approach outlines a variety of sources of problems such as homelessness, bar hours, public health hazards such as litter and trash, and a broader palette of incivilities both physical and social that may be considered within the sphere of problems. These larger categories may have an ambiguous relationship to the legal power of police and therefore are easy for organizations and officers to avoid, if so inclined. However, once engaged in problem-oriented policing that is consistent with the scanning, analysis, response, and assessment approach outlined by Eck and Spelman (1987), the likelihood that services and helping behaviors and referrals will be accessed increases. For example, interagency partnerships can form the backbone of these approaches as illustrated by the Beat Health program in Oakland, CA. Here the Oakland police department addressed decay and disorder via partnerships with other public agencies as well as private place managers such as landlords. In this case the service provided is creating a more ordered and civil public space in which conventional citizens may engage in legitimate daily pursuits. Conversely, confronting the problems in the local spaces discouraged the illegitimate use of spaces by, for example, street-level drug dealers. Thus a legal problem was solved by a service approach. So the gray area between civil and criminal was straddled in the Oakland experiment as documented by Mazerolle and Roehl (1999), whereas, two decades earlier, Muir (1977) working with the Laconia (a pseudonym) department found that officers tended to deny responsibility for cases that were civil in nature.

The blending of the civil and criminal authorities within local law enforcement, from a legal perspective, may be another area for future consideration. The nature of public regulation, compliance, and obedience is dramatically different in the 2010s than in the 1970s when the theoretical foundations for much criminal justice research on police and their behavior was being established (Reiss 1971; Brown 1988; Muir 1977). This transformation is undoubtedly related to the community policing movement and its explicit desire to deactivate the legalistic mindset that defined police work in terms of criminal law (e.g., Kelling and Moore 1988). More expansive definitions of police work will broaden what police can do and will also provide opportunities to study and understand why police make choices to help or provide service in some instances, but not others.

Populations in Need of Services: The Mentally Ill

Lurigio and colleagues (2008) have outlined the contemporary scene with regard to the extent to which police process the mentally ill and point out that the jail systems in Chicago, New York (Rikers Island), and Los Angeles represent the largest mental health facilities in the United States. Consideration of the mentally ill clients as persons in need of help mirrors some of the civil/criminal tension that has characterized the consideration of police service and helping behaviors. The police contact with the mentally ill is not a new subject for academic study as these contacts have long been considered an important part of police repertoire and a very difficult problem to handle with only legal tools such as arrest and coercion (Muir 1977). In many ways, bridging service and legal processing for this population has been a continuous challenge for street-level policing. Adoption of crisis intervention teams, collaboration built around psychiatric services and police, and emphasis on training officers for the difficulties inherent in encounters of the mentally ill point to efforts to shape discretion with respect to this particular population. Interestingly the movement has first recognized that police are often the first line of contact for mentally ill individuals, and to handle this exigency, agencies have trained and developed resources targeted specifically toward this population's needs. Equipping police with greater structure and resources shapes discretion but broadens possibilities of what police can do.

Summary and Future Directions

Police have always engaged in helping and service behaviors. Despite this, modern scholars and managers alike are hard pressed to measure, theorize, and evaluate the effectiveness of these actions. This stems from recognition that the mandate upon which helping behaviors rests is clearly not as strong as the law enforcement mandate, which is rooted in law and linked to fundamental issues involving the exercise and control of coercive force. Thus systematic study of helping has been largely overlooked, unmeasured, and, unfortunately, unrewarded. As the public comes to expect more service from police agencies, especially in times of economic hardship and social consequences that accompany it, there is likely to be greater pressure to systematically measure and evaluate this aspect of police work. Among police researchers, similarly, there is likely to be a movement to test propositions about "who gets what" from police in terms of services rendered. As noted here it is possible to speculate about how neighborhood characteristics, citizen race and ethnicity, and citizen social class relate to service delivery patterns; in truth, these are open research questions yet to be thoroughly addressed. Nevertheless, efforts to adopt the community and problem-solving approaches have driven police organizations and the officers within them to embrace a greater service role, absent information on how such service is delivered. Given this situation it is likely that much research will be targeted at best practices of service delivery, especially with regard to services targeted at special populations, such as the mentally ill.

Police Family Violence Services

Robert C. Davis and Sarah Greathouse
RAND Corporation, Arlington, VA, USA

Overview

In recent years a number of programs have been developed in which the initial police response to a family violence incident is followed by a visit from a trained team of officers or by an officer and a social worker. These "second responders" attempt to help victims find long-term solutions to recurring abuse (e.g. see Dean et al. 2000; Mickish 2002).

Second responder programs are based on the premises that family violence often recurs and that victims are likely to be especially receptive to crime prevention opportunities immediately following victimization. That is, there is a "window of opportunity" during the first hours or days after a crime during which victims feel vulnerable and are willing to seriously consider behavioral and lifestyle changes

(Davis and Smith 1994; Anderson et al. 1995). The response often takes the form of a home visit but other times consist of a phone call to the victim. The team provides the victim with information on services and legal options and (in some models) may warn those perpetrators present at the follow-up of the legal consequences of continued abuse. The purpose of working directly with the victims is to reduce the likelihood of a new offense by helping them to understand the cyclical nature of family violence, develop a safety plan, obtain a restraining order, increase their knowledge about legal rights and options, and provide shelter placement or other relocation assistance. A secondary aim of the intervention with victims may be to establish greater independence for victims through counseling, job training, public assistance, or other social service referrals. The purpose of conversations with abusers is to ensure that they understand that assaulting an intimate is criminal and that further abuse will result in (additional) sanctions.

Key Issues

History of Family Violence Officers

The role of police family violence services has evolved over time. Prior to the 1970s, law enforcement's response to family violence was significantly limited. Departments rarely contained specialized teams to respond to incidents of family violence. Responses by general patrol to family violence incidents were often slow or nonexistent (Ford 1983; Manning 1988). When police did respond to service calls, departmental policies often dictated that officers should only attempt to diffuse the immediate situation and subsequently refer the individuals to social service agencies; arrests of the perpetrator were rarely made and follow-ups to the initial call for service were rarely conducted (Hutchison et al. 1996; Parnas 1967). This lack of attention to family violence issues by law enforcement reflected both societal beliefs about family violence and traditional law enforcement culture. Family disputes were commonly viewed as private affairs, and it was believed that police's role in handling family disputes should be one of mediators and references to social services (Breslin 1978). As such, police officers often viewed responses to domestic disputes as not "real" police work (Buzawa and Buzawa 2003). Surveys of police officers' attitudes toward domestic violence, specifically, showed that police believed arrests to be futile because victims would rarely follow through to press charges and that arresting the male head of household would negatively impact the family as a whole. Police also endorsed the commonly held but incorrect belief that responses to domestic disputes placed the officer in greater danger compared to other calls (Buzawa and Buzawa 2003). As a result, law enforcement devoted little attention to family violence issues; even less attention and resources was devoted to taking actions that reduced further incidents of violence.

The law enforcement response to family violence began to become significantly more proactive in the 1970s and 1980s. Several events were catalyst for the change. First, victim's rights advocacy groups and feminist groups began to challenge the police's lack of forceful responses to domestic disputes and their failure to protect female victims of domestic violence (Buzawa and Buzawa 2003). Second, a series of legal cases in the 1970s and 1980s ruled that police departments could be held liable and face financial penalties if they failed to protect victims of family violence (*Bruno v Codd* 1977; Tracey Thurman et al. 1984). Finally, empirical research around this same time began to demonstrate that the actions taken by police had the potential to reduce incidents of family violence.

One of the most influential empirical studies of police response to incidents of family violence was an evaluation of police departments that employed violence family crisis intervention units (FCIU's) (Bard 1975). Originally developed by psychologists, officers in this program received training in mediating and diffusing domestic disputes. While the officers still responded to all calls for service, they were specifically called in to handle family violence calls. The National Institute of Justice sponsored a training and demonstration program that employed 10 family crisis intervention units in police departments across the country. The evaluation of these programs reported some positive effects of FCIU's, including decreases in arrests and officer injuries (Bard 1975). Although this evaluation also found that calls for service to family violence incidents increased, this finding was explained as evidence of the FCIU's increasing victims' faith in the ability of the police to effectively handle incidents of family violence. As a result of the reported success of these programs, many major US police departments began adopting either FCIU's or specialized units comprised of law enforcement and social service workers (Liebman and Schwartz 1973). Often funded with federal funds, these officers were specially trained in handling victim needs and problems and in keeping themselves safe during home visits. However, responses to FCIU's were not all positive. Liebman and Schwartz (1973) reported that New York City's highly praised FCIU's program had resulted in increased homicides and domestic disputes. Critical research findings, coupled with strategic difficulties in implementing specialized units, led many departments to completely cut or severely limit the role of family violence response units.

In the 1980s, police departments shifted focus from specialized family violence policing services to arrest and punishment of those individuals that perpetrate family violence. Several research studies were major forces in changing the manner in which police responded to family violence. The most prominent of these studies was an experimental evaluation of police responses to domestic violence conducted in Minneapolis, Minnesota (Sherman and Berk 1984). In this study, police who responded to domestic violence calls were randomly assigned to handle the dispute in one of three ways: (1) separate the parties (2) mediate the dispute (3) make an arrest. The researchers reported that making an arrest resulted in significantly fewer further domestic disputes between the couple. Although the study received some criticism from the scientific community (Binder and Meeker 1988; Lempert 1989), the results from this experiment were highly publicized and spurred mandatory arrest laws in many jurisdictions and arrest oriented policies in police departments across the country. This focus on deterring future violent behavior through arrest took precedent over employing specialized family violence units or secondary responder programs.

Although the criminal justice system has been largely focused on reducing repeated incidents of family violence through arrest and prosecution, in recent years there has been recognition that these policies may not be enough to effectively address and reduce incidents of family violence. Research studies have not always reported positive effects for pro-arrest policies (Dunford et al. 1990; Hirschel et al. 1992). In addition, despite a strong emphasis on pro-arrest policies, prior research reports a high chance of revictimization for victims of domestic violence, particularly immediately after the original incident of abuse (Lloyd et al. 1994). This research raised recognition that more needed to be done to assist and empower victims of family violence. As a result, a growing number of police departments began to adopt or re-adopt specialized family violence service units that provide secondary responses to victims following the initial call for service. Although the total number of such programs is not known, we do know a number of specialized programs across the United States and Great Britain have been implemented and evaluated. The research examining the effects of these specific programs will be discussed later in this article.

In recent years, law enforcement has also become increasingly aware of the need for specific units to address a special type of family violence, elder abuse. Traditionally, elder abuse was not considered a serious criminal problem. Law enforcement officers did not often receive specialized training to handle reports of elder abuse, and departments rarely seriously pursued elder abuse cases (Plotkin 1988). Recent research has demonstrated that incidents of elder abuse are much more prevalent than previously believed

(Tatara et al. 1997). As a result, a growing number of departments have established specialized units to handle cases of elder abuse (Heisler 2000). Because cases of elder abuse are often complex, specialized law enforcement often coordinates with local prosecutors and social service agencies to investigate reports of elder abuse and work with the victims.

Training of Family Violence Officers

Historically, police officers have received very minimal training about how to handle calls to incidents of family violence. A survey of law enforcement's training practices during the 1970s revealed that most often police officers received a limited amount of training on handling family violence during a half-day to 1 day training on responding to calls with disturbed individuals (Buzawa and Buzawa 2003). This module of training addressed a variety of situations and didn't solely focus on handling family disputes. Many of the training programs also simply reinforced the idea that police officers should only play a minimal role in handling incidents of family violence. Once on the job, officers rarely received continued training on handling family violence. The most common method of educating young officers came through observations of more experienced officers' responses to incidents of family violence.

Today, more structured training programs focusing on intervention strategies, arrest policies, and attitudes toward domestic/family violence are in existence. The International Chiefs of Police and other national organizations have produced recommended requirements for domestic violence training, and an increasing number of states are requiring their law enforcement officers to receive family violence training (Miller 1997). Although officer training on domestic violence may be more detailed, the amount of training officers typically received has not significantly increased. One survey found that on average officers receive 10 h of initial domestic violence training. Once in the field, most officers are not required to shadow officers who are experienced in handling family violence, and the quality of on-going training programs can vary significantly, from short videos to in-class trainings with role playing activities (Buzawa and Buzawa 2003). A growing number of states are also requiring officers to receiving training on elder abuse (Heisler 2000). Although national organizations such as the Police Executive Forum have distributed recommended practices for training officer on elder abuse, little information exists on the training practices of specific departments. Little information also exists on the typical methods used to train individuals within any specialized family violence or secondary responder units. Because there are not standardized methods for operating specialized family violence service units, methods of training these team members vary by department.

Functions of Domestic Violence Officers

Redlands, CA Police Department had a robust domestic violence officer program that was the subject of an NIJ-funded evaluation. Consequently, detailed information on what these officers did are contained in the evaluation report. The following description of the functions of family violence officers draws heavily on the report by Davis et al. (2010).

In Redlands, a team of officers, including a trained female domestic violence detective, attempted to visit households within either 24 h or 7 days of a domestic complaint depending on the severity of the incident. According to the officers conducting the second responses, contact was made with the victims at their homes in 84 % of the cases in which it was attempted. In cases where the home visit attempt was not successful, literature was left with information about community services.

The visits typically lasted 30–45 min, depending on the victim's receptiveness to assistance. The goals of home visits were to ensure that the victim had information about and access to resources and services, to answer any questions they had about the complaint or the justice process, and to encourage a sense of trust in the police and the criminal justice system as a whole.

A written protocol guided the officer or officers making home visits. The visits began by the officer talking to the victim about the recent incident and any immediate safety concerns that she had. The officer discussed with the victim the nature of domestic violence and the very real possibility that the incident she experienced would recur if no action was taken. The officer tried to make the victim understand that the police department took the matter seriously and was there to assist her. She also asked the victim a series of questions about her relationship with the abuser, history of abuse, and the presence of children and weapons in the home.

Once preliminaries were taken care of, the second response officer tried to ensure that the victim had information about resources and services; offered practical assistance; worked with the victim to develop a safety plan; and instructed the victim in how to document future abusive or stalking behaviors. Before leaving, the officer provided the victim with a written description of local resources to assist domestic violence victims, including housing relocation, counseling, domestic violence shelters, medical help, civil legal assistance, information about the criminal justice process, aid in applying for an order of relief, and emergency financial assistance. Referrals were most often made to counseling programs or parenting classes; smaller numbers of victims were referred to shelters, civil legal assistance, assistance in obtaining a restraining order, and district attorney victim advocates.

One concern about conducting second response visits was that the visit might trigger anger in the perpetrator. To avoid this, there was an intentional practice to call ahead to make sure perpetrators were not present when the officers came to the home. However, since officers were not always able to reach victims by phone ahead of time, there were some instances in which the perpetrator was there when the officers arrived. While partners were home during just a handful of visits, nearly half (46 %) of victims said in subsequent interviews that their partners were aware that the visit occurred. Of these, approximately one in four (28 %) reported that their partner had a negative reaction to the visit.

The Chicago Police Department has a similar second responder program for victims of elder abuse. Each Chicago police district has a designated elder abuse officer whose job it is to provide services to those victims. During the course of their home visits, the elder abuse officers ensure that victims' medical and physical needs (food and shelter) are being met. When they are not, officers arrange for temporary shelter. They make referrals to social service programs, including counseling, independent living services, Meals on Wheels, and programs for Alzheimer's patients. Officers also enroll victims in emergency identification bracelet program so police responding to future incidents can quickly grasp history and information on victim, assist victims in completing forms to receive state compensation, and provide assistance getting to court. Finally, a report is made to adult protective services.

Effectiveness

There have been a number of high quality evaluations of second responder programs yielding conflicting results. Several randomized field trials of second responder programs were conducted in New York City public housing projects. Each tested the same intervention model: persons who reported family violence to the police were randomly assigned to receive or not to receive a follow-up visit from a domestic violence police officer and a social worker. This follow-up visit was not immediate, as is the case with most second responder programs, but occurred an average of 2 weeks later.

The sample for one of the studies (Davis and Taylor 1997) included instances where someone had called the police in response to a family violence incident (this could be violence between romantic intimates, sibling violence, elder abuse, or other forms of violence between persons related or living under the same roof). The incidents were minor in nature (only 7 % of the incidents resulted in arrests and just 14 % of victims reported any form of injury).

Four hundred and thirty-five victims were randomly assigned to receive a home visit as a follow-up to the patrol response. The control group received only the initial police patrol response. Additional calls for police services were tracked for both groups over the next 6 months. At the end of the tracking period, researchers interviewed victims to ask about new abuse, about satisfaction with the police response, and about victims' knowledge and use of social services.

According to law enforcement records, households that received the home visit intervention were more likely to call the police during the subsequent 6 months than households that did not receive the interventions. Yet, according to victim survey data, there were no differences between the two groups in abuse during the 6 months following the trigger incident. In the literature on the effectiveness of arrest on curbing violence, victim reports and calls to the police usually are both treated as imperfect indicators measuring an underlying construct of actual violence. However, the two measures clearly are not synonymous. Many family violence victimizations are not reported to the police. Davis & Taylor interpreted this pattern of results to mean that the experimental interventions did not affect actual violence levels but did increase victims' confidence in the police and made victims more willing to report violence when it occurred.

A second experimental investigation (Davis and Medina 2001) of the same intervention was conducted several years later, this time using a sample of 402 public housing residents who had reported elder abuse incidents to the police. Like the cases in the first field test, incidents in this study were also relatively minor (5 % of the abusers were arrested, just 4 % of victims reported any injuries, and in only 22 % of the cases was a crime alleged to have occurred). Once again, law enforcement records for these households were tracked for the next 6 months. As in the first experiment, it was found that victims who received the home visit intervention called the police sooner and more often than controls.

Pooled analyses of these and a third unpublished experiment indicated that the interventions were associated with an increase in reporting of new abusive incidents not only to authorities (which could indicate simply greater confidence in the police), but also to research interviewers (Davis et al. 2006). The New York field tests suggested that second response programs might actually increase the likelihood of new abuse.

Going into these studies, it had been assumed that the effects of the interventions would be to empower victims through information about their situation, available services, and legal options. The program logic model posited that new abuse would decline as victims extracted themselves from self-defeating relationships or worked with social services and criminal justice staff to develop strategies to end the abuse while staying in the relationship. However, researchers in the New York studies found no evidence that those who received the interventions were more likely to avail themselves of social or legal services, so the intervention could not have worked – at least not in the way intended.

Some evaluations of other second responder programs found results similar to the New York field tests. A subsequent study by one of the authors of the New York evaluations, this one conducted in Redlands, CA, found that households that received a second response had worse outcomes on seven measures of new abuse, although the results were not statistically significant (Davis et al. 2010). Two studies conducted in New Haven, CT by Stover and her associates (Stover et al. 2009, 2010) found between them that persons who received a second response were more likely to call the police again, but less likely to report new abuse on victim surveys. A study by Hovell et al. (2006) found more reports of abuse to the police among victims who received a second response.

Other studies however, reported a positive effect of second responder programs. Greenspan et al. (2003) found that victims who received a second response in Richmond, VA were less likely to report victimization on a subsequent

survey. Pate et al (1992) also found a decrease in subsequent violence reported on a survey following a second response in Dade County, FL. Casey et al. (2007) reported fewer calls made to the police among victims who received a second response in New Haven, CT.

Davis et al. (2008) conducted a meta-analysis of second responder programs. The analysis concluded that the odds of reporting new abuse to the police were about 1-1/4 times higher for households assigned to a home visit treatment. The meta-analysis found no difference between treatments in reports of new abuse on research surveys (see Fig. 1 below).

In sum, then, the weight of the evidence does not indicate that second responder programs reduce new instances of abuse and may, in fact, increase subsequent calls to the police – possibly because the intervention generates more actual abuse or possibly because people who receive a second response have more confidence in the police.

Police in Nazi Germany

Herbert Reinke[1] and Thomas Roth[2]
[1]Bergische Universität Wuppertal, Wuppertal, Germany

Overview

Dictatorial regimes, not only in Europe but in many other countries outside Europe as well, have used and still use today the police for terrorizing and for controlling political opponents and for maintaining the power of the regime. The Nazi movement went far beyond this when getting hold of the police after their seizure of power.

While the Nazi regime particularly at its beginning drew on traditional police forces and started from authoritarian goals and strategies of police work, it rapidly generated a radical new kind of police organization, with a specific corps of officers, committed to Nazi ideology, and a radical concept of policing, focused on racial categories and the goal of systematically cleansing society of all groups labeled as deviant.

During the Nazi years, the maintenance of "law and order" and crime control and the persecution of political opponents became increasingly intertwined with policies of racial, often total, exclusion. A police force evolved not only supporting but promoting politics of genocide.

Police in Nazi Germany: Institutional Contexts

Since the beginnings of modern policing in Germany during the nineteenth century, and due to federalism as a core characteristic of the German political system, the police had always been under the command of the federal states. There has never been, except for the Nazi period, a large-scale and centralized national police. "Police" meant, and still means primarily, the polices of the Länder, federal states (i.e., before 1933 Prussia, Bavaria, Saxonia, etc.). This institutional context remained unchanged until the end of the Weimar Republic. Although demands were put forward during the 1920s for more centralization, in particular for fighting crime more effectively, a centralized police apparatus did not emerge before 1933.

In July 1932, the conservative German Reichsregierung, the national government, had the middle-left Prussian government on the basis of an emergency decree dismissed, constituting a kind of prelude to the institutional changes, which took place after the Nazi seizure of power. In 1932, a presumed incapacity for maintaining law and order was given as a reason for the replacement of the Prussian government (senior police officers included) by commissioners, installed by the national government.

After the Nazi seizure of power at the end of January 1933, a leading and prominent figure of the Nazi party, Hermann Göring, was commissioned to direct the Prussian Ministry of the Interior. This position served as a basis for getting hold of the Prussian uniformed police and the Kriminalpolizei (Kripo, Criminal Police) as power instruments for consolidating the Nazi regime. Two emergency decrees, issued in the weeks after the Nazi seizure of power, suspended the basic constitutional rights of the citizens, thus providing the Nazi regime with the capacities for prosecuting ruthlessly its political opponents. These two emergency decrees issued in February 1933 served until the end of the Nazi regime as a pseudo-legal basis for the unlimited police power of the regime.

Another leading and prominent figure of the Nazi party, Heinrich Himmler, became head of the Bavarian Political Police soon after the Nazi seizure of power. Thereafter, until the first months of 1934, Heinrich Himmler gained the command of most of the political police departments of the Länder and finally the command of the Prussian Political Police as well, which had been labeled since the end of November 1933 as "Geheime Staatspolizei." In November 1934, all political polices, existing by that time in Germany, were collected under the directorship of Himmler. In a parallel process, the command over the polices was transferred from the Länder to the national government. This development toward a centralized national police came to a central point, when Himmler was given in June 1936 the title of "Reichsführer SS and Chef der Deutschen Polizei," indicating his dual directorship as head of the SS and the German police. In the aftermath of this entitlement, the centralization and the "Vereichlichung" (nationalization) of the different police branches were further enhanced; under Himmler, a national police apparatus had been established, which had not existed before.

But the centralization of the police was only one aspect on the police agenda of the Nazi regime. A further, very important development was the merging of the police apparatus with the SS, in order to create a novel kind of security force effectively and vigorously serving the ideological ends of the Nazi regime. This meant a growing detachment of the police from its traditional institutional context, while it was more and more interleaved with the organizations of the Nazi movement. Under the organizational roof of the "Reichssicherheitshauptamt," a sort of holding for the different security forces of the Nazi regime, which was established in 1939 after the beginning of the war, this merging of the police with the SS apparatus did find its institutional imprint (Topographie des Terrors 2010; Wildt 2009).

Police in Nazi Germany II: From Dictatorial State Police to Ideological Security Force

After the Nazi movement got hold of the police in 1933, it took them only a few years to establish a new approach of policing, clearly exceeding the politics of persecution and suppression known from other dictatorships and authoritarian regimes being in power in Europe at that time.

Under the Nazis, the police's functions were no longer focused on "traditional" target groups only, such as criminal perpetrators and political opponents. The police became instead increasingly, and in a growing proactive manner, focused on specific categories of people, who, based on racial (Jews, Roma, and Sinti) and to a significant extent on criminal-biological criteria (social outsiders, habitual criminals), were labeled as enemies of the racially defined ethnic community of Germans, the "Volksgemeinschaft" (Herbert 2011).

Policing was conceptualized as a policy of social cleansing, meant to rid the "Volksgemeinschaft" of political and criminal "enemies of the people" ("Volksfeinde") and of all "community aliens" ("Gemeinschaftsfremde"), not fitting into or not willing or capable to adapt to the racial and biological scheme of the Nazi regime. This conceptualization was expressed in the image of the police as a "doctor" cutting out all symptoms of sickness out of the "social body." Racism, concepts of "racial hygiene," and criminal biology, increasingly popular since the 1920s, now penetrated nearly all layers of police work. The identification and persecution of members of "foreign races" and the stigmatization and exclusion of "hereditary" or habitual criminals and of other categories of people labeled as deviant became a core component of a police-driven, for those concerned increasingly deadly social engineering. The new police concept constituted the basis for an active participation of the police forces in the murderous and genocidal politics of the Nazi regime.

Policing during the Nazi regime rested upon a familiar yet specifically radicalized division of labor: While the State Police (Geheime Staatspolizei, Gestapo) organized the repression of political opponents and took part in the elimination of "racial aliens," such as Jews, Poles, or Russians, the Criminal Police (Kriminalpolizei, Kripo) became responsible for the prosecution and the elimination of criminals, social outcasts, and the group of Roma and Sinti. The uniformed police (since 1936 under the label Ordnungspolizei, Orpo), responsible for the overall maintenance of law and order in Nazi society, was involved in the surveillance of everyday life and played an important role in ensuring the populace's conformity and identifying deviants. It thus provided essential assistance to the Security Police making a significant contribution to the Nazi regime's political persecution and social exclusion.

Phases of Development

The historical research on the police during the Nazi regime has identified five phases for summarizing the growing involvement of the police in the Nazi regime. During the first phase, primarily during the months after the Nazi seizure of power, the efforts of the Nazi regime were much focused on getting hold of the police as a power instrument, indispensible for suppressing political opponents and for maintaining the Nazi regime during its first months of being in power. The second phase, consisting more or less of the years 1934 to

1936, could be described as the phase when foundations for a merging of the police and the SS apparatus of the Nazi movement were laid. This merging was started by putting Heinrich Himmler, the head of the SS apparatus, and other SS leaders at the head of the German police; by linking the Kriminalpolizei and the Gestapo under the label of a national socialist Security Police (Sicherheitspolizei); and by placing the Security Police and the Security Service of the SS, the Sicherheitsdienst (SD), under a joint institutional roof. The third phase, that is, the years from 1936 to 1939, was very much marked by specific forms of radicalizations of police practices. During these years, the Kripo and the Gestapo began to implement the racial-biological ideologies of the Nazi regime into police work and started to select systematically those groups labeled as enemies of the "community" for special police measures, for new forms of confinement, and eventually for deportation into the expanding concentration camp system. With the beginning of the war in September 1939 and the establishment of the "Reichssicherheit-shauptamt" in that year until late 1944, the police in its fourth phase of its involvement in the Nazi regime turned into the most important instrument for the completion of the Nazi racial ideologies: By its participation in the killing units of the "Einsatzgruppen," the police engaged as main actor in the mass murder of the European Jews in Europe. So did the units of the uniformed police, especially after the war against the Soviet Union had begun (1941). And back home within Germany, it was the police which summoned the German-Jewish population of the cities and the countryside for the deportation into the concentration camps and which accompanied as guards the trains and transported the victims to the death camps. By the same time, the Kripo again radicalized its practices by sending in more and more people into concentration camps, thus occupying next to the Gestapo a central position in the overall strategy for the cleansing of the "community" from its enemies. When carrying out this, the Gestapo and the Kripo were not only instruments used by the Nazi regime but engaged in it beyond obeying orders by putting forward own initiatives for improving the efficiency of the cleansing of the "Volksgemeinschaft," that is, of mass murder. During the fifth and final phase, which lasted from 1944 to the end of the war and the end of the Nazi regime in 1945, the radicalization of police practices intensified once again. During this final phase, the Security Police focused its control efforts on the foreign workers, who lived by that time in enormous number in Germany and had mostly been forced to work for the "Third Reich." Moreover, indicators on increasing discontent and disloyalty among the Germans within the "Reich" turned into a major concern for the Security Police. Starting in the last months of the war and the regime and continuing in its final days, the Security Police tried to cope with the decreasing power of the regime and the increasing disloyalty of the population with a dramatically growing brutalization, resulting in the mass murders of foreign workers and political opponents and selected killings of ordinary Germans no longer loyal to the regime during the final days of the war.

The Security Police and Its Personnel

In order to turn the Security Police into the police of the "Volksgemeinschaft," it became organizationally realigned, centralized, and provided with new hierarchical structures, guidelines, and standards. The transformation and renewal of the staff played a key role as well. While the personnel of the Kripo with about 13,000 employees was mainly transformed with the normal turnover of staff, the Gestapo was established fundamentally new. On the basis of the political police of the Weimar Republic, with its approximately 1,000 officers, the Gestapo grew to an apparatus with over 30,000 employees until the end of World War II.

Senior positions within the Gestapo and the Criminal Police were held since 1933 by men who openly showed their loyalty to the Nazi regime or had even been active in the Nazi movement for a long time already. The few police officers, who had declared themselves against the

Nazis and had represented a decidedly republican, democratic police during the Weimar years, were dismissed or demoted. New police recruits had to indicate, at least through membership in the Nazi party, that they were supporting the regime permanently. The police training combined political-ideological indoctrination and professional police instruction. Finally, with the inclusion of police officers in the SS, and with joint spheres of action and social contacts between the Security Police and the SS Security Service (SD), close relations between police and the Nazi apparatus emerged (Banach 1998; Browder 1996).

In this way, the Sipo established the model of a new type of police officer, combining expert knowledge and professional ambition with ideological radicalism and the commitment of a "political soldier." This new type of police officer became a dominating pattern inside the head office of the Gestapo and the Criminal Police in Berlin, as well as among the senior officers of the regional headquarters of the Sipo branches. This leadership group consisted mainly of younger cadres with middle-class background, well-educated, academically trained, often active in extreme right-wing organizations before 1933 and striving for implementing the societal models of the Nazi regime (Wildt 2009). Another form of "Nazification" took place among the lower ranks of the Security Police, particularly within the Gestapo, which, due to its growing staff requirements, recruited members of Nazi organizations with low-level formal education only and without specific police skills. These activists played an important part in the implementation of the Nazi movement's political and racial stereotypes and its violence into police practice.

Despite these fundamental changes, patterns of regular, traditional police work remained present in the Sipo (Dams and Stolle 2012; Roth 2010). Established procedures and routines of criminal investigation and administration were not abolished but pursued for the purposes of Nazi regime. In addition, older senior detectives, who had entered the police service during the German Empire or after World War I, played a significant role even after 1933. Although the Nazi leadership had promised to purge the police of politically "unreliable" officers after the seizure of power, the rate of dismissals in 1933/1934 was relatively low (<5 %), partially due to the lack of candidates for replacing the officers to be dismissed. Thus, detectives, who were professionally trained and socialized in the Weimar Republic, had a significant impact on the apparatus of the Sipo, in particular during the early years of the Nazi regime. In the middle and lower ranks of the Sipo, the local posts, and particularly inside the Kripo, they remained an influential and supporting element until the end of the regime. With their experience and technical knowledge, they contributed significantly to the functioning and effectiveness of the Security Police.

Reasons for Support and Initiative

The support that the Nazi regime gained from various groups of police officers was due to political indoctrination, opportunism, and careerism; instead, shared values and professional expectations were key factors in that respect as well. Nationalism, antiliberalism and anticommunism, radically stereotyped views on political outsiders or marginalized groups, authoritarian conceptions of state intervention, and social order ("law and order") had been part of the mainstream police philosophy during the 1920s. The rejection of parliamentary democracy and of the rule of law, demands for extensive and harsh control of political opponents, social outcasts and criminals, and the expansion, unification, and centralization of the police forces came upon a broad consensus within the police apparatus. The Nazis reacted positively on the demands and expectations circulating inside the police by suspending or abolishing existing legal restrictions and by giving the police the means for realizing their ideas of radical social control and social cleansing. In the "fight against criminality," against "enemies of the Volksgemeinschaft" or against "antisocial elements," the police and Nazi movement, senior detectives, and the new leadership of the Sipo shared the goals to pursue (Paul and Mallmann 1996; Wagner 1996).

As far as the cultural integration of the police in the Nazi state was concerned, celebrations or public events played a role, too. Of particular importance was that the Sipo was given a new image, which was perceived positively by most police officers. While public criticism of the police nearly disappeared after the suppression of the free press, the Nazi regime and senior Sipo officers developed an image of the police, which depicted the detectives as modern, scientifically trained, effective investigators and provided the Gestapo with the myth of an omnipresent and omnipotent power apparatus.

For the participation of Kripo and Gestapo officers in the terror of the Nazi regime, other factors and processes were important as well: increasing routine and familiarity with practices of exclusion and violence, the dehumanization of the victims through propaganda and bureaucratic procedures, and division of labor and responsibilities and social distance to those persecuted, but also the emergence of a specific Nazi 'cop culture' that was based on harshness and soldierly masculinity, camaraderie, and group pressure.

The Security Police: Methods and Instruments of Power

The alignment of the Sipo with the overall policies of the Nazi regime and the emergence of a concept of "racial policing" was accompanied by an expansion of instruments of power and a radicalization of police methods. Limitations of police work by legal bonds and external controls were abolished, and fundamental civil and human rights were suspended. Those affected were exposed to nearly unrestricted police arbitrariness.

While the Gestapo and Kripo detectives continued to work as a part of the law enforcement process and as an investigative administration for the public prosecutor, an independent police penal justice steadily expanded since 1933.

Its base was the introduction of an independent police custody, the so-called protective custody (Schutzhaft) used by the Gestapo and the "preventive custody" in the case of the Kripo. Both instruments allowed for detention without formal criminal justice proceedings and judicial review and resulted in permanent confinements of regime opponents and offenders in prisons or concentration camps. Those affected by these forms of confinement could be exposed to permanent drill, exhausting labor, hunger and disease, corporal punishments, and mortal danger. "Protective" and "preventive custody" enabled the police to punish, even on the ground of mere suspicion and poor evidence. Both forms of custody were used to "correct" court decisions and became instruments used massively for the intimidation and elimination of political opponents and people labeled as deviant. By applying this police custody, Gestapo and Kripo developed a policy of social exclusion that, until 1945, took several hundred thousand people into the concentration camps.The radicalization of police methods went even further within the Gestapo. While the use of physical violence against suspects by the Criminal Police was rather the exception, the Gestapo had the right to use violence for extorting statements. Against the backdrop of World War II, the Gestapo implemented its own prison camps, the so-called corrective labor camps (Arbeitserziehungslager), where prisoners were usually held for several weeks. In the 1940s, groups such as Jews, Poles, or Russians were completely removed from the realm of the judiciary and brought completely under the control of the Gestapo. Toward the end of the war, local and regional Gestapo offices were finally empowered to execute prisoners.

Arbitrary arrests and deportations, penetrations of the private sphere, extensive surveillance measures, and the use of informers (V-Männer) were the main features of the work of the Security Police, but routine police methods of investigation, detection, and forensic collection were continued as well, being the basis for the deployment of police terror. Despite the image of being omnipresent and omnipotent, the police force was dependent on the support of other institutions of the Nazi state. When heading for a comprehensive control of the "Volksgemeinschaft," the Sipo's own resources and personnel were insufficient (Gellately 1990;

Paul and Mallmann 1996). But the Security Police could count on the cooperation of other instances of social control: Together with subunits of the Nazi party, the uniformed police, government and municipal administrations, health and employment services, the tax administration, postal and railroad services, as well as the customs authorities and large parts of the economic sector, a cooperative network for enhancing and enforcing the policies and the terror of the Nazi regime was created. Significant support came also from the public. For controlling and suppressing core political opposition groups such as communists, or for controlling so-called criminals, the Gestapo and the Kripo could fall back on their own investigative work, but for the discovery of small individual deviances and minor violations, for the observation of everyday life, for the penetration into the privacy of suspected people, and for the pervasion of so-called closed milieus, the Sipo had to rely on denouncers and informers. For the discovery of a spontaneous protest, for the exclusion of the Jews from the "German" society, and for the close observation of minorities, input from the population and party organizations was essential. The power of Gestapo and Kripo derived not only from the results of its own investigations but from a network of individual and institutional supporters.

Key Aspects of Gestapo Work

Central to the work of the Sipo were permanent dynamics of radicalization (Dams and Stolle 2012; Mallmann and Paul 2000). When heading for an overall cleansing of the "Volksgemeinschaft" by eliminating political opponents' "racial enemies" and all sorts of deviance within the population, new enemy groups and accordingly new security requirements were continuously constructed. Initially the most important activity of the Secret State Police was the suppression of the left-wing workers' movement, in which the regime saw the main potential for opposition and unrest. The Gestapo's attack was directed primarily against communists, moreover against socialists, social democrats, and representatives of the Free Trade Unions. By 1933, tens of thousands of opponents have been arrested, mistreated and tortured, handled by criminal courts, or transferred to – by that time – early forms of concentration camps. Other measures were repeated raids, searches, and the confiscation of literature, printing machines, and illegal publications; the ban of organizations and newspapers; and the closure of the workers' movement's associations. Although the left opposition was constantly trying to reorganize illegal groups, the Gestapo managed to dismantle their resistance until 1936/1937.

Additionally, the Gestapo also developed a supporting role in the control of the Christian churches and religious groups. The aim was to stem criticism from the churches, to promote the adaptation of the believers to the Nazi ideology, to force the churches out of the public, and to reduce their impact on the population. Here, the repressive approach of the Gestapo was clearly more differentiated than toward communist resistance and was aimed mainly at integration into the "Volksgemeinschaft." While in Protestant-dominated areas, the Gestapo only monitored a critical minority within the church; in Catholic areas, where the Gestapo suspected a widespread reluctance to Nazism, the State Police developed a wide range of measures: It reached from the observation of meetings and church services and larger propaganda campaigns against the church to the ban on Christian associations and the punishment of individual representatives of political Catholicism and dissident clerics.

Another important field of Gestapo work was the control of public opinion. In addition to the suppression of critical statements from the labor movement and the churches, the communication of "ordinary" citizens should be regulated. Based on new decrees and laws putting the criticism of the representatives and actions of the government and the Nazi party under punishment as "treachery" (Heimtücke), the Gestapo initiated tens of thousands of investigations. Since the beginning of the war, expressing doubts about the Nazi propaganda or pessimistic statements about the war were persecuted more intensely and partly criminalized as "undermining of the military strength" (Wehrkraftzersetzung). The same was true of the media consumption of the population, as listening to foreign radio stations and distributing demoralizing information could be persecuted since 1939 under the label "radio crime" (Rundfunkverbrechen).

Since the mid-1930s, the State Police exerted increased pressure on nonconformist juveniles who rejected national socialist cultural hegemony by insisting on their particular subcultures and by turning against the Nazi youth organization. In addition, the Gestapo initiated wide-ranging prosecution actions against homosexuals, whose behavior was considered a threat to Nazi population policy. It punished violations of economic policy and labor discipline as well and was responsible for criminal proceedings against deviant members of the Nazi movement. On all these fields, the Gestapo sometimes acted in competition but usually in close consultation with the Kripo.

In several of these fields of action and against occasional violations of the norms of the community the Security Police, especially during the prewar years, acted selectively (Gellately 2001; Roth 2010). So it not only applied hard, negative sanctions but used warnings and lighter penalties to intimidate and discipline violators, in order to make them get in line with the "Volksgemeinschaft."

As far as the German-Jewish population was concerned, the police aimed at a radical marginalization and exclusion. While the political, social, and economic exclusion of Jews had been enhanced during the first years after the Nazi seizure of power very much by Nazi party subunits, the Gestapo thereafter took more and more the initiative. Since legislations in 1935, which turned German Jews into second-class citizens, the Gestapo went into organizing the discrimination, isolation, and exclusion of this population group. The police conducted the registration of German Jews, restricted their freedom of movement, were continuously involved in the criminalization of relations between Jews and non-Jews, and also contributed to the economic expropriation of Jewish citizens. As of November 1938, the Gestapo began with the systematic exclusion from German society. During and after the November 1938 pogroms, the Gestapo throughout Germany arrested more than 30,000 German-Jewish men and deported them into concentration camps, where the victims were released only when they had agreed upon abandoning their properties and upon leaving Germany. Just a few weeks earlier, in a nationwide campaign, the Gestapo had arrested about 17,000 Polish Jews and deported them over the German-Polish border – a test run for the mass deportations of the 1940s.

From the spring of 1941, the Gestapo organized the final spatial segregation of the remaining Jews within Germany. In the cities Jews were evicted from "Aryan" houses and sent to special "ghetto houses" or local camps. People of Jewish origin, who were kept in asylums, prisons, and other institutions, were separated from other inmates and handed over to the Gestapo. From autumn 1941, the State Police organized the deportations from the "Reich" to the ghettos and death camps in occupied Eastern Europe. By 1943 some 150,000 people were deported from Germany, while only a few were able to survive as "Mischlinge" (crossbreeds), partners in so-called mixed marriages or in hiding.

The Work of the Kripo

Unlike the Gestapo, the Criminal Police was initially focused more on traditional police activities such as criminal investigation and crime detection. During the 1930s, however, its practice was more and more determined by the methods and goals of a police of the "Volksgemeinschaft" (Browder 1996; Wagner 1996). In late 1933, the senior ranks of the Kripo opened a new field of activity under the label of "preventive fighting against crime" (vorbeugende Verbrechensbekämpfung). Under the pretext of reducing crime, the Kripo rendered recidivists into "preventive detention" by deporting them for an indefinite time into concentration camps, even in the absence of a specific offense or criminal court proceedings. Since 1934, the policemen were also enabled to subject known criminals to a "systematic observation" ("planmäßige Überwachung") and rigid rules of conduct.

At the beginning, the policy of preventive fighting against crime targeted at a relative small group of a few thousand criminals, which should be kept from further criminal activity by deterrence and confinement. With the vision of a "Volksgemeinschaft" without crime in mind, the Kripo constantly enlarged its net. According to a nationwide campaign of arrests against 2,000 so-called professional and habitual criminals ("Berufs-" and "Gewohnheitsverbrecher") in March 1937, the local Kripo offices started systematically detecting recidivists and sending them in very large numbers to concentration camps. The criminal deportations soon were directed not only against professional burglars and violent or sexual offenders but met more often petty criminals. At the same time, the persecution of homosexuals now shifted from the Gestapo to the Kripo. Even when acting against other social outcasts, the Kripo officers acted with increasing harshness. By doing so, the Criminal Police took up and radicalized the strategies and practices, pursued already by labor, social, and health administrations. As early as 1933, the Kripo had initiated numerous raids against prostitutes, beggars, and vagrants, demonstrating that social "disorder" and public "indecency" should no longer be openly tolerated. The next step came when the practice of "crime prevention" in December 1937 was extended to marginalized groups, and the Kripo was empowered to apply indefinite confinement on all individuals "endangering the general public by asocial behavior." Thereupon the concentration camp became a common measure against outsiders, while the Kripo turned into the dominant actor of social exclusion (Ayaß 1995; Gellately and Stoltzfus 2001).

In 1938, the police leadership prompted two nationwide sweeps against so-called work shy, in the course of which the Criminal Police arrested more than 9,000 people (the Gestapo about 1,500). Since then the local Kripo posts consistently put more and more "asocials" into "preventive detention" – next to prostitutes, homeless and vagrants welfare recipients, alcoholics, men neglecting their family duties, women labeled as promiscuous and women with venereal diseases, dealers, peddlers, etc. Even biographically, "crime prevention" radicalized: Since the early 1940s, 1,000 "criminal and antisocial youths" were interned, terrorized, and biologically examined in special camps. Especially involved was the female unit of the Kripo (Weibliche Kriminalpolizei), which not only served as kind of welfare police for (female) adolescents but was responsible for the elimination of "criminal offspring." Until the end of the Nazi era, the Kripo under the label of "crime prevention" delivered about 80,000 offenders to the terror of the concentration camps (Wagner 1996).

In addition, there was the fight against "alien races." The Criminal Police assisted the Gestapo in its anti-Jewish policy, for example, by sending Jews with criminal records to camps or persecuting relationships between "Aryans" and "non-Aryans" as "race defilement" ("Rassenschande").

To core projects of the Kripo belonged the exclusion of the Roma and Sinti, who, as "gypsies," had been particularly discriminated against and placed under special surveillance long before 1933 (Zimmermann 1996). Since the mid-1930s, they were deprived of civil rights, prohibited further mobility, separately registrated, examined by racial experts, and marked as "racial aliens." After May 1940 the Kripo started several deportations, taking thousands of German and Austrian Roma and Sinti to the annexed and occupied Poland, where most of them lost their lives. From March 1943, about 23,000 "gypsies" from the "Reich" and occupied Europe were transported to the extermination camp at Auschwitz. As the practice of Gestapo, the work of the Kripo since the 1940s was closely associated with national socialist mass murder.

Gestapo and Kripo During World War II

The beginning of World War II provided additional rationalizations for the radicalization of policing and increased the willingness of policemen to act harshly and murderously against political, social, and racial "enemies." With the expansion of the Nazi regime into large parts of Europe, new spaces of social control and eliminatory rule were created, while millions of people who were defined as dangerous by the Nazi regime fell in the hands of the Gestapo and the Criminal Police (Mallmann and Paul 2000; Topographie des Terrors 2010).

The further radicalization of the Sipo occurred in the occupied territories, where the Sipo exercised unprecedented and unbound physical violence. Since September 1939, more and more Gestapo and Kripo detectives had to leave their offices within Germany and put themselves at the service of Nazi occupation and warfare. Some of them participated in the "Einsatzgruppen," who entered the occupied territories behind the Wehrmacht to "cleanse" the conquered areas of indigenous elites, oppositional groups, Jews, and minorities like gypsies and the disabled. The "Einsatzgruppen," already established as mobile killing units in the Polish campaign 1939 and considerably extended since the invasion of the Soviet Union in 1941, have been responsible for the direct killing of hundreds of thousands of people especially in Eastern Europe (Klein 1997). In these units, and the offices established in the occupied territory, the institutional merging of police and SS was further promoted.

Members of the Security Police were involved at all levels in Nazi crimes: in the invention of killing techniques for the gas vans and death camps and the "administrative execution" of genocide; in the surveillance of ghettos and economic plundering of the occupied countries; in reprisals against political opponents, mass executions of Jews, political officials, prisoners of war, or "partisans"; and in the killing of "criminals," "asocials," or "gypsies." In the violent environment of the East, it could be practiced without restraint and directly, what the police in the "Reich" before the war could achieve only indirectly through deportation and imprisonment into concentration camps: the annihilation of those categories of people defined as enemies of the "Volksgemeinschaft." When doing this, the Security Police was not only supported by the Germany army or the civil administrations of the occupied countries. An important element of German police power in Europe was the collaboration of local police forces, radical nationalist organizations, and auxiliaries, which contributed significantly to the execution of mass murder.

The Security Police on the "Home Front"

In the course of World War II also inside Germany, the Sipo radicalized its scenarios of crucial enemies and possible dangers (Mallmann and Paul 2000). Political opposition and social deviance were now seen as a threat to the Nazi war effort and the stability of the "home front." But while this resulted in a further tightening of sanctions, gaps in the system of police control were widening, as many officers were withdrawn from the "internal front," the police functions were continually extended, and the prolonged war and ongoing air raids, especially in big cities, lead to a decline of law-abidance and loyalty to the regime. The impending loss of control in the war did not lead the Security Police to a strategy of de-escalation but was answered with a further intensification of terror. To this added, that police officers who had returned from the occupied territories brought their experiences of violence and concepts of "enemy combat" with them to the "internal front." Due to the expansion of control requirements and the social distractions of war society, the Kripo focused more and more on the disciplining of those refusing to work for the war community, on surveilling the conduct of young people and single women, on halting the spread of sexually transmitted diseases among prostitutes and soldiers, or on the persecution of the black market, "looting" and other war-related crimes (Roth 2010; Wagner 1996). These control efforts also met conservative and bourgeois opponents of the regime – as the mass arrests after the attempt to assassinate Hitler in 1944 illustrate.

However, on the "home front" within Germany, racial politics stood at the center of the State Police's activity. In addition to the exclusion of the Jewish population, the control of "foreign workers" became a main task of the Gestapo – especially since the intensification of the use of foreign workers in the German Economy (Ausländereinsatz) and the massive recruitment of forced laborers from the occupied Soviet Union since 1942. The Gestapo not only had to monitor the work discipline of foreign workers and to ensure the functioning of the war economy, it also was to suppress resistance and sabotage and punish forbidden relations between Germans and foreigners. That was mainly applied to workers from Poland and Soviet Russia: They were classified as "racial aliens" and placed at the bottom of the racial hierarchy of the Nazi system, were regarded as a special threat to the order of the "internal front," and were almost entirely subject to the power and violence of the State Police. Since the middle of the war, the measures of the Gestapo even included the killing of East European laborers. Numerous Polish, Ukrainian, or Russian civilian workers, who have had intimate relations with locals, were publicly executed due to transgression of "racial barriers" (Gellately 2001). This indicates what State Police practice characterized in the last months of the war: A policy of open terror, which brought mass murder to the "home front." In the final phase of the war, the Gestapo inside the "Reich" increasingly followed the models and methods of occupation. Hierarchies, bureaucratic procedures, and the formal allocation of responsibilities became less important, as much of the work of the State Police was taken by Sonderkommandos (special task forces) operating with high mobility and flexibility. They worked increasingly independent to the central offices in Berlin, with almost unlimited instruments of terror. In the last months of the war, executions, initially dependent upon authorization from Berlin, could be imposed by regional commanders of the Security Police and eventually the local offices themselves. Before the collapse of the Nazi system, the work of the Gestapo in the "Reich" was marked by mass arrests, targeted killings, and "combat missions." They were directed primarily against "foreign workers," young people, deserters, and criminals who were in hiding in the ruins of the big cities. Since the Gestapo with its flexible organizational structures and unlimited powers assumed nearly all of the Security Police's competencies, the officers of the Criminal Police lost importance and influence in the last months of the Nazi regime. However, at least some of the Kripo officers participated in arbitrary killings and supported the "final battle" of the Gestapo.

The Uniformed Police: Everyday Practices and Participation in the Holocaust

During the Weimar Republic Period, the uniformed police tried to change the image it had in the public. While an image, deriving from the police before World War I, lingered on, which portrayed the police very much as authoritarian, militaristic, and emphasizing the social distance between the uniformed police and the general public, senior police officers tried to change this image for a portrait, which displayed a police much closer to the public, a police, which was no longer primarily a protector of the state but a protector of the "people" as well. After the Nazi seizure of power, the leadership of the police attempted to give this portrait even more contours by popularizing a label, which showed "The police, your friend and helper." The uniformed police organized during the 1930s and even during the first years of the war a number of "Tage der Polizei" (days of the police), which, as a public relations action, were to propagandize the label. Other activities, inaugurated by the police during the 1930s, focused on improving the traffic circulation in the cities and on preventing the growing risk of traffic accidents, by training the general public, in particular children, how to behave adequately on the roads of the city. All this was intended to make the slogan "The police, your friend and helper" popular, but this label covered only partially the reality of the uniformed police during the Nazi regime. The uniformed police was "friend and helper" only to those, who were members of the "Volksgemeinschaft." Jews, for example, were not members of this community, which comprised only Germans along very narrowly defined social, racial, and biological criteria. Some of those, who were opponents of the new regime, or were not members of the "Volksgemeinschaft," experienced immediately, others very soon a new repressive side of the uniformed police and a new specific, selective approach to law and order, influenced by the political strategies of the Nazi regime. The uniformed police did not intervene, when political opponents of the Nazi regime were arrested, maltreated, or even killed but conceded instead to a partition of labor with the police doing the work, which looked professional and members of the paramilitary groups of the Nazi movement, often in the position of auxiliary police personnel, doing the "dirty" work, such as torture and killings of political opponents. And in 1933, soon after the Nazi movement had come into power, the police did not intervene, when the Nazi movement staged a boycott against German-Jewish shopowners and merchants, thus indicating law and order might not pertain to German Jews any longer. These attitudes became increasingly enhanced, when a growing loading of police training with patterns of Nazi ideology and anti-Semitic contents occurred (Matthäus 2003; Westermann 2005).

Institutionally and organizationally, the uniformed police experienced a drawback, when in 1936, after a organizational reconstruction, which had started very early after the Nazi seizure of power already, the units of the uniformed police were transferred to the German army to increase the army's numerical strength. This weakened the organizational resources of the uniformed police and reduced the number of its personnel to about fifty percent of its original strength. Until the end of the 1930s, the uniformed police gradually managed to increase again the number of its officers and to reestablish police units. The personnel of these newly established units, later named as police battalions (Polizeibataillone), was comprised to large extents of police reserve recruits without any professional police background instead of professional police officers. These police units were used alongside the military, when the Nazi regime annexed Austria (1938) and Czechoslovakia (1938/1939). These participations of units of the uniformed police still ran under the heading of securing the occupied territories, but with the start of the war against Poland in 1939, the uniformed police turned into an instrument executing the racial and genocidal ideologies of the Nazi regime. The uniformed police finally became a murderous key institution in the Holocaust. Already during the starting phase of the war against Poland, the units of the uniformed police, following the advancing German army, committed atrocities among the Polish population, Jewish and non-Jewish, thus becoming part of the racial strategies the Nazi regime started pursuing already during the first phase of the war. Especially the violent transfer of populations, the settlement of "ethnic Germans" in the occupied parts of Western Poland and the brutal eviction of Polish and Polish-Jewish inhabitants of these parts of the country into the occupied central Poland (the "Generalgouvernement") became one of the first elements of the participation of the uniformed police in the geostrategical and racial policies of the Nazi regime.

With the beginning of the war against the Soviet Union in June 1941, the involvement of the units of the uniformed police gained unprecedented genocidal dimensions. The so-called Einsatzgruppen, operating in the hinterland of the advancing German army within the Soviet Union, killed more than 500,000 victims until the end of 1941, most of them Jews. These mobile killings units not only were composed of members of the Security Police and the Security Service of the SS (SD) but could rely to large parts on military SS-formations (Waffen-SS) and members of the uniformed police. These mobile killing units advanced within the Soviet Union as far as the German army, that is, into the territory of the former Baltic states, and from there close to Leningrad, they covered Belorussia and moved forward into the vicinity of Moscow, covered the whole of Ukraine and proceeded as far as the northern fringe of the Caucasus. Most of the direct killing actions and massacres on the Eastern Front, as the killing of about 33,000 Jews from Kiew in Babi Jar, were carried out by the "Einsatzgruppen" and supporting units.

While the overall number of members of the "Einsatzgruppen" remained relatively small (there were up to 3,000 men in the "Einsatzgruppen" following the advancing German army in the war against the Soviet Union), the overall figures for the members of the units of the uniformed police participating in war, occupation and genocide were much higher: In occupied Poland and in the occupied parts of the Soviet Union, approximately 50,000 men served in different units of the uniformed police, the number of these units amounting to 90. This high figure of men serving in mobile units of the uniformed police was due to the fact that the Order Police was not limited to its participation in the murderous actions of the "Einsatzgruppen." The units of the uniformed police carried out a great number of executions of their own, quite often when the Ghettos in the cities of Eastern Europe, where the Jewish population was forced to live in, were dissolved and its inhabitants being sent into the death camps. But the radius of action of the uniformed police was not limited to Eastern Europe. In most of the countries occupied by Nazi Germany, units of the uniformed police held a significant position in the occupation apparatus, often charged with a more general maintenance of the security in the occupied countries. In the later phases of the war, units of the uniformed police became heavily involved in fighting guerrilla activities against the German occupation ("Partisanen-" or "Bandenbekämpfung," terms often used for masking executions of Jewish men, women, and children; the elimination of resistance groups; and the brutal suppression of the local population). During the final phases of the war, units of the uniformed police took part in the indiscriminate mass killings of hostages all over Europe, leading to the extinction of whole village populations (Oradour-sur-Glane).

The overall death toll, for which the uniformed police of the Nazi regime could be held responsible, is difficult to calculate precisely. But calculations in different publications, older ones (Gutman 1990) and more recent ones (Curilla 2011), count approximately 1,200,000 victims, who were either murdered by the units of the uniformed police or by members of this police as participating in mass executions as members of other units ("Einsatzgruppen").

After 1945: Research and Institutional Reflections

Elaborated research about the role and the functions of the police as part of the Nazi regime did set in late in Germany. The few studies available until the 1980s either gave limited descriptions of the police's institutional settings and the development of this settings during the years from the Nazi seizure of power until the end of the war, or they focused on the Gestapo, emphasizing a picture of the Gestapo as omnipresent and omnipotent, terrorizing political opponents and the so-called racial enemies of the German people and, since the beginning of the war, covering the whole of Nazi-occupied Europe with its murderous activities. This early research concentrated very much on a top-down perspective, by looking primarily at the main goals, leadership, and institutional context of the Gestapo's activities without analyzing the whole personnel involved and without detailing the Gestapo's impact and societal background. This changed for a bottom-up perspective, when the social history turn within historiography touched upon the writing about the Gestapo as well. This meant primarily to find out in detail what the Gestapo had meant for its victims. But next to the attempts of giving answers to this question, another feature turned up during the 1970s and 1980s: A new social history of the Gestapo revealed how important input from other institutions and the population had been for the work of the police during the Nazi regime, in particular input in the form of denunciations and input deriving from all sorts of informers. This led some historians to postulate, that Germany under the Nazis had been a self-policing society (Gellately 1990; Paul and Mallmann 1996). More recent research after the year 2000 however has refocused the attention on the terror exercised by the Gestapo and emphasized the initiative and specific political-ideological radicalization of the Gestapo corps.

At the same time earlier, descriptions of the Gestapo focusing mainly on Himmler and Heydrich or paradigmatic figures like Eichmann were replaced by more complex and differentiated analyses of the personnel, emphasizing factors like generational background, collective values, organizational culture, and institutional dynamics (Mallmann and Paul 2004; Paul 2002; Wildt 2009).

If the research about the Gestapo did set in relatively late already, critical studies of the other polices, that is, about the criminal and the uniformed police, did set in even later. The long-lasting silence surrounding the Kripo's crimes during the Nazi period had much to do with the fact that those victims affected by national socialist "crime fighting" were continuously marginalized after 1945, mostly remained objects of repressive policing and were not seen as "legitimate" victims of the "Third Reich." This changed during the 1970s as critical social scientists and "grassroots historians" developed a more comprehensive approach toward the exclusionary politics of the Nazi regime and claimed recognition for the formerly "forgotten victims" (Ayaß 1995; Wagner 2002). The research on the Kripo, which was clearly expanding since the 1990s, has given its attention on the politics of the "fight against criminality" and the Kripo's growing inclusion into the biological and racial strategies of the Nazi regime. While it elaborated the characteristics of crime fighting in the "racial state" of the "Third Reich," this research yet also made clear in what extent police work during the Nazi regime adapted values, images, policies, and techniques from pre-Nazi times – and what continuities of policing can be identified between the German Empire and the Weimar Republic – the Nazi regime, and the postwar years.

The interest, research has taken into the history of the uniformed police, has grown significantly in recent years. In particular its involvement in the mass executions of the Jewish population in Nazi-occupied Eastern Europe has been analyzed in great detail. Due to this focus, research on ordinary policing of the uniformed police in German cities is only gradually emerging. A core issue of the research about the uniformed police is asking for the factors, which turned policemen from members of the police force, loyal to the Nazi regime, into murderous perpetrators. There is currently a consensus among researchers that a whole spectrum of factors has to be taken into account for explaining this shift, ranging from the effects of political indoctrination to the habituation to murderous violence, from psychological factors such as group pressure to situational time- and location-based factors (Browning 1992; Welzer 2005).

In 1945, when Nazi Germany was defeated, the victorious allied forces declared the Gestapo, together with a number of Nazi organizations, a criminal organization, while the Kripo and the uniformed police were left out from being accused of a specific affinity to the Nazi regime. In those parts of Germany, occupied by the Americans, the British, and the French, purges of the police took place, but the overall continuity remained relatively high. Very many of the detectives and the officers of the uniformed police continued to work in the police service (Fürmetz et al. 2001). As the public – at least during the first decades of (Western) postwar Germany – was reluctant to a detailed and critical examination of the Nazi regime, its leading actors, and supporters and as strong political, institutional, and legal barriers were impeding systematic investigations against Nazi perpetrators, only few of the former members of the Gestapo, Kripo, and Orpo were accused and sentenced for their participation in racial politics and genocide (Mallmann and Andrej 2009; Ullrich 2011).

It has taken the German police considerable time to deal with the legacies of its Nazi past. First projects did set in during the early 1980s already. These projects, which quite often had the form of joint teams of police officers and academic historians, were much driven by so-called "critical" members of the police force, who saw police history as being part of a police reform strategy. This strategy aimed at a more civil, service-orientated, and self-reflecting police. But as this reform turned into a contested field, which did not find undivided acceptance among members of the police force, some of these early police history enterprises came under the critic from the police, especially as not everyone among senior ranks of the police was already "open" for critical views on the history of the police during the Nazi period. More or less a decade later, during the 1990s, a second wave of police history activities, involving big city police forces, did set in. The – in many aspects – most prominent among these big city police force histories was carried out under the auspices of the Cologne police (Buhlan and Jung 2000). A major result of this project on the Cologne police had been to show how deeply and intensively everyday policing had been involved in pursuing the exclusionary, racial policies of the Nazi regime. Further projects on the police of major German cities during the Nazi period confirmed these findings. In 2007, the Bundeskriminalamt (BKA) initiated a history project, which was to deal with the history of the BKA during the 1950s and 1960s, thereby focussing on the question to what extent continuities existed within the BKA: "Continuities" either meant asking for the members of the Bundeskriminalamt, who had served already in the security forces of the Nazi regime, or it meant trying to find out what impact (if at all) these characteristics of the BKA-personnel had on the practical work, the practices of the Bundeskriminalamt (Baumann et al. 2011). Since very recently (2011), projects dealing with the Nazi legacies within the Bundesnachrichtendienst (Federal External Secret Service) and the Bundesamt für Verfassungsschutz (Federal Internal Secret Service) are on the way as well. The initiatives for these projects are very much driven by the following logics: Firstly, dealing with the Nazi legacies of an institution such as the police, even if highly problematic aspects might emerge, is increasingly seen as important for a reflective police culture. Secondly, the German public generally recognizes positively efforts to deal with the Nazi past. And thirdly, and last but not least, within many institutions in the Federal Republic, a self-understanding has evolved, which sees the development of the institutional infrastructure of the Federal Republic as part of a democratic success story – which is the more successful, as this success had evolved on the background of a terrible past. That is why many of the research questions put forward in this context are not only directed on scandalizing continuities (personnel, practices) beyond the 1945 line within these institutions but to show how successful the respective institutions had moved toward democracy and "Rechtsstaat," the rule of law, despite the burdens of the Nazi past.

Overview

"Police state" is a translation of the German word *polizeistaat*. The first citation of the term by the *Oxford English Dictionary* comes from the *Times* (London) of 1851: "Austria has become more of a police state than before." The *War Illustrated* followed suit in 1939: "spies are everywhere; indeed, Germany is the modern exemplification of 'the police state' in action." One way to understand the category of the police state is to frame it in terms of the question of the relationship between the "police" and the "state" (Neocleous 2000). Two, albeit, crude distinctions can be drawn; on the one hand, there are regimes in which the relationship is intimate to the point where the police institution is merely a handmaiden of the state and concerned almost exclusively with the task of executing regime orders; the aim is to protect the regime rather than serve citizens. On the other hand are regimes that claim to operate in such a way as to maintain a distance between the state and the police institution. These two types of regimes correspond, respectively, with non-liberal and liberal political cultures. In liberal political cultures, the police institution is seen as identical with civil society. For example, it has been argued that the source of legitimacy for the British police is a strong moral and emotional identification between the police and the British people: Thus, Reith (1956, p. 287) stressed what he considered to be "the historic tradition that the police are the public and that the public are the police." This alleged independence of the police from the state is the converse of what happens in police states or totalitarian states.

This entry summarizes three main issues: First, it examines what is known about the nature of police states. Second, how do police states emerge? Third, it discusses what the police do and how well they do it in the police state. For example, what is the nature of crime in the police state, and what are the technologies of crime control? How reliable is it to assess the effectiveness of the technologies used? Fourth, how do citizens respond to the police state? Were the actions of the police considered "legitimate," or police states lie outside the consideration of legitimacy? Did citizens live in fear of the police or they expressed popular support for the police?

Problems of Definition[1]

The emergence of the modern state in Europe was associated with the birth of what has been termed the "well-ordered police state" in the sixteenth century. It is not that police states were unknown prior to this period. Indeed, some scholars make a distinction between the *traditional police state* and the *modern police state*, the latter referring to the well-ordered police state and the former describing the state prior to the era of the modern state.

Why are certain regimes classified as "police states"? Stated differently, what is the "police state"? Prima facie, the answer to both questions is straightforward, and many will easily cite examples of such regimes. However, a careful consideration of the literature leads to a more cautious appraisal of the concept, that one cannot simply make a binary categorization of regimes into police states and nonpolice states. Rather it is more useful to speak of a *continuum of police statehood*, with different regimes (both democratic and nondemocratic) positioned on different points of the continuum: totalitarian regimes at one extreme end of the continuum and (liberal) democratic regimes at the other end. One of the few attempts to engage conceptually with the idea of the police state is Brain Chapman (1970). He set out a number of criteria for measuring the applicability of the police state model.

The first is *politicization*. This is not to be equated with the idea that the police are political. All police forces, whether in totalitarian or liberal democracies, are political in the sense that they are created by the state and used by the state to maintain law and order. By politicization, Chapman is referring to police involvement in partisan politics and to a situation where police actions are dictated by partisan political considerations rather than the rule of law. Under such circumstances, the vicissitudes of police legitimacy are closely tied up with politics. Second is *militarization* of the police; rather than relying on the army for armed response where necessary, the police organization chooses to augment the capacity of its riot unit by providing it with armored vehicles and other equipments to enable it to operate independently of the army. This is a deeply problematic criterion, especially when Chapman argues that a state is on the road to becoming a police state if its police force weans itself from the control of the army and operates as an independent state institution (p. 119). There is no liberal democracy in which police operations are under the control or supervision of the army.

Chapman's third criterion is the *Centralization* of police services. It is hard to see how can be seen as a distinctive feature of the police state. For example, the structural configuration of a police force does not necessarily correspond to the character of the political culture in that country. Countries such as Belgium and Sweden have centralized police forces, yet they are scarcely the kind of countries we might describe as being totalitarian. A decentralized police institution does not guarantee against the emergence of localized despots, whether such despots are police officers acting on their own or

[1] The essay draws heavily on the work of Arendt (1968) and Evans (2005).

under the dictates of local politicians. The Royal Commission on Police in Britain considered and rejected this approach to defining the police state. The Commission argued that the proper criterion for the police state should be "whether the police are answerable to the law," and that in the police state, "the government acknowledges no accountability to a democratically elected parliament, and the citizen cannot rely on the courts to protect him" (1962, p. 45). But even this test of police statehood is not without difficulty. For example, it fails to differentiate between formal or procedural accountability and substantive accountability. Police states such as Nazi Germany had a parliament (the *Reichstag*) which, it was claimed, represented the will of the German public and passed laws to legitimate Nazi actions often in retrospect (The question of legality and its legitimacy will be considered in final part of this entry).

Finally, Chapman discusses what he labels *penetration*. This, he asserts, entails an encroachment into the judicial domain, with the police obtaining powers of arrest, supervision, and detention, and a right to inflict penal sanctions outside the control of the normal judicial machinery. It is very hard to claim that this characterization is typical of totalitarian regimes and that such encroachment is alien in liberal democracies, even in the twenty-first century; police forces in all societies are vested with powers of arrest and detention, although the duration of detention before trial varies widely. Nor is it unknown in democratic societies for police to have powers to administer penal sanctions without recourse to the courts. Take the example of Britain: Criminal Justice Act 2003 effectively granted police officers the power of punishment. Specifically, the Act allows officers to issue cautions to certain categories of offenders, a legal provision that has been criticized for its procedural and substantive unfairness (Brownlee 2007).

While dictionary definitions should not drive criminological analysis, a look at the dictionary can often illuminate our grasp of certain concepts. According to the *Oxford English Dictionary* the meaning of a police state is "a totalitarian state run by means of a national police force, using repressive methods such as covert surveillance and arbitrary arrest and imprisonment to control the population." Here again, the idea of a national or centralized police force is set out as a feature of totalitarianism, yet it is never entirely clear why centralization should be anathema to democratic governance. Even the notion of "repressive methods" is not without difficulties. Although a liberal democracy, the United Kingdom is considered to be one of the most closely surveilled countries in the world. For example, the City of London has 69 closed circuit television (CCTV) cameras per 1,000 population; Wandsworth, an area of 4.6 miles, has a total of 1,113 CCTV cameras which is far more than the CCTV cameras of police departments of Boston (USA), Johannesburg (South Africa), and Dublin City (Ireland) combined (BBC 2009). This level of surveillance was unparalleled by the experience of Nazi Germany or any other police state.

In the end, all regimes target certain sections of their populations (for example, migrants and suspected terrorists), and embark on elaborate surveillance against them. It may be a bold claim but it may not be delusional to suggest that it is not the *fact* of particular actions or modes of operation of particular regimes that ipso facto make those regimes totalitarian or police states; many liberal democracies share with totalitarian regimes the use of intensive covert surveillance, imprisonment as a means of control of some sections of their population, and encroach upon the powers of the judiciary. Far more important might be *how* these technologies are employed and what mechanisms exist for substantive democratic accountability. In other words, deploying the category of police state to label non-liberal states may not help to illuminate the difference between them and liberal states (Neocleous 2000). It is far more useful to pay attention to how the police in both liberal and non-liberal societies treat citizens during everyday encounters. As a dictum, claims to democratic governance "would hardly be allowed to go unchallenged if the police severely restricted public meetings and political demonstrations or resorted readily to physical force and intimation in order to prevent crime" (Bayley 1969, p. 11). Nor is it unreasonable to observe that even within democratic societies, the experiences and perceptions that some sections of society have of the police is akin to what citizens of police states experience. Put colloquially, one person's democratic state might be another person's police state.

Emergence of Police States

The preceding comments about the conceptual challenges in making sense of the category of police state do not mean that such a category is without merit. It has been argued that concepts are the gateway to the empirical world of study for empirical science, and therefore, the effective functioning of concepts is a matter of decisive importance (Blumer 1954). However, one cannot hope to deploy concepts effectively without-clarity in their meaning. That is not a task necessarily attempted here; the objective so far has been more modest, and it is to draw attention to the need for further work in order to understand more fully its analytical utility. Nonetheless, there are examples of states in recent history widely described as police states: Nazi Germany and Stalin's Russia.

Under what conditions do police states emerge? It is difficult to answer this question without the risk of contextless generalizations. The coming to power of Stalin and Hitler occurred under completely different conditions. Russian was a relatively backward country, with a weak economy and history of despotic rule. Germany, on the other hand, was a well-developed economy; it had a highly educated population with reasonably strong institutions and a burgeoning democracy. Indeed, as discussed below, Hitler came to power through elections. It is important to expatiate on the Germany situation further, because it demonstrates that economic development and education do not necessarily suppress the emergence of totalitarian rule (Fukuyama 1992).

Toward the end of the nineteenth century, Germany had embarked upon its first experiment with democratic governance, and the experiment had gone spectacularly wrong. Parliament was toothless, unable to check executive power. The rights of workers were not fully recognized and industrialists had mounted strong opposition against moves toward unionized labor, arguing that unionized labor was an impediment to economic growth. Nor could it restrain encroachment upon the civil liberties of some sections of the population, in particular Catholics and Jews, both of which were considered "enemies of the Reich" (Evans 2005). At the same time, extremist political parties were increasingly gaining prominence. These parties tapped into the anxieties and resentment of ethnic Germans who felt increasingly disillusioned by the major economic and social transformation in German society at the time. In many Western societies today, migrants and asylum seekers are easy targets for such anxieties (Bauman 2004). In Germany, Jews were the target; they were seen as the source of all societal problems. Extremist politicians argued for their civil liberties and economic activities to be restricted. Mainstream political parties capitulated. Finally, defeat in the First World War brought economic burdens, and there was also increased violence. The judiciary was a tainted institution, widely perceived as partisan in favor of reactionary elements.

It was within this context that Nazis came to power under the leadership of Adolf Hitler "who possessed one great gift: the ability to move crowds with his rhetoric" (Evans 2005, p. 7). The first electoral success for the Nazis was in September 1930 and July 1932, largely with support from the middle classes which had felt threatened by the election promises of the Communists to restrain capitalism. After various political maneuvers in parliament, Hitler was appointed the head of a new government in 1933. In the initial stages of the development of the police state, there is often a struggle for power and the focus of the regime is to liquidate all forms of organized resistance, both open and secret. Nazi Germany was not an exception. It established an extensive surveillance system that tracked down, arrested, and punished people opposed to it. So effective was this pursuit that the regime succeeded in crushing completely all forms of organized opposition. The Nazis banned all political parties, transforming Germany from a fledging multi-democratic state into a one-party state under the leadership of Hitler. In 1934, a nationwide plebiscite approved a law that made Hitler the Leader and Reich Chancellor; his authority was "total and all-embracing. . .and subject to no checks or controls" (Evans 2005, p. 44).

One of the features of the police state is the dominance of the police in domestic politics. The military tends to occupy peripheral positions. There are at least two interrelated reasons for this state of affairs. First, regimes in police states tend not to have confidence in the military to make the necessary cognitive shift from its raison d'être of dealing with external threats to that of considering its own people as if they were foreign combatants. Second, police states aspire eventually to establish a world government (Arendt 1968). Consequently, they tend to approach the victims of their foreign aggressive adventures as though they were rebels, and therefore prefer to govern them with the police rather than the military.

The Police State and Crime Control

To understand the effectiveness of the mechanisms of crime control, it is prudent to first consider what *law* and *crime* mean under the police state. A key feature of law in democratic societies is that it brings a certain degree of certainty and predictability into aspects of relationships among citizens. The law is also applied prospectively, thereby allowing those subject to power to know in advance when they will be subject to coercion and thus avoiding needless interference in their lives. The opposite is true of police states; unpredictability and uncertainty were the main features of the law both in Germany under Hitler and Russia under Stalin. The law and procedures for its application are always in "continuous flux."

In Nazi Germany, two states existed contemporaneously: the *normative state* and the *prerogative state* (Fraenkel 1941). The former was the formal institutions that existed prior to Hitler coming to power, and were bounded by long-standing rules, laws, and procedures. The Prerogative state was an extralegal institutional arrangement that derived its legitimacy from Hitler. Although initially characterized by conflict and sometimes accommodation, the relationship between the two eventually became one of subjugation; the spirit of the prerogative state permeated the normative state as it abandoned its legal procedures and gave approval to hitherto illegal state actions. Hitler's word was law, and the legally correct procedure was as he deemed it. At any rate, the courts of the normative state were dominated by Nazi sympathizers; the Nazis disregarded the law, including laws enacted by themselves if this suited their convenience. Within this context is to be expected shifting definitions of crime and their punishments.

Criminologists have long recognized that crimes are social constructions and that there is a great deal of variation between societies in perceptions of crime seriousness. Thus, the kind of behavior, utterance, or dissent that would be tolerated in liberal democratic societies is viewed as criminal in police states. For example, under the Malicious Gossip Law of 1934 in Nazi Germany, it was an offense to make "spiteful or provocative statements" in public against the governing party, to criticize its policies, or complain about suppression of freedoms and civil liberties. Whether the offense was for malicious gossip or not, the social identity of the offender was always an important consideration in determining the swiftness of police response and the severity of sentences by the courts. Thus, Jews, for instance, were punished more severely for criminal offenses that were otherwise overlooked or attracted very lenient sentences if committed by non-Jews.

Once the police state has been established, there is a shift from dealing with the "suspect" to dealing with the "objective enemy" (Arendt 1968). The objective enemy is unlike the suspect in many ways. Suspects are people whose previous and present deeds and "dangerous thoughts" give reason for the state to be suspicious about what they might do. They are people who oppose and desire to overthrow the government, or are believed to have committed crimes. The objective enemy, on the other hand, is the product of government policy irrespective of the orientations of those so defined. The objective enemy is seen as a "carrier of tendencies" considered a threat to the state. The government never runs out of objective enemies because new ones are easily found depending on the circumstances (Arendt 1968). For example, the Nazi regime had well-developed plans for the extermination of the Polish people when the extermination of Jews was near completion (Arendt 1968). This was to involve, among other things, attempts to impose regulations strikingly similar to what had been done before implementing "the final solution": for example, change of names and the death penalty for racially undesirable marriages, such as those between Germans and Poles (Evans 2005).

The secret police constitute the main channel through which orders of the government are transmitted. In addition to the change from dealing with suspects to attending to objective enemies is a corresponding change from *suspected offense* to *possible crime*:

> . . .every thought that deviates from the officially prescribed and permanently changing line is already suspect, no matter in which field of human activity it occurs. Simply because of their capacity to think, human beings are suspects by definition, and this suspicion cannot be diverted by exemplary behavior, for the human capacity to think is also a capacity to change one's mind. Since, moreover, it is impossible ever to know beyond doubt another man's heart . . .suspicion can no longer be allayed if neither a community of values nor the predictabilities of self-interest exist as social realities. (Arendt 1968, p. 430)

The result of this is to create *a system of ubiquitous spying*, infusing hitherto healthy social relationships with mutual suspicion. Each person feels under constant surveillance; what was once methods employed exclusively for dealing with the population is now the methods that ordinary citizens employ to deal with their neighbors in everyday encounters. As discussed later, however, scholars differ on whether fear, terror, and intimidation were as pervasive as it is often portrayed in popular accounts, or it was the case that citizens freely consented to the decisions and directives of the police.

In the initial years of the establishment of the police state, the focus is primarily upon eliminating all sources of organized opposition. Concern with suspects of possible crimes assumes prominence when the regime is fully established. As the police state enters its last and fully totalitarian stage, it abandons the category of objective enemy and possible crime. The new category of "undesirables" replaces them. Here victims are chosen at random and officially declared unfit to live. In the well-documented case of the Nazis, undesirables included the mentally ill and persons with certain kinds of diseases. This introduction of arbitrariness means that the police state becomes far more efficient in suppressing freedoms; both the innocent and the guilty share the fate of being undesirable. But more importantly, this change in the concept of crime and criminals comes with new methods for law enforcement. Consistent with their task of executing executive orders, it is the responsibility of the police to ensure criminals are punished and undesirables disappear, often without a trace. The only trace victims leave behind are the memories of those who knew them; a challenging task for the secret police is to ensure that even this trace will disappear with the victims. The Russian secret police, for instance, employed elaborate network analysis of families, friends, and acquaintances of suspects with the aim to eliminating those believed to possess "dangerous memories" of the disappeared. Hannah Arendt has captured this well:

> In totalitarian countries all places of detention ruled by the police are made to be veritable holes of oblivion into which people stumble by accident and without leaving behind them such ordinary traces of former existence as a body and a grave. Compared with this newest invention for doing away with people, the old-fashioned method of murder, political or criminal, is inefficient indeed. The murderer leaves behind him a corpse, and although he tries to efface the traces of his own

> identity, he has no power to erase the identity of his victim from the memory of the surviving world. The operation of the secret police, on the contrary, miraculously sees to it that the victim never existed at all. (Arendt 1968, pp. 434–435)

In common with their counterparts in democratic societies, the lifeblood of police work in the police state is information from the public. Two decades of empirical analyses of police legitimacy have shown that cooperation with police forces rests mainly on the perceived legitimacy of the police (Tyler 1990). Police states and their secret police forces were fully aware of this role of legitimacy in securing the flow of intelligence, and they devoted much energy and resources cultivating legitimacy among their publics. In Nazi Germany, the Gestapo relied upon the assistance of the German public, and there is strong evidence to show that many Germans responded positively, denouncing their neighbors, colleagues, and relatives to the secret police. The police in the police state also rely heavily on extensive networks of informers, both *impressed* and *voluntary* informers (Chapman 1970). The use of informers is not exclusive to police states; it is a technique that is also widely used by law enforcement agencies in democratic societies (Natapoff 2009). But informers are not always reliable sources of intelligence. The police therefore seek to operate their own sources of intelligence gathering by infiltrating areas of social and political life. Again, the strategy of infiltration is as much a practice of police states as it is of democratic states.

The police in Nazi Germany were effective in destroying initial opposition to the regime and subsequently perceived enemies and undesirables such as Jews and social outsiders. Levels of petty criminality were however comparable to those that pertain in democratic societies. Johnson (2011) has shown that a large proportion of Germans committed crimes on a frequent basis, without much fear of being detected and punished. The reason for that situation was not ineffectiveness by the police; on the contrary, it was because the police prioritize other crimes over petty street-level offenses.

Citizens and the Police State

How do citizens react to police states? This question divides historians of Germany under Hitler and Russia under Stalin, the two quintessential cases of police state in the twentieth century. There are two broad schools of thought.

One school of thought holds that citizens consented voluntarily to the police state. Some studies have produced evidence to show that the Gestapo, for example, was a much smaller organization than it was often thought. Hitler was "so immensely popular among most Germans that intimidation and terror were rarely needed to enforce loyalty" (Johnson and Reuband 2005, p. 329). Gellately (1990) cites election results in support of a view that the Nazi regime was popular among the German people. The coercion the regime applied was aimed at only a small proportion of minorities but that was even done with the approval of the majority of the population. Apart from election results, the other reason for the claim that citizens did not experience the police state as an "all knowing, all powerful, and omniscient" is the size of the secret police. The ratio of secret police to citizens is estimated at 1 per 10,000 residents in the cities of the Third Reich, and usually with extremely limited presence in rural areas (Johnson 2011). The secret police, it is said, were after all not always well resourced, and therefore could not be said to have relied systematically on terror and coercion to induce citizen compliance. As further evidence, scholars argue that the reaction of the ordinary population was that of voluntary supply of information through denunciation of neighbors (Johnson 2011).

A second school of thought contends that police organizations of police states were omnipresent and omnipotent, and that they employed arbitrary powers, repressive tactics, and unimaginable brutality against citizens. Consequently, citizens lived in fear and terror, mindful of the potentially ruthless repercussions from the police. Elections, it is argued, lacked integrity and therefore a poor measure of popular attitudes toward the police state. Far from being a society of "self-policing," terror was widespread.

The Nazis regularly publicized executions, court proceedings, and sentences. The aim of the publicity was to deter potential offenders from underestimating the risk of being caught and punished (Evans 2005).

It is fair to say that police states thrived upon a mixture of coercion and terror, and popular support both from within the security forces and the general population. There is no evidence throughout history to show that any regime relied exclusively on its ability to physically intimidate its subjects or citizens into obedience, not even the most "unjust and blood-minded dictatorship" (Fukuyama 1992, p. 16). The Nazis, for instance, "did not just seek to batter the population into passive, sullen acquiescence. They also wanted to rouse it into positive, enthusiastic endorsement of their ideals and their policies, to change people's minds and spirits and to create a new German culture that would reflect their values alone" (Evans 2005, p. 118). The question that rises is whether one can speak of *legitimacy* under totalitarian regimes. It is a question that recalls a long-standing debate among scholars. Social scientists approach legitimacy (that is, recognition of the moral rightness of power) within the particular historical societies rather than universally. They are fully aware that what makes power legitimate in one society may differ from others, and that the conditions for legitimacy in one may be repudiated by another. This approach does not require the social scientist to make any judgment about the appropriateness or otherwise of the social order she investigates. A clear implication of this line of thought is that it is possible for a researcher to conclude that a police organization is legitimate in the empirical sense (that is, it finds wide moral acceptance among citizens) and yet for that researcher to believe that that organization is deeply unjust or even "evil."

It is on this conclusion that moral philosophers and some political scientists depart from Max Weber. For them, legitimacy relates to whether by some objective standards of ethical evaluation, a claim to legitimacy can be recognized as valid. The contention is that one cannot simply reduce legitimacy to a matter of fact, the fact that citizens hold a certain belief about a regime. On the contrary, the concept should signify a normative evaluation of the correctness of the procedures, the justification for decisions, and the fairness with which regimes treat their subjects (Grafstein 1981). The full implication of this approach is that there is a need to connect analysis of legitimacy to theories about justice (Bottoms and Tankebe 2012). That is a discussion beyond the scope this entry. The point to note here, however, is that a focus on the public actions or behavior of citizens as the measure of their reactions to a regime, especially one that exercises unrestrained power, is unlikely to tell the whole story about power relations; indeed, it is likely to lead to the erroneous conclusion that "subordinate groups endorse the terms of their subordination and are willing, even enthusiastic, partners in that subordination" (Scott 1990, p. 4). What is known so far about the reactions of citizens to police states offers no assurance against this error.

Conclusion

It is commonplace to read from newspapers, and even from scholarly work, that some democratic societies are on a pathway to becoming police states. Such claims often arise from evidence that those states have undertaken certain measures to facilitate a greater surveillance of the population or a section of that population (e.g., the US Patriot Act and the UK CONTEST strategy for counterterrorism) and other forms of intrusion into private liberties of citizens. By any account, these are poor indicators of the police state; no state, democratic and totalitarian, can hope to respond effectively to threats in the modern world without some level of surveillance of (some) its population.

The absence of conceptual clarity regarding the category of police state suggests that the greatest immediate need in assessing the utility of that category has to start with attempts to clarify its meaning. It appears that criminology can contribute toward that endeavor from two interrelated standpoints. First is to return to

Edwin Sutherland's well-known definition of criminology as the study of "the processes of law-making, of law-breaking, and of reacting to the breaking of laws" (Sutherland 1939, p. 1). At the heart of this triumvirate is the question of power, and how it is exercised. A second and related issue is for criminology to engage with the political science literature with the aim of procuring a proper understanding of democracy. That literature suggests that democratic societies are characterized by a universalistic ideological claim about human equality, that all human beings are of equal worth and therefore entitled to equal respect and treatment. Consequently, any exercise of power must do so with respect for the principles of individual liberty and equality. Democratic societies attempt to achieve this through mechanisms of democratic accountability of the police, including external oversight of police institutions that is independent of government. How effectively such oversight works is open to debate. What is true is that democracies differ from police states on this check on police power, and it is here that the search for conceptual clarity should begin.

Police Integrity

Sanja Kutnjak Ivković
School of Criminal Justice, Michigan State
University, East Lansing, MI, USA

Overview

Police integrity and police misconduct are closely related; traditionally, the discussion of police integrity typically would focus on the events that signal the *lack* of integrity (e.g., forms of police misconduct and the ways of controlling them). Since the mid-1990s, the focus has shifted on police integrity, which, in turn, allows for the exploration of a broader concept – the development of a high-integrity police agency. Police integrity is defined as "the normative inclination among police to resist temptations to abuse the rights and privileges of their occupation" (Klockars et al. 2006).

Although police integrity could be associated with the moral virtues of individual police officers, starting with the writings by Herman Goldstein in the 1970s, the idea has started to develop that this "bad apple" theory of police corruption is inadequate and that a more organizational approach should be used instead. Klockars and colleagues (Klockars and Kutnjak Ivković 2004; Klockars et al. 1997) built upon this view and proposed their theory of police integrity. The theory features four dimensions: organizational rulemaking, detection, investigation, and discipline of rule violations, curtailing the code of silence, and the influence of public expectations and agency history on police integrity. The accompanying methodological approach has been utilized to survey police officers and to detect the contours of police integrity in nearly 20 countries across the world. Other research on police integrity explores the mechanisms used to enhance integrity and accountability, such as the early warning systems and citizen reviews.

Police Integrity

Introduction

In the 1990s, a wave of police misconduct scandals shook the country, from the police corruption scandal in New York, which prompted the establishment of the Mollen Commission, the Rodney King beating, which resulted in the establishment of the Christopher Commission, the Abner Luima sexual violence case in New York, which resulted in $8.75 million dollar settlement, and the Rampart Division scandal in Los Angeles. In 1997, the Office of Community Oriented Policing Services (COPS) and the National Institute of Justice (NIJ) held a national symposium bringing together policy makers and social scientists to address this emerging problem. A natural tendency would be to anchor the conference on the events that signal the *lack* of integrity. That is, the discussion would center on various forms of misconduct and the ways of controlling them. As Hickman and colleagues (2004, p. 1.1) put it, "[a]ll too often we infer integrity from its demonstrated absence. That is to say, research that focuses on corruption infers ideas about integrity absent its measurement." Instead, the COPS/NIJ team decided to use the term *police integrity* as the guiding theme for the conference (Greenberg 1997, p. v):

> The focus on "police integrity" opened a whole new domain. Although previous research, study, and experimentation had focused on critical issues such as corruption and excessive use of force, these approaches, had, in fact, revolved around single dimension. As a result, the solutions were constricted in that they were derived out of a need to control unwanted behaviors of individuals. In comparison, police integrity guided the focus on

> the broader domain of developing a healthy organization that would serve to reinforce and maintain the good character and constructive motivations of many of the individuals joining the ranks of law enforcement.

In July of 1996, about 200 police leaders, politicians, lawyers, and researchers attended a three-day National Symposium on Police Integrity in Washington, D.C. (Gaffigan and McDonald 1997). Among the participants who tried to define police integrity, the preferred approach was to envision a police officer with high integrity and list the characteristics (e.g., virtues, values, and character traits) that separate this police officer apart from other police officers of lower integrity. The characteristics explicitly listed at the Symposium were allegiance, courage, honor, honesty, prudence, trust, effacement of self-interest, intellectual honesty, justice, morality, principled behavior, responsibility, and dedication to mission (Vicchio 1997). Mark Moore was in charge of summarizing the findings of the symposium; he wrote that "[w]hat we mean by integrity and professionalism is law-abiding character, technical confidence, neutrality, distance – in Steve Vicchio's wonderful phrase, 'the effacement of personal interest' – and probably some notion of courtesy and client responsiveness" (Moore 1997, p. 63). Similarly, Hickman and colleagues wrote in their introductory remarks to a co-edited book on police integrity that "police integrity refers to the underlying values and ethical attachment of the police and how those values and ethics affect police behavior" (Hickman et al. 2004, p. 1.1).

These lists of characteristics contain expected individual police officers' character traits. As Klockars and colleagues argue (2006, p. xiv), "[t]he fact is that *any* virtue – charity, compassion, decency, faith, loyalty, passion, patience, and perspective, to add but a few to the list mentioned at the Symposium – is at least arguably as crucial to the integrity of a professional police officer as any other and this approach gives us no guidance whatsoever in prioritizing this litany." Yet, some of the officers who exhibit these characteristics may decide not to act in accordance with high integrity, just like the police officers who do not possess many of these characteristics may decide to act in accordance with high integrity. Finally, these character traits are features of individuals and they close the possibility that police integrity could be an organizational feature as well.

Since 1996, the issue of police integrity has been discussed at several conferences ("the 1999 NIJ/NYU Seminar on Police Integrity and Democracies; the 1999 *Strengthening Police-Community Relationships* conference; the 2000 biannual conference *Policing in Central and Eastern Europe: Ethics, Integrity, and Human Right* (Pagon 2000)*;* the 1998 *Sixth International Conference on Ethics: Integrity at the Public-Private Interface* (Huberts and van den Heuvel 1999")), and continues to be explored bi-annually at corruption conferences such as the *Global Forum against Corruption and Safeguarding Integrity* and the Transparency International's *International Anti-Corruption Conference*. The US Department of Justice provided a publication addressing the *Principles for Promoting Police Integrity* (2001). The co-edited book *Police Integrity and Ethics* (Hickman et al. 2004) contains chapters addressing various aspects of police integrity. However, the understanding of what police integrity is, and what should be covered under this topic, varies substantially across conference organizers, presenters, and authors. A substantial portion of the literature seeks to develop integrity-enhancing mechanisms or mechanisms that would control police misconduct (Pope 2000; Transparency International 2001; U.S. Department of Justice 2001; See ▶ Control of Police Misconduct).

Yet, it seems that even the basic debate regarding what constitutes police integrity has not been resolved. Sam Walker, a leading expert on police accountability, points out that "[t]he issue of police integrity is extremely important and has received an increasing amount of public attention among policy makers and the general public. Unfortunately, the academic literature has not adequately addressed this very important subject" (2004, p. vii).

Definition

Klockars and colleagues (Klockars et al. 2006) have provided a definition of police integrity that goes beyond the traditional focus on individual police officers' character traits and allows for the organizational approach toward it. They have also accompanied the definition with a theory of police integrity and the methodological approach toward its measurement. Klockars and colleagues (2006) define police integrity as "the normative inclination among police to resist temptations to abuse the rights and privileges of their occupation." According to the authors (Klockars et al. 2006), this definition has six critical components.

Normative – The normative aspect of the definition emphasizes that integrity is based on the moral norms of right and wrong (Klockars et al. 2006, p. 1) that tell people what they should or should not do. Thus, integrity combines a belief in moral values with an inclination to behave in accordance with that belief; "[j]ust as a belief in honesty inclines one to avoid lying and a belief in fidelity obliges one to be faithful, integrity requires not only a belief that certain behaviors are right or wrong, but also actions that are in accord with those beliefs" (Klockars et al. 2006, p. 2).

Inclination to Resist – This part of the definition emphasizes the difference between attitudes and behavior. The authors do not expect that the person of high integrity will always behave in accordance with these values. Rather, they discuss a general problem that people who believe in honesty sometimes lie; people who believe in fidelity sometimes are unfaithful; and people of integrity sometimes do things they know are wrong. Three dimensions of the relation between police attitudes of integrity and police misconduct are addressed.

The first point the authors emphasize is that, while integrity describes the normative inclination to resist temptations, integrity is not the only source (Klockars et al. 2006, p. 3). Other possible candidates include the lack of imagination, lack of opportunity, fear of discovery and public humiliation, shame, punishment, or a simple unfavorable risk/reward calculus as potentially critical in ensuring that police officers behave honestly. The second point the authors emphasize is that that attitudes of integrity put at least some pressure on police officers who share them to actually avoid wrongful behavior. Because these attitudes of integrity may lead police officers to comply with the rules and, at the same time, may not necessarily be the driving force behind compliant behavior, the authors have decided to refer to integrity as the *inclination* to resist rather than the actual resistance to temptations. The third point the authors emphasize is that the direction of the causal relation between attitudes of integrity and behavior of integrity is not always absolutely clear. In particular, while attitudes may cause behavior, behavior may also cause attitudes. Requiring of police officers to behave in accordance with integrity may lead them to adopt the attitudes of integrity as well.

Police – Klockars et al. (2006) emphasize that integrity is a characteristic of the "police," without specifying that this is a characteristic of individual police officers or police agencies. This reflects the view that integrity may be a feature of an individual police officer, a group of police officers, a subunit of a police agency, a whole police agency, or police agencies. The authors caution that the discussion about police integrity easily lapses into the discussion of integrity at the police officers' individual level. Yet, police integrity is also an organizational feature – a feature of police agencies, organizations, and institutions – and we can discuss organizational cultures of police integrity. However, the discussion of the dynamics and the relevant correlates of police integrity will differ depending on the level of integrity under discussion (e.g., individual, organizational); "[h]ow one understands and explains the psychology of integrity of an individual police officer will most certainly differ from the understanding and explanation of the evolution of a culture of integrity in a police agency" (Klockars et al. 2006, p. 3).

Temptations – The motivation or the reasons why police officers engage in misconduct could vary dramatically across forms of police misconduct, individual police officers, and police agencies. The most obvious of these temptations is *gain*, the monetary or non-monetary reward for type of police misbehavior, a typical feature of traditional police corruption. However, other forms of police misconduct are not necessarily motivated by gain; different forms of police misconduct are by no means the product of a similar, singular, or even ignoble temptation. The example of use of excessive force is particularly illustrative (Klockars 1995, p. 17):

> . . .[the excessive force] need not (and usually will not) be the product of malicious or sadistic behavior. It can spring from good intentions as well as bad, mistakes and misreading, lack of experience, overconfidence, momentary inattention, physical or mental fatigue, experimentation, inadequate or improper training, prejudice, passion, an urge to do justice or demonstrate bravery, misplaced trust, boredom, illness, a specific incompetence, or a hundred other factors that might influence an officer to behave in a particular situation in a less than expert way.

Klockars et al. (2006) conclude that the methods used to control misconduct should differ depending on the type of temptation and argue that the methods used to control corruption could be quite different for the methods used to control the use of excessive force. They also infer not only that the contours of integrity may be very different in different police agencies, but also that the contours of police integrity within the same police agency could be different depending on the form of police misconduct. They argue that police integrity need not be a uniform phenomenon. Consequently, "it is not difficult to imagine a police organization or subculture that was highly intolerant of officer theft, soliciting bribes, taking kickbacks and other acts of corruption and at the same time was much more accepting of discourtesy, excessive force, perjury, forging records, fabricating evidence, or unwarranted or illegal searches" (Klockars et al. 2006, p. 4). The authors proceed to note that one could also expect that police officers who succumbed to the temptations of one variety (e.g., gain) may also be more likely to succumb to the temptations of another variety (e.g., prejudice).

Abuse – A crucial element of the definition is the concept of abuse. In many situations, the abuse of office is obvious (e.g., a police officer accepts a bribe in exchange for letting the citizen caught violating the speeding limit). However, the discussion of whether particular behavior is abusive is confounded by two possible arguments. The first argument flatly denies that the behavior in question is abusive. For example, the police officers' acceptance of discounts, holiday gifts, free food, and liquor could be viewed as gestures of goodwill, hospitality, and/or gratitude. The second argument recognizes that the behavior could be abusive, but justifies and excuses it as an expression of "street justice." As Klockars and colleagues (Klockars et al. 2006, p. 5) elaborate, "[a] common theme is that police are 'human' and cannot be expected to behave without normal human emotions in situations in which they are insulted, defied, assaulted, deceived, shocked, repulsed, disgusted, or horrified by the conduct of those they police."

The Rights and Privileges of Their Occupation – Policing is a highly discretionary, coercive activity that routinely takes place in private settings, out of the sight of supervisors, and before witnesses who are often regarded as unreliable. Policing as an occupation is rife with opportunities for misconduct, as independent commission reports and scholarly studies clearly demonstrate (see, e.g., Christopher Commission 1991; Knapp Commission 1972; Manning and Redlinger 1993; Mollen Commission 1994; Pennsylvania Crime Commission 1974).

Causes of Police Integrity

Until relatively recently, the prevailing administrative view of integrity (at least in the United States) was to associate integrity with the moral virtues of individual police officers; consequently, the tendency was to fight corruption, for example, by carefully screening applicants for police positions, pursuing defective officers aggressively, and removing them from their police positions before their behavior spreads throughout the agency (see, e.g., Knapp Commission 1972). In the 1970s, Herman Goldstein (1975) embarked on the pioneering work and argued that this “bad apple” theory of police corruption is inadequate and that a more organizational approach should be used instead.

Klockars and Kutnjak Ivković and their colleagues (Klockars and Kutnjak Ivković 2004; Klockars et al. 1997) built upon this view and proposed their theory of police integrity. This approach stresses the importance of four distinct dimensions, each of which is profoundly organizational in nature.

Organizational Rulemaking – The first dimension of the organizational theory of police integrity addresses organizational rule making (see, e.g., Klockars and Kutnjak Ivković 2003; Klockars et al. 1997) and relates police misconduct to the ways police agencies create, teach, and enforce rules explicitly prohibiting misbehavior (Klockars and Kutnjak Ivković 2003, p. 1.4). In countries with highly decentralized police organization, as is the case with the United States, police agencies could differ dramatically in the nature of the behavior they prohibit. First, agencies could differ in terms of whether they have official rules at all. Some agencies may have no written rules, particularly if they are very small (fewer than 10 police officers), while others, particularly if they are very large (with 500 sworn officers or more), may have extremely lengthy official rules (e.g., standard operating procedures, official rules). Second, when they do have the official rules established, the behaviors those rules allow and prohibit may differ substantially from agency to agency. This is particularly the case for less serious forms of misconduct such as *mala prohibita* corrupt behavior (e.g., receipt of favors, gratuities, small gifts, free meals, and discounts, off-duty employment).

The problem of organizational rulemaking is further complicated by the fact that in many agencies, while an agency’s official policy formally prohibits certain activities, the agency’s unofficial policy tolerates them (see, e.g., Knapp Commission 1972; Mollen Commission 1994). The obligations of rulemaking require police agencies not only to develop both formal and informal rules that specify agency expectations of integrity, but also to teach these rules and enforce them. As Klockars and colleagues conclude (2006, p. 9), “[i]n a police agency of integrity police officers ought to know the agency’s integrity relevant rules, understand the agency’s rationale for them, and believe in the rightness of both.”

Detecting, Investigating, and Disciplining Rule Violations – The second dimension of the organizational theory of police integrity focuses on both the creation and maintenance of activities that permit detection, investigation, and discipline of misconduct (see, e.g., Klockars and Kutnjak Ivković 2003; Klockars et al. 1997). The activities are heterogeneous by nature. They include not only reactive and proactive investigations by police agencies, but also inspections, audits, early-warning systems, external reviews, reception of citizen complaints, and integrity testing. The extent to which these activities have been implemented and actually used by a police agency varies substantially across the agencies. According to Klockars and colleagues (2006, p. 9), in a police agency of integrity the occupational culture of the agency will support the introduction and management of the activities employed to detect, investigate, and discipline rule-violating behavior.

Circumscribing “The Code” – The third dimension of the organizational theory of police integrity emphasizes the police agency’s obligation to circumscribe the code of silence (i.e., “the blue curtain,” “the code”). The code of silence refers to the norm of the police culture which prohibits reporting of misconduct by fellow police officers (see, e.g., Klockars and Kutnjak Ivković 2003; Klockars et al. 1997). However, although potentially viewed as a single norm that could apply to all police officers, the reality is that the code of silence could vary substantially. First, exactly what behavior – in terms of its nature and seriousness – is covered by the code varies enormously across police agencies. The code of silence in some agencies may cover only the least serious forms of corruption (e.g., the acceptance of gratuities and small gifts), while in others it can cover even the most serious forms of corruption (e.g., thefts from crime scenes, the acceptance of bribes from motorists caught speeding). Second, to whom the benefit of the code's protection is extended could also vary extensively. In some agencies, the code could be limited to protect only misconduct by partners, viewed a testimonial immunity that would be a mirror image of traditionally privileged relationships (husband and wife, physician and patient, lawyer and client). In other agencies, the code could protect misconduct not only by police partners, but also by all police officers working on the same shift, section, or unit. Klockars and colleagues (2006, p. 9) write about the close relation between the code of silence and integrity:

> Many police administrators probably understand that circumscribing both whom and what The Code covers should be an administrative priority . . . However virtually all police administrators were line officers at some point in their careers, and thus they have at least an appreciation, if not an affection, for the bonds of collegial loyalty and fraternal support that are part of the subculture of policing. To the extent that circumscribing The Code requires the weakening of those bonds of loyalty and support, it is a task that not a few police administrators approach with ambivalence. A police agency of integrity is one in which the occupational culture is intolerant of those who abuse the rights and privileges of their office.

The Influence of Public Expectations and Agency History on Police Integrity – The fourth dimension of the organizational theory of police integrity relates to the influence of the social and political environment in which police institutions, systems, and agencies operate (see, e.g., Klockars and Kutnjak Ivković 2003; Klockars et al. 1997). This theory argues that the integrity of a police agency is affected by the larger social and political environment in which it operates (Klockars and Kutnjak Ivković 2003). Although this understanding – the idea that the police agency is affected by its environment – is the underlying assumption of virtually all historical studies of police, Reiss and Bordua (1967; Reiss 1971) were the pioneers who provided the first systematic exploration of the topic.

When the society at large expects ethical behavior of its officials, police agencies are also more likely to set high expectations and expect ethical behavior from its employees. Not only do the expectations of integrity differ enormously across the world (see, e.g., Transparency International Corruption Perceptions Index), but they could also differ within the same country. Using the United States as an example, Klockars and colleagues (2006, p. 10) argue that some parts of the country have long and virtually uninterrupted traditions of persistent police corruption (e.g., Chicago, New Orleans, Key West), some areas have equally long traditions of integrity (e.g., Milwaukee, Kansas City), and other areas have undergone repeated cycles of scandal and reform (e.g., New York, Philadelphia, Oakland). In the end, Klockars and colleagues conclude that "not only public expectations about police integrity exert vastly different pressures on police agencies in different areas, but also police agencies of integrity may effectively resist such pressures" (2006, p. 10).

Measuring the Extent of Police Integrity

Klockars and Kutnjak Ivković (2003) designed a questionnaire that seeks to measure the extent of police integrity in systematic, standardized, and quantitative manner. The respondents were provided with a letter asking them to assume that the officer described in the scenarios had been a police officer for 5 years, had a satisfactory working record, and had not been disciplined in the past. The first version of the questionnaire contains 11 hypothetical scenarios focusing mostly on corruption and ranging from those merely giving an appearance of a conflict of interest to those describing incidents of bribery and theft (Klockars and Kutnjak Ivković 2004; Klockars et al. 1997). The second version of the questionnaire went beyond seeing police integrity as the opposite of police corruption and includes a range of police misconduct such as the use of excessive force, failure to execute an arrest warrant, and falsification of official record, as well as police corruption. Each scenario is followed by the same set of seven questions that ask about police officers' knowledge of official rules, their opinion about the seriousness of particular rule-violating behaviors, the discipline these behaviors should receive and would actually receive, and their estimates of how willing they would be to report such behavior.

The first version of the questionnaire has been distributed across 30 police agencies in the United States (Klockars et al. 1997, 2000), characterized with a decentralized police. The authors reported substantial differences across the agencies. Although the sample of police agencies is not nationally representative, but a convenience sample, it nevertheless illustrates the point that the level of police integrity could vary substantially across the police agencies. Klockars and colleagues (2000) created a ranking of police agencies based on their levels of integrity. The authors (Klockars et al. 2006, p. 37) note:

> In some police agencies in our sample police officers found nearly half of the behaviors described in our sample to be of sufficient seriousness to merit dismissal. In those agencies officers also claimed that they and their police colleagues were highly likely to report all but the least serious forms of misconduct. In other agencies only theft from a crime scene was, in the opinion of a plurality of respondents, sufficient grounds to fire a police officer and not even that offence would motivate the majority of officers in such agencies to break the Code of Silence and report the misconduct of a colleague.

A comparison of the results from the two large municipal police agencies, one ranked at the top and one at the bottom of the police integrity scale, shows large differences in how serious police officers perceive misconduct, what discipline they expect and approve, and how wiling they seem to be to report the fellow officers' misconduct. With one exception, police officers from the agency at the bottom of the police integrity scale would not expect the police officer to be dismissed for any of the behaviors described in the questionnaire, while the police officers from the agency at the top of the police integrity scale expected dismissal in four most serious cases. In addition, Klockars and colleagues (Klockars et al. 2006) found stark contrasts in the extent of the code of silence between the two agencies: in the agency ranked at the top of the integrity scale, the majority of police officers reported that their colleagues would report their fellow officer who engaged in the behavior described in all cases. On the other hand, the majority of police officers from the agency ranked at the bottom of police integrity scale did not expect their fellow officers to report misconduct in any of the described cases.

However, as the subsequent study of three large municipal police agencies (identified to be in the top third of the police integrity scale) demonstrates, police agencies can be quite diverse in the ways they create and maintain their integrity (Klockars et al. 2006). The authors studied each of these three agencies – Charleston, South Carolina; Charlotte-Mecklenburg, North Carolina; and St. Petersburg, Florida – for two years and have developed their integrity profiles.

Since 1996, nearly two dozen studies have used this first police integrity survey. Three studies (Micucci and Gomme 2009; Burbach Raines 2009; Marche 2009) analyzed the 30-agency data collected by Klockars and colleagues, and another four studies (Chappell and Piquero 2004; Hickman, et al. 2004; Schafer and Martinelli 2008, Gottschalk 2009) used the police integrity questionnaire as the basis for their surveys of other US police agencies. In addition to the US agencies, the same questionnaire has been used in nearly 20 countries across the world, including Austria, Bosnia and Herzegovina, Canada, Croatia, the Czech Republic, Finland, Hungary, Japan, the Netherlands, Pakistan, Poland, Slovenia, South Africa, Sweden, and the UK (see Klockars et al. 2004).

Although the list of the countries participating in the survey is far from exhaustive, the findings clearly show that the levels of police integrity differ substantially and significantly, analogously to the tremendous variation in the levels of police integrity across the 30 US police agencies. The nature and extent of police integrity measured in the countries such as Finland and Sweden is quite different from the nature and extent of the police integrity measured in countries such as South Africa and Pakistan (see Klockars et al. 2004). The differences are visible not only in the police officers' perceptions of seriousness and willingness to report, but also in their views of appropriate and expected discipline (Klockars et al. 2004, p. 13):

> It appears that in each country the seriousness of officers' misconduct is, in large part, determined by the absolute level of discipline the organization is expected to visit on the offending officer. In almost every case, when the police organization is expected to punish a offense very severely, officers regard that offense as serious. Conversely, when organizations do not punish misbehavior severely, as is the case in Hungary, Pakistan, and South Africa, officers seem to have little ability to distinguish among the levels of seriousness with regard to misconduct. Perhaps the most dramatic finding that emerges from examining the contours of integrity concerns the worldwide prevalence of the code of silence.

The authors continue to note that, in five out of 14 countries included in the book "Contours of Police Integrity," the code of silence would cover misconduct described in *every* scenario (Klockars et al. 2004, p. 17). In addition, the code of silence would protect behaviors such as the acceptance of a bribe from a person caught speeding – a violation of the penal code – in nine out of 14 countries.

The heterogeneity of police integrity is influenced by a host of reasons; a police agency's local social, political, economic, and legal environments influence its level of police integrity. Research indicates that countries that belong to the same category along one dimension (e.g., economic development, geographic location) still have different levels of police integrity. This is the case for both developed democracies (e.g., the USA and the UK) and countries in transition (e.g., Croatia and Hungary), as is the case for countries from Northern America (e.g., the USA and Canada) and Europe (e.g., Croatia and the Netherlands).

The second version of the questionnaire, exploring the resistance to various sources of temptations (not only police corruption), has been developed as well. The initial work by Klockars and colleagues explored the extent of police integrity in three US police agencies using both versions of the questionnaire (see Klockars et al. 2006). The comparative efforts are underway, with the first results coming from Croatia (Kutnjak Ivković 2009), South Korea (Kutnjak Ivković and Kang 2011), and South Africa (Kutnjak Ivković and Sauerman 2012).

Other Research on Police Integrity

The issues of police integrity and police misconduct are closely interconnected. Please see separate entries addressing different forms of police misconduct (e.g., "police corruption," "use of excessive force," "police lying"). A few writings *explicitly* connect police misconduct (or any of its specific forms) with police integrity. For example, Garner and colleagues (2004) studied the patterns in the police use of force as a way of measuring police integrity. The authors (Garner et al. 2004, p. 6.119) conclude that, although the average extent of force used by the police during a typical arrest is about equal across racial categories (and thus should be taken as an indication of police integrity), the extent of force used by the police during a typical arrest of male suspects is larger than the quantity of force used during a typical arrest of female suspects (and thus should be taken as an indication of the lack of police integrity).

In 2001, the US Department of Justice published *Principles of Promoting Police Integrity*. The publication, available in print and on the Internet, lists the "best practices" for promoting integrity. The first part of the publication explores the use of force, complaint and misconduct investigations, training, recruitment, hiring, and retention, as well as general principles of promoting accountability and effective police management. The second part of the publication contains examples of promising police practices and policies, as well as the research projects on police integrity funded by the US Department of Justice. Many of the practices that should be used to enhance integrity (e.g., complaint misconduct investigations, the early warning systems, citizen reviews), at the same time, are mechanisms of accountability. Publications like that, focusing on the specific mechanisms or practices that should be used to enhance integrity, have significantly grown in numbers since the late 1990s. A separate body of research focuses on these mechanisms. Please see the entry "Control of Police Misconduct."

Police Leadership Styles

Joseph A. Schafer
Department of Criminology and Criminal Justice, Southern Illinois University, Carbondale, IL, USA

Overview

Leadership is of central importance to the operation of effective, efficient, and equitable police organizations, yet it remains an elusive concept. It is clear that good leadership is vital to ensure that an agency operates in a manner that preserves public legitimacy and trust. Among the compelling evidence in support of this assertion is the fact that a crisis of leadership is often associated with major scandals in police agencies. Despite recognizing that strong leadership is of vital importance, scholars and police organizations have struggled to measure and understand a number of key questions, including what leadership styles are commonly used by police supervisors, when and how supervisors can influence subordinate performance and output, and what distinguishes between effective and less effective leaders.

This entry considers the topic of police leadership styles. Literature considering leadership in police organizations can be separated into two major approaches. First, some write about how general theories of leadership and organizational behavior might be used to explain aspects of police organizations (Adlam and Villiers 2003). This is often the approach taken in textbooks and professional literature. The second approach examines the styles and methods supervisors use in seeking to influence subordinate personnel (Engel 2001). The entry begins by briefly reviewing the dominant implications arising from these two traditions. It continues with an examination of what research evidence suggests about the ability of police leaders to influence unit productivity and output. The entry concludes by considering how different generations of police personnel and leaders might respond to different styles of leadership.

Introduction

At the onset it is important to distinguish between police management and police leadership. Police supervisors are often interchangeably referred to as managers and leaders. Management is the control of routine processes and the maintenance of the status quo. Leadership emphasizes changes that will improve processes, personnel, and organizations. Effective supervisors tend to excel at both management and leadership, because both skill sets are important. However, they are not of the same quality, and policing has tended to emphasize management far more than leadership to its own detriment. It should also be noted that leadership is a behavior that can be independent of formal rank or authority. Some very prominent and influential leaders in police organizations are front-line personnel. Much of what has been written about police "leadership" is actually describing aspects of managing, administering, and supervising police organizations and personnel.

The emphasis of this entry is on true leadership, not what is often described in policing literature (including academic scholarship, which has tended to confuse management and leadership). Leaders innovate, take calculated (and often necessarily) risks, encourage and develop personnel, and are willing to challenge tradition and status quo. This does not imply that leaders blindly challenge anything, everything, and everyone in the organization. Rather, they have the courage to confront the pointless, mindless, counterproductive aspects of their organizations and its practices. This tendency is sorely lacking in many aspects of the modern public sector, particularly policing.

Though much has been written about leadership in broader settings, especially in corporate, military, political, and athletic contexts, policing scholars have given limited empirical consideration to matters of leaders and leadership. The traditional perspective found in police literature tends to cast leaders as using a narrow range of directive and controlling styles; as a consequence, supervisor-subordinate relationships are characterized by tension and animosity (Rowe 2006; Van Maanen 1984). More recently, research evidence has suggested an alternative perspective. Leaders have increasingly been framed as using a range of styles and approaches when interacting with those they seek to influence. These clusters of leadership approaches go beyond the traditional, authoritarian, and autocratic supervisory approaches that once dominated policing (Kuykendall and Unsinger 1982). It is quite likely this change reflects a very real transformation in leadership styles observed in policing.

Major Theories Relevant to Police Leadership

A wide array of theories has been offered to describe and explain the behavior of individuals and organizations. Some of the earliest studies of leaders and leadership tended to focus on the "great man/great woman" tradition. Well-regarded leaders were studied in a biographical format in the hope of deriving an understanding of the behaviors and actions that contributed to their perceived success. Over time, studies expanded this tradition by examining samples of recognized leaders. Modern research continues to seek an understanding of the casual links between leader traits and subsequent efficacy; what characteristics, habits, and behaviors differentiate leaders who are most effective from their peers?

Because early studies were concerned with the traits and habits of leaders, they tended to pay less attention to followers. The latter were often seen as liabilities and risks that organizations and supervisors needed to manage through control, policy, procedure, reporting requirements, and similar of mechanisms. This was based on what Douglas McGregor (1960) referred to as Theory X assumptions, and it led to a very distinctive, controlling, directive form of management. In contrast, McGregor described Theory Y approaches that were predicated on the belief that people can achieve good work outcomes when they are given the proper motivation and environment. As a result, Theory Y management approaches emphasize creating the optimal environment in which employees can be engaged and empowered, rather than seeking to regulate and constrain their choices and behavior.

James Burns observed a similar duality in the nature of leader-follower interactions, writing about "transactional" and "transformational" approaches to leadership (1978). Transactional leaders were seen as emphasizing exchanges and quid pro quo arrangements with the personnel they supervised. Followers were provided with an understanding of what they were to accomplish and how it was to be achieved; they also understood what they would receive for adhering to those expectations and the consequences of violating accepted practices. The role of leaders in such arrangements was not to provide leadership; in actuality, they were there to monitor and manage followers, grant rewards when earned, and issue discipline when needed. Followers were given "carrots" (rewards) for good behavior and faced the risks of "sticks" (punishments) if they did not produce the expected outcomes in the expected way.

In contrast, transformational leadership was characterized as a process of seeking to improve organizations, operations, and personnel. Leaders truly lead rather than just managing and maintaining the status quo. To accomplish this outcome, transformational leaders sought to inspire employees to embrace a shared vision and empowered them to use discretion and creativity in the pursuit of that outcome. Followers were given the freedom to make choices, the authority to develop new ideas, and the independence to identify and implement ways to pursue the leader's vision. In other words, followers were viewed as being smart enough and creative enough to be entrusted to solve problems, pursue new ideas, and act in a way that was consistent with the vision of the leader. This was done without requiring followers to engage in burdensome reporting requirements, bureaucratic permission seeking, and mindless compliance checks.

Though not universally embraced, there is also a sense in more contemporary perspectives that the models, styles, and traits that generate leadership efficacy are situational. This idea was first expressed by Tannenbaum and Schmidt (1958) in writing about management in the corporate world. They arrayed leadership approaches on a continuum from "boss centered" to "subordinate centered," noting that a major challenge for (then) modern managers was deciding where to fall on the continuum in a given situation. In policing contexts, this suggests that "what works" for a leader is rarely universal, instead varying based on context, culture, position, objectives, the environment, the strengths and predispositions of a leader, and the preferences and characteristics of those the leader seeks to influence. An officer or leader who is ineffective in one agency or assignment might perform quite well in a different set of circumstances or vice versa. It has also been argued that leadership is not the same at all levels of an organization. The behaviors that make a leader an effective patrol sergeant might not yield the same outcomes for the leader when promoted to serve as a lieutenant overseeing the records division. Leaders need to be conscious of the fact that the approaches used in a given situation and/or to achieve a given end might not yield universal success.

Leadership is a challenging process, but it can be the element that distinguishes organizations that are "great" from those that are merely "good." In addition, leadership is a behavior, not a position within an organization. Leaders are people who demonstrate certain skills and habits, regardless of their formal rank or office. Too often it is presumed that all supervisors are leaders and that only supervisors can lead. Increasingly there is awareness and celebration of the idea that every officer must be a leader, at least in some contexts. Informal leadership is very difficult to measure in any type of organization, but it can have a profound influence on personnel and operations (Schafer 2001). Though the influence of informal police leaders is generally evident in policing scholarship, research has not been able to empirically define when and how it matters.

Theoretical perspectives and explanations regarding leadership extend far beyond the brief ideas reviewed in this passage. What is of relevance for this discussion are the ideas that leadership is situation but that modern perspectives tend to emphasize involving employees in the decision-making process. It is sometimes observed that leadership is something done *with*, not *to*, others. Further, it should be recognized that good leadership is actually quite difficult to achieve. Effective leaders continually seek ways to improve their performance as they confront new and different challenges (Schafer 2012).

Leadership Styles Displayed in Policing

Despite the presumed importance and influence of informal leaders in policing context, studies of police leadership have focused on studying formal supervisors. As a consequence, what is known about leadership styles and their influence (or lack thereof) is based on studies of those who have been awarded a rank. Such supervisors may or may not demonstrate actual leadership behaviors as they carry out their duties. Far less is known about leaders in police organizations, who may or may not hold an official rank in their agency (Van Maanen 1983). This section reviews literature seeking to describe the management and leaders styles police supervisors have displayed in prior studies. There is a distinction between what scholars found when they first began to study police supervisors and what is more often seen in contemporary agencies.

Early efforts to study the management styles of police supervisors did not paint a favorable picture of the level of actual leadership taking place in organizations. Kuykendall and Unsinger (1982) administered a leadership inventory to police managers. Their results suggested that most respondents used a variety of styles in the course of performing their supervisory duties. The most commonly reported management styles were selling, telling, and participation. There was little evidence that supervisors used actual leadership or other forms delegation as a component of their managerial style, though their data was collected in the late 1970s before these types of approaches had entered the discourse of police management. In other words, managers reported a preference to use styles that were oriented more toward "safe" methods emphasizing control and direction of personnel, rather than responses that might be considered more "risky" styles, such as delegating important tasks to subordinate personnel.

Mayo (1985) contended supervisors tended not to trust the skills, loyalty, and judgment of personnel in their agencies. This resulted in the observed practice of police supervisors engaging in micromanagement. Girodo (1998) surveyed police executives from around the world and found most reported leaning toward what might be considered "Machiavellian" approaches. End objectives were achieved not through democratic and participative approaches but through the manipulation of subordinate personnel. This is reflective of the tendency for police agencies to seek to operate as paramilitary organizations that exert top-down control over personnel, communication, and decision making. These traditional styles of police supervision have been subject to extensive criticism because they do not encourage employees to be committed, productive, and creative members of the workforce.

Allen (1982) found the type of supervision (i.e., the use of incentives) was likely more influential than the volume of supervision. Quality was more important than quantity (more contact), though his measures were quite limited. It should also be noted his research was conducted on a 1970s group of front-line police personnel. The education, traits, experiences, and expectations of modern patrol officers are likely quite different than what was seen in earlier eras.

Johnson (2006) studied supervisor influence on traffic and drunk driving enforcement in a collection of agencies in the Cincinnati metropolitan region. His results support that leadership matters, both in terms of the priorities of agency executives and also the priorities of patrol supervisors. Though leadership was deemed important, it was not the only factor influencing enforcement productivity. Organizational factors such as policies, supervision, and bureaucratic requirements do influence when and how officers enforce the law but so do situational factors, officer preferences, and environmental considerations. In other words, even when leadership matters, it is not the only force or factor influencing officers and the decisions they make.

Engel (2001) developed four broad categorizations of supervisory styles that help frame an understanding of different leadership approaches in policing. "Traditional" leaders were highly task oriented and expected aggressive enforcement of the law from subordinates; they were focused on traditional policing outcomes and presumably would have leaned toward transactional relationships with followers (e.g., officers making a lot of arrests and issue a lot of citations would presumably be ranked higher by traditional leaders). "Innovative" leaders were situated further onto the transactional end of the leadership continuum; they shared power with subordinates, sought to have friendly and productive relationships with subordinates, and emphasized community relations. "Supportive" supervisors sought to be a buffer between front-line personnel and top agency leaders; they place less emphasis on accomplishing traditional policing tasks. Finally, "active" supervisors were themselves highly active in front-line policing matters; they had positive views of their subordinates, tended to exemplify the idea of "leading by example," and did not see themselves as radically different than those they supervised. Active supervisors demonstrated the most influenced in the two agencies included in Engel's study.

Beginning in the 1980s, there has been a greater emphasis on democratic and participative approaches to police supervision and leadership (Wycoff and Skogan 1994), though limited advancements have been realized. The promise of such approaches is multifaceted. A leader who engages subordinates in making decisions can tap into the creativity, experience, and intelligence of employees. It is expected that participative approaches can make organizations more adaptable and responsive in the face of shifting and dynamic social environments. Leaders who use these types of approaches do not make all choices unilaterally. They engage subordinates to identify problems, determine priorities, and derive solutions. This does not suggest that all choices and actions are subject to full participation by all employees. Certainly there are aspects of police operations that require command-and-control authority and decision making, but such circumstances are the exception, not the rule. Though there is limited evidence assessing these types of practices, experiences to date suggest promising implications (Steinheider and Wuestewald 2008).

Survey data from police officers finds personnel often express a preference for supportive and participatory leadership styles (Witte et al. 1990). Officers do not like directive and controlling management styles. Instead, they prefer to be led in a process that grants them a voice and input into organizational decisions. This does not suggest that officers do not understand and support the needs of leaders to have ultimate authority. Rather, it implies that, when possible, officers prefer to be able to participate in organizational decision making in an open and democratic manner. Tentative evidence suggests that many police executives and leaders are similarly open-minded in employing nontraditional systems (Steinheider and Wuestewald 2008; Tannenbaum and Schmidt 1958). It is less clear, however, whether those expressions of support translate into actual changes in supervisory style as perceived by employees.

Consideration of supervisory styles in policing should not overlook the role of poor or ineffective leadership. Barbara Kellerman (2004) offered one of the best considerations of this topic in leadership literature. She argued that too often, professional and scholarly discussions of leadership frame leader behavior as benevolent and positive behavior. She and others have argued consideration of leadership needs to acknowledge leaders sometimes use less-than-ideal methods. Some supervisors achieve their objectives while using poor leadership techniques. Some leaders are quite successful but pursue ignoble or evil objectives (Adolf Hitler is the common example of this outcome). People who are generally very good and effective leaders occasionally make mistakes. Leaders who have been successful sometimes “derail” (McCall and Lombardo 1983). Consideration of police leadership styles should not overlook how poor and ineffective approaches can hamper the ability of leaders to achieve their objectives.

The Influence of Leadership

It is generally accepted that police supervisors (who are formally in positions of leadership) can shape various organizational and individual outcomes produced by employees (Engel 2001). Supervisors are thought to have the ability to influence the tone of police operations, helping shape the style, tactics, and outcomes. In reality, it is far easier to believe that supervisors have such a strong and direct influence on officers and the organizations than it is to prove that belief is reality. This is partially a function of the limited amount of quality research studying supervisory and leadership influences in policing. It is also a reflection of the nature of the police organization itself.

In many organizational contexts, supervisors have routine and direct contact with their subordinates. The task environment is also such that employees often have limited discretion, established accountability mechanisms, and routine reporting demands that serve to structure, regulate, and formalize the decisions they make. Police departments are often characterized as a quasi-military bureaucracies characterized by command-and-control relationships between supervisors and subordinates. This tends to support the use of directive supervisory styles, which are predicated on the ability of a manager to closely monitor employee performance.

In reality, officers are frequently separated from their supervisors by both time and space. The nature of police work also means that officers enjoy a wide degree of discretion in performing their duties, particularly the low seriousness events that typify much of police work (Brown 1988; Van Maanen 1983). Additionally, police operations and personnel are influenced by cultural and external forces that serve to condition where, when, how, and to what end police decisions are made. The result is that it has been suggested police agencies are "loosely coupled organizations" (Maguire and Katz 2002). Police managers do not have the time or capacity to effectively monitor the actions of officers on the street. The unpredictable, dynamic, and complex nature of police work also makes it quite difficult for agencies to craft effective policies to govern and guide how officers make decisions in the field. As a result, police personnel are not nearly as restricted by administrative impositions.

On paper and in textbooks, agencies are orderly and control is clear; reality is quite different. This makes leadership (particularly transformational and democratic approaches) all the more important. Directive, controlling, manipulative, and micromanaging approaches actually function to push officers away from organizational objectives and discourage them from supporting the mission and vision of executives. Real leadership (as opposed to management) can help engage, empower, and motivate personnel to support and pursue organizational objectives. Because officers are often performing their duties with no direct supervision and little reliable evidence verifying when, where, and how they perform their duties, having engaged personnel is all the more important. Creating work environments that treat officers in accordance with McGregor's (1960) Theory Y assumptions would, in the aggregate, be expected to produce better outcomes and results for the organization.

As a result of these factors, it is reasonable to expect limitations on the ability of police leadership to influence police personnel. Many of these challenges are far more acute in policing than in other occupational and organizational settings. Police personnel operate in environments with limited direct supervision, handle a diverse range of tasks, and make myriad high-discretion decisions (Allen 1982; Engel 2001; Van Maanen 1983, 1984). Though supervisors and organizations seek to impose policies, protocols, structures, and mandates to condition and direct discretionary behavior, officers enjoy a considerable degree of latitude in performing their duties. This totality of circumstances suggests that leaders will have a limited, but not nonexistent, ability to influence officers. Police supervisors and leaders are able to exert at least a limited degree of influence on personnel.

Much of the research studying supervisory influence has focused on examining traditional policing outcomes, such as enforcement behavior, use of force, and officer misbehavior (Brown 1988; Huberts et al. 2007). Though such considerations are important, they reflect but a narrow range of the tasks to which officers attend and the expectations the public has of their police. Equally important, they tend to focus on the ends, rather than the means, of policing. A small number of studies have attempted to examine issues such as the nature of police encounters with the public and self-initiated efforts officer undertakes to address specific problems. Taken as a whole, researchers have achieved mixed assessments of whether supervisors can influence the behavior of subordinate personnel (cf, Allen 1982; Brown 1988; National Research Council 2004). It should be noted that many of these studies were limited in the types of influence they were studying and the methods that were used to measure specified outcomes.

It has conventionally been assumed that bringing about change in police organizations is akin to "bending granite" (Rowe 2006). In recent years, increasing experience and empirical evidence have begun to suggest this may not always be the case. Jermier and Berkes (1979) studied officers in a Midwestern agency, finding that officers were supportive of leadership approaches that emphasized participation. Officers reported they were less inclined to respond to directive and controlling management approaches. Case studies of community policing have highlighted the role of leadership as a mechanism to facilitate rapid (and at times, radical) organizational transformation (Wycoff and Skogan 1994). Though critics have dismissed the roles of William Bratton and COMPSTAT as causal forces influencing New York City's crime decline, there can be little doubt that his leadership style in NYPD (and elsewhere) has brought about rapid change in climate and culture. Thus, leadership can change police culture, though it is still difficult to determine how and why that outcome is achieved in some instances and not in others.

Several studies based on data collected for the Project on Policing Neighborhoods (POPN) tend to offer some provisional evidence that supervisors can influence front-line personnel (Engel 2001). Importantly, these studies attempted to assess not just the general idea of supervisory influence. Instead, supervisors were categorized based on their general management style. Findings based on the POPN data offer a possible explanation for the mixed results achieved in prior studies by suggesting that variation in supervisory influence is partially a product of dissimilarity in supervisory styles. Not all supervisors use the same approaches in seeking to control, influence, and lead. The methods and styles used by supervisors vary based on the circumstances, timing, and audience, as well as the supervisor's perceptions of various situational exigencies.

Far less is known about the measurement of leadership efficacy beyond considerations of officer performance, output, and conduct. What other metrics might be used and who should provide input on the performance of a given leader? These efforts can be challenging, as they require the development of broader definitions and measures of leader efficacy, which tends to invoke a number of methodological difficulties. Huberts et al. (2007) studied Dutch police officers. They found leadership approaches did influence integrity violations by officers. In particular their results suggested that officers were influenced by strong role modeling by their leaders. When leaders took a strong stance against integrity violations and were perceived to perform their duties with a high moral standard, officers were more inclined to emulate that approach. This is certainly a favorable representation of what might be achieved through leadership, at least based on some important outcomes of relevance to policing.

As a result of this body of literature, several important observations and conclusions can be made about leadership and influence in police organizations. Supervisors can influence front-line personnel, at least in the production of some outcomes using some management styles. Poor leadership practices can also generate real and negative consequences in the workplace, including poor productivity, dissatisfaction, stress, attrition, and absenteeism, among other concerns (Kelloway et al. 2005). Though traditional police leadership approaches were primarily transactional (stick and carrot) approaches, transformational strategies seem more promising in their ability to favorably influence personnel and behavior. There is evidence that followers might prefer such participatory approaches and that leaders are open to their use. To date, however, research has not been able to conclusively contrast the outcomes of transactional and transformational leadership approaches in policing.

Generational Effects

There may be generational and experiential influences that shape the approaches used by supervisors. In the 1960s and 1970s, there was a renewed emphasis on college education for police personnel. Pursley (1974) compared police chiefs based on education, experience, and involvement in professional activities (belonging to national professional associations, publishing in professional periodicals); he analyzed their responses to a variety of leadership inventories. He found that educated chiefs had less experience (both as officers and chiefs, suggesting they were also likely to be younger), were more connected with professional groups and activities, and were more receptive to more transformational leadership approaches (though he did not use this term).

Younger leaders were more willing to support delegating authority within the workforce, allowing subordinates to participate in decision making, embracing more democratic approaches, and supporting less authoritarian and controlling leadership approaches. Thus, when considering how generations influence policing and police leadership, it is not just a matter of different mentalities across groups of different officers. Supervisors from different generations might also have different ideas about how to lead personnel.

Cohen (1980) studied command personnel (captains and above) in the New York City Police Department based on data collected in 1972. He found two primary management styles. Tradition-oriented leaders generally had no education beyond high school. Reform-oriented leaders generally had attended or were attending college. Tradition-oriented leaders were focused on power and authority, while reform-oriented leaders were more participative and emphasized community relations and service. Cohen found that reform-oriented leaders had received lower ratings on internal performance assessments, but he attributed this to the probability that tradition-oriented leaders were evaluating most reform-oriented leaders. Thus, it is would not be surprising to see that the disjuncture in their orientations toward leadership and the broader role of the police might result in less positive performance evaluations.

This holds important implications for understanding leadership. First, it reinforces that leadership is situational; at the very least "good" leadership is a time-bound concept. Cohen's work was being done during a time of transition and reform in NYPD. Second, leadership practices and police personnel might both experience different generations. Several factors contribute to this situation. In general, different generations are distinct from one another based on variation in life experiences, culture, and broader society during their formative years. During eras of transition in policing (the movement out of the traditional model in the 1970s, the proliferation of community policing in the 1980s and 1900s, the emergence of various data-driven and evidence-based policing practices in the 2000s), there is likely to be tension throughout all ranks of police agencies. Personnel who started their career one (or two) ideological generations earlier might be less inclined to adapt their beliefs, values, and practices. Making matters more complicated, the role of leadership in periods of reform and transition might be a function both of a leader's generation and position within the organization. Top executives likely are driving forces behind implementing these reforms and innovations, so their support might be expected. In contrast, the drag or tension may be among mid-level supervisors. Sergeants, lieutenants, captains, and others who feel no ownership over the new idea have little reason to embrace new perspectives. They may resist the change or evenly actively obstruct its emergence because they view the change as a threat to both their perspective on leadership and their continued advancement in the organization.

Andreescu and Vito (2010) found contemporary managers expressed strong support for ideals consistent with transformational leadership approaches. These included inclusive and human-oriented styles of leadership, the articulation of an organizational vision, caring for the well-being of employees, and setting an example for employees. Transformational approaches remain a challenge for police organizations. Though support for this style of leadership is apparent among police personnel and leaders (Witte et al. 1990), there is also a belief that such circumstances as participatory management are not actually found in most organizations. Stamper (1992) found a disjuncture between how executives perceived themselves and how members of their executive staff perceived them. Executives believed they lead their organization in one fashion. This self-perception tended to differ from how those around the executives perceived their leadership style and influence.

Intuitively it makes sense that younger officers might be more likely to support transformational, participatory, and democratic approaches to leadership. These youth are more oriented toward social interaction, social involvement, and being allowed a voice in aspects of organizational operations. Scholars and professionals continue to speculate that there might be a generational preference for transformational leadership approaches, but there is still an absence of research evidence assessing this matter in policing contexts. As the labor force becomes increasingly filled with those from generations desiring more transformational leadership, it will be increasingly important that police leadership adapt to reflect that situation. If organizations are to maintain long-term viability, it will be essential to create work environments that attract and retain newer generations of officers.

Conclusions

Leadership remains a vital issue in modern police organizations. Its importance cannot be refuted, and the need for leadership (not simply strong management) is quite apparent within the profession. What remains more elusive is a clear understanding of when and how leadership matters as a force influencing the values, beliefs, attitudes, and behaviors of police personnel. Though there is a natural appeal toward transformational leadership styles, the potential benefits of these approaches remain presumed rather than proven in police organizations. Issues of leadership will most likely continue to become increasingly important in the future as police organizations need to be more adaptive in responding to ever-changing criminal threats and community expectations. This will be compounded by work forces increasingly composed of officers from more recent generations, who may well require a very different style of leadership and a very different organizational environment. If police organizations are going to remain viable in confronting crime and disorder, real leadership will be of increasing importance. Both the research community and the profession itself must support the development of greater knowledge of the role leadership will play in these dynamic future environments.

Overview

Research on police legitimacy is an area of growing interest among researchers and practitioners. The concept of legitimacy ties together issues of compliance, obedience, satisfaction, trust, and order. The fundamental recognition of its importance rests on the idea that police will more easily maintain order when civilians view the police as legitimate. Regimes, organizations, and individual officers lacking legitimacy, conversely, face crises based on undermined public support for their authority. The discussion that follows considers how legitimacy is influenced by individual encounters with authorities and in a reciprocal sense, provides a context for understanding how citizens relate to police in terms of future cooperation and compliance.

Fundamentals

Definition of Legitimacy

Legitimacy is an outlook, with cognitive and affective components as well as behavioral predispositions. People who believe that the police are legitimate trust the police to exercise their authority appropriately, identify with the police (Tyler and Huo 2002), have confidence in the police to do the right thing, and feel an obligation to obey the police. The sense of obligation to obey has been central to discussions of legitimacy, because insofar as legitimacy has behavioral implications, it points the way toward broader and more economical ways for the police to cultivate public support, cooperation, and compliance. More generally, we might say that when police are perceived as legitimate, they are thought to be entitled to have their authority reciprocated with obedience.

From the observation that legitimacy encompasses a sense of obligation to obey, it does not follow that obedience ensues reliably from legitimacy; the association between legitimacy – an outlook – and obedience (a behavior) is imperfect. Many studies of attitude-behavior consistency have reported only rather modest associations, and against that empirical backdrop, the reported relationships between legitimacy and obedience appear quite robust, as we summarize below, but they are far from perfect, and we might surmise that the strength of the relationship depends in part on the nature of the behavior.

Legitimacy, to the extent it is an attitude toward police, likely shares a high correlation with other attitudes, such as satisfaction with the police, which have been studied more extensively. Furthermore, a variety of research points to the likelihood that legitimacy is conceptually multidimensional, comprised of trust in motives, obligation to obey, and identification with the authority. This suggests that legitimacy is a composite of both affect toward authorities and their motives (e.g., trust and identification) and perhaps what might be considered an "action"-oriented component based on whether the authority's directives should be followed (obligation to obey) or can form the basis for citizen authorization (empowerment).

We would add that legitimacy is a property of different types of authority – of political systems; discrete political institutions, such as Congress or the Supreme Court; legal systems; specific legal institutions or agencies; and even private employers. We focus here on the legitimacy of the police, but we caution that inasmuch as the police exercise a mandate based, arguably, in law enforcement, police legitimacy is difficult to separate from the legitimacy of the legal order in which police are embedded. The police are, thus, tied directly to the concept of legitimacy as they represent the legal order and simultaneously are reliant on deference to that order as a reservoir of public cooperation, obedience to their authority, and trust. The relationship between these concepts and legitimacy is explored below.

Sources of Legitimacy

Wilbur Miller's (1977) comparative history of the New York City police and the London "bobbies" illustrates the tie between legal order and legitimacy. In England, for example, the police were viewed as impersonal representations of the established legal order, which was primarily divided along the lines of social class in the relatively homogeneous English society. As such the police had impersonal authority that stemmed from a general civilian deference to the larger political structure in 1800s England. Conversely, in New York, during the 1800s, there was no such easily agreed upon legal order, given the diversity of religious, ethnic, and social classes occupying the city. Thus, in this environment, police authority was believed to emanate from personal authority that was essentially earned respect and deference from the community which accumulated over the course of face-to-face encounters.

Legitimacy of one's role and action that ties directly to the law would appear to be advantageous to police as the bobbies enjoyed a reluctant respect even among the lower classes with whom they had a more adversarial relationship. However, this simplification glosses over several differences between the US police system and those of much of the remainder of the world. First, centralized authority in England allowed for uniform lawmaking and centralized police forces. The USA, conversely, has a proliferation of thousands of agencies, each which has to build its own reservoir of authority from a local (or State) body of law. Thus, fragmentation and decentralization push legal legitimacy to local levels in the US political system. While one might argue this is a weakness and causes police to diverge from a strictly legal mandate, there is some evidence that police function in such an environment, in the long term, may offer some advantages.

First, no local police agency in the USA represents the legitimacy of law in the United States. Hence, we should distinguish the legitimacy of the legal system, in the more abstract sense, from the legitimacy of police or of individual police agencies in a more concrete sense; the latter is much more proximate to the day-to-day work of police officers. The fragmented and decentralized nature of US policing, instead, gives police a local legitimacy and authority. By contrast, in the Fall 2005, French police chased several Muslim youths, and two were accidentally electrocuted. This situation boiled into many days of widespread riots against French police, since, in the more centralized governmental system, the police represent all of French government in some respects. As one can observe, the source of legitimacy in a political system has trade-offs and costs, some of which are not readily apparent in the day-to-day function of police.

Clearly, in the USA, with a proliferation of local police departments, legitimacy is homegrown by departments and the men and women who serve within those organizations. To paraphrase Tip O'Neill's keen observation, "Much policing is local." Thus, important questions to ask are as follows: Where does legitimacy come from, and what are the consequences of legitimacy? As such one might consider legitimacy to be both a dependent variable (something caused by other forces, such as respect for political institutions and the behavior of those institutions) and an independent variable (one that predicts changes in some outcomes, such as citizens' cooperation with authorities).

Where Does Legitimacy Come from?

The encounter between police and the public has been studied as a petri dish for the creation of legitimacy among the public. Observations of police-citizen contacts as well as post-contact surveys of citizens have formed the basis for a substantial body of literature pointing to the antecedents of legitimacy. These antecedents emanate from the treatment that citizens receive or perceive receiving in those encounters they have with authorities, such as police. The term *procedural justice* is used to describe treatment that is fair, respectful, and generally thought to lead to a sense that the processing one receives is appropriate and that the authority behind it is legitimate. *Satisfaction* or the extent to which citizens are content with the encounter is also correlated with legitimacy. These linkages are explored below.

Tom Tyler (2003, 2004) and other researchers have done extensive research to outline the relationship between processing, procedural justice, and legitimacy. Procedural justice has been conceived as encompassing two broad elements: *quality of treatment* and *quality of decision-making*.

Quality of treatment encompasses the tenor of interaction between citizens and authorities and includes elements such as *voice*, or the notion that people believe that they should be given an opportunity to tell their side of a story, explain their situation, and communicate their views, and *quality of interpersonal treatment*, the notion that people believe that they should be treated with dignity and respect.

Quality of decision-making comprises a set of signals that pass from authorities to citizens about how decisions are being made in any particular instance and whether they appear to be fair. Indicia of quality decision-making include how authorities demonstrate *trustworthy motives*. For example, people believe that authorities should care about their well-being and consider their needs and concerns, and they draw inferences about that when authorities explain their decisions and justify and account for their actions. Similarly, *neutrality* is a marker for quality of decision-making, since people believe that decisions should be made evenhandedly and with proper consideration of objective facts.

While it may be helpful for heuristic purposes to describe these elements of procedural justice as distinct constructs, they are conceptually and empirically intertwined with one another. Empirically, these features of police-citizen encounters tend to be strongly or at least moderately correlated, yielding only one (Reisig et al. 2007; Gau 2011) or two (Tyler 1990) factors in factor analysis. These patterns of association are open to (at least) two interpretations: It might be that authorities' behaviors are correlated (e.g., officers who are polite also tend to listen to citizens and explain themselves) and that citizens' perceptions are correlated (citizens who judge officers' actions as respectful also tend to perceive them as attentive), or some combination of both sets of forces.

Survey research has repeatedly shown that the procedural justice that people subjectively experience in their encounters with the police is directly related to their satisfaction with the encounters and, moreover, to the legitimacy that they attribute to the police. People are more satisfied with their encounters with the police when they perceive that police acted in a procedurally just fashion. Furthermore, people have greater trust in the police, and feel a greater obligation to obey police instructions, when they have experienced procedurally just encounters with the police. This is the sense in which legitimacy can be "created" by police in their day-to-day interactions with the public and also illustrates its close tie to citizen satisfaction. Satisfaction and legitimacy can also be eroded by police, if they act with procedural injustice, if they are impolite or disrespectful, and if they interrupt citizens, ignore what citizens have to say, or do not permit citizens to explain themselves. The core linkage posited is that elements of processing which leave citizens unsatisfied (e.g., disrespect, bias) undermine legitimacy, while those which amplify satisfaction (e.g., respectful treatment, explaining decisions) similarly enhance legitimacy.

For example, in one of the earliest studies, Tyler and Folger (1980) surveyed a random sample of Evanston (Illinois) residents in 1979, identifying among the respondents those who reportedly had a personal experience with Evanston police in the previous 5 years, by either calling for assistance or being stopped by police. About each type of contact, they asked respondents to indicate the outcome (police had or had not taken care of the problem, and police issued or did not issue a citation, respectively), whether police treated them fairly, and how satisfied they were with the contact. They found that both outcome and perceived fairness affects citizens' satisfaction in both types of contacts, and also that perceived fairness affects citizens' more general evaluations of the police. Similarly, Tyler (1988) surveyed a sample of Chicago residents, nearly half of whom reportedly had a direct experience with Chicago police and/or courts in the preceding year. He found that procedural fairness affects citizens' satisfaction with both their outcomes and their treatment in the particular case, and also that procedural fairness affects citizens' more general evaluations of and support for the authorities.

Moreover, this research makes it clear that citizens' subjective experience is not determined entirely or even primarily by the outcomes that they receive. Put differently, neither substantive justice (whether one deserves what one objectively receives) nor distributive justice (whether one receives what others who are similarly situated receive) is as important to attitude formation as procedural justice (the manner in which justice is delivered). Even citizens whose outcomes are unambiguously unfavorable – who, for example, are cited for a traffic violation – may be satisfied with their experience if police are procedurally fair. It is people's normative expectations about how authority should be exercised, more than their instrumental considerations about the favorability of outcomes, that drive their assessments of their own experiences.

Since much of the research on this topic is based on cross-sectional survey data, the analysis of which forms the basis for only rather tentative inferences about cause and effect relationships; caution in drawing conclusions is advised. Several studies suggest that citizens' prior attitudes toward police shape both their subjective experiences, including perceptions of procedural justice, and their more general attitudes toward the police, including legitimacy, thereby contributing to a partially or wholly spurious relationship between procedural justice and legitimacy. But when these relationships have been examined in panel surveys (e.g., Tyler 1990; Tyler and Fagan 2008), so that the temporal ordering of the variables can be properly specified, the results have shown that even while prior attitudes do influence judgments about procedural justice and legitimacy, procedural justice has independent effects on subsequent legitimacy.

The structure and context of police-citizen encounters vary considerably, with respect to visibility, the nature of the issue that prompted police involvement, the "situational status" of the citizen (as complainant, suspected offender, witness), and the neighborhood setting of the encounter. The structure and context of interaction between police and citizens likely contribute both to objective features of the encounter (the routines of interaction or typical procedure) and how the interaction is experienced by the citizen. One structural feature that has an important bearing on citizens' subjective experience is how the encounter is initiated – at the request of a citizen or on the authority of the officer. Citizen requests may serve, at least to a degree, to legitimate the involvement of the police, as the officer(s) is responding to a request for police assistance. For at least one of the citizens who participate in such an encounter, the encounter is voluntary. When police intervene on their own initiative, however, as they do when they stop traffic violators or other people who arouse police suspicion, citizens' participation is not voluntary but obligatory, and citizens may be more apt to question the propriety of police involvement (Reiss 1971). Such "obligation encounters" (Moore 2002) pose greater challenges for police in meeting citizens' expectations for procedural justice. Skogan (2006) found among Chicago residents a significant disparity in satisfaction between those whose contacts with the police were self-initiated (78 % satisfied) and those whose contacts were initiated by police (58 % satisfied). Furthermore, procedural justice criteria appear to have an even greater bearing on citizens' satisfaction in police-initiated contacts than they do in citizen-initiated contacts. Tyler and Folger (1980) found that procedural fairness has a larger effect when citizens are stopped than when citizens call for assistance. Wells (2007) surveyed citizens involved in any of three types of contacts with the Lincoln (NE) police: victims of crimes, drivers involved in vehicle crashes, and drivers who received citations. He found that in each type of situation, citizens' judgments about procedural justice affect their ratings of overall police performance in the encounter, though procedural justice mattered less for crime victims, who typically call for assistance, than for motorists who are stopped for traffic violations.

We would also note that the effects of satisfactory experiences many not be as powerful as the effects of unsatisfactory experiences. Skogan (2006) stresses the asymmetry in the effects of positive and negative experiences with the police, finding in survey data on Chicagoans that their confidence in the police is very weakly or not at all related to positively evaluated contacts, but negatively evaluated contacts have a substantial detrimental effect on confidence. Skogan (2005) also found that citizens' satisfaction with their contacts is shaped by procedural justice. More specifically, whether police were polite and whether they were helpful were the most important predictors of satisfaction with citizen-initiated encounters, and whether police were polite and whether they were perceived as fair were the most important predictors of satisfaction in police-initiated encounters. Satisfaction was also enhanced if police explained what action they would take. These beneficial effects of procedural justice did not, however, translate "up" to confidence in the police. Other studies have also found asymmetrical effects, though not to the degree that satisfactory contact had no effect on more general attitudes (e.g., Reisig and Parks 2000).

No treatment of police legitimacy would be complete without acknowledging the attitudinal disparities across race and ethnicity: African-Americans hold less favorable views of the police than whites do, with Latinos typically in between. For example, Weitzer and Tuch (2006) conducted a national survey and found variations in satisfaction with police across race and ethnicity, as 86 % of White, 80 % of Hispanic, and 73 % of Black respondents reported being satisfied or very satisfied with the police department in their city. More interestingly, perhaps, they also found that the effect of race on satisfaction was mediated by what citizens perceived as police actions. For instance, those believing police were involved in misconduct, such as improper stops, verbal abuse, excessive force, or corruption, were less satisfied with police. Further, they found that beliefs about misconduct were shaped not only direct, personal experiences but also by vicarious experiences (those communicated to individuals by others). Thus, the police-citizen encounter can have far-reaching effects that ripple through a community.

The overriding racial issue in policing for the past 15 years has been racial profiling, with countless police departments across the US collecting and analyzing data on the race of the people stopped by their officers in order to address concerns about racial bias. The analyses are seldom conclusive with respect to bias, but some research suggests that procedural justice plays an important role in shaping citizens' perceptions of bias. For example, Tyler and Wakslak (2004) surveyed residents of Oakland and Los Angeles who had been stopped by police. Those who thought that police were polite, treated them with dignity and respect, and showed concern for their rights were much less likely to believe that they had been profiled. Other elements of procedural justice had similar, albeit more modest effects on profiling attributions. More recently, Gau and Brunson (2010) interviewed 45 youths from low-income areas of St. Louis, MO, and reported findings consistent with the theme that perceptions of unfair treatment undermined youths' support for the police.

Thus, legitimacy appears to be causally linked back to the basic concept outlined above: those situations where there is an obligation to obey the authority, which can be boiled down to several simple aspects of police encounters. Were the police invited to intervene (as compared to proactively inserting themselves into a situation)? Did the police clearly explain the rationale behind their decisions? Did police allow the individual to tell his or her side of the story? Did the police listen to the individual? Did the police act courteously and show respect to the individual? These types of questions, when answered affirmatively, illustrate the procedural justice of police encounters; they also represent important antecedents of legitimacy, and, not surprisingly, they are closely correlated with citizen satisfaction.

Legitimacy is intrinsically important, but it is important also because it is consequential. Legitimacy affects citizens' acceptance of police decisions, their cooperation with the police, and even their compliance with the law more generally. We turn now to a consideration of these outcomes.

Legitimacy and Outcomes: Support and Citizen Self-Regulation

Police rely heavily upon citizens for support and self-regulation. Supporting citizen behavior and attitudes is important to the police for the maintenance of order and the control of crime. Police effectiveness depends upon citizen involvement in community activities, reporting crimes and giving information to the police, which would be considered as *cooperation*. *Empowerment* of the police is also a form of (active or passive) support, in the sense that citizens who grant police the capacity to exercise authority with fewer rather than more restrictions, and are supportive of (or do not oppose) police tactics and strategies, offer important if implicit consent from the governed to the authorities.

Self-regulation, that is, obeying laws and complying with police requests, represents another area in which police rely on citizens. Thus, if police request citizens to leave a scene or to discontinue making noise at a party, they are relying on citizen self-regulation (Mastrofski et al. 1996). In the larger sense, police rely on everyday self-regulation or self-control in refraining from committing minor (e.g., littering) and major (e.g., robbery) crimes.

One might think that citizens comply and cooperate due to the overall legitimacy of the legal system in which police-citizen contacts are embedded. This, for example, might help us understand why an English citizen would obey a bobby but someone in New York would be reluctant to obey a police officer in the 1880s. Thus, in that larger sense, legal legitimacy can predict cooperation in face-to-face encounters. Analogously, one might look across US agencies and examine the relationship between the police and the community as an indicator of overall police legitimacy. Thus, in locales where police-community ties are strong, one might expect greater cooperation and compliance from citizens in encounters with police.

Legitimacy and Support

It is a well-understood fact that police rely on the public for information and mobilization to identify and solve problems. Police rely on citizens to report crimes and to act as witnesses and information providers on scene. One question that arises is whether there is a link between legitimacy and the willingness to cooperate with the police. If so, then police that engage in promoting legitimacy will build public support and cooperation.

Evidence linking legitimacy and cooperation has slowly accumulated from the body of research on procedural justice. Tyler and Fagan (2008) used a panel data survey design with 830 respondents to test the relationship between legitimacy and cooperation. This allowed them to measure legitimacy at two points in time and determine how contact with police influenced subsequent legitimacy and self-reports of intention to cooperate with the police. Consistent with other research, procedurally just treatment yielded increases in perceived legitimacy of the police. More specifically, those respondents reporting they had been treated fairly and with respect had measureable increases in legitimacy, controlling for whether they received a positive or negative outcome from the police.

To measure cooperation, the researchers asked citizens how likely they were to call the police and report a crime, help find a criminal, and report suspicious activity. A parallel scale regarding helping the community fight crime was constructed from similar measures asking whether the respondent was likely to volunteer time to help the police, to patrol streets with others, and to attend community meetings about crime. In multivariate analyses, taking advantage of the panel design capacity for causal analysis, Tyler and Fagan (2008) found that those who reported police as being more legitimate were more likely to report intending to cooperate directly with the police and also cooperate with others in efforts to deal with community crime.

Sunshine and Tyler (2003) have examined the relationship between empowerment and legitimacy among a panel of New York City respondents. Empowerment represents the extent to which citizens recognize a greater scope for police action and discretion. The findings from that research indicated that citizen perceptions of legitimacy and to a lesser extent distributive fairness predicted respondents' extent of empowerment.

Legitimacy and Self-regulation

Research on self-regulation has focused on whether citizens obey the commands of police immediately as well as in the longer term with respect to both minor offending (e.g., traffic or other violations) and serious crime (e.g., violence). The research on immediate compliance has been derived from observations of what police do in interactions with citizens and whether citizens comply with police requests for self-control. For example, McCluskey (2003) studied face-to-face interactions between police and 939 suspects in St. Petersburg, FL, and Indianapolis, IN. The results of that research indicated that, with regard to immediate compliance, it appears that citizens who are given opportunities to tell their side of the story and are treated respectfully are significantly more compliant than citizens not afforded such courtesies during the police-citizen encounter. This type of treatment and behavioral outcome lends support to the linkage between treatment by authorities, legitimacy, and compliance.

Sunshine and Tyler (2003) collected survey data regarding the link between citizens' reports of compliance and the legitimacy of police. That research indicated a similar effect of perceptions of legitimacy, which provided a robust explanation of citizens' self-reported compliance with the law. Thus, observed and self-reported behaviors, among the general public, are influenced by legitimacy. More simply, as legitimacy increases either as measured by perception of citizens, or by the fair procedures consistent with legitimacy, compliance increases. It is important to note that the observed police-citizen contacts and self-reports involve typically more trivial disputes or lawbreaking. Thus, one is obliged to ask: Does the perceived legitimacy of the police and law influence serious misbehaviors in a similar fashion?

With regard to legitimacy's relationship to longer-term patterns of compliance among serious offenders, several studies involving arrestees for spousal assault, intoxicated drivers, and serious delinquents indicate substantial links. Paternoster and his colleagues (1997) were the first to study the influence of procedural justice on serious criminal activity. Using data collected for the Milwaukee Domestic Violence Experiment, they found among a sample of males arrested for spouse assault that perceptions of procedural justice influenced recidivism. All of these offenders experienced an unfavorable outcome (arrest), but some of them perceived their treatment as procedurally fair, and those who did were significantly less likely to recidivate. Moreover, the recidivism rate for those who were arrested and who felt that the process was fair was similar to the recidivism rate for those who had been warned only. These findings suggest that legitimacy impacts long-term legal compliance to the extent that perceived fair treatment reported by these offenders is related to their sense of fair and legitimate treatment.

Based on a sample of offenders arrested for drunk driving in Australia, Tyler and his colleagues (2007b) evaluated the impact of reintegrative shaming and procedural justice on recidivism. Recidivism was based on self-reports in a 2-year follow-up period and on police records for a 4-year follow-up period. The study tested the hypotheses that procedural justice and restorative justice conferences (as opposed to traditional court proceedings) would foster more positive assessments of the law and lead to higher levels of law abidingness. First, they found that the treatment (restorative justice conference) was not associated with lower recidivism (measured in terms of self-reported drunk driving or police records), though they did detect a direct effect on self-reported efforts to curb driving while drunk. With respect to the influence of legitimacy on behavior, they found that those who viewed the police as more legitimate were less likely to recidivate. This held true when behavior was measured in terms of self-reported levels of drunk driving and when it was measured using police records. The extent to which the initial experience was viewed as procedurally just shaped subsequent views of legitimacy, which in turn led to lower levels of recidivism.

Bouffard and Piquero (2010) analyzed the Philadelphia Birth Cohort data follow-up for 212 juveniles with police contacts. Those characterizing their initial contact as unfair had substantially higher frequency and longer periods of offending compared to those who did not. Fagan and Piquero (2007) examined a sample of 1,355 juveniles referred to courts in Philadelphia and Phoenix and found that assessments of procedural justice had a strong direct impact on perceptions of legitimacy among these serious offenders. In turn, legitimacy exercised a substantial direct impact on self-reported aggressive and income offending.

In sum, across multiple methodologies, law-abiding and lawbreaking samples, and less serious and serious behavioral outcomes, it appears that where police legitimacy and behaviors consistent with procedurally fair policing are greatest, citizen self-regulation, both immediately and in the longer term, is greater. More specifically, citizen self-regulation is positively associated with police legitimacy.

The Policy Consequences of Legitimacy and Future Research

As the notion of procedural justice (Tyler 1990) and legitimacy came to the forefront of academic consideration, it was recognized that at least some of what police might accomplish required thinking about the issue of legitimacy and how citizens come to see authorities as legitimate.

This sparked research on procedural justice and has led to the recognition that legitimacy is to a significant degree in the hands of police as they relate to the public in everyday encounters. Clearly police misbehavior, corruption, and rudeness can do much damage to legitimacy. But the more optimistic side of the research indicates that police can repair and create legitimacy via politeness, taking time to explain their decisions and treating individuals in a fair manner. This is a very economical solution to the police-community relation issue which has at times seemed intractable and dominated by *us vs. them* rhetoric.

Field stops by police have attracted considerable attention and generated considerable controversy, especially in New York City, where police have in recent years documented hundreds of thousands of "stop, question, and frisk" contacts annually. Proponents tout the value of such stops in confiscating illegal firearms and, more generally, reducing crime. Critics hold that the stops exhibit a racially biased pattern and, moreover, detract from the legitimacy of the police, as stops for low-level offenses may be viewed by the citizens who are stopped – and by their family, neighbors, and friends – as harassment (Gau and Brunson 2010; Warren 2011). Extant research does not suffice to resolve this controversy, even if it could be resolved with reference to empirical evidence, but we would note that several questions are important to consider in this connection: (1) How often are stops made? (2) For what reasons are stops made? (3) Are stops concentrated in places and at times at which crime occurs? (4) Are the stops conducted by officers in conformance with principles of procedural justice?

Some have called for a "procedural justice model" of policing (Schulhofer et al. 2011; Meares 2009). A procedural justice model of policing does not hold that police platoons become grin-and-wave squads. The coercive authority of police is, as Bittner (1970) observed long ago, their unique occupational prerogative, and it enables them to fulfill their role in society: negotiating or imposing solutions upon emergent problems. Procedural justice is not about whether but how authority is exercised. Police who operate according to a procedural justice model will of course need to exercise their authority, but they do so sparingly, judiciously, and in accordance with principles of procedural justice: They honor legal limits on their authority; they treat the people with whom they interact – even the people whom they arrest – with dignity and respect; they allow – even invite – people to explain themselves and their situations; and they explain their actions.

Police departments that adopt such a model would, we suppose, establish and enforce expectations that their officers will exercise their authority in these ways. Their chief executives make procedural justice an explicit priority. They embody their expectations in department policies and procedures. For example, the Redlands (CA) police revised their traffic stop procedures, as their chief explains, "instead of starting out the interaction between the motorist and the police officer, where we typically walk up and say, 'Let me see your license and registration, please,' then we walk back to our car, and the next time you see us is when we're handing you a ticket or whatever. Turning that around and saying, 'Good afternoon, my name is Officer Bueermann, and I've stopped you because you were speeding. Is there some reason you might have been speeding?' And then we give you the opportunity to explain to us what was going on in your head, or why you were doing . . ." (quoted in Tyler 2011). They train their officers in proper police-citizen interaction (see, e.g., Rosenbaum and Lawrence 2012). They monitor the available indicators of police performance, such as complaints and uses of force, and recognizing the limits of these indicators, they make supervisors responsible for spot-checking the quality of police-citizen encounters. They might even develop more systematic measures of such performance. And they treat officers with the same procedural justice that they demand of officers in their encounters with citizens, thereby nurturing the legitimacy of the organization and its rules in the eyes of its human resources (Tyler et al. 2007; Wolfe and Piquero 2011).

Beyond these basic suppositions, however, extant research does not provide much guidance for police administrators who are persuaded that their agencies would benefit from systematic efforts to engage in procedurally just policing. Hardly any empirical evidence is available for these purposes. One study showed that police disrespect toward citizens – a form of procedural injustice – is most likely a response to citizen disrespect toward the police, but it is also affected by a citizen's lack of self-control (e.g., in the form of intoxication) and social status (Mastrofski et al. 2002). The same study also detected some differences across jurisdictions that might be attributable to differences in department administration. But at this time the translation of research on procedural justice and police legitimacy into the practice of procedurally just policing is largely a matter of trial and error.

As research on legitimacy and procedural justice yields more insights regarding the specific content of just and fair processing and its consequences, it becomes imperative to begin developing key elements into the content of everyday police-citizen contacts. Answering questions such as what dosage level and content of procedurally just processing are related to the formation of a "sense of legitimacy" will help to tune police action to desired outcomes. If the current research trajectory on legitimacy matures into an action research agenda, then perhaps the police will find they have always had the tools for building legitimacy, cooperation, and compliance at their disposal. This would have an interesting symmetry with the idea of personal authority and the difference between cops and bobbies outlined at the beginning of this entry. More simply, the creation of legitimate police authority, in a decentralized republic, does in fact lie in the day-to-day contact between police officers and citizens. Thus, legitimacy is indeed local and continuously recreated or undermined in those everyday encounters.

Police Line-Level and Agency Accountability

Michael E. Buerger
Bowling Green State University, Bowling Green, OH, USA

Overview

The exercise of discretion – the ability to choose among options for resolving a situation – is bounded by officers' "intuitive understanding of situational exigencies" (Bittner 1970). Police officers are employees of the public and agents of the state, so there is a general expectation that they will observe the law, treat all citizens equally and with basic respect (even those whose behavior has been the antithesis of respectful), and generally work for the betterment of the community as a whole.

Society must trust the officer's instincts to make correct decisions in thousands of dissimilar incidents. Law enforcement agencies must create and maintain proper means for shaping and verifying those decisions along ethical lines, to increase the likelihood that officers will choose well. It must also have a proportionate way to respond to misjudgments, whether based on simple error, lack of proper preparation, or some more venal animus.

The good work of policing has been tarnished by a long series of public scandals exposing abrogation of responsibility and lingering distrust generated by police misconduct: incompetence, callousness, brutality, corruption, and criminal acts while in uniform dominate the list of offensive behaviors. At the organizational level, systemic biases – lack of services to a particular population, racial or other profiling, tolerance of brutality, and corruption of the legal process – have been the dominant problems, along with a persistent unwillingness of some agencies to investigate properly any allegations of wrongdoing by employees.

The antidotes to sins of omission and commission by police officers and agencies have been parallel efforts to upgrade police service and improve supervision. The broad philosophical push toward ***professionalism*** is one such effort: it is manifested in the hiring, training, and supervisory functions, reflecting articulated values. A narrower bureaucratic focus on ***rules and regulations*** complements professionalism by clearly identifying proper and unacceptable behaviors. Each has positive and negative aspects, and sometimes an incisive eye is required to distinguish true adherence to professional precepts from linguistic smoke screens designed to protect less desirable forms of policing (Klockars 1991). These approaches are combined at the agency level in the convention of state or national ***accreditation***.

In addition, police work continues to be subject to external scrutiny and judgment: prosecutorial and judicial review of individual cases and ***political oversight*** of agency operations and results. State and federal oversight occasionally is brought to bear at the organizational level in the form of ***consent decrees*** when agencies are or appear to be unresponsive to other corrective measures (Walker and Macdonald 2009). Over the last quarter century, ***citizen review*** of police activity has been promoted as a local-level control of police behavior, with mixed results.

Professionalism

For years, "professionalism" was claimed by the police because of a single attribute: the desire to govern their own affairs autonomously, as had been the case for the three classic professions of law, medicine, and the clergy. The catchphrase that "only a cop can judge another cop" was passed from generation to generation of police as a cultural meme, despite a lack of supporting evidence. For those generations, the other two attributes of a profession – a unique body of knowledge acquired through years of study and a service orientation – were more honored in the breach than the observance, despite the extensive community service provided by individuals.

Since the crisis of confidence in the police that marked the 1960s, the professional model has made great strides toward filling that void. While the nature of the criminal justice system makes it unlikely that the police will ever be free of external review, the understanding of the relationship of professional conduct to *police legitimacy* in the eyes of political sovereigns is now widely recognized and serves as a basis for both professionalization and bureaucratic mechanisms. Cultivating professionalism begins with hiring the right people, then training them with a proper orientation to the work to be done, and continuing to reinforce that orientation with adequate supervision and performance feedback.

Hiring

The hiring process is integral to creating and sustaining professional orientation and demeanor. In the best case, it involves a recruiting process that presents a clear articulation of the qualities expected of new employees and of the nature of the job to be performed. A good hiring process will select candidates who are intelligent, both well educated and attuned to important concepts like cultural diversity and changes in the social and legal environment. Critical thinking skills, a sound ethical grounding, flexibility, physical fitness, and mental toughness are all important attributes for future police officers. In the case of lateral transfers (experienced police officers from other departments joining a new agency), demonstrated good performance and ethical behavior in prior assignments are critical.

The hiring process has its own variance and weaknesses. The hiring pool for a particular agency may be weak, forcing agencies to hire the best candidates from a thin field of applicants. In some cases, too rapid an expansion of a force under political duress leads to cutting corners, trading integrity for numbers (see, e.g., and Harrison and Flaherty 1994, et. seq.). Written tests vary widely in both their rigor and their applicability to policing, and finances or politics may dictate the choice available: civil service tests for larger municipalities may test only for basic city employment, not specific police needs. Physical agility tests tend to be basic fitness gauges and may not indicate mental toughness for more rigorous training or more complex motor skills needed for police work.

Training

Though the best-case scenario for hiring is often limited by resources available to the agency, the process is now bolstered by a formal external control: state certification of police officers under Police Officer Standards and Training (POST) Board standards or other state peace officer requirements. The judgment of the hiring agency must be reinforced by a judgment of fitness by a neutral body with broad responsibilities. The long-standing model for certification and licensing began with the agency hiring a candidate, then putting the rookie through academy training, followed by an FTO period, and then annual retraining and firearms certification. Under that model, the background check preceded hiring and training.

Financial pressures created a second route to police employment, known as preservice certification. Individual candidates make themselves more marketable by paying for their own certification, either at a community college program or by attending a regular state academy. The community college option often involves earning an Associate's Degree as well as police certification but takes a longer period of time. The regular academy process tends to be shorter, between 480 and 650 hours, though many municipal and State Police academies are longer. In both models, elements of professionalism are embedded in all aspects of the training regimen.

Attaining police certification and licensing demonstrates a basic level of physical skills and intellectual knowledge about police tasks and expectations. It does not necessarily provide insight into a person's mental orientation to the job, aside from an ability to give "the right answer" on a test. Background checks are intended to fill the void but may take a backseat to the financial benefit of hiring an already-certified officer who can go to work after an abbreviated orientation period. A similar flaw attends the lateral-hiring route, where problematic officers may leave a department with a "golden handshake" agreement that will mask their troublesome behavior from a casual background inquiry.

Field Training

New hires are provisional employees in most cases, serving a probationary period with no guarantee of employment, civil service protection, or union eligibility until they have been more fully tested and observed. Field training pairs new officers with an experienced officer who serves a dual role as coach or tutor and evaluator. Where possible, rookies will work with more than one field training officer (FTO) in order to gain additional perspective and avoid the appearance of personal bias.

The FTO period places the rookie in a different testing environment, gauging his or her reactions and applying skills and knowledge to real-world incidents. Performance is graded, and feedback provided, during the experience, always with the intent to reinforce good behavior while correcting substandard work. If a rookie's work and attitudes do not meet acceptable levels at the conclusion of the FTO period, additional training may be offered to bring performance up to standard. However, if serious deficiencies remain, a sub-performing officer may be separated from the agency at any time prior to the completion of the probationary period.

Supervision and Performance Review

The agency's responsibility to its employees extends through their careers and takes many forms. Providing training and education to update and upgrade skills is essential to performance levels and opportunities for promotion or other career development. Providing feedback and supervision validates proper behaviors and corrects deviations from acceptable norms of effort, attitude, and exercise of discretion. Organizational expectations may be articulated in one of two main ways: as organizational *values* or as a series of specific rules and regulations.

Rules and Regulations. The traditional form of organizational direction of its employees is The Rulebook. A definitive set of do and don't regulations are codified in a growing register.

The Rulebook is provided to each new employee, and they are expected to read it, understand it, and internalize its requirements on their own.

The basic problem with The Rulebook is the same problem that leads to the need for discretion: it is impossible to anticipate every possible need the organization will have. Rules and regulations are also amenable to strict interpretation. New rules tend to be added to the book when an employee does something that is clearly unethical or unprofessional, but is not covered by a specific existing rule; the void is then filled retroactively, against future misconduct of that one particular type. Few, if any, of these rules have a specific empirical basis: even though no evidence exists that the conduct would have been widespread without the rule, the lack of subsequent violations is considered sufficient justification to maintain the rule.

Because police officers tend to be concrete thinkers, they are fairly good at following the rules, with the mind-set that "As long as I follow the rules, they [the administration] can't punish me." In public discourse, this is referred to as "being in compliance" with organizational expectations. Rule-bound behavior is not always effective at fulfilling organizational missions, however, and pushing the limits of specific rules can extend as far as breaking the law (see Crank and Caldero 2010).

While most issues of error or minor misconduct are handled informally, persistent problems are addressed through a system of *progressive discipline*, which applies to relatively low-level infractions or performance deficiencies: major problems, such as criminal conduct on or off duty, may lead to immediate suspension or dismissal. For the lesser offenses – usually violations of in-house rules – progressive discipline almost always begins with a verbal warning from a superior officer. No record is kept, as the presumption is that the employee will understand and comply with the correction (the supervisor may make a note of the date and nature of the warning in her or his own records, but the matter is not part of the employee's personnel file). If misbehavior or substandard behavior persists, a written warning may be issued: typically, these warnings are entered into the employee's file for a limited period of time and may factor into the next annual performance review. Letters of reprimand are the next step, followed by suspension with or without pay, and finally a move to dismiss the officers if the problem behavior remains uncorrected or worsens.

Progressive discipline is a process of documenting both the employee's errors or infractions and the agency's response to them. Like the use of force continuum in a different context, it constitutes a measured response with graduated penalties but can quickly be asserted at higher or lower levels depending upon the employee's response. The documentation that an employee has been offered additional counseling and guidance, and has failed to respond positively, is an essential element to support more drastic measures such as suspension without pay or dismissal.

The tension between being a public servant (an agent of the state) and a police officer's Fourth Amendment property right in employment is salient in the disciplinary process. As a general rule, agencies may compel their employees to answer questions about misconduct truthfully; if the employee refuses to answer or fails to answer honestly, they can be dismissed. However, the Fifth Amendment guarantees a right against self-incrimination in criminal matters. The 1967 Supreme Court decision of *Garrity v. New Jersey* established that "information which is compelled by government" as a condition of employment cannot be used in criminal proceedings. The Garrity Rule was expanded in the 1968 *Gardner v. Broderick* decision, which indirectly affirmed the right to dismiss employees for not answering "relevant questions about official duties" but reaffirming the protection against subsequent use of any incriminating information thus revealed.

Values. An alternative to the narrowly defined specifics of rules and regulations is a values orientation: broad declarations of expectations, such as observance of the law, fair and ethical treatment of all citizens, and the like. The emerging trend called "transformational leadership" rests in large part upon just such an orientation:

desirable conduct is clearly visible as a large picture, not a complex tapestry of small, narrow rules. Values are subject to interpretation, which is a cause of concern for unions and other representatives, but they constitute a broad platform that avoids the "if it's not in The Rulebook" approach that hinders effective response to clearly unacceptable behavior.

Performance Measures

Most departments have a formal means of assessing an employee's overall work performance, usually administered on an annual basis. Quantifiable outcomes such as arrests, traffic citations, calls handled, and occasional contributions to other efforts (providing critical information to detectives to help solve a case, for instance) will be recorded and evaluated. Areas of outstanding, acceptable, and inadequate job performance are scored on a scale and become part of the employee's permanent record, used for decisions about promotion and requests for special duty (Mastrofski 2003).

The disadvantages of performance evaluations can outweigh their advantages if the organization's oversight is lax. Some supervisors may evaluate all their employees in the middle range, avoiding the need to justify "why he was rated higher than I was." Others may give maximum marks to all subordinates ("everyone's a swan" in the words of one commander), especially if others in the organization are known to do the same: few supervisors will knowingly disadvantage their subordinates' chances for promotion or other improvements. Even without those attitudinal limits, transfers and promotions may present new supervisors with the responsibility to evaluate subordinates whose work they have had only a week or two to observe.

Some performance indicators are administered by the agency but are linked to the external certification. The most visible of these, and arguably the most important, is the firearms proficiency requirement. Any officer who fails to maintain his or her proficiency with regulation firearms is ineligible for street duty. The same may be true for other basic skills, including physical fitness standards: not only is every officer at risk of intense physical activity, their ability to control violently resisting individuals is critical to the safety of their brother and sister officers.

Performance measures may or may not embody all of a department's expectations, however. Certain standards may be known informally, but never appear in print. Officer-initiated activity, whether motor vehicle citations or stop-and-frisk checks, is unlikely to have formal declarations, in order to avoid complaints of bias. While "quotas" are avoided as a negative image, "performance expectations" will be unofficially encouraged and formally enforced, even if nebulously articulated.

In like manner, not all internal controls are paired to The Rulebook or to other formal elements of correction. Transfer to an undesirable shift or other type of assignment is a clear signal of organizational disfavor but without any rebuttable criticism that could be cause for further action. At more intimate unit levels, denial of requests for days off or special coverage serves a similar purpose.

Internal Affairs (IAD)

Most agencies of any size have some office like the old Internal Affairs Unit: police officers who investigate complaints against other officers. More likely to be called the Office of Professional Responsibility or similar title today, officers in these units investigate complaints originating from citizens and from within the department. Citizen complaints usually center on biased behavior, brutality, or complaints of criminal behavior such as theft of personal property. Because many of these complaints boil down to "he said/he said" situations, officers are often exonerated for lack of evidence. Some may trigger more extensive observation of the officer's behavior, particularly if a pattern of credible but not conclusive evidence emerges over multiple complaints. In such cases, the investigators are careful to discern between legitimate complaints from citizens and those which appear to be retaliatory complaints from criminals seeking to neutralize righteous police pressure on illegal activities.

Over the course of time, IAD investigations are more successful in validating internal complaints: dereliction of duty, calling in nonexistent stops to avoid unpleasant calls, abuse of sick leave, misuse of departmental equipment, and outright crime such as theft of drugs from the evidence room. IAD investigations are referred to the administrative chain of command for action: hearings are held at the command level for complaints that are substantiated; those which could lead to dismissal are usually at the chief's decision.

External Constraints

Departmental discipline is not a self-sufficient exercise: it is often bound by decisions made by other bodies. Disciplinary actions can be appealed to civil service boards or reviewed by outside arbitrators, depending upon the state, the municipal situation, and any applicable union rules. Even nominally "at will" employees have recourse for wrongful actions under some circumstances. The appeals process is intended to be a part of checks and balances against biased or arbitrary actions on the part of the agency.

There are a number of high-profile cases where employee "for cause" dismissals that were clearly proper have been reversed by politically distinct agents or entities, saddling the organizations with undesirable employees who seem to be impervious to the usual internal controls.

The civil courts provide the final resort for employees appealing adverse decisions. For agencies that have had to reemploy an undesirable worker, the options are relatively few: restrict the duties and thus the opportunities for harmful conduct ("hide the problem child in a closet") or return the person to regular duty under close scrutiny and begin the documentation process again ("give him enough rope to hang himself").

Depending upon the state, decertification may also be a route for dealing with problematic officers. In some states, only the employing agency can initiate a request for decertification for cause. In others, citizens or other entities may also initiate the process, within narrowly defined statutory criteria. There are distinctions between decertification for oversights, which are correctable, and decertification for cause, which effectively ends a person's ability to work as a police officer in that state. Recertification in another state remains possible, but the International Association of Directors of Law Enforcement Standards and Training (IADLEST) maintains a National Decertification Index (NDI) that tracks decertification cases in many (though not all) states.

Agency Accountability

By definition, accountability for agencies lies with external sovereigns. State legislatures and the Congress define the powers for police acting in their jurisdictions. Local, state, and federal appellate courts define and refine the specific applications of those powers. Municipal, county, and state political bodies control the budgets for the agencies, as well as the power of appointment of the chief in most cases.

Agencies are accountable for at least two levels: for the overall accomplishments of the department, usually but not universally measured by the crime rate, and for the manner in which police services are delivered. Even rising crime rates may be tolerated if the police response to the problems are considered to be positive: the influx of a new drug, dramatic shifts in local economics (both a downturn and a sudden boom), or other new circumstances may exceed a department's capacity for a short period of time. If a proper foundation has been laid, and communication with the public open and candid, a temporary inability to produce dramatic results need not be negative.

The second level is the activities and attitudes of the agency's employees as perceived by a significant constituency of the public. Where the agency has little choice but to back its officers in he said/he said complaints on an individual basis, citizens take a broader view of all interactions. Common to almost every complaint about police interaction with citizens (up to and including complaints of excessive force or brutality) is the phrase “no respect.” Complaints about officer attitudes are difficult to resolve, but the enduring effects of widespread perceptions of disrespect by officers can be toxic.

Political Control

Most law enforcement agencies are not autonomous units but rather are a department within a larger government organizational unit: a cabinet-level department in the case of many federal agencies, part of a justice department or working under the state’s attorney general’s office at the state level, and subject to the control of mayor, council, city manager, or other executive power at the local level. Where county police departments exist, they are answerable to the county commissioners or the county executive (see, e.g., Skogan and Frydl 2004, pp. 196–202).

Sheriffs are an exception to the general rule above. In almost all states, the county sheriff is an office authorized by the state constitution. As such, the sheriff is answerable only to the voters of the county he or she serves. In some cases, sheriffs have been voted back into office despite federal convictions for various offenses.

In Hawaii, the sheriff’s division is a part of the Department of Public Safety. Alaska has no counties, and thus no county sheriffs (Alaska State Troopers provide law enforcement services where no local police department exists). Connecticut eliminated the constitutional office of sheriff in 2000 in response to a series of corruption scandals. Because the office of county sheriff was written into the state constitution, a constitutional amendment was required. By a margin of almost two to one, voters in Connecticut eliminated the office of sheriff, transferring its duties to the existing Judicial Department and to a newly created office of marshal, who were to be overseen by a State Marshals Commission.

As a rule, when agencies are underperforming or malfunctioning in the eyes of their political constituents, the most common response is to replace the chief (by whatever title). The old “Chief for Life” convention is largely gone, replaced by a renewable contract for fixed terms, usually between 3 and 5 years (Mastrofski 2002). Since most chiefs serve at the pleasure of the administrative unit (whether an individual or a board), the contract preserves their property right, but not their tenure: a severance agreement must be reached if the chief is dismissed for political reasons, such as a change of mayor or board, though a dismissal for cause usually voids the contract.

It is a commonplace in law enforcement that if a chief leaves for another post or retirement when an agency is performing well, her replacement will come from within the department. If there is dissatisfaction with the overall performance of the agency, a replacement will be chosen from outside, with a mandate to institute organizational change.

Even if that perception is based on a generally reliable fact pattern, it overestimates the effectiveness of the chief executive. Like replacing the coach of a losing team, the malfunctioning players remain. If the problems of the organization stemmed from defective leadership, a new approach from the top position may very well turn performance around. If the root problem is an entrenched cultural one, change will be more difficult to achieve. Incompetence can be addressed by the infusion of new leadership and training resources; malevolent or self-serving cultures are more difficult.

In some instances, police agencies are simply disbanded, though that is much easier to do for smaller jurisdictions than larger cities. Scandal is often not the reason, though it has accounted for some instances. Budget difficulties are more often the reason, sometimes complicated by a desire to eliminate union rules or defined-benefit pension obligations, as is alleged in the 2012 elimination of the Camden (NJ) Police Department.

When such instances occur, law enforcement duties are transferred to another agency. Camden is incorporating with the county police; many small towns contract with their county’s sheriff’s office or rely upon State Police for the infrequent problems that arise. Contract cities are relatively common in the American Southwest, with Sheriff’s Departments providing a specific number of hours or standard police presence, in addition to emergency responses and criminal investigations as needed.

Accreditation

The agency-level articulation of professionalism is embodied in a set of national standards articulated by the Commission on Accreditation for Law Enforcement Agencies (CALEA). Using an accreditation model similar to that used in higher education, CALEA promulgates "gold standard" sets of agency requirements across a broad spectrum of issues, from rules and regulations to equipment, training, personnel standards, bona fide occupational standards for specialty positions, and others (CALEA n.d.). CALEA specifications are tailored to meet the different situations found in the broad range of law enforcement agencies, including size and available resource. After revising their operations and documenting the results, agencies apply for an independent evaluation of their adherence to these standards.

Accreditation is an attempt to formalize legitimacy of police operations and is often offered as a hypothetical defense against liability. Whether it actually serves that purposes remains an open question; few serious challenges have been mounted. The national accreditation process has also been criticized as time-consuming and expensive. The latter condition has led to the creation of state-level accrediting bodies (see, e.g., California CALEA n.d.).

Citizen Oversight

At the local level, dissatisfaction with the organization's internal controls may give rise to a call for citizen review of complaints. When this occurs, the cause is often not dissatisfaction with overall results but with a perceived lack of effective action taken against malfeasant officers (Skogan and Frydl 2004, pp. 202–204).

Citizen oversight – often called "civilian review" – is one of the responses to the belief that "the police protect their own" rather than serve the broader interest of the public. Different models of direct citizen oversight have been tried and some abandoned over time. One grants citizens an advisory role in the disciplinary process, but no direct input. A second limits citizen input to a general review of cases over time, again without direct input into individual cases. Yet another allows for citizen participation in the investigatory process, including the right to be present on case review boards, but without any real power: the results of the investigation are referred to the agency's internal process for adjudication. The most controversial form, and most desired by community groups, is a direct role in investigating complaints, with a power to recommend discipline. Even in this most stringent form, however, the final decision almost always rests with the police chief or other internal body.

Police fear that citizens cannot fully understand what police officers face in confrontational, potentially dangerous situations and thus are likely to be overly critical, with unrealistic expectations about police capacities. For their part, citizens consider themselves considerably more realistic than police give them credit for: not only do they deal with the same difficult individuals the police do, but they do so for longer periods of time and under a wider set of circumstances. Moreover, they are also capable of distinguishing between good police service and poor service.

The citizen review option is not a panacea. Selection of the oversight board's members can become a highly politicized process, with police advocates contending against police critics for the slots. Police themselves – fearing a "stacked deck" of longtime police critics, who are often the persons pushing the reform – may attempt to game the system by encouraging the candidacy of those who believe the police can do no wrong, ever.

In most cases, however, civilian review boards have faced the same dilemma that confronts police internal processes: the lack of definitive evidence of an officer's conduct, as well as the conduct of the accuser. That state of affairs has undergone a rapid and radical shift in recent years, however, with the proliferation of cell phone cameras and other visual media. The "low visibility environment" that once protected police misconduct in the field is now almost fully illuminated by citizen witness video. From

George Halliday's incomplete video of the Rodney King incident to the pepper spray incidents at U-Cal Davis and the G-20 protests in Toronto, individual video records have verified complaints of misconduct that in prior years would have been dismissed. Video is a neutral witness, however: dashboard cameras in police cruisers, GPS tracking systems, and even private security videos have exonerated police officers from false complaints of misconduct.

Consent Decrees

In a relatively small number of cases, the United States Department of Justice has stepped in where police agencies demonstrate a "pattern and practice" of abusive or derelict performance. The most famous case is perhaps the consent decree with the state of New Jersey over claims of racial profiling in the 1990s, complaints that were validated by the State Police records and training materials.

The intent of a consent decree is remedial more than it is punitive, though the restrictions placed upon the agency are often perceived to be punitive: the loss of autonomy is itself a punishment. Toll-free complaint lines, independent auditors, onerous reporting duties, and other requirements are generally part of a comprehensive plan to force a new manner of performing police duties, under scrutiny. The consent decree is also a signal to the political entities responsible for the agency that drastic change must be created internally. Many of the avenues of recourse described above may also come into play at the local level while the consent decree is in place.

Police Lying and Deception

Jennifer C. Hunt
Montclair State University, Montclair, NJ, USA

Overview

This entry explores some police lying and deception that arises in different social contexts including among patrol officers, in interrogations by police detectives, during undercover operations, and by superiors of different rank. Some scholars have utilized epistemological approaches to the study of lying that assume that an objective reality exists that is independent of interpretation and retrospective construction. Such works assume that most lying that violates law and procedure is deviant or malicious and unjustifiable and that police administrators are not aware of the endemic nature of lying and want reform. This entry touches on the works of these scholars but highlights the perspectives of police officers who view the police organization in a different way. Police officers believe that cops and detectives lie, that supervisors expect them to lie and lie themselves, and that managers use deception to manipulate the press and public.

Introduction

"If a perp 'falls' in a stationhouse where there are no civilians around to see it happen, did it happen at all?" This statement was made by NYPD police officer during a standup comedy routine delivered at a New York club. It revised a classic philosophical question to comment on the secrecy that surrounds police activity and the lies that accompany certain violations of law, in this case the beating of a suspect. This entry addresses the subject of police deception and lying, the exploration of which circles back to the question the NYPD officer raises. It may be impossible to separate fact from interpretation and narrative construction in the police organization because it is grounded in deception from the bottom to the top of the chain of command.

Police lying has been subject to special scrutiny in the scholarly literature because of the social and legal contexts in which it takes place, the power police have in determining suspects' fates, and the public assumption that police should be honest and trustworthy (Alpert and Noble 2009; Leo 2008). This entry begins by exploring different types of lying with reference to the scholarly literature, most of which takes an outsider's perspective that there exists a world of fact that is separate from interpretation and retrospective narrative reconstruction. It goes on to examine how lying is understood and constructed from the perspective of rank and file officers who work inside the police world. The entry concludes with a summary of the areas that need to be addressed in future research in order to develop an understanding of lying within the police organization as a whole.

Lying is defined as an act of symbolic communication that is known to be false and is meant to deceive its audience (Hunt and Manning 1991, p. 52; Manning 1974). Lying is a feature of everyday life in a variety of subcultures and organizational and occupational environments besides the police (Aquino and Becker 2005; Pershing 2003; Manning 1974). It can involve a simple omission of facts; an odd arrangement of adjective, subject, and verb; or the formulation of completely fictitious narrative. While formally lying may be depicted as wrong and shameful, informally it is recognized as a tool of survival in a world in which truth can result in punishment, loss of peer support, or accusations of insensitivity, social ineptitude, or mental illness. Meltzer (2003, p. 1) goes so far as to suggest that "Human life is thus only a perpetual illusion.... [and] Human society is founded on mutual deceit."

In view of the illusion that people should be truthful and organizations operate according to an established and mostly visible set of rules, deception may evoke moral dilemmas for participants, depending on the social context in which it is used. As a result, individuals who routinely lie in the course of their work may experience emotional distress (Aquino and Becker 2005). It thus becomes necessary to develop accounts that excuse and justify acts of lying, neutralize guilt, minimize stress, and maintain participants' sense of moral worth without the introduction of paralyzing moral qualms that could interfere with work (Aquino and Becker 2005; Hunt and Manning 1991; Scott and Lyman 1968; Sykes and Matza 1957).

Police Lying and Ethnographic Fieldwork

Hunt (1984; Hunt and Manning 2000) was first introduced to police lying when she was doing a year of fieldwork in mostly high crime precincts in the New York City Police Department in the late 1970s. She recalls accompanying two veteran officers into the large apartment of an elderly couple who were living in a neighborhood in which crime was becoming a serious problem. The couple explained that some young men had thrown a rock at their window and nearly hit one of them. They pointed to two rocks the size of a man's fist and a lake of shattered glass on the floor. After the cops took a report, they began to give the husband and wife "a hand job," a term police use to describe a lie that is intended to reassure in situations in which nothing can really be done. The officers promised to watch the building. They then applied scotch tape to one of the rocks in order to "take fingerprints" that they claimed would help detectives investigate the case. Desk officers have been known to "marry" and "divorce" people in busy precincts in the Bronx, Brooklyn, and Harlem.

Hunt's understanding of police lying in the NYPD helped her develop rapport with police in the Philadelphia P.D. when she went there to do 18 months of participant observation (Hunt 1984). The department was under investigation for corruption and brutality, including the homicide division whose members had been accused of using torture during interrogations. Initially, police officers believed she was a spy for the Justice Department or Internal Affairs. During her first tour, she rode with an officer who insisted that she was wearing a "wire" (recording devise) and refused to talk to her for the first four of their 8-h shift. In Hunt's second day on patrol, her veteran partner took her into a restaurant while his peers picked up his jobs, an arrangement she believed they made in advance. She and the officer sat in the diner a long time without alerting radio communications regarding their whereabouts. Hunt proceeded to converse with her police partner and make up cover stories to account for their absence from the street. In doing so, she revealed that she understood informal norms surrounding self-protective lying. When they returned to the precinct at the end of 4 p.m. to midnight shift, his colleagues asked him if Hunt had learned anything. "I think she knows it already," her partner replied (Hunt 1984). Subsequent tours went smoothly as she continued to try and negotiate trust by showing, in small symbolic gestures, that she understood and would follow cops' rules, including those that surrounded deception. An NYPD officer told a joke that illustrated this basic principle of lying: "How many cops does it take to screw in a light bulb? Four – one to screw in the bulb and the other three to say: "I didn't see nothing!"

Hunt quickly learned that "he fell down the stairs" was the most common explanation that followed the beating of suspects who emerged, bruised and swollen, from the backroom of a police facility. Lies like this were not simply addressed to her as a civilian but also to cops who did not witness events. It was commonly understood that knowledge could be a burden in the event that an investigation took place. By then police trusted that she knew how to read between the lines of the explanations that typically accompany legally problematic events. "I don't know nothing" became her standard reply when she was questioned during internal inquiries into suspicious incidents. These sorts of responses led to nods of approval, more exposure to violence than she would have liked, and an invitation from homicide detectives to accompany them on jobs. "You'll have to ride with us sometimes," one said in the wake of an investigation into why a suspect had sustained burns on his legs while in police custody (Hunt 1984).

Police Interrogations

Police lie in a variety of social contexts. The use of torture during interrogations has largely been replaced by methods that claim to have scientific support in psychology (Leo 2008). Detectives may attempt to manipulate suspects by claiming they have evidence they don't have, displaying evidence that does not belong to the case being discussed, and playing good and bad cop roles that allow one officer to break the suspect down and the other to build rapport. In "Fluffing up the Evidence and Covering Your Ass: Some Conceptual Notes on Police Lying," Barker and Carter (1990) organize police deception into a three fold taxonomy that includes accepted, tolerated, and deviant lying. Deception by interrogators is categorized as accepted lies because they adhere to procedure and law and fulfill "reasonable" organizational goals. Indeed, detectives receive formal training in deceptive interrogation techniques.

Alpert and Noble (2009) construct a continuum of deception that ranges from lies that are acceptable to those that are "malicious" and "unjustifiable." From their perspective, lies by police interrogators fall within the acceptable range. Police officers generally concur with this view. In their eyes, such techniques are not only necessary but can be rationalized because most suspects who are subject to even prolonged psychological interrogation techniques are guilty or have a record of guilt that justifies harsh treatment. Furthermore, detectives would argue, psychological methods do not result in physical harm, and thus injury can be denied.

Leo (2008) is critical of the use of deception on the part of police interrogators. He notes that detectives falsely believe that they can assess when a suspect is untruthful by certain behaviors, such as the movement of eyes. They also believe that sorting mistakes are rarely made and that innocent people cannot be induced to confess unless they are subjected to "the third degree" or are mentally ill. The use of deception in interrogations is harmful to our adversarial system of justice because it violates the right against self-incrimination of mostly poor and minority citizens and sometimes forces innocent people to confess. Alpert and Noble (2009) acknowledge the problem of false confessions. Feeling trapped by a flood of information that police insist prove guilt and convinced that a false admission might result in a sentence reduction, suspects can be induced to confess to acts they did not do. It is notable that in some countries, including Germany, there are stricter rules surrounding the use of deception in police interrogations and result in suspects making statements that conflict with their self-interest (Ross 2008).

Undercovers

Both Alpert and Noble (2009) and Barker and Carter (1990) view the acts of deception and trickery that accompany undercover work as accepted and/or justifiable within their taxonomy or continuum of police lying. Officers who work undercover must manage impressions in such a way that they appear to be someone else. In large departments, some undercovers may work several cases at once and have to keep their lies consistent when they work or when "clientele" call to talk to them on their cell phones. Undercover officers typically take pride in their acting skills, enjoy the expertise the work involves, and appear to have little problem neutralizing the use of deception. After all, they would argue, the job results in the arrest of serious felons including gun or drug dealers and does not focus on the single buyers who are at the bottom of the "food chain."

While legal, deception in undercover operations may have unintended consequences, some of which police do not recognize. Gary Marx (1989) suggests that officers who use deception in sting operations sometimes border on entrapment and/or encourage the commission of crimes that otherwise would not occur, criminalizing those who might not have otherwise violated the law. Police undercover work is also physically and psychologically dangerous for the officers involved. Police organizations are more cognizant now than in the past of the psychological hazards of deep cover operations that operate for lengthy periods of time. Today there is frequent contact between undercovers and their peers and bosses, resulting in the reinforcement of police identity and bolstering resistance to "going native" in the criminal world. Still officers who work in deep cover narcotics operations may be put in positions in which they feel compelled to take drugs or blow their cover. Undercovers who are assumed to be criminals may be killed by "other" criminals. Friendly fire incidents have been known to result in injuries of officers working in plainclothes operations in units like Anticrime. Several years ago, two undercovers were murdered during a gun buy. Their colleagues did not believe they had been "made" as cops although the district attorney wanted their commanding officer to testify that he believed the officers had been made. This case suggests that lying by police is sometimes encouraged by other players in the criminal justice system and may be systemic in the larger organizations with which the police interact. An additional negative side effect of chronic lying by undercover police is that the practice can contaminate other aspects of their lives, including family relationships that are based on mutual trust.

Lying Among the Ranks of Uniformed Patrol

Patrol officers lie routinely during the course of their daily work. Sometimes they lie to make people feel good in situations in which there is little else they can do. The fingerprint story provided an example. Carl Klockers (1984) calls this type of lying "police placebos" and notes that placebos are created for the benefit of members of the public, not the officers involved. He mentions death notification as an example. When police inform family members that a relative has died in an accident or as a result of crime, they may say that the death was instant and caused no pain regardless of the circumstances involved. Most "placebos" would be categorized as acceptable or tolerated according to the scholars' taxonomy or continuum (Barker and Carter 1990; Alpert and Noble 2009).

Patrol officers also use deceptive ruses in situations in which they are suspicious of peoples' claims and want to put them to the test. In this case, the lie is not intended to make the person feel good but to increase discomfort so he or she reveals information that will allow officers to better assess "the facts." One New York City patrol officer recalled that, in the late 1990s, the precinct was getting a rash of reported robberies by European tourists. Suspicion was aroused when a man from Spain walked into the precinct and told the officer that he had been robbed near Columbus Circle in Manhattan and needed a police report for insurance. During the interview, the victim claimed that the "perp" had ordered him to "Stick'em up!" Stifling his laughter and assuming there was a language problem involved, the officer asked the victim if those were the suspect's exact and literal words. The victim said they were. The officer took the victim back to the scene of the crime and then pretended to ask "Central" (central communications – or police radio) to download the "nonexistent" videotapes from the "nonexistent" cameras affixed to the buildings within scanning view of the location. The officer explained what happened after that:

> The victim starts to freak and back out of his story, claiming he had to get to the airport. When we started pressing him, he admitted the story was BS and he was subsequently arrested for filing a false report. The fake video cameras became SOP (standard operating procedure) in (the area covered by the precinct) for a while and several people were arrested. Word must have spread because when I (transferred to a different unit), the fake reporting seemed to have died down.

Cops also use deception in lieu of physical force to punish "assholes" (Van Maanen 1978) who challenge their authority. This sort of lying would probably not be included in the realm of acceptable or justifiable lying in the schemas of most police scholars but is viewed as reasonable and necessary by cops because it helps restore the proper imbalance of power – that cops have more – and also evens the score. A video recording of a one-man theatrical show by a retired NYPD officer provides an example. In the tape, two police officers are redirecting traffic in Central Park in Manhattan because a rainstorm has led to significant flooding in a wide and deep pocket of the road that directly connects the west and east sides. When one of the officers politely attempts to redirect the driver of a car with diplomatic plates, the driver becomes argumentative and insists on taking the direct route. The officer backs down and tells him to go ahead, while informing his partner that he does not want to cause an international incident. The diplomat soon finds himself alone and immobilized in a deep river of dirty water that covers a large section of the street.

Patrol officers as well as those from other units routinely lie to supervisors to create narratives that benefit their personal goals, such as extending a sick day from one to three or whatever the maximum is before a visit to a police surgeon is required. While scholars might view such lies as unacceptable because they involve "stealing departmental time," cops believe that bosses expect such lies to arise. After all, bosses were once cops who know how the game is played. Such acts are rationalized with reference to "common sense" and the scarcity of rewards. Veteran cops think it is stupid not to take advantage of available opportunities unless a respected boss needs them for an unusual event.

Police also believe that bosses "don't want to know" about much of what they do behind superiors' backs. One detective in a first responder unit explained that he and his teammates had had a party during an all-night tour of duty inside. When the lieutenant comes to work in the morning and discovered that all of them were drunk, he angrily ordered them home. In response to the order, one of the officers explained that he could not go home because he was "too drunk to drive." Furious, the lieutenant went to the captain and told him what his officers had done. The captain asked the lieutenant if he planned to do anything. When he said no, the captain responded: "Then why are you telling me? There are some things I don't have to know" (Hunt 2010a, p. 337). A patrol cop provided an example of a lie he told his sergeant that he believed the sergeant would have approved. Indeed, the officer justified the lie as necessary to prevent his boss from involvement in a troublesome incident that might result in accusations that he had not properly done his job.

> One time I sprained my ankle while leaving my girlfriend's apartment. Problem was, I'm on duty but way off post. I'd gone down to court to process an arrest and her place was on the way back to the stationhouse. Now, there's no way I'm telling my squad sergeant where this happened because it's going to open a whole can of worms and drag him into a mess, failure to supervise and shit like that. So I sprained my ankle down the block from the precinct. What's the difference anyway? My ankle is still sprained. Right? It's not like I'm dragging myself to work after spraining it playing softball! Now that would be fucked up!

While Barker and Carter's (1990) taxonomy of accepted, tolerated, and deviant lying is useful in some respect, it takes an outsider perspective that does not illuminate how rank and file officers construct their world of deception in contrast to high-ranking members of the police organization. Alpert and Noble (2009) appear to assume the perspective of administrators who recognize that lying can have negative consequences and some forms should be subject to punishment, including the dismissal of the officers involved. Cops would argue that such administrators only surface when lying by rank and file officers and detectives becomes a source of embarrassment for the department.

Solutions to Police Lying and the Reproduction of Deception

Alpert and Noble (2009) advocate a number of solutions to the problems they see in acceptable lying that does not violate law and procedure and malicious lying that does. These include the incorporation of materials on ethics and the consequences of deceptive interrogation processes in police training. If liability issues did not interfere, it would also be helpful to include materials on what street cops do and how they neutralize deceptive practices as this instruction might help undermine recruits' ability to effectively use the relevant accounts while preparing them for what is to come. In order to avoid problems that could ensue if former recruits got into trouble and claimed they learned to lie in the police academy while reading and discussing papers on what police really do, instructors typically isolate recruits from veteran colleagues while indoctrinating students about the formal rules as if policing is done by the books (see Moskos 2008; Hunt 1985). In a way, academy training thus creates the deception that "the job is on the level," a reality that diminishes with time on the street. This phrase refers to the belief of naive police or non-police persons that the police organization is what it claims to be and deception is not endemic.

Street Cops Perspectives

Police categorize as normal particular types of lying that violate law and procedure. Such culturally sanctioned lies are also viewed as troublesome because they could subject officers to legal scrutiny and punishment. The classic case of a troublesome lie that went amok occurred in the O. J. Simpson case when detective Mark Fuhrman claimed that he had not used the word "nigger" in at least 10 years. When proof was introduced that Fuhrman had used the word "nigger" more recently, including during taped interviews with a writer, working on a screenplay, it discredited the rest of his testimony and bolstered the defense's suggestion that he had planted a bloody glove on Simpson's property (Slobogin 1996). Although Fuhrman did not go to jail for perjury, his actions undermined the prosecution's case and embarrassed the department.

Once police leave the formal world of the academy, they learn to distinguish normal lies from those that are culturally unacceptable in their world. They also learn how to construct normal lies and account for their use in ways that are shared with veteran peers. The ability to skillfully lie in appropriate social contexts helps define the boundaries between police and "the other" that does not understand or belong in their world. From the cynical perspective of street cops, "the other" includes scholars who believe police administrators' claim that they, themselves, do not engage in deception, do not want cops to tell lies that violate law and procedure, and desire serious reform that extends beyond removing the few rotten applies who float to the surface and embarrass their department. The phrase "the job is not on the level" refers to street cops' belief that the police organization is built on deception and informed by politics and that those at the top of the chain of command are complicit in maintaining the status quo.

Case Lies

One type of troublesome lies that are recognized by patrol officers is case lies that are presented in court testimony or on paper to facilitate the conviction of suspects (Hunt and Manning 1993). Cops routinely lie in court to invent probable cause when it is weak or absent if they are fully convinced that the suspect is guilty. Typical cases involve minor issues that do not result in serious punishment to defendants, such as disorderly conduct by juveniles that result in complaints. Cops also lie in the construction of case stories by creating narratives of events that manipulate the perceived sentiments of judge or jury. Among the accounts cops use to neutralize internal conflict in the wake of lying in court are claims that court is “a game” in which each player has to top the other’s story (everyone lies), the suspect is guilty and deserves what he gets (denial of the victim), the punishment is minor (denial of injury), and “I made the arrest at the request of superiors who told us to clear the corner” (denial of responsibility) (Hunt and Manning 1993).

Cover Stories

Cover stories are the second type of lies that police categorize as normal and acceptable even when they arise in a “troublesome” context in which officers could be exposed. Police use cover stories to avoid revelations that could result in punishment in situations in which they have violated departmental procedure and/or law. Cover stories routinely arise in innocuous contexts such as when patrol officers miss a radio call because they are running a personal errand or when the sergeant needs an explanation for why subordinates were not on the street when he or she came by to sign their logbook. Police lie to supervisors to create narratives for personal benefit such as extending a sick day.

In one case, a supervisor and captain got together to create a coherent narrative about an accidental discharge of weapons that did not result in injury. Neither one of the bosses believed the cop’s account of the event. The sergeant tried but failed to persuade the cop to alter his statement to one that made sense to him. To avoid questions from superiors, the sergeant and captain got together and wrote a report that revised the officer’s oral statement and created a “believable” account that would minimize additional inquiry.

The *NYPD Patrol Guide* and similar documents in other departments contain an abundance of formal procedures, some of which make the job hard to do expediently. The result is that even the best cops violate one or another rule at various times during the course of their work. This means that supervisors who view particular cops as troublesome can always “get something on them” if they want to do them harm. For this reason, officers believe that cover stories are necessary to avoid persecution by political enemies within the department. Officers who have good relationships with supervisors are convinced that bosses expect them to violate some of the rules and to prepare cover stories in the rare event that an inquiry comes to pass.

Officers routinely get together to create cover stories in instances in which suspects are beaten or physically abused. Typically such occasions include such trumped up charges as resisting arrest and assault on an officer. Police also sometimes invent cover stories in the wake of ambiguous use of lethal force incidents. Hunt and Manning (1993) provide examples of how officers got together to construct an imaginative cover story that fit observable facts in what they recognized was a “bad shooting” of a child. Police define a bad shooting as one that is not culturally sanctioned or legally justified. Waegel (1984) provides an example in which an officer claimed that his “bad shooting” was the result of an “accidental discharge.” It is interesting that the military uses the term “negligent” rather than “accidental” discharge. In most cases, the only way an officer can “accidentally” fire his gun is if he has his finger on the trigger when he does not have a reason to shoot. This practice violates weapons’ training and is dangerous to civilians and cops.

The frequency of lying by police in instances in which lethal force is used is confirmed by Paul Chevigny (1995) who notes that police often lie in shooting incidents when lying is not necessary to make their case or protect themselves. Indeed, such lies can result in inconsistencies in police testimony and accusations of perjury. Hunt (2010a) suggests that it is not surprising that police officers frequently get together to make up cover stories in the wake of shootings in view of the expectation that their memories should be clear and intact. Studies have shown that stress can affect memory and there is little correspondence between “accuracy and confidence of recollection” in the reporting of critical incidents (Hunt 2010a, pp. 327–327; Artwohl and Christensen 1997; Alpert et al. 2011).

Some scholars have labeled cover stories as deviant or malicious and unjustifiable (Barker and Carter 1990; Alpert and Noble 2009). Police officers have a different point of view. Police only view cover stories as "bad" when they are not composed with the skill that is required to have them pass as truth. Cover stories are also seen as only as "moral" or acceptable as the incident that they are trying to protect. If the act underlying the lie is viewed as corrupt or brutal and cannot be neutralized with reference to culturally sanctioned accounting practices, then the cover story is also stigmatized. Prohibitions against ratting out peers that ordinarily maintain cover stories intact may be neutralized in instances in which the underlying act is heavily frowned upon.

This was the case when police officer Justin Volpe sodomized Haitian immigrant, Abner Louima, in the bathroom of the "7-0" (70th) precinct in Brooklyn, New York, in 1997. The majority of officers in the NYPD did not believe Volpe had committed the crime until he confessed at trial because they could not face the fact that a fellow cop could commit such a heinous act (Hunt 2010a, pp. 162–166). Instead, even the most cynical cops preferred to believe the absurd story propagated by the defense that Louima hurt himself while participating in rough but consensual, homosexual sex. The irony here is that even cops, who routinely lie and believe that they can assess when others are telling the truth, were convinced that Louima's injuries were self-inflicted. Officers had no doubt that Louima was beaten in the patrol car on the way to the precinct if Volpe (mistakenly) believed Louima "sucker punched" him while they were standing in front of the club. However, most police could not believe that Volpe had perpetuated a sadistic, homosexual assault. Such an act did not fit cultural notions of how far even corrupt and brutal cops will go.

A number of the 7–0 precinct officers who saw Louima before or after the assault came forward and confessed what they had seen. At first glance their actions appear to have been a violation of the "blue code" in which police officers unite to protect themselves (Manning 1978). However, other police did not shun those who testified for the prosecution. From their perspective Volpe's crimes neutralized the code. Not only did he commit a horrible act but he also made cops ashamed to be cops (Hunt 2010a, pp. 162–166). It is notable that the statement "he's good with his hands" is not a compliment. Most officers do not want to work with partners who resort to physical force at the drop of a hat (see Hunt 1985).

Deception Up the Chain of Command

Despite the relative abundance of works on police lying compared to deception in other occupations, the current scholarly literature tends to focus on deception that occurs at the level of rank and file officers in uniformed patrol and in the detective division among interrogators. Police scholars therefore have a limited understanding of the nature of lying up the chain of command and the degree of collusion that exists at the level of middle and upper management. As the phrase "the job is not on the level" suggests, police view deception as endemic to the organization. It is difficult to assess the nature of managerial involvement in deception that violates law and procedure. An examination of official reports suggests that there is some degree of collusion in terms of issues that relate to high-ranking officers' desire to protect the image of the organization and demonstrate loyalty to the police commissioner or chief.

Official reports are typically sanitized accounts of complex events that strive to eliminate the confusion and ambiguity that sometimes accompany decisions made on the street. Such accounts tend to draw a neat line between officers' actions and their justification in law and departmental procedure, regardless of the confusion that greeted the real events (Van Maanen 1980; Hunt 2010a). Collusion by members of top brass in the creation of sanitized police incident reports may be more common than we know. In one recent case in a large urban police department, the attendance and experience of a particular group of police officers were left out of an official account of a police shooting in order to avoid liability in the event that the victim's relatives filed a lawsuit. While the shooting was technically legal, it could have been avoided according to the group who were left out of the report. Top brass knew the group had been at the scene and had a different take about what went on.

They also knew that the group was excluded from inclusion in the final report.

There is a growing body of evidence that suggests the collusion of high-ranking members of the NYPD in the falsification of crime reports through encouraging the underreporting or downgrading of crime (Silverman and Eterno 2012; Hunt 2010b, c; Rayman 2010). It appears that pressure exerted from the top of the chain of command is partly responsible for police officers and supervisors' manipulations of crime statistics. Recent reports in the *New York Post* indicate that nine police precincts are showing an "alarming spike in crime" (Bennett et al. 2011).

The NYPD recently removed Deputy Inspector Jose Navarro from his position as commanding officer of the three to four precinct because he could not "control" the rise in crime. The *Post* article also states: "NYPD Chief Joseph Esposito and Deputy Commissioner Patrick Timlin have launched a get-tough policy with precinct commanders to demand they get crime under control" (Bennett et al. 2011). There are limitations in how much police can control crime through altering deployment strategies in view of the limited manpower available. Apparently, management does not want to acknowledge that punishing precinct commanders for problems they cannot always control has the same result as encouraging the manipulation of crime statistics to create the appearance that crime is not on the rise. One NYPD police officer recalled a conversation in which his commanding officer (a captain or deputy inspector) pressured him to change a "61" (name of the type of report) from a burglary to a larceny "because a building in a park can't really be considered permanent, right?"

There appears to be less transparency in the NYPD today under Mayor Michael Bloomberg and Police Commissioner Raymond Kelly than in past few administrations. The existence of police operations that appear to violate the constitution or other legal standards is routinely denied by Paul Browne, the NYPD's Deputy Commissioner, Public Information. Prior to the publication of a documented article about the NYPD Demographics Unit by the Associated Press, Browne denied that the Intelligence Division contains the seventeen-member unit (Appuzo and Goldman 2011; Demographic Unit, undated). The unit is composed of undercover officers ("rakers") who are tasked with spying on members of Muslim communities in the tri-state area. Rakers "visited Islamic bookstores and cafes, businesses and clubs [that attracted relevant minorities]....moniter current events, keep an eye on community bulletin boards inside the houses of workship and look for 'hot spots' of trouble. ... They played cricket and eavesdropped in the city's ethnic cafes and clubs....when the CIA would launch drone attacks on Pakistan, the NYPD would dispatch rakers to Pakistani neighborhoods in New York, New Jersey and Connecticut...." (Apuzzo and Goldman 2011). After the article was published, Browne changed his statement but claimed that "We do not employ undercovers...unless there is information indicating the possibility of unlawful activity." The department has also denied CIA collusion in the activity of the NYPD through a former member of the Agency is on the department payroll (Apuzzo and Goldman 2011). Browne did not explain what legal grounds justified the actions described in the AP article or in other newspapers describing the NYPD's efforts to spy on Muslim college students.

Conclusion

A number of excellent studies exist that explore police lying and deception during their daily activities, including the interrogation of suspects; patrol jobs involving hard-to-handle human problems; undercover detective work including sting operations, in court testimony; and to avoid punishment in situations in which officers make mistakes, abuse their authority or knowingly participate in acts of corruption that peers would not support. However, scholars know little about deception and lying by police officers at the top of the chain of command. One arena in which such lies appear to arise involves the construction of official reports of critical incidents that might make the department look bad in the eyes of the public or subject the department to lawsuits. Another involves implicit or explicit encouragement of the falsification of crime reports. A third area that would be worth pursuing is the manipulation of the media by police entities that manage the public and the press, such as the Office of the Deputy Commissioner, Public Information (DCPI) in the NYPD. The hidden activities of the secret undercover unit in the NYPD Intelligence Division remain just one of several units that should be of particular concern for researchers in terms of issues of deception, transparency, and the trampling of the US constitution. The activities of such units are authorized by high-ranking members of the service and subject to lies and distortions by commanders including those in the Office of the Deputy Commissioner, Public Information. Such lies are aimed at deluding the public into thinking that the police are only concerned with protecting them against terrorism and do not engage in illegal activities or others that waste financial resources and deplete police precincts of officers dedicated to serving the community and managing crime.

In terms of the issue of lying, the separation between management and street cop views is not as distinct as some would have us think (Hunt 2010a, pp. 305–308). Managers know that cops lie in a variety of legal and not so legal social contexts because they generally did the same when they were cops. Rank and file officers and supervisors believe that "there are some things" bosses don't want to know. Cops thus believe that supervisors and police executives, including top brass, expect them to lie or keep certain types of information to themselves. Only when something arises that threatens to spiral out of control and into the arms of the press do superiors want cops to tell them the truth of what is going on so they can put out the fire before careers are undermined and the administration goes up in flames. Then managers will scramble the facts to create a version of events that shifts the blame to the lowest ranking participants and leave the organization intact. If what cops believe is true is, in fact, true, the police department is an organization that is sustained on lies and deception but strives to maintain the illusory image that managers encourage the opposite. Alternatively, high-ranking superiors have come to believe that the illusion of truth that they began to perpetuate as they moved up the ranks actually reflects the reality of an organization that is founded on deceit (see Meltzer 2003).

School resource officers (SROs)

Overview

Criminal offending, victimization, and disciplinary problems at school have been a great concern in the USA, and millions of dollars are being spent on improving school safety. Unsafe school conditions can have detrimental effects on students' academic and behavioral outcomes either directly or indirectly by influencing the nature of social relationships within schools and school climate. Not surprisingly, public concerns about school crime and violence have led to a variety of responses to increase the safety of schools, which include the use of security and surveillance practices. One of the strategies gaining popularity to enhance school safety is having uniformed police officers stationed on the school grounds. In the past 12 years, the rising concerns about high-profile school violence and shootings led to a dramatic increase in the use of school resource officers (SROs), and the number of schools with full-time SROs still continues to grow rapidly, especially in large, urban, and secondary schools.

While most key stakeholders (especially school administrators and SROs) believe that the presence of SROs increases school safety, such positive impressions are often not corroborated when more objective measures of school safety are used to assess the effectiveness of

SRO programs. Both quantitative and qualitative research suggests that increased use of SROs might lead to the over-criminalization of disciplinary problems and increased reliance on harsh discipline and exclusionary practices to deal with problematic students. The presence of SROs might also disproportionately affect specific segments of population (e.g., racial/ethnic minorities, special education students).

This entry begins with a discussion of the recent trend towards increasing reliance on SROs and the reasons why SROs are being used extensively in schools within the context of larger historical, structural, and political shifts. This is followed by a discussion of the possible reasons for and consequences of increased use of police in schools, including both anticipated and unexpected effects. Then extant research on the effectiveness of SRO programs is summarized. This entry ends with a discussion of implications for future research and policy.

The SRO Concept and Trends

The concept of SRO first emerged during the 1950s in Flint, Michigan, as part of the implementation of community policing (Girouard 2001). The concept grew during the 1960s and 1970s, primarily in Florida, although it did not spread nationally until the mid-1990s, when legislation such as the Safe Schools Act of 1994 and a 1998 amendment to the Omnibus Crime Control and Safe Streets Act of 1968 encouraged partnerships between schools and law enforcement. The US Department of Justice "COPS in Schools" grant program dramatically increased the use of SROs in schools beginning in 1999. SROs are typically uniformed, armed officers who have been trained for their role as school-based officers. Their duties typically involve patrolling the school, investigating criminal complaints, handling student rule/law violators, and trying to minimize disruptions. They are also often involved with educational and prevention-related programming, such as counseling students and providing DARE instruction. Although the specific goals of SRO programs may vary across time and space, the federal "COPS in Schools" program has two primary objectives: to "encourage working relationships between police and schools, thus bringing the principles and philosophy of community policing directly into the school environment" and to "assist communities in focusing leadership and resources on the issues related to creating and maintaining a safe school environment" (Girouard 2001).

According to the most recent School Crime Supplement to the National Crime Victimization Survey (NCVS), the percentage of students aged 12–18 who reported the presence of security guards and/or assigned police officers at their schools was 69 % in 2007 (Dinkes et al. 2009). A recent New York Times article (January 4, 2009) reported that more than 17,000 police officers are now placed in the nation's schools.

The use of police in schools has not always been so high. In 1975, principals in only 1 % of the nation's schools reported police stationed in the school (National Institute of Education 1978). Non-city schools and elementary schools almost never had police stationed in them. Only between 10 and 20 % of senior high schools had police. The School Survey on Crime and Safety (SSCS) data shows that by the 2003–2004 school year, principals in 36 % of schools reported police stationed in the school and by 2007–2008, the percentage had risen to 40 %. Other data sources concur. Data collected from a nationally representative sample of local police departments (from the Law Enforcement Management and Administrative Statistics [LEMAS] survey) show the number of SROs placed in public schools grew from 9,400 in 1997 to 14,337 in 2003 (Bureau of Justice Statistics 2000, 2006) and the percentage of students aged 12–18 who reported the presence of security guards or assigned police officers at their schools increased from 54 % in 1999 to 69 % in 2007, according to the NCVS.

Reasons for the Increase

Why is the use of police in schools increasing in the USA? The simplest answer is that the federal government has been increasing funding for police in schools. The Department of Justice Office of Community Policing Services (COPS) initiated the "COPS in Schools" (CIS) grant program in 1999, just after the highly publicized shootings at Columbine High School. As of July, 2005, COPS has awarded in excess of $753 million to more than 3,000 grantees to hire more than 6,500 SROs through the CIS program and more than $10 million to hire approximately 100 SROs through the Safe Schools/Healthy Students program. In 2004 the CIS program provided an additional $1.5 million in federal funding for SROs in conjunction with the Office of Justice Program's Gang Reduction Project. States often subsidize federal funding to hire additional SROs and provide funding to support school security, sometimes requiring that schools employ SROs to qualify for certain state money

The increased funding for police in schools was a highly visible response to increasing rates of juvenile crime throughout the 1980s and the numerous school shootings that occurred during the 1990s, culminating in the Columbine event. Between 1984 and 1994, the homicide rate for adolescents doubled and nonfatal victimizations increased nearly 20 % (Elliott et al. 1998). Rates of victimization at school were also high during this period, with 56 % of juvenile victimizations occurring at school in 1991 (Elliott et al. 1998). These realities created an urgency to do something about the problem. But why police in schools? Hirschfield (2008) places this response in larger historical, structural, and political context, tracing the origins of the trend towards "criminalization of school discipline." The placement of police in schools is but one element of a larger shift towards more formal treatment of student discipline. Legal reforms have mandated that certain offenses (such as drug and weapon possession) be referred to the police when they occur on school property. Other reforms have increased surveillance by using a variety of security technologies including metal detectors and security cameras and have broadened the conditions under which student searches are conducted.

This trend, according to Hirschfield (2008), was in part a delayed response to the student rights movement during the 1960s and 1970s that resulted in several judicial rulings limiting the discretion of school personnel to exclude students from school for disciplinary reasons. Teacher unions and associations and the national school principals associations, seeking to limit their constituents' liability for disciplinary actions, strongly supported more defined roles for teachers and principals with respect to school discipline responses in general and zero tolerance policies in particular. With increasing youth violence and highly publicized school shootings, the passage of the Gun-Free Schools Act of 1994 requiring that schools adopt a "zero tolerance" approach to weapons in schools became politically feasible. Many schools extended zero tolerance policies to apply also to the use of drugs and alcohol. As of 1998, 91 % of school principals reported that their schools automatically or usually (after a hearing) expelled or suspended students for possession of a gun, drugs, alcohol, or a knife (Gottfredson and Gottfredson 2001). This shift away from school personnel discretion and towards formalization of school responses to school discipline sets the stage for the more widespread use of police in schools that would soon follow.

Consequences of Increased Police Presence

Increasing police presence in schools may have made sense as a reaction to increasing rates of youth violence and school shootings, but these events cannot explain why police continue to be stationed in school buildings today. Since 1993, schools have enjoyed a strong downward trend in crime of all types that mimics the downward trend in overall youth victimization. Based on the NCVS data, Cook et al. (2010) report that the victimization rates of youths aged 12–18 at and away from schools continued to decline between 1992 and 2005. For theft and violence, the 2005 figures were about one-third of the peak in 1993. Yet the use of police in schools continued to rise as school crime rates declined.

In all likelihood, schools continue to use SROs because these officers are widely regarded as effective for maintaining school safety. Proponents believe that SROs contribute to school safety not only through their surveillance and enforcement functions but also because they create bonds of trust with students, who are then more likely to report potential crimes to them (McDevitt and Panniello 2005). SROs might also contribute to improved relations between youth and police. Of course, the presence of police in schools also provides readily available first responders in the case of real emergencies, and they help school administrators determine if certain behaviors constitute law violations.

Others share a less optimistic view of the consequences of keeping police in schools. The cost of adding SROs to schools is high, not only in personnel costs but also in extra costs related to formal processing of misbehaviors that would otherwise be handled in the school. Some research suggests that students attending schools with SROs are more likely to be arrested, especially for minor offenses such as disciplinary infractions (Theriot 2009). This becomes more problematic considering the "invisible" costs and consequences that such over-criminalization might produce (e.g., negative impact on the youths while they are held in adult detention centers before cases are dismissed or when they are actually processed through juvenile courts and labeled as criminals). In addition, one of the most troubling consequences is that SROs can shape the school discipline climate in ways that could potentially harm students. The findings from qualitative analysis of SRO effectiveness (e.g., Kupchik 2010) suggest that increased use of police officers facilitates the formal processing of minor offenses and harsh response to minor disciplinary situations. That is, school principals tend to rely on the officer as a legal adviser when there is an uncertainty about the relevant rules of law to apply. Police officers are more likely to resort to legal definitions and formal processing, especially when they have an obligation to take legal action under the zero tolerance policies. To the extent that minor behavioral problems are redefined as criminal problems and teachers are expected to rely on police in dealing with disciplinary problems, discipline responsibilities tend to be shifted away from teachers, administrators, and other school staffs to the SROs.

There are also civil liberties issues to be considered. A recent inquiry about civil rights violations related to the use of SROs highlighted another potential downside of the program. As reported in the New York Times (January 4, 2009), an A.C.L.U. inquiry into school-based arrests in Hartford, Connecticut, found that the presence of SROs disproportionately affected minority youths. This accords with a larger body of research showing that the use of suspension, especially long-term suspension, has a disproportionate impact on minority and special education populations, whose behavior places them more at risk for suspension. Civil liberties advocates have long argued that zero tolerance policies rob youths of their right to a public education. Unfortunately, these possible negative and positive consequences of increasing police presence in schools still remain untested by rigorous studies.

Research on SROs

To assess the effect of placing SRO officers in schools on the level of school safety, it is necessary to compare a reliable and objective measure of school safety pertaining to a period during which SROs worked in the schools to a suitable measure representing the counterfactual condition – for example, no SRO officers. The counterfactual measurement might be based on a reliable estimate of the outcomes taken from comparable schools with no SRO or from a time period before placement of the SRO. In either case, the number of observations of both the treatment and control conditions must be sufficient to generate stable estimates for each condition, and the outcome measurement must not be influenced by the placement of the officers in the school as it would be, for example, if the officers' own incident reports were used.

No evaluation of SROs to date meets this standard. National assessments of SRO programs supported by the National Institute of Justice (e.g., Travis and Coon 2005; Finn and McDevitt 2005) focus exclusively on the roles played by SROs, factors related to these roles, and how the SRO programs have been implemented. When they discuss the program effects, they either present descriptive statistics or simply rely on perceptions of campus safety as outcomes. Several other evaluations of SRO programs have also asked key stakeholders such as SROs or school administrators to report on their perceptions of the effectiveness of the SRO programs for increasing school safety. Not surprisingly, almost all (99 %) SROs report that their presence has increased school safety (Trump 2001) and most school administrators also report generally positive impressions of the SRO programs (e.g., May et al. 2004). However, it is well known that positive impressions of the effectiveness of an intervention are often not corroborated with more objective measures.

Other studies rely on surveys of students in schools with SROs to assess the likelihood of reporting crimes to the SRO officer, perceptions of safety, opinions about the SRO officer, and frequency of interactions with SRO officers (e.g., McDevitt and Panniello 2005). While providing useful information about youth impressions of SRO officers, these studies do little to inform us about program effectiveness because they cannot compare the experiences of students exposed to SROs with those of students not exposed. For example, McDevitt and Panniello (2005) report that students feel comfortable reporting crimes to SROs and that they feel safe at school. The important question, though, is whether students in schools with SROs feel safer than students in schools without SROs and whether they are more likely to report crimes to an adult in schools with SROs than in schools without SROs.

The first published evaluation of an SRO program to go beyond stakeholder impressions (Johnson 1999) also used cross-sectional self-report data collected from SROs, program administrators, and school principals in five schools in Birmingham, Alabama, all of which had SRO officers. But the evaluation also included a comparison of suspension counts from the year before the SROs were placed in the cities' schools until the semester after they were placed for all 18 schools that received SROs. Although the evaluation concluded that the placement of SROs into the schools was effective for reducing suspensions, the lack of a non-SRO comparison group, the reliance on a single time point of pretreatment data for schools with SROs, and the use of suspensions counts rather than rates meant that the study was not sufficiently rigorous to enable confident conclusions to be drawn regarding the effectiveness of SRO programs on youth behavior.

Subsequent evaluations have also failed to meet the standard necessary for drawing causal conclusions about program effectiveness. Only three studies have compared SRO schools with non-SRO schools. One (Theriot 2009) found that the presence of SROs increased rates of arrest for disorderly conduct but decreased rates of arrest for more serious assault and weapons charges. Another (Gottfredson et al. 2002) reported no effects of SRO presence on students' beliefs about the acceptability of offending or on their perceptions of the police, but students in the SRO schools were *less* likely than controls to report that they would be identified if they were to participate in delinquent activities. The contributions of these studies are limited because they were based on small numbers of nonrepresentative schools and nonrepresentative samples of students within the schools (Gottfredson et al. 2002), lacked comparable non-SRO schools or a sufficiently long pretreatment assessment period (Jackson 2002; Theriot 2009), or lacked measures of actual student behaviors or perceptions of school safety (Jackson 2002). Also, Theriot (2009) compared the SRO condition with non-SRO schools that employed law enforcement officers who are not trained in school-based policing but focus exclusively on law enforcement functions, making the results less interesting for our purposes.

The most recent study of SROs (Na and Gottfredson, forthcoming) used a nationally representative sample of US public schools to compare schools that added SROs or other sworn law enforcement officer to schools that did not. They examined the extent to which the addition of police in schools is associated with changes in levels of school crime and schools' responses to crime. They presented both cross-sectional comparisons and comparisons based on a longitudinal sample that allowed for more complete controls for preexisting differences among schools than were available in previous research. Outcomes included principal reports of the number of school crimes, the percentage of those school crimes that were reported to the police, and the percentage of offenses for which the offending student was removed, transferred, or suspended.

Unlike studies that have reported on key stakeholders' perceptions of the effectiveness of the SRO programs for increasing school safety, this study found no evidence suggesting that SRO or other sworn law enforcement officers contribute to school safety. That is, for no crime type was an increase in the presence of police significantly related to decreased crime rates. The preponderance of evidence suggested that, to the contrary, more crimes involving weapons possession and drugs are recorded in schools that add police officers than in similar schools that do not. The analyses also showed that as schools increase their use of police officers, the percentage of crimes involving nonserious violent offenses that are reported to law enforcement increases. These findings are consistent with the conclusions from a previous qualitative research (Kupchik 2010, p. 115) which found that the presence of police officers helps to redefine disciplinary situations as criminal justice problems rather than social, psychological, or academic problems and accordingly increases the likelihood that students are arrested at school. Adding police, however, does not increase the reporting of serious violent crimes or crimes involving weapons and drugs to law enforcement, probably because the rates of reporting of these crimes to law enforcement are already very high.

Contrary to speculations that the presence of SRO officers may unjustly rob students of their right to a public education through increased use of suspension and expulsion or may contribute to civil rights violations by disproportionately impacting minority or special education youth, Na and Gottfredson (forthcoming) found that students in schools that add police officers are no more likely to be removed, transferred, or suspended from school as a result of an offense than are students in schools that do not.

Future Directions

The findings from the studies discussed here need to be interpreted carefully due to their weak design and inherent limitations. The most important limitations in the extant research are that (1) the measurement of school crime may be influenced by the placement of a police officer in the school, (2) the research designs used in the studies have been incapable of ruling out selection artifacts as an alternative explanation for observed associations, and (3) the mechanisms through which SROs might influence school crime and safety have not been studied.

A substantial number of violent and nonviolent crimes committed within schools are never reported. Having SROs stationed at schools would tend to increase arrest rates simply by increasing surveillance and detection of crime even when the number of crimes remains the same or is reduced. Similarly, the number of crimes reported by the principal may reflect the actual level of crime in the school, the accuracy of the recording of school crime, or both. To the extent that police officers increase the accuracy of reporting in the school in which they are stationed or to the extent that police officers redefine ambiguous situations to conform to legal definitions of law violations, the observed increase in recorded school crime due to police officer presence observed in some of the studies may reflect a change in measurement practices rather than an increase in actual crime. Future studies of the effects of police officer presence on school crime should use crime measures that cannot be influenced by changes in official recording, such as student self-reports of victimization and offending in school.

The second major limitation of the existing evaluation studies is that most are based on the cross-sectional data that makes it difficult to determine the true causal directionality of the associations observed. To the extent that SROs are placed in the most troubled schools (as was demonstrated in Na and Gottfredson, forthcoming), a positive association will be observed between the presence of SROs and crime. Longitudinal data is needed to control for preexisting school conditions. Even using longitudinal data, available pretreatment measures may fail to adequately control for preexisting differences between schools with and without police officers. Future evaluations of the effects of placing police in schools should randomly assign schools to have police officers stationed therein or not.

Finally, no studies have examined the mechanisms through which SRO presence might increase or decrease school safety and crime outcomes. As noted by Girouard (2001), SROs are expected to serve a multifaceted role (e.g., law enforcement officer, counselor, educator). Through such a variety of duties, SROs can have a substantial impact not only on school safety itself but also on school environment in general, which in turn affect school safety (Cook et al. 2010). Scholars have hypothesized about the effects that the presence of police officers may have on the social climate of the school. While some evidence suggests that police contribute to a more positive school climate by encouraging student trust, other evidence suggests that increased law enforcement presence in schools erodes the school's sense of community, diminishes students' willingness to confide in school staff, and creates confusion about the roles of school administrators and the police in resolving disciplinary incidents. These social climate outcomes should be measured in future SRO research.

Implications for Policy

Any intervention strategy that adds new personnel to a system is bound to be very costly. Programs that station police in schools is no exception. In the USA, federal and local tax dollars pay these costs. In addition to the apparent costs of the program are hidden costs related to large increases in the formal processing of youthful offending in the schools in which police are placed. Note that the studies discussed in this entry suggest that students involved in less serious crime are more likely to be either formally arrested or reported to law enforcement in schools in which police are stationed.

Like many social programs that are motivated by a sense of urgency to do something about a perceived crisis situation, SRO programs have grown dramatically without benefit of scientific evaluation. As noted earlier, compared to 1975 when only 1 % of the nation's schools had police stationed in them, as of the 2007–2008 school year, 40 % of schools had police stationed in them. No rigorous study to date has demonstrated that placing police in schools promotes school safety. To the contrary, scholars have suggested that increased police presence may have the unintended effect of increasing school crime via school climate changes described earlier.

The bottom line is that more rigorous research on this topic is absolutely essential. The possibility that placement of law enforcement officers in schools increases referrals to law enforcement for crimes of a less serious nature and results in systematic construal of ambiguous situations as law violating behavior requires us to assess more carefully the school climate and school safety outcomes related to this popular and costly practice. Needed are studies involving enough schools to provide sufficient statistical power to detect important differences on the outcomes of interest, using a research design that can effectively rule out selection effects and using objective measures that are not likely to be influenced by the presence of police in the schools. It would also be desirable if the studies had sufficient statistical power to detect differences by type of school or community in the effectiveness of SRO programs. Hirschfield (2008), for example, provides a rationale for anticipating that the functions of SROs will differ in suburban and urban schools. The effectiveness of SRO programs may also differ depending on the perceived level of crime in the school and community.

In the meantime, a more cautious approach to maintaining order in schools would be to rely on approaches that have been demonstrated in research to reduce school crime. There is no shortage of such evidence-based practices. Several narrative reviews and meta-analyses of school-based interventions aimed at reducing conduct problems and delinquent behavior have been published in the last 10 years (e.g., Gottfredson et al. 2002; Hahn et al. 2007; Wilson and Lipsey 2007). All of these sources identify numerous school-based programs and practices that have been demonstrated in high-quality research to enhance school safety. Many of these effective practices are also known to be cost-effective (Drake et al. 2009). Until the effectiveness of the practice of placing police officers in schools can be demonstrated, schools are encouraged to make more extensive use of these effective practices.

Notes and Acknowledgments This entry is based on a more detailed chapter (Cook et al. 2010) on school crime control and prevention. Portions of this work are also included in Gottfredson et al. (2012) as well as in Na and Gottfredson (forthcoming).

Police Performance Measurement

Craig D. Uchida
Justice and Security Strategies, Inc.,
Silver Spring, MD, USA

Overview

This entry discusses systems of performance measurement for police agencies. It briefly examines trends in measurement from the early years of policing to the twenty-first century. Common themes that run through the entry include the following: What are the purposes for measurement? Who is concerned about the measure (i.e., are there external or internal pressures or concerns?)? Have the measures been implemented and to what degree or level of success? Have researchers conducted evaluations? What are the results?

The entry focuses on four major areas: (1) fundamental or traditional measures, (2) the rise of CompStat as a performance management tool, (3) the use of early intervention or early warning systems to measure police misconduct, and (4) comprehensive systems of performance measurement.

Fundamentals

What should be measured by police? What is the appropriate measure of success? Is it crime reduction, clearance rates, complaints, calls for service, or use of force incidents? Is it the number of community meetings attended by officers or the quantity and quality of problem-oriented policing projects? In most instances, answers to these questions depend on the mission and goals of the agency but are further complicated by the political problem of whether they should be measured and the technical problem of how to measure them. Selecting and using appropriate measures is a problem shared by administrators in most public agencies that have no single, definable outcomes (Maguire and Uchida 2000; Bayley 1994; Moore and Braga 2003a).

It is well established that law enforcement officers engage in many different activities. They make arrests, process offenders, serve warrants, quell disturbances, respond to emergencies, work with the community, solve problems, form relationships with the community, and perform many other things in many jurisdictions. These activities are their outputs. Most attempts to measure and explain these outputs have relied on arrest, clearance, response times, and crime statistics.

Since the inception of municipal police departments in the early to mid-1800s, police agencies have gauged their performance primarily through arrest rates and reported crimes, though historians have shown that they also kept track of lost children and other noncrime activities (Monkkonen 1981). The rise of professionalism in the 1900s led the International Association of Chiefs of Police (IACP) and the FBI to focus on crime fighting rather than noncrime services. This marked a profound shift in how police characterized their work and led to the collection of national data through the Uniform Crime Reports (UCR) (Uchida 2010).

Reformers like Chief August Vollmer of the Berkeley Police Department and the IACP urged departments to maintain records related to crime and operations. The IACP Committee on Uniform Crime Records was formed in 1927 to create a system for collecting uniform police data. Standardized definitions were formulated to overcome regional differences in the definitions of criminal offenses. By 1929, the committee finalized a plan for crime reporting that became the basis for UCR. The committee chose to obtain data on offenses that come to the attention of law enforcement agencies because they were more readily available than other reportable crime data. Seven offenses, because of their seriousness, frequency of occurrence, and likelihood of being reported to law enforcement, were initially selected to serve as an index for evaluating fluctuations in the volume of crime. These Crime Index offenses were murder and nonnegligent manslaughter, forcible rape, robbery, aggravated assault, burglary, larceny/theft, and motor vehicle theft. By congressional mandate, arson was added as the eighth Index offense in 1978.

There were two primary purposes for uniform crime reporting. First, police leaders saw the value of better data for the improvement of management and operation strategies. Second was the desire for data that could combat the perception of crime waves created by the media. Police managers were concerned that such crime waves were seen as a reflection of their departments' inadequacies. They believed that uniform crime data would dispel the notion of crime waves and, therefore, demonstrate the value of police efforts to control crime. The tension between developing a system that would represent a true measure of crimes known to police and developing one that would prove crime was not increasing has been present in UCR since the beginning (Wellford 1982).

Since 1930 the UCR has evolved from a relatively small data collection effort into a large-scale national effort. In its first year of operation, the program collected data from 400 cities in 43 states, representing about 20 million people. In 2011 UCR collected data from nearly 17,000 jurisdictions in all 50 states, representing about 300 million people. UCR remains a voluntary reporting program, with city, county, and state law enforcement agencies reporting monthly to the FBI the number of part 1 offenses and part 1 and part 2 arrests that have occurred within their jurisdictions. In addition to monthly tallies of offenses and arrests, additional data are captured on particular offenses, and data on age, sex, race, and ethnicity are collected for arrests.

Another important measure is response time, the seconds or minutes that it takes for a patrol car to respond to a call for service. This measure has been used by police to show the public how efficient and effective they are in dealing with crime. But research has shown that rapid response does not lead to apprehension of suspects immediately nor is it an expectation of those who call the police (Spelman and Brown 1981). Changes in available resources have led police to streamline their response strategies and in the process make measurement more specific. Police have employed alternative strategies, known as differential police response (DPR) where priorities are established regarding calls, reports are taken over the telephone by civilians, or complainants are asked to use the Internet and online reporting. Since the 1980s, departments often use "priority" call types. For example, Priority 1 may include crimes in progress or more serious violent crimes (homicides, rapes, robberies), while Priority 2 and 3 calls may include those crimes that require nonimmediate responses (burglaries, alarms, etc.).

Changes in Measures

With the discovery of police discretion in the 1960s, researchers and police administrators realized that order maintenance and other noncrime activities were also important to measure, as officers were not engaged in crime fighting all of the time. But it was not until the 1990s with the community policing movement did researchers and police begin to recognize that this new paradigm should include new performance measures. Alpert and Moore (1993) recommended the adoption of nontraditional measures that were tied to essential goals of community policing. Yet they still focused primarily on police-related data and measures, including number of traffic tickets, crimes and arrests cleared by conviction, and police misconduct. Some of the nontraditional measures included time and dollars allocated to problem-solving initiatives, types of assistance provided to victims, and resources for strengthening police-community relationships. From this point forward, researchers and police began to develop appropriate measures that covered the spectrum of traditional policing to community policing and problem-oriented policing activities and outcomes.

The Rise of CompStat

In 1994 Commissioner William Bratton and Jack Maple introduced the New York City Police Department (NYPD) to CompStat (comprehensive computer statistics), a management tool that emphasized using appropriate resources in the right place at the right time to reduce crime. A harsh and oftentimes unforgiving method, CompStat was known for publicly questioning precinct commanders about their knowledge of crime in their areas and what they were doing about the problem. Using technology and computer-generated mapping, CompStat generates crime statistics for each precinct and uses them to hold precinct commanders accountable for their areas (Bratton and Knobler 1998).

CompStat became a popular mechanism for crime reduction, and police departments across the country quickly adopted the methodology. Indeed, by 2000 nearly one-third of the country's largest police agencies had implemented a CompStat-like program (Weisburd et al. 2001). This occurred even though evidence of crime reduction was not validated by research efforts. The explosive growth in computer power (in terms of speed and storage capacity relative to cost), the standardization of formats across software programs, and the increase in user accessibility (and decrease in cost) to these software programs among other factors facilitated the dramatic spread of CompStat across police agencies. In addition, cities, counties, and at least one state (Maryland) have established CitiStat, CountyStat, and StateStat (respectively) to assist in decision making and accountability.

Though some scholars express doubts about the success of CompStat (especially for crime reduction), it is generally accepted that Bratton mobilized the NYPD and, later, the Los Angeles Police Department (LAPD) to raise arrest productivity significantly.

From an administrative perspective, CompStat represents a significant change from the past. Moore and Braga (2003a) see CompStat as setting the standard for innovation for police management and as a unique system for internal and external accountability. They emphasize that as a measurement system it is "behaviorally powerful" in that it drives the NYPD and other departments in the following ways:

- It is aligned with organizational units that hold managers accountable for performance.
- The measures are simple and continuously used so that performance can be observed over time.
- The measures are aligned with those who oversee the department externally.
- Accountability is frequent, so that managers are attentive.
- Managers recognize that CompStat affects their current and future standing, pay, and promotional opportunities.
- Reviews of performance are public.
- Comparisons can be made across situations and managers.

While the original model of CompStat has evolved since 1994, its basic principles of accountability and measurement remain intact.

Systems to Account for Police Behavior

The problems of police-community relations identified four decades ago by the President's Commission on Law Enforcement and Administration of Justice (1967) continue to exist. Concern over use of force by police officers led Congress in 1994 to order the US Department of Justice (DOJ) to acquire data about the use of excessive force by law enforcement officers and to publish an annual summary of the data acquired (McEwen 1996). The Bureau of Justice Statistics served as the repository for such data.

Concern over the practice of racial profiling by police officers making traffic stops, a long-time concern of minority communities, led to calls for measurement on the severity of the problem. During the early part of the twenty-first century a number of large and small departments across the country began to implement methods to measure officer encounters with the public as a result. More than 20 states have passed legislation prohibiting racial profiling and/or requiring jurisdictions within the state to collect data on law enforcement stops and searches. According to Northeastern University's Racial Profiling Data Collection Resource Center, "hundreds of law enforcement agencies" are now collecting such data (see http://www.racialprofilinganalysis.neu.edu/index.php).

Early Warning Systems

In addition to collecting racial profiling data, the US Department of Justice (DOJ), through the Violent Crime Control and Law Enforcement Act of 1994, imposed systems of accountability on law enforcement for "patterns or practices" of policing that violate the Constitution (Chanin 2012). Since 1994 at least 25 law enforcement agencies have been investigated and/or reached settlements with DOJ regarding practices that violate citizens' federal rights. These agencies often agree to operate under consent decrees to improve policing practices to avoid further litigation. A common requirement of these consent decrees is the implementation of an early warning system (EWS) or early intervention (EI) system designed to identify and intervene with officers at risk for future misconduct. EI systems are promoted as a specific example of practices designed to promote police integrity (United States Department of Justice 2001). One of the major assumptions behind these systems is "that a small number of police officers are responsible for a disproportionate amount of problematic police behavior." The long-term goal of such a system is to "create a culture of accountability in the agency" and thus reduce citizen complaints and litigation (USDOJ 2001, p. 10).

EI systems are expected to improve the capacity of police agencies to police themselves by concentrating their efforts on the people that generate the most problems. By generating "red flags" on persons who engage in more misbehavior than their colleagues, police agencies can intervene more effectively in reducing that behavior. Evaluations of these systems have shown mixed results; some show success in reducing officer misconduct, while others raise questions about their efficacy.

An example of an early intervention system is that of TEAMS II in the Los Angeles Police Department. In TEAMS II (Training Evaluation and Management System 2nd phase), data are collected from 14 separate systems and compiled for all 10,000 sworn officers in the LAPD. This information is compiled in the Risk Management Information System (RMIS) and is used in two ways: employee performance assessments/continued monitoring and the automated risk management system. Like other EI systems, RMIS is designed to examine employee outcomes across five domains: use of force, citizen complaints, claims and lawsuits, preventable vehicle crashes, and vehicle pursuits. After one of these events has occurred, RMIS conducts an automated assessment of the officer's performance against patterns established by his or her peers. These measures are then compared to the performance of the peer group defined by similar work functions. An action item or AI is generated if the measure for the individual officer is substantially different from his/her peer group.

Once an action item is generated, the report is automatically forwarded to the employee's supervisor for review. The supervisor is then required to notify the employee of the action and to conduct a review of all relevant information to identify whether the employee's actions (both the current activity as well as prior activity) indicate a persistent pattern of at-risk behavior. If evidence suggests the possibility that at-risk behavior may be occurring, the supervisor engages in an investigation of the available information in the system reports. The supervisor documents the results of this examination by summarizing the various reports, determining whether there is a pattern of conduct, provides a comparison of the employee's performance to similar employees, explains any significant differences between the employee's performance and that of similar employees, selects and justifies a disposition (including a decision to take no action), and provides a brief summary of supervisor's discussion with the employee about this report. Cases that are canceled, judged to require no action, or end with informal counseling receive no further review up the chain of command, but those receiving other actions are reviewed up the chain to the commanding officer level.

A recent Office of Inspector General (OIG 2012) audit found that TEAMS II corrective actions are rare. Only 64 of 1,384 AIs generated from August 1, 2010, to January 31, 2011, yielded any corrective action disposition. This audit also revealed that approximately 72 % of the AI investigations were completed within 60 days of their initiation (OIG 2012).

As part of its accountability process, LAPD has integrated the TEAMS II process into its CompStat process. This ensures that the middle and upper levels of LAPD's hierarchy are kept informed of progress in reducing undesired or questionable patterns of police practice and makes it more likely that the organization will attend to these aspects of agency as well as individual officer performance.

Studies of Early Warning/Intervention Systems

Since 2000 a handful of studies have examined EI systems similar to the LAPD's. These include a study of Pittsburgh (Davis et al. 2002); a national evaluation and three case studies by the Police Executive Research Forum (PERF) and the University of Nebraska Omaha (UNO) (Walker et al. 2001); Worden et al. (in press) in a northeastern city; and a study of a southeastern police department by Bazley et al. (2009).

In 1997 the Pittsburgh Police Bureau became the first police organization to be issued a consent decree (Davis et al. 2002). The consent decree required implementation of an early warning system (EWS) and it stipulated both the specific information to be included (citizen complaints, training, transfers, arrests, etc.) as well as the categories that should be capable of being examined (individual officer, squad, shift, unit, etc.). This EWS was designed to compare officers to their peer groups using standard deviation calculations. In this way, for example, officers working the day shift in a low-crime area were not directly compared to officers working the night shift in a high-crime area.

The evaluation looked at the effects of the consent decree by conducting in-depth interviews, examining trends in departmental procedures, and administering a community survey (Davis et al. 2002). The researchers did not directly analyze the effect of the EWS on officer performance, but instead reported on interviews with officers and supervisors and provided data on trends in police performance and disciplinary actions before and after the consent decree was issued. Overall the interviews showed a mix of views about the EWS. Some supervisors appreciated the system, while others said it did not provide any new information. Supervisors complained about the extra time and paperwork and said that they had less time to respond to serious incidents and to supervise their squads on the street. Officers voiced concerns about being afraid to do their jobs, stating that it was safer to do nothing.

Ultimately, the researchers concluded that "the early warning system . . . all but ensures that officers heading for trouble will be identified and efforts made to straighten them out." They also recognized problems like system redundancies and the extra time for filling out paperwork and commented that "most of the potential problem officers identified by the early warning system may already be known to supervisors" (Davis et al. 2002, p. 62). Lastly, they noted that in the absence of a more thorough methodology, it is difficult to determine what effects the EWS may have had on the performance, attitudes, and values of officers in the department and what effects can be attributed to the imposition of the consent decree.

Walker et al. (2001) conducted a national survey of police agencies to determine the prevalence of early warning systems. They found that 27 % of surveyed agencies had an EWS in 1999, with 12 % planning to institute a system. Larger departments were more likely than smaller agencies to create an early warning system. The researchers also evaluated the effectiveness of three different early intervention systems: Miami-Dade, Minneapolis, and New Orleans. They found that in all three departments the "program appeared to reduce problem behaviors significantly" and that they "encourage changes in the behavior of supervisors as well as of the identified officers" (Walker et al. 2001).

More recently, Harris (2009, 2010) and Worden and his colleagues (Worden et al. in press) examined officer misconduct and evaluated the effects of an early intervention system in a large police department in the northeastern United States. In evaluating the overall effects of the EI, Worden et al. found that "rates of citizen complaints, personnel complaints more generally, and secondary arrests all declined." Yet, matched controls in the department "exhibited very similar patterns, suggesting that these changes should not be attributed to the Officer-Citizen Interaction (OCI) School intervention." They also found a small negative effect on arrests, particularly proactive arrest, stemming from the classes. Finally, they found a marked and problematic potential for false positives in early identification systems. If false positives occur at too high a rate, this could seriously jeopardize the efficacy of these systems as well as their legitimacy among officers and supervisors.

Bazley et al. (2009) examined use of force reports as an indicator for one large (over 1,000 sworn officers) urban southeastern police department's EI program. In 2000, when the study was conducted, 33 officers qualified for the program under use of force criteria. Departmental data were analyzed to determine whether either of their independent variables – total number of officer use of force reports and weighted officer force factor value (calculated by subtracting force level from resistance level) – had a statistically significant effect on officer qualification for the early intervention program. They found that both variables were statistically significant, but only the number of use of force reports was in the direction expected (more use of force reports indicated a greater likelihood of qualification). Weighted officer force factor, on the other hand, indicated that the program actually "flagged officers who clearly displayed a tendency to use less force when confronting higher levels of resistance" (p. 119). Moreover, the system did not flag any of the 22 officers in the department with negative weighted force factor values that indicated a tendency "to use more force than resistance encountered" (p. 120). Ultimately, then, Bazley et al. state that "these findings would seem to bring into question whether the qualifying use of force criteria, i.e., tracking the numbers of higher level use for force incidents quarterly and annually, are actually identifying the problematic officers in this department" (p. 121).

Comprehensive Systems of Performance Measurement

In the twenty-first century, researchers and practitioners have sought appropriate and comprehensive measures for police performance. The search for meaningful measures included national organizations – the Commission on Accreditation for Law Enforcement Agencies (CALEA) and the Police Executive Research Forum (PERF) working with researchers and police executives. Ultimately, they wanted to broaden the scope of police activities and goals and attached specific measures to them. The work of Maguire (2004), Moore and Braga (2003b), and Milligan et al. (2006) established the theoretical and research-based groundwork for CALEA and PERF. These works showed the multidimensionality of police work and demonstrated the need for multiple measures and diverse data collection methods and analyses.

Maguire (2004) traced the development of performance measures within the context of police organizations. He stressed the need for formulating broad dimensions of police performance and the use of specific measures and tools. Citing previous research by O'Neill et al. (1980), Hatry et al. (1992), Moore (2003), and Mastrofski (1999), Maguire provides examples of the dimensions of police activities. In brief, they include such areas as crime prevention, crime control (apprehension of offenders), fear reduction and the feeling of security, fairness and courtesy, police administration (financial resources), use of force, and satisfaction of customer service. Measurement tools include the use of general community surveys, specific contact surveys, employee surveys, direct observations, and independent testing or simulations for collecting information about an agency's performance. Moreover, he included methods of analysis, weighting of measures, and a detailed section on how to implement comparative performance measures.

Similarly, at PERF Milligan et al. (2006) identified seven dimensions of policing that warranted measurement: (1) community safety and security; (2) perceptions of safety and security; (3) confidence, trust, and satisfaction; (4) response to crime; (5) prevention of crime; (6) enhancement of safety and security; and (7) community health. The authors found that the Prince William County (VA) Police Department followed these dimensions and had also established appropriate performance measures.

Building on all of these studies, Davis et al. (2010) and CALEA developed a pilot project to establish useful and useable performance measures. Researchers and a group of police executives drafted performance indicators to assess nine dimensions of policing: (1) delivering quality service; (2) fear, safety, and order; (3) ethics/values; (4) legitimacy/customer ervice; (5) organizational competence/commitment to high standards; (6) reducing crime and victimization; (7) resource use; (8) responding to offenders; and (9) use of authority.

Each of these categories contained multiple indicators that applied to a spectrum of large and small agencies, police departments, and sheriff's offices. Four CALEA-accredited agencies – Dallas, TX; Knoxville, TN; Kettering, OH; and Broward County, FL – developed and tested 28 specific measures that were part of the nine dimensions. Data were collected using five instruments, including:

- *A self-assessment instrument* that asks agencies to provide traditional data – basic crime rates, clearance rates, arrests, citizen complaints, and budgetary information
- *Community surveys and business surveys* to gauge people's and local retailers' perceptions of police effectiveness
- *Contact surveys* that assess the quality of interaction between police and citizens who request police assistance or who are stopped by the police
- *Officer surveys* that measure a broad array of perceptions of police including morale, integrity, agency leadership, and knowledge of policies

After successfully implementing the pilot phase of the project, five participants were added to the original four – Raleigh, NC; Avon, CT; Boca Raton, FL; and Las Vegas, NV, Police Departments and the Arapahoe County, CO, Sheriff's Office.

The results from the analysis of the nine agencies show the value of this comprehensive set of measures. As the authors indicate, the set of measures or subsets can be used for a variety of purposes (with appropriate caveats). Some examples include:

- Comparing performance across patrol areas to determine "whether some areas stand apart from the others in how satisfied citizens are with the handling of a crime complaint or a traffic stop"
- Making year-to-year comparisons of agency of patrol area performance to determine if performance is trending in a positive direction
- Comparing performance with other agencies to provide a benchmark against which to assess how an agency is doing in various areas

Lastly, the authors provide detailed information about their measures, particularly the survey instruments. They give specific instructions about implementing the surveys and describe their results in the nine agencies. Further, they provide the range of scores for the specific measures that they use. These explanations and tables serve as a guide as to whether an agency's performance on each dimension is within the bounds established by agencies involved in the field test. The value of the research allows another agency or researcher to use the data collection instruments and analyze the data appropriately. The results from an individual department can be compared to the nine CALEA agencies to obtain an overall context for its performance.

Key Issues/Controversies

While a range of performance measures for police has been discussed, created, and implemented for over 150 years, adequate measures have yet to be fully agreed upon and validated by researchers and practitioners. This entry has attempted to identify those approaches and to describe research and evaluation that have been conducted on those measures. This section discusses key issues and ongoing controversies about measurement.

On Traditional Measures

Traditional measures of arrests, crimes known, clearance rates, and response times have been criticized for their lack of comparability and validity. In addition, using crime rates as a measure of police success ignores other factors such as the social, economic, and political influences within jurisdictions. Reported crime rates also do not reflect the number of actual crimes that occur. Underreporting of crime is commonplace, especially among high-risk populations, immigrant groups, those fearful of retaliation, and those who do not believe that police can do anything about a particular crime. Arrests and clearance rates are also problematic. Legal definitions of arrests vary across jurisdictions, making them difficult to compare. Clearance rates are indicators of investigative effectiveness but oftentimes can be manipulated and subject to measurement error (Cordner 1989).

On CompStat

As indicated above, CompStat has been a popular method as a management tool and to measure performance. From a measurement perspective, CompStat relies on the same crime data that have been criticized as inadequate measures of police performance for the past 30 years. The difference in their use today is that computer-generated maps, trend analysis, and other visualizations assist decision makers in "seeing" what is occurring on a week-to-week, month-to-month, and year-to-year basis.

CompStat has received accolades and criticism from various circles, including researchers and practitioners. Evaluations of CompStat focus primarily on its effectiveness (or lack thereof) regarding crime reduction (see Willis et al. 2007). Evaluations of CompStat as a management tool are virtually nonexistent.

On Early Intervention Systems

Early warning/intervention systems focus primarily on officer misconduct, though the LAPD's system includes performance measures of employees. Researchers have found mixed results about the effectiveness of EWS/EIs in deterring that misconduct. Problems with the studies abound and are self-reported by the researchers themselves. For example, Walker et al. could not determine the most effective aspects of intervention or whether certain aspects are more effective for certain types of officers. This problem occurs with the studies by Davis et al. and Bazley et al. Another problem is the inability of the early warning systems to collect data on positive police officer performance, so measuring the deterrent effect of an early intervention is difficult to assess. Third, researchers could not disentangle the effect of the general climate of rising standards of accountability on officer performance from the effect of the intervention program itself.

On Comprehensive Performance Measurement Systems

While researchers and practitioners recommend different designs for comprehensive performance measurement systems, the actual implementation of those systems is rare. O'Neill et al. (1980) and Hatry et al. (1992) suggested multiple dimensions and multiple measures, but those were not implemented. Maguire and Moore and Braga's systems were adopted in part by CALEA and used in nine agencies (Davis et al. 2010). It remains to be seen whether more agencies will implement the system.

The CALEA/Davis et al. approach (2010) is noteworthy for its use of multiple surveys and data instruments, but the difficulties lie in their actual use. A representative sample is necessary to obtain accurate perceptions of the jurisdiction and decisions need to be made about the sampling frame and sample size. Similarly, the use of contact surveys with victims of crime or those who were involuntarily stopped by police include problems with sample size, administering the survey, and completion rates. If these can be overcome, however, the information gathered from the surveys are particularly valuable for the police and the jurisdiction that they serve.

Future Directions

Despite the problems associated with performance measurement, the future of this topic is bright. Police agencies are striving to become more efficient and effective in their work because of the budget crises and economic downturns in their jurisdictions. In addition, police executives are looking for ways to continue to reduce crime, particularly violent crime. Measuring performance and justifying or maintaining their budgets are important to these executives. As a result, using CompStat-like methods, obtaining feedback from residents and businesses, keeping track of officer performance, and continuing to make managers accountable for their areas, divisions, and precincts are methods that will continue to be used and expanded.

Technological developments will assist in the ease of use of measurement tools. Traditional data of crimes, arrests, clearance rates, and response times will be managed more efficiently because of improvements in computer systems and will be analyzed and visualized more quickly than before. Computer-generated "dashboards" that show charts, graphs, maps, and tables of crime are available now and will be used extensively by executives, commanders, and managers for a variety of purposes including performance measurement. Tablets, iPads, smart phones, software applications, and the Internet will enable agencies to conduct surveys of officers, citizens, and businesses on a routine basis.

Police Promotional Practices

Cassi L. Fields
Fields Consulting Group, Inc., McLean,
VA, USA
LeT Corporation

Overview

Controversy surrounds promotional process in American police departments. This is true despite the fact that promotional tests are valid and useful tools when constructed consistently with professional and legal guidelines. Candidates and management share some concerns about promotional processes, but candidates' concerns focus mostly on the degree to which promotional processes are high quality, transparent, consistent, and fair. Management's concerns focus more on whether the promotional process identifies the best candidates, and minimize costs and grievances. The research on promotional tests is informative in the best practices to construct tests and promotional processes. In an effort to avoid direct and indirect costs, departments often avoid utilizing best practices. When the result of cost savings is an invalid test, the consequences are severe including litigation, low employee morale, and ineffective leadership succession plans, whereas the investment in a well-designed promotional process creates buy-in, promotional opportunities, employee development, and a clear leadership succession plan.

Key Issues/Controversies

Introduction

Promotional processes in American police departments are considered high-stakes tests because their outcome affects candidates, department management, customers (i.e., citizens), and potential other departments within a jurisdiction including human resources, budget, and legal. These tests may include a simple multiple-choice job knowledge test, assessment center, structured interview, performance evaluation, or some combination of these components. Relative to other test types, a multiple-choice test is inexpensive. However, it is a limited tool. Multiple-choice tests do not require candidates to directly demonstrate their knowledge and have often been shown to result in adverse impact against minority candidates (Hunter and Hunter 1984; Rushton and Jensen 2005).

Assessment centers are a combination of simulations such as oral presentations, writing exercises, and emergency incidents that measure candidates' knowledge, skills, and abilities in different testing formats. The research has shown that assessment centers are valid measures of knowledge, skills, and abilities (Arthur et al. 2003) and are a more direct measure than a job knowledge test.

Interviews and performance evaluations are often used in place of, or to augment, other types of tests. An interview can be structured to be a more direct measure of knowledge, skills, and abilities than a multiple-choice test. Structured interviews have high validity, but they do not measure written communication skills.

Performance evaluations are generally unreliable measures. Unless properly validated, they should not be incorporated into a promotional process, and even then, they are routinely subject to successful legal challenges. The job analysis of the target rank determines what knowledge, skills, and abilities should be measured. Whenever possible, the best promotional practices incorporate multiple assessment tools in order to measure a broad set of important knowledge, skills, and abilities (indirectly and directly) and to reduce subgroup differences whenever possible.

Controversy in Promotional Processes

Controversy surrounds promotional processes in American police departments. The causes of the controversies vary. Typically, these controversies stem from the candidates who take the tests; less frequently, they stem from management.

Candidates who do not get promoted after they take a promotional process often must wait

1–3 years, and in some departments longer, to go through another promotional process. These candidates believe that this *waiting period* delays their salary increases, their career progression, and, potentially, their pensions.

Those that do get promoted are critical to the success of the department because they must be able to supervise and lead officers who are often assigned to decentralized positions. They must ensure that patrol officers protect the rights of citizens, protect victims, properly handle illegal drugs and money, and perform many other critical tasks. Without effective supervision and leadership, there is unlimited opportunity for intentional and unintentional corruption.

One of the most challenging aspects of using promotional exams in police departments is ensuring that they are valid *and* produce a diverse group of candidates. This result can be achieved, but it takes a deliberate and thorough plan to succeed. Further, creating a valid test that is defensible if legally challenged is difficult and expensive. Recently, it has become more difficult to defend a challenged test because proving that the test is valid may be insufficient (Johnson v. City of Memphis 2006). Today, it seems that the defense must also demonstrate that they considered all equally valid alternatives and ultimately administered the test with the least adverse impact. However, finding or developing a valid alternative that produces acceptable diversity remains elusive due to:

1. Testing outcomes (i.e., population subgroups may not perform equally)
2. Strict laws that govern testing in employment settings

Who Writes the Test?

There are no statistics showing how many police departments outsource their promotional exams compared to those who write them internally. Since the 1970s, there has been insufficient internal departmental staff to validate promotional exams consistent with the *Uniform Guidelines on Employee Selection Procedures* (*EEOC*1978), the *Principles for the Validation and Use of Personnel Selection Procedures* (2003), and case law precedent. There is a tendency for departments who write their exams internally to continue to do so until there is a specific challenge. Those that use external consultants have experienced mixed results, but there seems to be a pattern of better success in defending a test with consultant services than without.

When insufficient resources are devoted to promotional tests, an invalid test may result and the consequences are often severe. A civil rights challenge (Civil Rights Act 1964, as amended in 1991) can stop a promotional process for several years because the litigation is lengthy and expensive. The ripple effects from a suspended promotional process affect the ability to fill vacancies in other ranks, competence in supervision and leadership within the department, and individuals seeking promotion but who cannot compete due to the litigation.

Candidate Protests

Candidates express concerns about promotional processes that contain poor-quality test content and lack transparency, consistency, and fairness.

Test Quality

Researchers have analyzed test bias and test flaws and the manner in which they may contribute to test performance disparities. This line of research presumes that test bias is either partially or entirely the cause of test performance disparities. These biases and flaws include, but are not limited to, test unreliability, invalid cognitive load, and invalid passing or weighting schemes (Hunter and Hunter 1984; Sackett et al. 2001). In general, these theories have not led to the creation of perfect tests as evidenced by continued internal grievances and external litigation.

Furthermore, candidates are not likely to accept a test containing questions with typographical errors, those that ask about *minutia*, those that are academic in nature, or those that are relevant solely to a subset of the population (e.g., questions that investigators need to know when it is a first-line supervisory test). The degree to which these types of tests negatively affect subgroup populations determines what types of actions candidates take. If, for example, minority candidates are excluded from promotion based upon a test, they might sue their department or jurisdiction. If all candidates believe the test was poorly constructed, they might internally appeal, grieve, or verbally protest. In cases such as these, it is likely management will know about the problems. However, management rarely takes action unless pressure comes from an outside source such as the US Department of Justice, the Equal Employment Opportunity Commission, a lawyer, or the union. The irony is that a successful promotional process, without that unwanted interference, is developmental. It creates a highly ethical environment, and it is an automatic part of a succession plan.

Transparency

There is little research on promotional process transparency. Transparency can be defined as "informing candidates about their promotional process *before* the process is administered to include, but is not limited to, test dates, times and locations, test components, what will be measured, how it will be administered, how it will be scored, how the results will be published, and how long the results will be used for promotions." There has been some debate over whether the scoring criteria for a test can be determined after test administration. This debate is contentious because the reasons for assigning passing scores or test component weights after test administration are generally unethical. For example, this system would allow the department to select a specific number of candidates, select specific individuals, or select a specific group of individuals (e.g., minorities, females, nonminorities). Each of these reasons negates transparency. Candidates, in general, prefer that the test process and rules be announced in advance of the test so that any potential for manipulation of the results is eliminated. Unless the leaders of the department have ulterior motives, they too tend to prefer a completely transparent promotional process.

Test score banding falls under candidates' transparency concern. Banding is a process in which candidates' test scores are placed into bands or groups. For example, candidates scoring between 90 and 100 are place in one band and candidates scoring between 80 and 89 are placed in another. Banding can be unpopular because candidates often believe that the highest-scoring candidate should be promoted first. This belief is based upon the theory that a test is a perfect predictor of future job success. A valid test is not a perfect measure of performance nor is it complete. It is a predictor; it predicts who is most likely to succeed in the target rank. A separate article could be devoted to banding because it is controversial (e.g., Bobko and Roth 2004). This author has had success in using administrative bands which are used to place candidates' test scores into predefined (fixed) groups (e.g., rule of 10) and then creating a valid measure to select from the band. This procedure can assist with promoting a diverse workforce, and if the rules are published in advance, it is transparent.

Consistency

It is well known among test developers that a test's validity is limited by its reliability (Cascio 1998). This means that if a test is unreliable, it cannot measure what it is intended to measure. Three examples of unreliability are (1) inconsistent test administration, (2) unreliable test content, and (3) inconsistent ratings, if ratings are used. When a test is administered inconsistently to candidates, the candidates' scores are likely to reflect that inconsistent administration. It is impossible to identify whether the inconsistent administration caused those differences in candidates' test scores or the test content caused those differences. This invalidates the test.

It is also well known that when test content is unreliable, the test cannot be valid. For example, when the wording of a question is indecipherable, it is unreliable. If the responder cannot interpret the question correctly, then the response is unreliable and therefore invalid.

Often, raters score part of a promotional test. If these assessors cannot agree on a score for the candidate's performance, the test will also be considered unreliable. The rating criteria must assist assessors rate candidates consistently.

If the raters cannot do so, then the rating criteria are unreliable, and therefore the test is invalid.

Candidates generally recognize an unreliable test because inconsistent test administration and indecipherable test content are obvious. Unreliable rating criteria are not as obvious to candidates unless they receive feedback about their test performance. Typically, the feedback about their performance will cause candidates to question the quality of the rating criteria.

Fairness

Decades of research have focused on the differences in test outcomes between population subgroups, with particular emphasis on race differences in test performance. Subgroup populations that have been compared and found to differ with regard to test performance include, but are not limited to, African Americans, Asians, Hispanics, and Whites (Cullen et al. 2004; Neisser et al. 1996; Nguyen 2003; Roth et al. 2001; Rushton and Jensen 2005; Schmidt and Hunter 1998). The extent of the gap between African American and White cognitive ability test performance has been shown to be between 0.5 and 1.5 standard deviations (e.g., Hunter and Hunter 1984; Rushton and Jensen 2005), with White test takers scoring higher than African American test takers. Research examining African American-White test performance differences seems to have dominated the research and continues to be a dominant concern.

Some researchers consider this consistent group difference evidence of a difference in intelligence levels between subgroups. This intelligence is also referred to in the research literature as *g*, shorthand for general mental ability (Gottfredson 1997). In military studies, path models of training and job proficiency have shown that *g* strongly predicts success in training and acquiring job knowledge, which in turn strongly predicts task proficiency (Ree et al. 1995). Studies throughout the decades, that include both nonmilitary and military samples, have shown that cognitive ability test performance, driven by *g*, is one of the strongest predictors of job performance and training outcomes (Schmidt and Hunter 1998).

Researchers continually examine whether cognitive ability test performance is a valid predictor of job performance. The research repeatedly finds that cognitive ability tests are valid predictors of training and job performance with some exceptions. For example, Campbell (1996) states that there is no substantive definition of intelligence which becomes problematic as we attempt to measure it. This means, because it is so difficult to define *intelligence*, it may be difficult to reliably measure it.

Campbell (1996) says that achievement-based knowledge may predict individual differences in management performance better than measures of intelligence. Intuitively, this makes sense in that testing a more specific content domain (such as promotional testing) would help determine differences in job performance better than testing a content domain that may be too general (such as cognitive ability). “If test scores represent the relative mastery of a particular domain of response capabilities, then a ‘score’ must be a function of the amount of exposure to the domain, the amount of attention paid to it, the motivational forces that control attention, the amount and kind of practice, and the retention of the specified response capabilities” (Campbell 1996, p. 131).

Regarding fairness, the findings, in general, are that cognitive ability tests do not differentially predict African American and White test performance (e.g., Neisser et al. 1996; Rushton and Jensen 2005; Schmidt and Hunter 1998, p. 272). This has led to the conclusion that tests are not culturally biased. Campbell (1996) wonders if the importance is not whether tests and criteria are culturally biased but whether bias is appropriate. In other words, should observed group differences be accepted as fact?

The concepts of cultural bias and differential prediction are two definitions of fairness, but not everyone agrees. For example, some individuals define fairness as a test that produces equal, or near equal, subgroup outcomes. This philosophical debate occurs during test litigation and in informal settings more so than in the scientific literature. In the scientific literature, the preponderance of the research concludes that cognitive ability is a valid and fair predictor of job performance.

In sum, the scientific evidence concludes that tests, in general, produce different subgroup outcomes even though they do not contain cultural bias nor do they differentially predict subgroup job performance. However, many in American society have not accepted these conclusions. As a result, plaintiffs have brought employment discrimination lawsuits, litigation has ensued, and laws have been enacted.

Why Do Subgroup Differences Exist? Another Explanation

Current researchers who study subgroup differences in test performance are focusing on differences in education and socioeconomic status that occur well before test takers enter the workforce (Campbell 1996; Campbell et al. 2001). "If two groups differ in mean IQ, culture-only theorists conjecture either that the lower scoring group has been exposed to one or more deleterious experiences or been deprived of some beneficial environmental stimuli or that the tests are not valid measures of their true ability" (Rushton and Jensen 2005, p. 240).

What cultural influences might cause group disparities in test performance? There are a host of environmental factors including, but not limited to, the type and quantity of tests individuals were exposed to during primary education and their formative years. For example, one might hypothesize that better school systems utilize greater numbers of tests, greater number of source material for those tests (e.g., textbooks), a greater amount of formal test preparation training, more extensive instruction, and that the tests, textbooks, formal test preparation training, and instruction are of higher quality.

If subgroup test performance is based upon early life cultural influences, then test professionals have a potential method to build systems to compensate for what was not provided in early life. According to Ryan (2001), test perceptions (stemming from environmental influences) include anxiety, self-efficacy, motivation, belief in tests, and perceptions of a specific test's fairness and job relatedness. Ryan (2001) noted that there has been a recent "focus on how differences between African Americans and whites may be a function of the way they approach the cognitive ability testing situation itself" (Ryan 2001, p. 45). Any examination involving moderators of the race-employment test performance relationship implies that if the moderators of that relationship can be controlled, group differences should disappear.

Some common moderators, discussed next, are test-taking skills, test motivation, test anxiety, and stereotype threat.

Test-Taking Skills

Test preparation training assumes that certain population subgroups were improperly or incompletely prepared to take tests during their primary education. Test preparation can influence test-taking skills which incorporate test-wiseness, practice, and preparation. Test-wiseness includes the ability to utilize information within the test to assist the individual in identifying the correct answers, independent of the construct being measured (Sarnacki 1979). An example of this would include the ability to eliminate alternatives in order to identify the only correct alternative, or understanding the level of detail that must be displayed in order to increase one's test score (e.g., in a writing test or in an oral communication test). Test-taking preparation includes organizing, learning, and memorizing the study material. Clause et al. (2001) found that differences in the effectiveness of study methods and learning processes could explain differences in individual test performance. Test-taking practice is repeated exposure to the type of test questions that the individual will respond to in the test. Test-taking practice should positively affect test-wiseness and test perceptions. However, "mere experience in testing does not guarantee future success on tests" (Sarnacki 1979, p. 264).

Hough, et al. (2001) reviewed the research on test preparation courses (test orientation sessions, test coaching), and concluded that test preparation courses have mixed results in improving cognitive ability test performance. The major problems with this line of research are:

- That, in each case, the test preparation course is not clearly described;
- Test preparation participation is not mandatory meaning only those who are motivated to do well, or perhaps high performers in any case, attend, and
- No control groups to compare performance of those who attended test preparation to those who did not.

There is a clear pattern in law enforcement that better test performers attend test preparation classes and seek out test-related feedback more than those that do not perform well. To address this issue, more departments are making test preparation courses a mandatory part of the promotional process. This mandatory requirement has the added benefit of increasing the transparency of the promotional process for all candidates, thus decreasing the chance of protests about "not being aware" of some part of the process. It also permits challenges in advance of the process that can be addressed before a problem multiplies.

Test Motivation

Test motivation research has focused on whether test takers' motivation influences their test performance. Hough, et al. (2001) summarized research comparing subgroup test perceptions and test motivation. A summary of their research concludes that differences in test attitudes do in fact explain subgroup test score differences. Clause et al. (2001) found that individual test-taking motivation and self-efficacy impacted an individual's meta-cognitive preparation activity. In essence, those who were most motivated and most aware of their own strengths and weaknesses as they relate to test content were most likely to structure their test preparation time to maximize their own test performance.

The most common motivation-test ability interaction stems from Vroom's (1964) expectancy theory, which indicates that, when motivation is low, both high and low ability individuals demonstrate similar low levels of performance. When motivation is high, however, variability in performance due to individual differences is more apparent (Kanfer and Ackerman 1989). Overall, test-taking motivation can be divided into two general categories: (1) the motivation to succeed on the test based upon the expectation that it will be instrumental in achieving desired outcomes (e.g., selection), and (2) the motivation to exert effort throughout the entire testing program.

Several studies have observed that motivation affects individual performance in several ways (Kanfer and Ackerman 1989). Ployhart and Ehrhart (2002) found that differences in test-taking motivation across groups could be reduced through development of more face valid tests. An individual who is unmotivated to perform in the target position may also be unmotivated to extend the effort necessary to study and learn the testing (selection) process and associated materials. Furthermore, test takers who do not believe they can succeed in a testing process may lack the motivation to succeed. Those who have witnessed numerous testing program failures may not be motivated to succeed in a testing program since they believe the test results are likely to be unusable. This lack of motivation will then negatively affect test takers' performance on the test, or their desire to exert effort from beginning to end of a long testing process.

Sanchez et al. (2000) found a positive relationship between expectancy and actual test performance, indicating the motivational influence of expected outcomes and test performance. Additionally, when compared to a pretest, final test-taking motivation is different among participants from different subgroups even after controlling for race and performance on the pretest (Chan et al. 1997). Test preparation has been shown to increase test motivation indicating that preparation is the mechanism through which motivation affects test performance (Clause et al. 2001).

Test Anxiety

Test anxiety research focuses on a priori test anxiety that individuals bring to a test situation and that which candidates experience while taking their tests. A priori test anxiety can be attributed to fear of the unknown (the test format/content) and fear about test performance. Tobias (1985) examined anxiety that candidates experience while taking the test, specifically the extent to which test anxiety interferes with retrieval of prior learning. More specifically, fill-in the blank tests (such as assessment center exercises), are more of a problem for test-anxious students (Benjamin et al. 1981). When test takers were trained in test-taking skills, their anxiety levels were reduced, resulting in higher performance (Tobias 1985).

Stereotype Threat

Another topic of research in subgroup test performance disparities has been stereotype threat. Stereotype threat has been shown to partially explain minority test performance and cognitive ability. If stereotype threat is low, the test performance of minority applicants improves (McKay et al. 2003). Steele and Aronson (1995) hypothesize that this stereotype threat may interfere with intellectual functioning. Additionally, race differences in cognitive ability tests were significantly lowered (Brown and Day 2006) when stereotype threat was low. It is important to note that stereotype threat is not theorized to be responsible for the gap, but it is believed to widen existing gaps in test performance (Nguyen et al. 2003).

Management Concerns

Management's concerns about promotional processes include identifying the most qualified candidates, the indirect and direct cost of giving them, and the number of complaints, grievances, appeals, and/or litigation that result. They typically want the most qualified candidates to succeed in the promotional process, and they want a diverse candidate pool from whom to choose. They are frequently concerned with the cost of testing in terms of direct dollars and human capital time. In some cases, as discussed earlier, they will administer lesser quality tests in order to save money and time. If test grievances and litigation abound, the department's leadership succession plan may be compromised. Grievances and litigation also negatively impact the integrity of the department and employee morale.

Why Use Promotional Processes?

As stated, the research on promotional tests has generally shown that they are valid predictors of job performance (e.g., Schmidt and Hunter 1998). For this very reason, American police departments are large buyers and users of promotional examinations. Other reasons for their reliance on promotional exams include their desire for objectivity and their need to evaluate large candidate pools. Promotional tests, in particular, meet all of these requirements.

Conclusions

It is possible to create a valid promotional process that produces a diverse candidate pool and that withstands candidates' and managements' protests. The research suggests that a comprehensive promotional testing program will include at least:

1. A test developer trained in test validation
2. A thorough test preparation session that makes the promotional process transparent and provides exposure to the test format and test preparation strategies
3. A valid test that measures a representative sample of the important knowledge, skills, and abilities (KSAs) needed for the target rank
4. Multiple methods to measure those KSAs so that all adult test takers can successfully demonstrate their KSAs (e.g., verbally, in writing)
5. Informing candidates of their scores (while maintaining their right to privacy)
6. Administrative banding of test scores
7. Detailed candidate feedback

The up-front costs of a well-designed promotional process far outweigh the costs of a poor promotional processes.

Synonyms

School police; School resource officers

Overview

Since the time when formal policing began, police officers have provided services to communities in a number of contexts. Components of the police officer role have included traffic control, crime investigation and apprehension, social service referrals, and a wide variety of other tasks that prospective officers do not normally consider when contemplating employment in policing. In the early 1970s, the role of the police took on a new, highly visible context when police begin working regularly in schools as Drug and Alcohol Reduction Education (D.A.R.E.) teachers. This move, coupled with existing relationships between some school districts and police departments that had assigned police officers to patrol the school setting, began a relationship that has blossomed into a field that has now become known as police school services.

The most narrow (and perhaps most commonly used) definition of police school services would define this concept as placement of sworn police officers in school environments to assist with (1) investigation and apprehension of criminal offenders in the school setting and (2) delivery of law-related educational programs to reduce student involvement in crime. Nevertheless, this definition would neglect a wide variety of services that are provided by law enforcement to students in the school setting. First, and perhaps most importantly, many officers providing supervision in police roles in school settings are not sworn police officers. Although these officers do not have official arrest powers, they are an important component of police school services. Second, police also provide coverage for all schools in their jurisdictions, whether they have an officer formally "assigned" to the school or not. These officers often serve as members of safety planning committees, volunteer coaches, and in a wide variety of other roles that assist the students, staff, and teachers in the school setting.

As Brown (2006) states, it is difficult to determine when police school services actually began. Although some trace the origin of school resource officers (SROs) (and thus the beginning of formal police school services) to Flint, Michigan, in the 1950s, there is evidence that police officers were in schools in the United States several decades before that. Police school services are not only present in the United States; police officers are in schools in the United Kingdom and South Korea and other countries throughout the world. Given that the most extensive evidence about school police services is limited to the United States, the following discussion draws primarily from that literature.

Fundamentals

Although police school services vary by state, by county, and often by school, the three most prominent police school services are school resource officers (SROs), D.A.R.E. officers, and officers that deliver Gang Resistance and Education and Avoidance Training (GREAT officers). Each of these programs is discussed in detail below.

SROs

An SRO is officially defined by Part Q of Title I of the Omnibus Crime Control and Safe Streets Act of 1968 and amended in 1998 as a "career law enforcement officer, with sworn authority, deployed in community-oriented policing, and assigned by the employing police department or agency to work in collaboration with school and community-based organizations" (United States Department of Justice 1999, p. 1) although the term is often applied to any sworn law enforcement officer working in an educational environment. SROs are thus sworn officers whose primary function is law enforcement in schools. Nevertheless, this is not the SRO's only function.

The image of the "typical" police officer is a uniformed and armed individual. The SRO is not the typical police officer; they work in a unique and unusual environment. In fact, the National Association of School Resource Officers (NASRO) recommends that, in addition to the role of law enforcement, SROs should also (a) act as a liaison between the school, the police, and the community; (b) teach law-related education classes; and (c) counsel students (United States Department of Justice 2001).

Although there is a National Association of School Resource Officers (NASRO) with a number of state chapters, it is difficult to accurately estimate the prevalence of SROs assigned full- and part-time to work in schools. The 2004 census of law enforcement agencies reported that 3,517 officers were deployed in public school districts (Reaves 2007, p. 7), although the National Association of School Resource Officers website reported that there were 6,000 officers who were members of that organization (NASRO 2010). In a recent report, Wald and Thurau (2010) observed that there were an estimated 17,000 SROs within the United States (p. 1).

SRO programs have existed for over 60 years. In 1948, the Los Angeles School Police Department was started. Their website states it was created "to create a safe and tranquil environment for the students, teachers and staff of the Los Angeles Unified School District" (Los Angeles School Police Department 2012). This created a school police department that is based in a school district. Other law enforcement scholars have the first SRO program originating in Flint, Michigan, in the 1950s (Brown 2006, p. 592). As the LASPD website has shown, there were SROs around of different kinds for many, many years. Despite the debate around the origin of the SRO program, there is no debate that the presence of SROs in schools in the United States increased after the school shootings in the 1990s (Theriot 2009), and the Community Oriented Policing Services (COPS) funding that began in 1994 created a number of SRO positions throughout the United States. In 2006, the National Association of School Resource Officers reported that the school resource officer was the fastest growing area of law enforcement (Theriot 2009).

School resource officers are trained to work in their primary role of law enforcement officer, and they often answer directly to their agency (municipal police chief or county sheriff) chain of command (Brown 2006, p. 591). They work in a school building filled with teachers, kids, and administrators. Brown states that school resource officers "serve a multifaceted role which incorporates the duties of law enforcement officer, counselor, teacher, and liaison between law enforcement, schools, families, and the community" (Brown 2006, p. 593). As referenced above, SROs are commonly said to follow the triad model. The triad model encompasses three areas: law enforcement, teaching, and advising/mentoring (Brown 2006; Finn 2005; NASRO 2010).

In general, most SROs engage in at least some activities that fall under each part of the triad. They may partake in various kinds of law enforcement activities, from patrolling school facilities to issuing citations. They may advise, mentor, and counsel school staff, students, or families. SROs often teach students about drugs, legal issues, safety education, crime awareness, and conflict resolution. Nevertheless, some evidence suggests that SROs may not be fulfilling all the elements of that triad model equally. May and his colleagues (May et al. 2004; Ruddell and May 2011) have determined that, rather than a triad, a more accurate conceptualization of SRO duties would be a quadrant model, with two of the quadrants devoted to law enforcement (for a total of half their time dedicated to law enforcement duties) and one each to law-related counseling and law-related teaching.

Despite the large number of SROs throughout the United States, there is limited evidence examining the type of training that SROs receive and the effectiveness of that training.

Unpublished research by Wheaton and May (2012) suggests that the most common source of SRO training is NASRO. They offer Basic Training, which is a 40-h, 5-day week, and an Advanced Courses, which is a 3-day, 24-h block of training (NASRO 2010). A number of states (e.g., Kentucky, Georgia, Minnesota, and Mississippi) have developed their own basic training for SROs. Other than the description posted on the NASRO website, however, little is known about the type of training SROs receive. Nevertheless, many states also report that no formal training is offered to SROs in their state and none is required (Wheaton and May 2012).

Despite the abundance of SROs throughout the United States, there is limited research examining their effectiveness. The limited evidence examining the effectiveness of SROs suggests (1) principals at schools where SROs are assigned generally value their presence and feel they make a valuable contribution to school safety and (2) the presence of SROs at schools often leads to increases in student arrests for less serious crimes, particularly disorderly conduct. The research is mixed on how the presence of SROs impacts perceptions of students about safety and whether SROs truly make schools a safer environment (Brown 2006; May et al. 2004; Theriot 2009). These results have caused some to question the use of SROs in schools and others to argue they should be removed entirely (Justice Policy Institute 2011).

Nevertheless, Finn (2005) has highlighted four benefits of SRO programs. These benefits include (1) reduced law enforcement workload by decreasing the amount of time that patrol officers have to spend at the school by the SRO handling calls that would previously have been handled through a traditional 911 calls, (2) SROs can improve the image of law enforcement among juveniles, (3) the SRO creates a better relationship between the schools and police, and (4) the SRO can enhance the police agency's image in the community.

Although SROs continue to be a controversial addition to the school environment, both critics and advocates agree that more research is needed regarding their effectiveness in making schools safer environments. Brown (2006) suggests a number of methodological approaches to answer these questions. Until researchers uncover these answers, SROs will continue to be one of the most visible (and controversial) elements of police school services.

D.A.R.E. Officers

The largest and longest active drug prevention program developed specifically for school-age children is the Drug Abuse Resistance Education (D.A.R.E.) program (DARE Annual Report 2007). D.A.R.E. was developed in 1983 by the Los Angeles Police Department and is a police officer-led series of classroom lessons with the goal of educating children on ways to resist conforming to peer pressure by providing students tools to live a drug- and violence-free life (D.A.R.E. 2012).

Initially, D.A.R.E. was developed to focus on fifth- and sixth-grade students. The belief was that this was the age group most responsive to D.A.R.E. training, and if police officers could instill the abilities to resist pressures to use drugs of students at this age, those students would go on to lead drug-free lives (Rosenbaum et al. 1994). The D.A.R.E. program has now been expanded to cover kindergarten through 12th grade and has even expanded into educating families and communities, creating a national nonprofit organization in D.A.R.E. America.

D.A.R.E. has trained literally hundreds of thousands of police officers and has educated millions of children about drug prevention strategies in 43 countries. Each year, a day in April is set aside as National D.A.R.E. Day (Berman and Fox 2009). While the D.A.R.E. program focuses on teaching the skills needed to stay drug-free, it is different than other drug prevention programs because it utilizes specially trained police officers to teach and interact with students in a school environment. This provides an opportunity for the D.A.R.E. officer to develop a relationship with his/her students that goes beyond the normal crime and punishment aspect most perceived as the cops' job. Through the D.A.R.E. program, police officers become "humanized" and "young people can relate to officers as people" (dare.com). D.A.R.E. helps to foster a community policing relationship by developing an open line of communication between school, law enforcement, and families (Carter 1995).

Unlike the limited research around the effectiveness of SROs, widespread evidence indicates that D.A.R.E. does not reduce drug use among its participants (Pan and Bai 2009). Although D.A.R.E. does not reduced drug use, D.A.R.E. does appear to improve perceptions of police among the parents and students involved in the program (Lucas 2008). In determining the effectiveness of D.A.R.E. officers, not only are the children's and parents' opinions necessary but so are the perceptions of the educators. Little research has been committed to the task of exploring the importance of D.A.R.E. officers in the classroom. Donnermeyer's (1998) study of the educator's perspective of D.A.R.E. officers in 300 public schools throughout Ohio's school districts found that overall, there was a positive perception of the work that the officers were doing. More than two in three teachers and principals involved in the study found that the "graduation ceremony, the content of the curriculum, teacher/officer interaction, the student workbook, and the role playing exercises" were excellent. Nevertheless, only 20 % of the teachers and principals believed that the students' change to a more positive attitude was because of the D.A.R.E. program (Donnermeyer 1998).

D.A.R.E. requires the officers to go through a specific and detailed training program before entering a classroom. Dusenbury and colleagues (2002) found that one of the characteristics needed for a drug abuse prevention program to be successful was determining how the officer was prepared based on the training that was required of the officer. Hensley (2002) found that the specific training for D.A.R.E. officers required 80 h of instructor training in topics such as classroom management, teaching strategies, communication skills, adolescent development, drug information, and instruction of the D.A.R.E. lessons. An additional 40 h of training is geared toward teaching a high school curriculum to the officers. As a result of this training, the instructors are prepared to teach a structured curriculum consisting of hourly sessions with the officer in the classroom over the length of 17 weeks. Due to the supervisory position that is required of a D.A.R.E. officer, it becomes necessary to understand how important the role actually is. The supervisor must be able to relate to their students in a positive and supportive relationship (Kadushin 1992).

Despite the limited effectiveness of D.A.R.E. in reducing drug use, it appears that the D.A.R.E. program is in no danger of losing funding in the near future. D.A.R.E. is supported by numerous corporate, private, and government organizations, and according to the D.A.R.E. website, over 200 communities have started programs in the last 3 years (www.dare.org). In fact, D.A.R.E. is lauded for its innovative training strategies, its permanence and effect on police-child relationships in local communities, and its widespread impact across most school districts in the United States and many throughout the world (Berman and Fox 2009). Thus, despite the limited success in reducing drug use (and unlike SROs reviewed earlier), most researchers, policymakers, police officers, and local community leaders accept D.A.R.E. as an important police school service.

G.R.E.A.T. Officers

The first Gang Resistance Education and Treatment (G.R.E.A.T.) program was developed in 1991 by a law enforcement agency in Phoenix, Arizona. In response to the local gang problem in Phoenix, the initial goal of this program was to educate school-age children about gang violence. The G.R.E.A.T. program was created to emulate the D.A.R.E. program described earlier and follows a similar structure and curriculum as that of D.A.R.E. (Esbensen et al. 2011). Where the D.A.R.E. program brings in police officers to the schools to teach students about how to resist drugs and educate them on drug abuse, the G.R.E.A.T. officers deliver an antigang message within the schools. The semblance of the curriculum's structure and content to that of the D.A.R.E. program can be seen from the influx of the D.A.R.E. officers into the G.R.E.A.T. program (Winfree et al. 1999). The skills that the program intends to create are based on various life skills that are needed in order to reduce negative attitudes toward law enforcement and reduce gang involvement and subsequent gang violence and other negative ramifications of gang membership (Humphrey and Baker 1994).

Originally, the program consisted of eight lessons over a 9-week period that was targeted mainly to middle school students. Based on evaluations over the last decade, the program has been extended to a 13-session curriculum for middle schools, as well as an elementary school curriculum, a summer program, and a family training program. As the G.R.E.A.T. program has expanded, so has its coverage. What was intended to be a locally based program has now expanded nationwide, consisting of four regional training centers for law enforcement across the country (GREAT.com).

The G.R.E.A.T. program is designed to help youths avoid gangs and youth violence and delinquency. The G.R.E.A.T. program has four primary components – an elementary school curriculum, a middle school curriculum, a summer program, and a families training component. Although officers may offer up to four of the programs at the G.R.E.A.T. program sites, the required, core component of the program is the middle school curriculum, which teaches students problem-solving strategies and life skills with the end goal of helping them avoid violence, delinquency, and gang membership (Promising Practices Network on Children and Communities 2012).

Each of the two school components (elementary and middle school) is delivered by uniformed police officers in the school setting, while the summer program component and the families program component are led by facilitators trained in those components (usually uniformed officers as well). The 13-week middle school curriculum consists of 13 lessons that are 45–60 min long and are designed to produce changes in behavior and attitude through active learning, including positive-behavior rehearsal and other role-playing scenarios. The elementary school curriculum is also a skills-based curriculum designed to be delivered to fourth- and fifth-grade students. In addition to curriculum designed to reduce delinquency and gang membership, the curriculum consists of six 30–45-min lessons covering topics such as bystander intervention in bullying situations and the importance of involving adults when problems arise. The summer program extends the lessons taught to the students through the curriculum delivered in the school setting and works to enhance students' cognitive and social skills by providing alternatives to gang involvement in the summer months. The families program is designed for youths age 10–14 and their families and consists of six sessions that work in conjunction with the other curriculums to engage entire families in cooperative lessons whose goal is to improve both communication and decision-making skills among family members (Promising Practices Network on Children and Communities 2012). From its inception, G.R.E.A.T. has focused on the importance of training and program integrity (Dusenbury et al. 2003). Dusenbury et al. (2003) listed four areas that were important to fidelity for programs like G.R.E.A.T.: officer/instructor training, officer/instructor characteristics, the support the officer received from the host organizations (i.e., school and national G.R.E.A.T. program), and the integrity of the program itself (e.g., manual and curriculum). G.R.E.A.T. officers receive two different types of required training; separate trainings are designed and delivered in one- and 2-week training sessions. The variations in training are based on classroom experience. The 1-week training requires the officer to have experience in classroom management or to have a teaching certificate. The 2-week training is required for all officers that do not meet the requirements of having classroom experience.

Esbensen et al. (2011a) completed a comprehensive study of the fidelity of the G.R.E.A.T. Officer Training (G.O.T.) 2-week training period (the 80-h training). The authors studied three specific areas based on Dusenbury et al.'s (2003) four characteristics of fidelity: how the officer was prepared, the commitment the officer gave to delivering the program to students, the support that was received, and the value of the G.R.E.A.T. program. As outside observers of the training, Esbensen and colleagues found that the G.O.T. sufficiently prepared officers with the knowledge and skill to execute the G.R.E.A.T. program effectively in a classroom environment. To prepare the officers, the G.O.T. requires them to practice public speaking daily, beginning with 2- to 3-min presentations and eventually building up to a presentation of an entire G.R.E.A.T. lesson. Along with presentations, the officers went through lessons in a variety of teaching styles and attended discussions of pedagogy led by educational specialists who also showed officers examples of gang crime and gang research.

In assessing their second area of fidelity (the support that was received), the authors surveyed school personnel. In general, school personal were supportive of programs such as G.R.E.A.T. They generally felt that these types of programs could encourage kids to stay away from drugs and gangs. While most school personal supported the G.R.E.A.T. program, few continued or reinforced the education of the program after the officers left. Their evaluation found that the school personnel were still "untapped resources" and that school personnel should have a greater involvement in program delivery and implementation in the future than they had in the past.

Finally, Esbensen and colleagues (2011) also examined the quality of program delivery. In this analysis, the researchers focused on the management of time and classroom, the teacher involvement in the program, and the overall quality of the program. Officers were found to be competent in all categories. In the category of teacher involvement, Esbensen and his colleagues suggested that better coordination between teacher, student, and officer equaled better program quality.

The G.R.E.A.T. program has received a "promising" rating from at least one agency evaluating its effectiveness membership (Promising Practices Network on Children and Communities 2012). The evaluators cite two evaluations of the program that suggest that students receiving G.R.E.A.T. training were less involved in both total and minor delinquency than their counterparts who had not participated in G.R.E.A.T. Although the evaluators cite methodological weaknesses of the evaluations and accurately highlight that no significant evidence of reduced gang involvement was found in either evaluation, Esbensen et al. (2001) suggest that the G.R.E.A.T. program may have a delayed (rather than an immediate) impact on participants. Esbensen et al. (2001) determined that while there were no significant differences in outcome variables between control and treatment groups after 1 year, there were some significant differences at 1-, 2-, and 3-year follow-ups.

A more recent evaluation provides even more promising results. Esbensen and his colleagues (2011) conducted an outcome evaluation using a longitudinal panel of approximately 3,800 students from 31 middle schools in 7 cities where G.R.E.A.T. was being used. This evaluation determined that (1) the vast majority of school personnel that were familiar with G.R.E.A.T. in schools where it was being used had positive attitudes about the program and (2) the officers implementing G.R.E.A.T. did so with high program fidelity. Additionally, the evaluators also determined that G.R.E.A.T. students were significantly more likely than non-G.R.E.A.T. students to report lower rates of gang membership, more positive attitudes about police, less positive attitudes about gangs, more frequent use of refusal skills, and greater resistance to peer pressure. G.R.E.A.T. students were just as likely as non-G.R.E.A.T. students to engage in general delinquency and did not show improvements over their counterparts who were not exposed to the G.R.E.A.T. curriculum on measures of empathy, risk-seeking, and conflict resolution (Esbensen et al. 2011b).

Despite the somewhat ambiguous evidence around the effectiveness of G.R.E.A.T., particularly in reducing involvement in gangs, the support for G.R.E.A.T. continues among funding agencies, law enforcement officers delivering the program, and personnel working in schools where G.R.E.A.T. is delivered. Of the three most well-known police school services, G.R.E.A.T. has the most empirical support for its effectiveness and thus will continue to be delivered in communities throughout the United States.

Future Directions

This entry has reviewed the three most common police school services. Despite the differences in the program goals, missions, and delivery, there are a number of similarities among the programs. First, and most importantly, each of the three programs needs more rigorous evaluation to determine its effectiveness. In fact, the current evidence suggests the three programs could be placed on a continuum of effectiveness with D.A.R.E. on one end as largely ineffective (at least when it comes to reducing drug use) and G.R.E.A.T. on the other end, with the majority of the empirical evidence suggesting that the current program is meeting its goals of reducing involvement in gangs. Given the lack of rigorous evaluations, SRO programs would best be placed between the two on this continuum. A second similarity between the three programs is that, by and large, in schools where the program is being delivered, school personnel (and, to some extent, students) have positive things to say about the program. In each case, the harshest critics of the police school service programs are not within the school, but those outside the school. Finally, none of the three programs appears to be in danger of extinction in the near future. For each of the three programs, funding at the national level has been reduced in the last 5 years with minimal impact on program delivery, suggesting that local communities are so supportive of the police school services in their community that they are willing to find funding to keep those programs afloat. In fact, if anything, the future may hold further expansion of police school services, as improved relations between school administrators and law enforcement agencies may bring about further expansion of the role of law enforcement in the school environment.

Police Selection

Michael G. Aamodt
DCI Consulting Group, Inc., Washington, DC, USA

Overview

Over the past 30 years, great progress has been made in developing a process for selecting police officers. There are four distinct phases to the selection process: conducting a job analysis, determining which applicants have the competencies to be good officers, investigating the background of the applicant, and conducting a psychological evaluation to determine if there is something about the applicant that would be a threat to the safety of the officer or to others. Each of these four phases is conducted by professionals with very different skills and training. This entry will describe each of the four phases and summarize the research findings regarding what methods best predict police officer job performance.

Conducting a Job Analysis

The first step in developing a system to hire police officers is to conduct a job analysis. The goal of a job analysis is to identify the tasks that are performed, the conditions under which they are performed, and the competencies needed to perform the tasks. Although there are many job analysis methods, the typical job analysis begins with the job analyst observing the job being performed (*ride alongs*) and then conducting interviews with incumbents. These interviews are conducted with individual officers, groups of officers at one time, and their supervisors. When the interviews are conducted with groups of incumbents and supervisors, they are called subject-matter expert (SME) conferences.

Once the observations and interviews are concluded, the next step is to develop a task inventory and a competency inventory. The task inventory is a list of the tasks performed by the officers, and the competency inventory is a list of competencies (e.g., knowledge, skills, abilities) needed to perform the tasks. Next to each task are scales where incumbents will rate the frequency with which a task is performed as well as the importance of the task. Some tasks, such as writing traffic citations, will be rated as being important and frequently occurring, whereas others, such as shooting a gun, will be rated as occurring with low frequency but of having high importance.

Once the task and competency inventories have been developed, they are administered to a sample of police officers who will rate the frequency and importance of the tasks and competencies. These ratings are then summarized to determine which tasks and competencies are *critical* to the performance of the job.

Although the critical tasks identified in the job analysis are often similar across law enforcement agencies, the frequency with which they occur can vary tremendously. That is, while every police officer makes arrests and writes traffic citations, the frequency of those activities might be different in a large city with a high crime rate than it would in a small rural town.

Developing the Test Battery

Now that the critical tasks and competencies have been identified, the next step is to decide how to measure whether an applicant has the necessary competencies to perform the essential tasks. Some competencies, such as knowledge of the law, will be taught in the academy and thus will not be a part of the selection system. For competencies that cannot be easily learned in the academy, it is essential to test for them prior to hiring the officer. Although the term *test* often conjures up the image of a paper-and-pencil test, psychologists and the courts use the term to describe any technique used to evaluate someone. Thus, selection methods such as interviews and background checks are considered to be tests. Common tests used in police selection include minimum qualifications, interviews, cognitive ability tests, personality inventories, and physical ability tests.

Minimum Qualifications

Every law enforcement agency has minimum qualifications that an applicant must have to even be considered for the job. These minimum qualifications, often determined by state regulation, include such requirements as being 21 years of age, having at least a high school diploma/GED, possessing a valid driver's license, and having never been convicted of a felony. As an example, in 2012, the minimum requirements in Arizona are:

1. Be a United States citizen
2. Be at least 21 years of age; except that a person may attend an academy if the person will be 21 before graduating
3. Be a high school graduate or have successfully completed a General Education Development (G.E.D.) examination
4. Undergo a complete background investigation
5. Undergo a medical examination within 1 year before appointment
6. Not have been convicted of a felony or any offense that would be a felony if committed in Arizona
7. Not have been dishonorably discharged from the United States Armed Forces
8. Not have been previously denied certified status, have certified status revoked, or have current certified status suspended
9. Not have illegally sold, produced, cultivated, or transported for sale marijuana
10. Not have illegally used marijuana for any purpose within the past 3 years
11. Not have ever illegally used marijuana other than for experimentation
12. Not have ever illegally used marijuana while employed or appointed as a peace officer
13. Not have illegally sold, produced, cultivated, or transported for sale a dangerous drug or narcotic
14. Not have illegally used a dangerous drug or narcotic, other than marijuana, for any purpose within the past 7 years

15. Not have ever illegally used a dangerous drug or narcotic other than for experimentation
16. Not have ever illegally used a dangerous drug or narcotic while employed or appointed as a peace officer
17. Not have a pattern of abuse of prescription medication
18. Undergo a polygraph examination
19. Not have been convicted of or adjudged to have violated traffic regulations governing the movement of vehicles with a frequency within the past 3 years that indicates a disrespect for traffic laws or a disregard for the safety of other persons on the highway
20. Read the code of ethics and affirm by signature the person's understanding of and agreement to abide by the code

Interviews

Interviews used in police selection will differ in structure and style. The structure of an interview is determined by the source of the questions, the extent to which all applicants are asked the same questions, and the structure of the system used to score the answers. A *structured interview* is one in which (1) the source of the questions is a job analysis (job-related questions), (2) all applicants are asked the same questions, and (3) there is a standardized scoring key to evaluate each answer.

An *unstructured interview* is one in which interviewers are free to ask anything they want (e.g., Where do you want to be in 5 years? What was the last book you read?), are not required to be consistent in what they ask of each applicant, and may assign numbers of points at their own discretion. Interviews vary in their structure, and rather than calling interviews structured or unstructured, it might make more sense to use terms such as highly structured (all three criteria are met), moderately structured (two criteria are met), slightly structured (one criterion is met), and unstructured (none of the three criteria are met). The research is clear that highly structured interviews are more reliable and valid than interviews with less structure (Huffcutt and Arthur 1994).

The style of an interview is determined by the number of interviewees and number of interviewers. *One-on-one interviews* involve one interviewer interviewing one applicant. *Serial interviews* involve a series of single interviews. For example, the lieutenant might interview an applicant at 9:00 a.m., the captain interviews the applicant at 10:00 a.m., and the chief interviews the applicant at 11:00 a.m. *Return* interviews are similar to serial interviews with the difference being a passing of time between the first and subsequent interview. For example, an applicant might be interviewed by the HR manager and then brought back a week later to interview with the chief. *Panel interviews* have multiple interviewers asking questions and evaluating answers of the same applicant at the same time. Panel interviews are the most commonly used interviews in police selection.

Questions asked in job interviews for law enforcement positions often focus on two major areas: the applicant's background and their situational judgment. Background questions might focus on whether the applicant has used illegal drugs, why they want to be a police officer, and the extent to which they have engaged in violent behavior (e.g., fights at school, yelling at a girl/boyfriend). Situational judgment questions ask the applicant how he or she would handle a hypothetical situation. For example, an applicant might be asked, *If you saw a fellow officer accept a bribe, what would you do?* or *If a motorist would not roll down their window during a traffic stop, what would you do?*

Interview questions often vary tremendously across law enforcement agencies. For example, questions asked of applicants for the Michigan State Police focus on building trust, adaptability, decision making, work standards, initiating action, stress tolerance, continuous learning, customer focus, communication, and job fit, whereas questions asked in one New Mexico agency covered such topics as history, current events, and hobbies.

Cognitive Ability Tests

In one form or another, cognitive ability tests are commonly used in law enforcement selection. This category of tests includes a wide variety of tests ranging from those tapping general intelligence to those tapping such specific aspects of cognitive ability as reading, math, vocabulary, and logic. From a content validity perspective, cognitive ability tests are thought to be important in law enforcement selection as they are related to the ability to perform such tasks as learning and understanding new information, writing reports, making mathematical calculations during investigations, and solving problems.

Cognitive ability tests can be placed into four categories on the basis of where they were developed and the extent to which they are commercially available: Publisher developed general cognitive ability tests, nationally developed law enforcement tests, tests developed by the federal government, and locally developed civil service exams.

Publisher Developed General Cognitive Ability Tests. This first category includes cognitive ability tests developed by national test publishers. These tests are available for a wide variety of uses and can be purchased directly from the publishers. Though these tests were not specifically designed for law enforcement selection, many are certainly compatible with constructs related to law enforcement performance. Tests from this category that are commonly used in law enforcement selection include the Wonderlic Personnel Test, Nelson-Denny Reading Test, Shipley Institute of Living Scale, and the Wechsler Adult Intelligence Scale.

Nationally Developed Law Enforcement Tests. The second category of cognitive ability tests includes those developed by consultants or trade organizations for specific use with law enforcement agencies. Examples of tests from this category include the Entry-Level Police Officer Test, National Police Officer Selection Test (POST), and the Law Enforcement Candidate Record (LECR). The Entry-Level Police Officer Test, published by the International Public Management Association for Human Resources (a trade organization), is a 100-item test that measures observation and memory, ability to learn police material, verbal and reading comprehension, and situational judgment and problem solving. It also contains a noncognitive component that measures interest in policing as a career. In contrast, the POST, published by Stanard and Associates (a private company), is a 75-item test that measures arithmetic, reading comprehension, grammar, and incident report writing.

Tests Developed by the Federal Government. The third category of tests was developed by the federal government for use either with the military or with general employment testing. The major test in this category used in law enforcement selection was the Army General Classification Test. Although these tests were commonly used for police selection in the 1960s and 1970s, they are seldom used today outside of the federal government.

Locally Developed Civil Service Exams. The fourth category consists of cognitive ability tests developed by various municipalities and Civil Service Commissions for their own use. Normally, the municipality hires an outside consulting firm to develop these tests. Though it is not unusual for these tests to be shared with other agencies, they are not commercially available.

The use of cognitive ability tests in law enforcement selection is controversial. Proponents of these tests cite an abundance of research demonstrating that cognitive ability tests are excellent predictors of performance in a wide variety of jobs (Schmidt and Hunter 1998) as well as good predictors of how a police cadet will perform in the academy (Aamodt 2004). Opponents argue that cognitive ability tests result in adverse impact against Blacks and Hispanics (Roth et al. 2001) and that there are alternative methods with comparable validity but result in lower levels of adverse impact.

Because of the high levels of adverse impact that occur with cognitive ability tests, it is essential that a law enforcement agency conducts a validation study to ensure that the people who score highly on these tests actually perform better on the job than those that do not. In the typical validation study, the test is administered to newly hired police officers, and their scores are correlated with such criteria as academy grades, supervisor ratings of on-the-job performance, number of commendations received, and number of disciplinary incidents.

In recent years, applicants have challenged the legality of cognitive ability tests based on the score needed to pass the test. That is, should the applicants with the highest scores always be given preference over people with lower scores or should the law enforcement agency set a passing score (e.g., 70 %) such that anyone who achieves that score is considered equally qualified for the job? Most law enforcement agencies have adopted the passing score approach.

Personality Inventories

Personality inventories are commonly used methods to predict performance in law enforcement settings (Weiss 2010). Although there are hundreds of personality inventories available, they generally fall into one of two categories based on their intended purpose: measures of psychopathology and measures of normal personality.

Measures of Psychopathology. Measures of psychopathology (abnormal behavior) determine if individuals have serious psychological problems such as depression, bipolar disorder, and schizophrenia. Commonly used measures of psychopathology used in law enforcement research include the Minnesota Multiphasic Personality Inventory 2 (MMPI; MMPI-2), Millon Multiaxial Clinical Inventory (MMCI-III), Personality Assessment Inventory (PAI), and the Clinical Assessment Questionnaire (CAQ). Such measures are designed to *screen out* applicants who have psychological problems that would cause performance or discipline problems on the job. Measures of psychopathology are not designed to *select in* applicants and are seldom predictive of job performance (Aamodt 2004, 2010).

Measures of psychopathology are considered to be medical exams. As a result, to be in compliance with the Americans with Disabilities Act (ADA), they can only be administered after a conditional offer of employment has been made. Prior to the passage of the ADA in 1990, these tests were routinely administered to all applicants.

Measures of Normal Personality. Tests of normal personality measure the traits exhibited by normal individuals in everyday life. Examples of such traits are extraversion, shyness, assertiveness, and friendliness. Though there is some disagreement, psychologists today generally agree there are five main personality dimensions. Popularly known as the Big Five, these dimensions are openness to experience (bright, adaptable, inquisitive), conscientiousness (reliable, dependable, rule oriented), extraversion (outgoing, friendly, talkative), agreeableness (works well with others, loyal), and emotional stability (calm, not anxious or tense). Commonly used measures of normal personality in law enforcement selection include the California Psychological Inventory (CPI), M-PULSE, 16PF, NEO PR-R, Inwald Personality Inventory (IPI), and Edwards Personal Preference Schedule (EPPS). In contrast to measures of psychopathology, measures of normal personality are used to *select in* rather than *screen out* applicants.

Though personality inventories are commonly used in police selection, in part because racial groups tend to score similarly (Foldes et al. 2008), a meta-analysis of the validity of personality inventories indicates that, in general, they are not good predictors of police performance (Aamodt 2004, 2010).

Physical Ability Tests

Most law enforcement agencies require applicants to pass a physical ability test either prior to hire or at the completion of the academy. These physical ability tests usually come in one of two formats. In the first format, applicants perform a variety of exercises related to stamina and strength. Such exercises often include sprints, push-ups, and sit-ups. In the second format, applicants perform a job-related simulation involving physical agility. Such a simulation might involve getting out of a car, running a short distance, leaping over an obstacle, climbing a fence, going through a window, and dry firing a pistol at the end of the obstacle course.

Because physical ability tests often result in adverse impact against women, it is essential that law enforcement agencies establish the validity of their physical ability tests. Best practices include using simulations rather than individual tests (e.g., push-ups) and using cutoff scores that are realistic and appropriate for the work being performed.

Below is an example of the physical ability test used by the Oakland (CA) Police Department:

- *Cone Maze*: While running through the cone maze, you may not knock over or move any of the cones from its original position. If you do, you will be asked to put the cone back to its original position. The additional time you use to do so will be counted toward your overall qualifying time.
- *Fence Climb*: You will have three (3) chances to climb over the 5-ft fence. If you fail to go over the fence after three attempts, the proctor will stop the test and give you a failing grade. While climbing the fence, you may not use the support on either side of the fence to assist you.
- *Ditch Jump*: You will have three (3) chances to jump over the simulated 4-ft ditch (rubber mats). Your foot must not come in contact with the ditch area at anytime. If you fail to complete this event after three attempts, the proctor will stop the test and give you a failing grade.
- *Stair Climb/Window Entry*: When climbing the stairs and going through the window, you must step on each stair on both the front and backside of the simulated window frame. You may use any part of the window frame to brace yourself in order to help facilitate your climb through the window frame.
- *Dummy Drag*: In order to pass this event, you must successfully drag the dummy around the designated cone and drop it after it crosses over the black tape marker. Then you will run as quickly as you can to the handcuff simulator platform. Your timed run will end when you touch the handcuff simulation platform.
- *Handcuffing Simulator*: This is the last event of the physical ability test. You are allowed three (3) attempts to complete. You must grasp each end of the bar and bend the bar until both ends touch. You must hold the bar in this position for 30 s. You may not interlock your fingers and your hands must not touch your chest at any time. If you let the ends of the bar separate, even slightly, your time will be restarted and you must begin the event again. Remember: The time begins when the ends of the bar touch.

The applicant must complete the first five events within 2 min and 35 s. To pass the handcuff simulation, the applicant must perform the activity for 30 s while maintaining a proper posture.

Background Investigation

Once it has been determined that an applicant has the competencies needed to be an effective police officer, the department then conducts a background investigation to determine if there are problems that were missed in the interview and testing process. The background investigation begins with the applicants completing a lengthy set of questions regarding their education, work history, credit history, driving record, arrest and conviction record, and previous places of residence. The department will then verify whether the applicants have the degrees they claim to have earned, worked at the jobs listed in their application, and listed all arrests or convictions. From there, the investigators will often contact the applicants' former professors, employers, and neighbors to determine if the applicant acted in a way that would reflect potential problems. For example, an employer might indicate that an applicant was verbally aggressive with customers, a neighbor might mention the loud music and noise from wild parties that came from the applicant's apartment, and a professor might indicate that the applicant occasionally *seemed stoned* during her 9:00 a.m. class. The last step in the background investigation is a polygraph test in which the applicant is asked questions about such activities as drug use, theft, and aggressive acts.

At the conclusion of the background investigation, the investigator will compile all of the information and make a recommendation about the fitness of the applicant. This overall recommendation is important because seldom does a single piece of information (e.g., number of traffic citations, being fired from one job) predict how an officer will perform on the job. Instead, it is a *pattern* of problematic behaviors that is most predictive of potential problems.

Psychological and Medical Evaluation

The final step in the selection process is for the applicant to be evaluated by a licensed physician and a licensed psychologist. The physician is given a job description and asked to evaluate whether the applicant has any medical condition that would keep him or her from performing the duties of a police officer. The clinical psychologist is asked to determine if the applicant has a psychological disorder that might make them a potential danger to themselves or to others. The Americans with Disabilities Act requires that the medical exam and the psychological exam be administered after a conditional offer of hire. That is, the applicants are told that they will be hired as long as they pass the medical and psychological evaluations.

The nature of the psychological exam will depend on the needs of the department. If the department already has a comprehensive selection system such as that described in this entry, the role of the psychological exam is limited to determining whether the applicant has some sort of psychopathology that will limit his or her ability to be an effective police officer. This limited role is because the law enforcement agency has already tested and interviewed the applicant and believes that the applicant has the competencies needed to perform the job. What the agency needs from the psychologist is certification that there is not some form of psychopathology that will make the applicant a danger to themselves or to others.

If, however, the applicant has applied to a small police department that does not use extensive testing, the agency might ask the psychologist to determine not only whether the applicant has some form of psychopathology but also whether the applicant has the basic competencies (e.g., personality, cognitive ability) to effectively perform the job. In some states, such as New Mexico, an applicant can go directly to a clinical psychologist to get certified and then take that certification to the department as proof that they are ready to be hired and sent to the academy.

Though clinical psychologists will differ in how they conduct psychological evaluations, there are usually three main parts to the evaluation: assessment of background information, a written test of psychopathology (e.g., MMPI-2), and a clinical interview. The clinician will use all three components to arrive at an overall recommendation of whether the applicant is psychologically fit to be a law enforcement officer.

From these assessments, Trompetter (1998) believes that the clinical psychologist should determine whether the applicant:

1. Can accept criticism
2. Can adapt to change
3. Be assertive when appropriate
4. Be interpersonally sensitive
5. Is motivated to achieve
6. Be objective
7. Be persuasive
8. Be vigilant
9. Can conform to rules and regulations
10. Has good impulse control
11. Demonstrates integrity
12. Demonstrates practical intelligence
13. Demonstrates reliability
14. Demonstrates social concern
15. Exhibits a positive attitude
16. Can manage his/her anger
17. Can tolerate stress
18. Can work in a team

The Academy

Once the applicant has been hired, he/she will still need to complete a law enforcement academy to become certified as a police officer, sheriff's deputy, state trooper, or other law enforcement professional. Graduation from an accredited academy is mandatory in order to be certified as a peace officer. Each state sets a minimum number of training hours for an academy, but each academy can offer more extended training. The average academy lasts 761 h (19 weeks) at a cost per cadet to complete the academy of $16,100

Police Selection, Table 1 Topics learned in law enforcement academies

Topic	% of academies offering	Median hours of instruction
Operations		
Report writing	100	20
Patrol	99	40
Investigations	99	40
Basic first aid/CPR	99	24
Emergency vehicle operations	97	40
Computers/ information systems	58	8
Weapons/self defense		
Self-defense	99	51
Firearms skills	98	60
Nonlethal weapons	98	12
Legal

Cultural diversity/ human relations	98	11
Basic strategies	92	8
Mediation skills/ conflict management	88	8
Special topics		
Domestic violence	99	14
Juveniles	99	8
Domestic preparedness	88	8
Hate crimes/bias crimes	87	4

Source: Reaves (2006)

(Reaves 2006). Louisiana has the fewest required hours (520), and West Virginia has the most (1,582; Rojek et al. 2007). Approximately 14 % of cadets who enter the academy fail to complete the requirements needed to become a certified police officer (Reaves 2006). As shown in Table 1, there are a wide range of topics studied in the typical academy.

After completing the academy, the final step toward becoming a law enforcement professional is to complete supervised field training. Some academies include this field training as part of the academy training, whereas others have the agency that hired the cadet conduct the training. The typical department requires 520 h (13 weeks) of field training (Rojek et al. 2007).

Conclusion

As you can see from this entry, law enforcement agencies often expend tremendous effort and finances to ensure that their agencies are staffed with high-quality employees. To survive a legal challenge, each stage of the selection process must be shown to be job related.

Police Self-Legitimacy

Justice Tankebe
Institute of Criminology, University of Cambridge, Cambridge, UK

Overview

In many ways, these are the best times for legitimacy in criminology. For decades, legitimacy had been peripheral in criminological research although it was a central concept in both political science and sociology. In many ways, this inattention to legitimacy was due to a general historical tendency for criminologists to avoid normative issues. The situation today is different; legitimacy is now an established topic in criminological studies, with an explosion in empirical research about its antecedents and consequences. The impetus for the remarkable change of fortune for legitimacy can undoubtedly be traced to the pioneering work of Tom Tyler, beginning with his *Why People Obey the Law*. Tyler's procedural justice arguments have been studied in different contexts, focusing principally on everyday interactions between criminal justice agents – such as prisons and police officers – and citizens. The results from these studies consistently show that public perceptions of police legitimacy shape general compliance with the law, cooperation with legal authorities, recidivism in spousal assault, and even support for vigilante self-help.

Notwithstanding this important advancement in our understanding of legitimacy, some areas of legitimacy remain underdeveloped. One of these is the police's views of their own legitimacy. To date, the dominant approach to legitimacy is from the standpoint of citizens; thus, various empirical analyses attempt to assess the conditions associated with citizens' views of the legitimacy or otherwise of the police. Yet one must equally be attentive to the belief and the confidence that officers have in their own legitimacy because such a belief can have important implications for how they carry out their work and for the cultivation of legitimacy among citizens. Max Weber, to whom we owe much for the stature of legitimacy in contemporary social science, emphasized their duality of legitimacy (see further below).

This dimension of legitimacy from the standpoint of power-holders is what has been described as *power-holder legitimacy* or *self-legitimacy* (Bottoms and Tankebe 2012). Self-legitimacy refers to a belief on that part of power-holders, such as the police, that the positions they occupy and their attendant roles are morally acceptable and justified to themselves. It is, in other words, about the self-recognition of entitlement to power. Unlike organization legitimacy, which focuses on power-holders' views of the organization, self-legitimacy is concerned with power-holders' views of their own individual legitimacy. What relationship exists, if any, between self-legitimacy and organizational legitimacy is yet to be empirically examined. This entry presents a brief theoretical analysis of self-legitimacy, hypothesizing a number of factors that might shape officers' self-legitimacy. It also discusses the consequences of police self-legitimacy.

Understanding Police Self-Legitimacy

A surfeit of definitions of legitimacy exists in the social sciences. However, many of these definitions are one-dimensional, in that they approach legitimacy from the standpoint of those subject to power; the views and beliefs of those who govern are often not taken into account. There are however a few exceptions, the most instructive of which is perhaps that offered decades ago by Dolf Sternberger: "legitimacy is the foundation of such governmental power as is exercised both with a consciousness on the government's part that it has a right to govern and with some recognition by the governed of that right" (1968: 244). There are many attractive elements in this definition, of which three are particularly noteworthy. First is its emphasis on the normative character of legitimacy that it is a positive *recognition* of the moral *right* to be in a position of power. Second, it is necessarily *conditional;* legitimacy of any power-holder or institution can be squandered or "deliberately nourished." Third, it extends both to the *power-holders* and to their *audiences*. The focus of this entry is on how power-holders, in particular police officers, legitimate their authority in their own eyes.

As with all contemporary analysis of legitimacy in the social sciences, the starting point of self-legitimacy is Max Weber. Weber argued that power-holders have a need to cultivate legitimacy of their power and positions not only for the purposes of securing the cooperation of their power-subjects but for their own personal consumption. As he put it, the powerful have a need to "persuade *themselves* that their fates are deserved and therefore rightful" (Kronman 1983: 41). In Weber's conception, self-legitimacy is a necessary precondition for claiming legitimacy among citizens. "To the extent that he anticipates and understands the criticism of those who are less fortunate, the man of good fortune must already be a critic himself" (Kronman 1983: 41).

Weber did not develop his analysis of this dimension of legitimacy as fully as he did the audience dimension. Nonetheless, the authors argue that because of the central place that Weber assigned to formal legality in his treatise on audience legitimacy, it might be reasonable to suspect that it would have been the grounds on which power-holders would seek to justify the rightness of their power to themselves. In other words, police officers will believe in their own legitimacy if and only if they ensure that the positions they occupy, the powers they wield, and the manner in which such powers are exercised on a day-to-day basis are formally and legally correct. Yet, legality is not sufficient to establish legitimacy; in addition to legality, those in power must also be able to convince themselves that their claims to legitimacy is justified in terms of a society's shared values and beliefs. Dennis Wrong has emphasized this need for reference to the shared beliefs held both by rulers and by those who are governed, when he notes that power-holders have:

> a need to believe that the power they possess is morally justified, that they are servants of a larger collective goal or system of values surpassing mere determination to perpetuate themselves in power, [and] that their exercise of power is not inescapably at odds with hallowed standards of morality. (1995: 51)

However, analysis of power-holder legitimacy in the political science literature has tended to focus almost exclusively on the ruling elite, thereby potentially missing the significant role in social order played by more junior power-holders (such as basic-grade police and prison officers), who are in direct contact with citizens and often exercise a significant degree of local power on a daily basis. Such local power-holders of course play crucial roles in all law enforcement agencies. Nonetheless, "as dominated dominators or, more precisely, as dominated parties within the field of power" (Bourdieu as cited in Frow 2000: 313), such junior power-holders are a special group. For example, patrolling police officers are "the state made flesh. [. . .] they are the most direct representatives of the state for citizens given their visible, uniformed, 24-h presence on the streets and their crucial involvement in social intervention and law enforcement" (Punch 2000: 322); but simultaneously, they can sometimes be the least powerful group within a large criminal justice agency. The decisions of police managers undoubtedly set limits and create opportunities for ordinary officers. Similarly, however, the nature and outcome of everyday police–public interactions may lead to outcomes that necessitate a recalibration of the modes of external legitimacy and a transformation of police practices and procedures. Given this, it would seem that the problem of ordinary police officers' cultivation of self-confidence in their own moral entitlement to exercise power is a question that has to be taken seriously. Indeed, for street-level officers, it might be hypothesized that the further one climbs downwards on the rungs of organizational structure, the greater the energy, time, and intensity of legitimation for the confirmation of claims to authority.

A central conceptual problem for self-legitimacy concerns the "disconnected" power-holder who has lost touch with the public he or she serves and takes an "I am always right" position (Bottoms and Tankebe 2012). Unfortunately, under certain circumstances members of police services can easily slide into this kind of attitude, as seen in, for example, the too-frequent abuse of power in policing, in so-called noble cause corruption, where officers subscribe to the view that it is appropriate to manufacture evidence against a suspect because "he is clearly guilty anyway." In such instances, officers are implicitly making claims to possession of a higher normative validity than that which the State represents; adherence to such a norm is, in their view, a necessity for society to survive. By contrast to these approaches, a healthier view of self-legitimacy asserts that "means and ends are not separate; the things we care about profoundly affect *how* we honour [them]" (Archer 2000: 84). In a criminal justice context, self-legitimacy is therefore best understood as the cultivation of self-confidence in the moral rightness of power-holders' authority, within a framework of both official laws and regulations, and societal normative expectations (Bottoms and Tankebe 2012).

As noted previously, police researchers have not yet paid sufficient attention to self-legitimacy in their empirical analyses of legitimacy. It is nonetheless important to note that the main thrust of this dimension of legitimacy is at least implicit in Muir's (1977) in-depth field on good policing, as well as an empirical description of ways in which police deviate from it. A core element of Muir's argument is that police officers are moral animals and that they wrestle with justifying their actions in moral terms. That is, they need to construct moral arguments about "the rightness of their cause," which is at the core of the idea of self-legitimacy. Muir famously identified four "types" of officers – *professionals, enforcers, reciprocators*, and *avoiders* – each with different orientations to their work but all seeking some way to justify their actions in particular and their work styles in general. Officers with a greater sense of self-legitimacy approximate Muir's professional officers:

> The professional response never involved an indefensible violation of the law. Any apparent illegality, if there was one, was always put in an understandable and acceptable light, openly and publicly justified. Nor did the professional response amount to the naked assertion of the law. The law was invoked after careful preparation of a foundation of knowledge, or fearfulness, or both. (1977: 144–145)

What Factors Promote Self-Legitimacy?

Practically and theoretically, the problem of understanding the conditions that help to create and sustain police self-legitimacy is of immense importance. However, empirically, not much is known about those conditions. Part of the reason is that this dimension of legitimacy has been undeveloped. However, it is possible to hypothesize a number of such factors that might relate to officer self-legitimacy. That is the aim of this section of the entry. Specifically, it will consider the possible role of procedural justice, relational social capital, and experiences of misconduct, and effectiveness in crime prevention.

Procedural Justice

Jack Barbalet has argued that "feelings of confidence arise from acceptance and recognition in social relationships" (2001: 87). Within this context, procedural justice becomes potentially useful in analysis of officers' feelings of confidence in their own legitimacy. Procedural justice is now an established area of criminological research. It refers to the perceived fairness of the procedures used to determine specific outcomes. In more developed work, procedural justice has itself been shown to comprise two separate elements: namely, *quality of decision-making* (e.g., did the citizen have a fair opportunity to state his/her point of view?) and *quality of treatment* (i.e., how far was the citizen treated as a person with human dignity and respect?).

There is a growing body of empirical studies that show procedural justice is the predominant determinant of citizens' perceptions of police legitimacy. Among power-holders, a study by Tyler, Callahan, and Frost (2007: 476) found that assessments of legitimacy made by both law enforcement agents and soldiers were significantly influenced by procedural justice. Tyler and his colleagues were concerned with evaluations of organizational legitimacy rather than the individual officers' self-confidence in their own legitimacy. Yet it is reasonable to hypothesize that procedural justice can be important in promoting self-legitimacy among police officers. Indeed, in his study in Ghana, Tankebe (2007) reported that officers who perceived that they had been treated with fairly by their supervisors were those who expressed greater confidence in their self-legitimacy.

Relational Social Capital

According to Coleman (1988: 101), "a group within which there is extensive trustworthiness and extensive trust is able to accomplish much more than a comparable group without that trustworthiness and trust." It is a group characterized by the so-called relational social capital, and is considered "an aid in accounting for different outcomes at the level of individual actors" (Coleman 1988: 101). The general notion of social capital is not new to criminology; there is a strong body of evidence demonstrating the role of conventional social capital suppresses offending and protects against victimizations (McCarthy et al. 2002), while criminal social capital facilitates it (Hagan and McCarthy 1997). Among police officers, the police subculture literature suggests that relational social capital among officers can be an important resource for getting police work done as much as it can facilitate misconduct among officers. The concern of the present analysis is to extend the notion of relational social capital to the legitimacy discussion by exploring its influence on officers' understandings of their own legitimacy. As previously argued, following Barbalet (2001), feelings of confidence have their foundation in social relations; thus, we expect officers' self-confidence in their legitimacy to arise from situations of high relational social capital. This is supported by Tankebe's (2007) study in Ghana, which found that officers with strained relationships with their colleagues were those who expressed lesser degrees of self-legitimacy. This is consistent with Muir's (1977) study, which emphasized the role of social capital (the attachment to and views of one's peers) to the cultivation, maintenance, and reproduction of officers' self-legitimacy.

The salience of relational social capital in promoting self-legitimacy would be even stronger in contexts in which there is less regularity in interactions between management or supervisors and frontline officers. One of the remarkable developments in policing over the last several decades is the use of technology. It has allowed police managers and supervisors to communicate to, and to access information (e.g., data on performance targets) from frontline officers without much warrant for recurrent face-to-face interactions. As Cain (1973) found in her detailed ethnographic work in England in the United Kingdom, low visibility and infrequent interactions with senior officers were the seedbed of trust and camaraderie among officers. It is thus the quality of relationships among these officers rather than the quality of interactions with "virtual supervisors" that might prove more crucial in promoting self-legitimacy among police officers.

Effectiveness in Crime Prevention

In the *Leviathan*, Hobbes argued that the raison d'être for the state and its agencies is the procurement of security and safety for citizens. This assertion of the foundational role of effectiveness to legitimacy is widely repeated by political theorists. Rothschild (1977: 488–489) puts it this way: a legal and political order, "though fully legitimate, is subject to erosion and delegitimation over the long run if it becomes chronically incompetent or ineffective" and continues that "no system stands still, forever legitimate, without being effective." Criminologists have, of course, had long-standing recognition of the momentous influence of effectiveness in reducing crime, disorder, and fear on the moral standing of criminal justice agencies. For example, the appearance of effectiveness in crime prevention was a key mode of legitimation for Robert Peel's "New Police" in Britain. More recently, survey-based studies have provided support for the effectiveness–legitimacy nexus, even if the effects of effectiveness are consistently found to be subservient to the role of procedural justice.

However, the focus of those studies has been on public views; it can be suggested that this can be extended to the question of the police's self-legitimacy. It is reasonable to expect that positive assessments of levels of safety and security in their jurisdictions will increase or strengthen self-confidence in legitimacy, but negative assessments will undermine it by engendering disillusionment among officers as they begin to cast doubt on the moral validity of their continuous claims to the exclusive exercise of power. What moral self-justification is left for legal authorities if they appear overwhelmed by insecurity, the prevention of which constitutes the rationale of their authority? In his discussion of vigilantism in Nigeria, Harnischfeger (2003: 25) reports that not only did criminals operate with confidence and impunity but also "in most cases, [the police] would run away whenever and wherever they sighted them." Anecdotal information from southeast Nigeria indicates that some officers even jettisoned the organization to join the vigilante groups that had emerged to fight the upsurge in crime. As Bauman has noted, such instances are expressive of a "tangible weakening, perplexity or sheepishness of power" (cited in Lewis 1984:15) and a diminution of the last strand of self-justification of the rightness of the authority vested in the police. Perceptions that they, or the police organization as a whole, are doing well in promoting neighborhood safety and security may therefore exert a strong influence upon a feeling self-legitimacy.

Police Misconduct

Previous studies have shown that police misconduct, including corruption, can undermine the external legitimacy of both political and legal institutions. It is therefore reasonable to argue that officers' experiences and perceptions of misconduct within the police organization can also be important for the level of confidence they express in their own legitimacy. As Goldstein (1977: 199) argues, "[a]n officer who sees the processing of hundreds of petty offenders through a city's minor courts cannot help but be struck by the futility of the procedure – the lack of justice, the lack of dignity, and the ineffectiveness of the criminal justice process [. . .]." Such cynicism can be detrimental to power-holder legitimacy in much the same way that public experiences and perceptions of corruption under perceived legitimacy of legal and political institutions.

Personal Characteristics

In his study in Ghana, Tankebe (2007) found that the personal characteristics of officers were largely unrelated to self-legitimacy. Only the rank of officers had a significant effect on confidence in self-legitimacy in Ghana; in particular, the results showed that corporals and sergeants expressed greater confidence in their legitimacy than did inspectors. It is important for future studies to examine more fully how self-legitimacy among officers differ by age, gender, rank, length of service, and ethnicity. In the countries such as the United Kingdom and the United States with ethnically diverse personnel, there is urgent need to test potential ethnic differences. This is against the backdrop of evidence suggesting that the experiences of ethnic minority officers within police forces in those countries have often been negative (Bland et al. 1999; Holdaway and Barron 1997).

Consequences of Self-Legitimacy

Why should one take self-legitimacy seriously? What practical implications does it have for everyday police work? Again, on these important questions, we currently have almost no answers. Yet it is possible to speculate on a few potentially important consequences, which might be the subject of future empirical analysis. This section focuses, in particular, upon three consequences: use of deadly force, audience or external legitimacy, and organizational commitment.

First, self-legitimacy can help to explain why some officers are more prone to the use of deadly than others. According to Archer (2003: 139), people with different identities will "evaluate the same situations quite differently and their responses will vary accordingly." If that is correct, it would seem reasonable to expect individual differences in officers' beliefs about their self-legitimacy, as well as the social and institutional context, to influence how they perceive, evaluate, and respond to situations (Bottoms and Tankebe 2012). In Muir's work, he found that unlike the "professional," the "enforcer" was "more aggressive . . . more impatient and unenlightening, unresponsive to the possible changes going on inside the citizen's head and heart" (1977: 145). Similarly, officers with differential self-legitimacy will lead to different uses of power and therefore differential quality of interactions with citizens, including the tendency to use (deadly) force. It has been hypothesized that a lack of confidence in self-legitimacy among officers can translate into indiscreet, impulsive, and unreflective handling of interactions with citizens. Bottoms and Tankebe (2012: 145) have therefore argued that, properly developed, self-legitimacy should result in "a *critical self-awareness* by police officers of the importance of the ways in which they view themselves and use power."

The second possible consequence for self-legitimacy is its implication for the successful cultivation, maintenance, and reproduction of external or audience legitimacy. Unless officers are able to cultivate belief in the moral rightness of their own legitimacy, it might be difficult for them to convince others that they are entitled to the positions they occupy and the accompanying powers. Bottoms and Tankebe (2012) have recently argued that legitimacy is best conceptualized as involving a continuous *dialogue* between power-holders and audiences, with the former (e.g., police officers) making claims, the latter (e.g., citizens) responding, power-holders then perhaps adjusting their claims, and so on. If that is correct, then one might argue that the initiator of the dialogue has to be clear on its necessity, before she can convince others to participate.

Finally, organizational commitment has been defined as "the relative strength of the individual's identification with, and involvement in, a particular organization, [. . .] characterized by three factors: (a) a strong sense of belief in, and acceptance of, the organization's goals and values; (b) a readiness to exert effort on behalf of the organization; (c) a strong desire to remain a member of the organization" (Porter et al. 1974, p. 604). Although there are various studies that examine the correlates of organizational commitment, the role of self-legitimacy has so far not been sufficiently considered. An exception is Tankebe (2010) survey-based study, based on data from Ghana. In that study, the author found that self-legitimacy had an indirect influence upon organizational commitment.

Conclusion

Previous empirical analysis of police legitimacy had approached it from two standpoints. On the one hand, there are studies that focus on the perceptions of citizens regarding the moral rightness of police exercise of power. On the other hand are studies that examine the perceptions of law enforcement personnel on the legitimacy of their organizations. This entry sought to draw attention to a third and complementary standpoint, namely, officers' perceptions of their own individual legitimacy. This dimension of legitimacy has been described as self-legitimacy or power-holder legitimacy. This is in accordance with Holmes' (1993: 39) contention that legitimacy "is not merely about mass/popular attitudes toward a regime and/or system. Nor is it merely concerned with the beliefs of the leaders and/or the staffs. It is about all of these." In focusing on this aspect of legitimacy, the object of this entry has been to extend prior knowledge on the subject.

There have been only a handful of studies that have sought to understand, empirically, the conditions that create and sustain self-legitimacy; others have looked at the consequences of self-legitimacy (Muir 1977; Tankebe 2007, 2010). Although important in seeking to extend the boundaries of legitimacy result, these studies have their own limitations. There is therefore a need for more empirical studies that examine the various hypotheses discussed above. For example, there is the need for longitudinal studies that attempt to measure changes in the levels of self-legitimacy over time and the conditions that might be antecedent to stability and change in levels of self-legitimacy through time. Second, and as noted earlier, there are prior studies on employees' perceptions of organizational legitimacy. These studies have identified procedural justice as consistent primary antecedent of perceived organizational legitimacy. To what extent might self-legitimacy relate to assessments of organizational legitimacy? There are presently no systematic attempts to address this question, but it might be worthy to investigate it because the answer can offer an additional pathway to enhance organizational legitimacy. Thirdly, might levels of self-legitimacy help to shed light on officers' readiness to use force against citizens? To accomplish this will require an obvious need for methodological diversity since survey-based data alone cannot help satisfactorily to investigate these questions. It would be necessary for future tests to use data from systematic social observations (Mastrofski et al 1998) and interviews of the kind Rydberg and Terrill (2010) employed in their investigation of the effects of educational attainment on police behavior.

Police Use of Firearms

Jyoti Belur
University College London, London, UK

Overview

Police forces around the world are mostly routinely armed. Even those countries, such as the UK, New Zealand, and Norway, where police officers are unarmed, exceptions exist in the form of special armed units. Police use of firearms is always under scrutiny, especially in the aftermath of a high-profile incident of shooting where the police are accused of either overusing or abusing their power to legitimately employ deadly force. Nevertheless, there is a growing demand for paramilitarization of the police in a world increasingly perceived as being at risk from terrorism and growing insecurity. Further arming of the police as a result of increasingly risky working conditions, in turn, multiplies risk for police officers themselves, as well as affecting police-public relations adversely. It engenders distrust and suspicion of the police, especially among ethnic and minority communities. The resulting public disorder and antipolice demonstrations increase the gulf between the police and the community it serves and are detrimental to police fulfilling their primary functions.

Explanations for police overuse or misuse of firearms are provided at the individual, organizational, and structural levels in the literature. Accordingly, policy recommendations for eliminating misuse or abuse of firearms are focused on better training, stricter administrative, and legal policies and increasing public awareness. The movement of a civil police force towards becoming increasingly armed and paramilitarized seems inexorable and is irreversible. Following the terrorist attacks of 9/11, even unarmed police in the UK are increasingly moving away from a "restraint paradigm," which focused on minimum use of force, to a "military paradigm," adopting a shoot-to-kill counterterrorism policy. How the changing face of the civil police will affect police-public relations is a matter for police leaders and policy makers to incorporate in their vision for policing in the future.

Police Use of Firearms

Modern policing was introduced in Britain and in the USA based on the premise that in opposition to the military, the police would intentionally be an intensely civil and democratic institution. However, while the police in Britain were routinely unarmed, paradoxically, the gun as the most overt symbol of police power became synonymous with the American style of policing (Waddington 1999). The colonial model, a distinctive militarized form of policing, where the main role of the police was to subjugate the rebellious population by force is the precursor to many of the policing models in ex-colonies (Waddington 1999). Despite the type of policing model envisaged, police work, almost universally, is characterized by features such as danger, authority, and the mandate to use coercive force that is nonnegotiable (Bittner 1975; Skolnick and Fyfe 1993). As the governmental law enforcement agency, the police see themselves as the "thin blue line" that separates anarchy from order (Skolnick 1975), and the use of violence to maintain that order is deemed legitimate and necessary. Deadly force as the most extreme form of police violence has attracted its fair share of attention from criminological scholars and the public alike. Deadly force can be employed either through the use of firearms and other lethal and nonlethal weapons or through the improper use of holds or restraining techniques, but here the focus is limited to the use of firearms.

The police use firearms in the course of their official duty, either in a situation of direct confrontation between the police and alleged criminal(s) or in a riot control or public disorder situation. The circumstantial and situational factors precipitating the use of deadly force in both these scenarios are quite different. Policing civil disorders often engenders fear, anger, frustration and heightened anxiety for police officers who are too close to the actions to be objective; additionally, heightened emotions on the part of the public make the situation more volatile. Therefore, stricter supervision, command, and control of such operations are required (Waddington 1991). Only when the crowd turns uncontrollably violent does the police resort legitimately to the use of deadly force, ideally and theoretically, in a controlled and methodical manner. In contrast, a sudden confrontation between police and "suspects" can be more fluid, with greater discretion on the part of individual officers to use firearms. Though admittedly, some riot situations may flare up, and some confrontations with criminals may be planned operations. However, principles that ought to govern the use of firearms by the police are universal and not contingent upon the situation under which it has to be employed.

Punch (2010) describes four facets of police use of firearms:

1. *Shoot to prevent* – traditional understanding of the use of firearms in the UK and the USA is to prevent or incapacitate and not to kill. Thus, the police are mainly operating under the "restraint paradigm" where the governing principle is "minimum force necessary." However, Waddington (1991) raises concerns about shooting to injure since shots intending to injure are likely to miss as limbs are more difficult to hit than the torso; a wounded person is unlikely to be incapacitated totally or immediately; and as the result of the first two, officers would be inclined to shoot at a much lower level of threat; the result often is an increase in serious injury and death.
2. *Shoot to kill* – informal cop code advises that a firearm should not be deployed unless the intention is to kill. If the intention is stopping and immediate incapacitation – and if in the process the person dies, then the officer must be prepared for that. A failure to totally incapacitate can prove costly to the police or other innocent people.
3. *Shoot to kill as murder* – police use of firearms in some countries and in some circumstances amounts to illegal executions. In some contexts, shoot to kill has come to mean summary executions, such as in Northern Ireland

(Waddington 1991), India (Belur 2010), various countries in Latin America (Chevigny 1995), and the Caribbean (Bowling 2010).

4. *Shoot to eliminate* – where the aim is not only to kill but also to shoot until all possibility of recovery or retaliation is eliminated. This is especially the case during covert counterinsurgency operations and is a clear move from the restraint paradigm to a military paradigm where the civil police operate with the intention of eliminating the target as a matter of policy.

The principle governing any use of force is that it should be necessary and reasonable. The question then arises regarding who determines what is necessary and reasonable and what is the benchmark for judging this. For example, the US Supreme Court ruled in the *Graham v. Connor* (1989) case that the use of force must be "objectively reasonable" and went on to specify that every instance of use of force will be judged to be within the constitutional limits on a case-by-case basis from the perspective of a reasonable officer on the scene rather than retrospectively on hindsight (Klinger and Brunson 2009).

Geller and Scott (1992) examine use of deadly force as a result of police shootings of civilians and shootings of police officers by civilians and other police officers in the USA. They acknowledge problems associated with police shootings, such as whether incidents occurred while an officer was on duty or off duty and whether they were officially or personally motivated. Geller and Scott (1992) suggest that the most common type of police shooting involves an on-duty, uniformed, white, male officer and an unarmed black, male civilian between the ages of 17 and 30 in a public location within a high-crime precinct at night in connection with a suspected armed robbery or a "man with a gun" call.

Researchers have found that in Western democracies race was a crucial element in shooting incidents and that black people were more likely than their white counterparts to be involved in police-related shootings (cf. Belur 2010, Chapter 2). Some research studies found this to be rooted in systematic racism. Others suggest the possibility that blacks and Hispanic minorities were disproportionately involved in violent crimes and therefore were represented in higher numbers in police shootings. They also displayed disproportionately higher unemployment, thus likely to spend their time on the streets, thereby exposing them selectively to confrontation with the police and involvement in shootings All these factors reflect wider structures of racial inequality. Other researchers observed that race was not a controlling factor in a patrol officer's decision to shoot, nor were there significant differences in the race of the victim given similar situational factors. Various findings regarding the connection between police shootings and race are highly contradictory and do not conclusively show any correlation between the two.

Fyfe (1981) describes a continuum from elective (the officer decides whether he wants to shoot or not) to nonelective shootings (where the officer has no choice but to shoot). Research shows that officers' reasons for shooting range from gun use threat to use of threat of other deadly weapons, fight without other resistance, other reasons for intentionally shooting, accidents, mistaken identity, a stray bullet, warning shots, shots to summon assistance, and felonious shootings (Geller and Scott 1992). However, the worst abuses occur when the police, impatient with the workings of the courts, take it upon themselves to dispose of suspects in bogus "shootouts" (Chevigny 1995).

Clearly, gender, race, and age of the police officer and of the "suspect" as well as the situational factors and circumstances that lead up to the incident appear to be important. Also important are structures of race and class inequality and the culture of racial antagonism that flows from this.

Explanations for Police Use of Firearms

The only legally acceptable and morally justifiable reasons for police shootings are self-defense or defense of another person's life. In some countries, it is legally permissible for the police to use firearms while arresting a dangerous and armed suspect who is avoiding arrest. The police in these countries are thus legally entitled to use force in the pursuit or arrest of a dangerous "criminal," but not in the UK or the USA, where the Supreme Court ruled in the *Tennessee v. Garner* (1985) case that the police may not use deadly force in pursuance of a fleeing felon if there is no imminent danger to a person's life.

Three main types of explanation for police violence available are individual and situational, organizational and subcultural, and sociological and structural (Green and Ward 2004). Theoretical explanations for police violence are pitched at different levels and can be classified as micro, meso, and macro theories and are interconnected.

Micro-level theories explain police violence in terms of individual officers' psychological makeup and/ or the situational exigencies in which they have to exercise their judgement. There are two types of individual theories. The "rotten apple theory" states that the attitudes and personal characteristics of some officers make them prone to use more violence than others, and it rests on the assumption that a majority of police officers are not violence prone but work within the limitations of law. The other strand of individual theories, the "fascist pigs theory," suggests that only people with certain dispositions, such as authoritarian personalities, are attracted to police work due to its nature so that a majority of officers are violence prone (Uldricks and van Mastrigt 1991). The individual theory espouses that "violence-prone" or "problem" officers manifest a *propensity* to use force and account for a majority of use of excessive force incidents (Toch 1996).

Meso-level theories explain police violence in terms of the organizational culture that encourages or tolerates such use. In turn, the organization and its culture, rules, procedures, and allegiance to rule of law and accountability affect an individual officer's attitudes and "dispositions" to act in certain ways, varying according to individual officer's personality. Organizational level theories are grounded in the explanation that the police, like other organizations, have their own subculture, which on the one hand can create a "violent" officer and on the other protect the officer's actions from external censure. Key cultural characteristics of police officers have been identified as follows: mission, action, cynicism, suspicion, machismo, isolation, solidarity, loyalty, pragmatism, and conservatism (Reiner 2000). These characteristics are core elements of the central police culture, caused by the structural features of police work such as authority, danger, and pressure for results, which gives rise to a certain "working personality" (Skolnick 1975).

The nature of the organization and the emphasis on factors such as loyalty and secrecy protect officers who are violence prone. "Closing ranks" or erecting a "blue wall of silence" are techniques by which the organization shields its officers from being under scrutiny or being prosecuted or punished by outside investigating agencies. It can also be argued that certain police organizations appear to either have an overt or a tacit policy or have specialist units that support the use of force by police officers in certain situations.

Macro-level theories, essentially sociological and structural explanations, take into account social, political, economic, and cultural factors that create circumstances that allow and legitimize police use of force. Sociological theories aim to develop understanding of the problem of police violence beyond the micro processes of individual action and organizational culture that ask the question: "Why do the police do it?" These theorists aim to answer the question "why are they allowed to do it?" by referring to a broader sociohistorical framework. Police violence tends to increase in proportion to the elite's fear of disorder, and the more fearful the elite, the more likely they are to tolerate illegal violence against potentially dangerous groups. The police use of violence as informal punishment for defying police authority or as "street justice" or vigilante justice has been reported by researchers (Skolnick and Fyfe 1993; Chevigny 1995). This penal character of police shootings is of particular concern especially when it enjoys a degree of popular support in societies where such summary justice is not considered inappropriate (Chevigny 1995; Belur 2010).

Another social trend in some Western democracies has been the growth of paramilitary policing to control social disorder. The demand for and subsequent creation of specialist elite units, whose training and culture emphasizes features of the police culture most conducive to violence: the perception of danger, fear of outsiders, isolation, secrecy, intense group loyalty, and pleasure in "warrior fantasies" (Green and Ward 2004). The increased threat of terrorism globally has meant that this trend has intensified. Historically, it has been demonstrated that measures originally justified on the basis of countering terrorism are quickly absorbed and translated into everyday policing (Green and Ward 2004).

Thus, the reasons an officer shoots or does not shoot result from the interplay of personality traits, proximal and distal situational and structural factors, and within a complex matrix of social forces such as the police department, legal context, and larger social culture (Scharf and Binder 1983).

Policing involves situations where the use of force is legitimate and necessary. However, there are other situations that are perceived as requiring the use of dirty means, including the use of force as a last resort in order to achieve a good end. Another way of approaching the problem of understanding use of force decisions is by viewing it as a "classic police dilemma" – the "Dirty Harry problem" (Klockars 1991). The Dirty Harry problem originates from the film *Dirty Harry* (1971) where Inspector Harry "Dirty Harry" Callahan is placed in a series of situations where he has to make decisions about whether "bad" means can justifiably be used to achieve "good" ends. The troublesome aspect of this problem is not whether a right choice can be made, but that any choice is between two wrongs and in choosing either, the policeman is inevitably tainted or tarnished (Klockars 1991). Thus, by choosing either to act or not act, the police officer is guilty of wrongdoing. The policeman often tries to solve the dilemma by denying the dirtiness of its means, justifying its use for achieving good means. The only way to put an end to the moral problem is by punishing officers who adopt dirty means regardless of the ends they aim to achieve, though this by no means is an easy moral choice either (Klockars 1991).

While police officers in some countries like the UK may be held individually accountable for serious events, even while they were acting under orders of their superior commanders (Punch 2010), officers in Nordic countries are exempt from criminal liability when they use firearms in the exercise of "lawful authority" (Knutsson and Noree 2010). The police are often in effect allowed to get away with blatant abuse of force. Prosecutions of officers may be rare even in cases of excessive use of deadly force in many countries, and convictions rarer still (Uldricks and van Mastrigt 1991; Geller and Scott 1992; Belur 2010). Factors responsible for low rates of culpability for police officers in many instances of excessive use of force are as follows: frustration with the criminal justice system which appears to provide a magical cloak of immunity for police officers; the relatively small number of complaints made against the police; difficulties in substantiating complaints; complete control of investigation by the police themselves; the "code" of silence that ensures officers go to great lengths to protect fellow officers; the greater credibility commonly attached to a police officer's account of events as opposed to that of an accused criminal; and jurors frequently feeling more sympathetic to an officer than the complainant and sometimes even intimidation of witnesses, lawyers, and magistrates. One of the most effective ways in which the aftermath of a controversial police shooting can be managed is a credible independent investigation, whether it is by an internal or external agency (Geller and Scott 1992).

Proper use and supervision of police use of force is essential not only to maintain state order and legitimacy but also as it affects public perception, attitude, and behavior towards the police and the government.

Police Use of Firearms and Police-Public Relations

The traditional policing model based on the restraint paradigm that emphasized containment, minimum casualties, and apprehension of suspects for criminal justice processing rather than summary execution is increasingly being replaced by a militarized version of mainstream policing based on secrecy, overwhelming force, uncompromising tactics, and military solutions post-9/11 (Squires and Kennison 2010). The fatal nature of shootings ensures their prominence in any discussion about police violence. Public discourse on shootings has focused on the strict legality of the shootings, their necessity, their moral and ethical parameters, the training of police in the use of force, and the speculation of racism in a culture of violence (Coady et al. 2000).

Police shootings can be socially divisive, threatening to damage the fabric of trust, legitimacy, and accountability which are the founding principles of civil policing (Squires and Kennison 2010). Many communities have been torn asunder following a perceived abuse of force incident resulting in urban riots and profound political unrest. The police, as custodians of the state's monopoly to legitimately use force, are entitled to use deadly force. However, as the executive arm of the law and government, their actions involving deadly force cause considerable disquiet and are under close scrutiny from the public, the media, politicians, and NGOs as well as the organization itself, at times.

Often scrutiny of police actions results in one or more of the following 5 reactions: public protests, public riots, hearings by government bodies, organizational reform, and civil litigation (Klinger and Brunson 2009). Each of these is potentially problematic for building public confidence and trust in the police. Racial disparity is often the main cause of such discontent, particularly where white officers allegedly target black or minority ethnic men disproportionately, even in the use of deadly force. These racial disparities in shooting statistics might be explained by differential involvement in criminal activity, that is, more black men are likely to commit serious crimes and are therefore more likely to be shot either by white of minority ethnic officers. Locke's (1996) examination of relevant research fails to establish an unequivocal relationship between race and police use of excessive force; however, this does not deny the racially linked outcomes for law enforcement: outcomes such as complaints and civil damage suits, which cause significant problems for police-minority community relations. Minority citizens have especially charged the police with abusing their power in the use of deadly force, an issue which has often polarized "blacks and whites, liberals and conservatives, and police officers and civilians" (Scharf and Binder 1983).

It has been recognized that public attitudes towards the police use of force can be sometimes pretty raw, often ill-informed, occasionally easily influenced, subject to personal biases and prejudices, and more likely to be fueled by sensationalist reporting than by an accurate reflection of the overall picture. Since the media pays too much attention in instances where the police have allegedly used excessive force, these comparatively rare events have nonetheless prompted a perception of police volatility, thus encouraging renewed reform of policies, training, supervision, and accountability structures (Alpert and Dunham 2004). Not all use of force incidents are deemed newsworthy and get more than a passing coverage in the media. Lawrence (2000) proposes that only when journalists find "critical story cues" do they deem a story to be newsworthy. Some of these critical cues are "accounts of family, witnesses and other sources that challenge the police or official version"; coroner's report or when a legal proceeding is initiated against the officers; availability of evidence of wrongdoing; when there is a strong citizen reaction; racial identities of the officer and citizen, especially white on black incidents; when officials make a public pronouncement or initiate special investigation; or when police policies are reformed.

It is unclear whether these critical cues reinforce media interest or whether media interest reinforces critical cues that maintain the newsworthiness of a story. Managing public perception and engaging with the media in productive ways is one of the biggest challenges facing police leaders in the aftermath of a police shooting. If handled poorly at this stage, it can have serious consequences for the organization and police officers involved.

Police-public relations are worst affected not only when the police are ill-trained and ill-disciplined to the extent that they injure or kill the innocent but also when they, due to their incompetence, fail to protect the public from dangerous offenders. So the police are damned if they do [shoot the "wrong" person] and damned if they do not [shoot the "dangerous" offender]. The trick is in the balancing act – shooting those who cannot be dealt with in any other way and protecting life in situations where the use of firearms is uncalled for. The problem is that the decisions regarding who is the right and wrong person are always made on hindsight, which can be problematic.

Public reaction to police use of firearms is ambiguous, depending upon whether the use of force is perceived as being legitimate and justified or not. There have been many early attempts to measure public attitude towards the police, asking questions in public surveys about "satisfaction" with the police or "approval" for local police and even "confidence" in the police. By and large, most of these studies have found that a majority of the public are generally satisfied with the police, but there are differences based on the characteristics of the citizens, the characteristics of the neighborhoods, and the frequency and type of citizen-police contacts (Flanagan and Vaughan 1996).

Since use of deadly force incidents are relatively rare, public attitudes towards them are reflected more in the immediate protests, or public disturbances following such an incident, than in the large-scale public opinion surveys on confidence in the police. Especially since it has long been recognized that public opinion is very sensitive to events and pressures, each survey should be taken to reflect the immediate opinion at that particular point of time. Flanagan and Vaughan (1996) cite the example of public opinion polls taken in various cities in the USA which showed that public opinion regarding police brutality and excessive use of deadly force fluctuated sharply within and between various ethnic communities depending upon whether it followed a much publicized police brutality case or not. They conclude that public opinion definitely acts as a vehicle of social control on abusive police practice and that regardless of whether public perception that the police use excessive force commonly is justified or not, there is a need to educate the public about the realities of police work and concerns about use of deadly force as well as introduce police reforms for the benefit of both.

Controlling Police Use of Firearms

Prescriptive studies on police use of deadly force offer solutions to curb the phenomenon at the individual, organizational, situational, or social level depending upon the particular theoretical approach adopted. Scharf and Binder (1983) suggest that various solutions are guided by different theories of how the interventions will work and are based on certain assumptions about police behavior. For example, those who assume that excessive shooting occurs because officers are poorly or inadequately trained advocate better training to allow officers to use finer discrimination and tactics to avoid using deadly force. Similarly, those who advocate an intensification of shooting review procedures and increased accountability assume that the police use excessive force because of low levels of sanctions in the organization and society. Thus, if scrutiny and punishments are increased, avoidable shootings will be reduced.

Reforms at the level of the individual officer include attitude and psychological tests as part of the recruitment process to ensure only the most "suitable" candidates are chosen to be able to use firearms. Better training and sensitizing programs are also part of the solution to ensure that individual officers are given an opportunity to renew their commitment to the rule of law and human rights (Grant and Grant 1996). However, Worden (1996) found little consistency between both, officers' attitudes and behaviors, and an individual officer's behavior from one incident to another. Thus, solutions that sift out "unsuitable" candidates at the recruitment stage (via psychological tests) and emphasize training and sensitizing officers though useful are not the whole solution to curbing excessive use of force.

Research that locates the source of violent behavior of officers in the police subculture and organizational ethos either put forward solutions that emphasize training and placing administrative controls to ensure no abuse of force is tolerated or suggests that real change can come about only when police culture can be changed to ensure that tolerating or encouraging deviant behavior is prohibited (Reiner 2000). Some studies concluded that introduction of administrative controls via new guidelines and procedures succeeded to a large extent by bringing down use of deadly force in New York, Kansas City, and Atlanta (Fyfe 1978; Sherman 1983). Sherman's (1983) research showed that the reduction in shooting was only in dubious cases, but shots fired in more serious, life-threatening circumstances (what might be termed as "nonelective" shootings in Fyfe's terminology) remained the same. There is, nevertheless, general agreement among policing scholars that cultural change possibilities are very limited without structural change.

Studies that focus on analyzing the situational aspect of the violent police-citizen interaction advocate solutions whereby officers have better control on the nature of the encounter and are able to process information better to enable them to take adequate precautions to ensure that the outcome of a chance encounter is not violent (Scharf and Binder 1983). Fyfe (1986) suggests that in order to reduce unnecessary violence, the police role must be defined as one of a diagnostician, and they must learn that role thoroughly as well as use principles of tactical knowledge and concealment to reduce the likelihood of having to resort to deadly force, before they actually confront someone who may be armed and dangerous. By keeping things simple, involving as few people as possible, and not getting too close, cops can avoid unnecessary shootings.

Tackling the problem of police abuse of deadly force has been attempted by developed countries like the USA, the UK, and Canada as well as developing democracies like Brazil, Argentina, and South Africa. The difference in the approach has been at the various levels at which the problem is perceived and addressed. For example, in the USA, the UK, Canada, and Australia, which have more established democratic traditions, accountability mechanisms exist, but the emphasis is on fine-tuning them or making them more refined to suit the purpose. In developing countries in Latin America or South Africa, the problems are more fundamental, of propagating a culture of democratic accountability to the rule of law and the people, of setting up proper accountability mechanisms in the first place, and also of reforming management and supervision practices to ensure greater independence from political interference and ensure more professionalism. Such reforms would require changes in the wider social context and problems facing the police.

Current Issues and Controversies

There are 4 issues that are currently the subject of research and controversy in the area of police use of firearms:

1. *Establishing a standard of "reasonableness" for use of firearms decisions*: Shooting incidents are considered suspicious either because the police fired too many shots, police accounts conflicted with each other or with the facts, or witness accounts contradicted the official version of events. Furthermore, officer decisions to shoot are generally judged on the basis of hindsight, by people with inadequate technical know-how and often under pressure from public opinion and dissatisfied minority ethnic communities.

   However, research into use of lethal force by police officers has demonstrated that perception, judgement, and reaction times of police officers in stressful situations can be hugely complex (cf. Belur 2010, Chapter 2). Testing officer reaction times under laboratory conditions demonstrated that the more stressful the situation, the slower a person is likely to respond to changes in the situation. Thus, once officers begin shooting under perceived stressful conditions, while doing many other activities simultaneously and sequentially, their reaction time to stop shooting will be longer This might explain the large number of bullets fired in some of these cases.

   Research has indicated that hindsight bias (i.e., perception of an incident is influenced by outcome knowledge) plays an important role in the way an incident is perceived by the actors involved and others observing or commenting on it. In incidents where the "victim" was not found in possession of a weapon, observers perceived less danger to the police officers on the scene, and police use of deadly force tends to be considered less justifiable under those circumstances. Research has also lent support to the contention that stressful situations such as shooting incidents can distort officer's perceptions in different ways, leading to accounts conflicting with each other and with the facts. Additionally, graphic visualization techniques and expert testimony were used to explain consistency between officer's accounts and forensic facts in particularly contentious shooting incidents. More work needs to be done in this area in order to place officer's decisions to shoot in perspective given the stressful nature of the experience and concomitant distortions in perception and decision making this can induce.

2. *Arming the unarmed police*: The British police have traditionally been unarmed, and there continues to be significant support for this position. However, Punch (2010) traces developments in arming the British police from what he calls hazardous amateurism in the early 1950s to the emergence of armed force support units in some police forces in the 1970s, to the growth of armed response vehicles nationally in the late 1980s, towards a more professional deployment of armed units, culminating in the shoot-to-kill counterterrorism policy called Operation Kratos following the London bombings of July 2005. The main reasons why police have become armed is because they have felt unsafe and vulnerable to attack in certain areas so that they have readily available means at hand to deal with armed crime and terrorism and more recently as a public reassurance exercise. The creation of SWAT teams, first by the LAPD, followed by other elite squads of armed and trained officers for special operations has become a trend in various parts of the world, including the UK, showing a move towards the militarized end of the spectrum (Waddington 1999).

   Research in Australia showed that in areas with comparable rates of violent crimes the risk of police officers being killed are significantly higher in areas where the police are armed than in those where the police are unarmed (Hawkins and Ward 1970). Another unintended consequence of paramilitarization of policing is the transfer of police issued weapons into the hands of antisocial elements. The Maoist-inspired insurgents in India have become a formidable guerrilla force to reckon with after they began arming themselves with weapons looted from government armories, state police, and security forces from the 1980s onwards (Ramana 2006).

   Given the "incident-driven" nature of the introduction of greater arming of the British police, there is a danger that a particularly horrific incident can escalate arming of the police, but there are few events that can prompt a compensating de-escalation especially given the rising threat of terrorism (Waddington 1991). The decision of arming an unarmed police force requires careful consideration as this can only be a one-way path – the experience of many countries, for example, postwar Germany and Japan, shows that disarming an armed police force remains no option once the level of societal violence has escalated to accommodate an armed police force (Phelps 2010).

3. *Use of alternative nonlethal force*: Given the pressure of performing under increasingly challenging conditions as well as from the human rights groups regarding the use of firearms, police forces are exploring alternative means of less than lethal force in order to achieve incapacitation of target without loss of life. Innovations in weaponry such as stun guns, incapacitation sprays, disorientation instruments, directed energy devices, and acoustic technologies which are being tried and tested are themselves not totally guaranteed to be nonlethal or free of controversy (Summers and Kuhns 2010). Many impact, chemical or electrical weapons have limitations in terms of accuracy, distance, or effect. They all work if used within the parameters placed upon them by their

manufacturers. However, police work involves fluidly dynamic and totally unexpected situations often precluding the manufacturer's parameters, in which case they are often useless. Less lethal technologies are still in the stage of development and testing. Police officers are often reluctant in placing their trust in such equipment to overcome someone with a gun, though the first steps are being taken. Clearly there is need for further research not only in the area of development of less lethal technology but also in their performance under a wider range of situational and circumstantial factors, as well as their impact on police-public relations more broadly. Policy analysts, police leaders, practitioners, technologists, and theorists need to work together in developing more acceptable and less lethal weapons of force fit for purpose.

4. *Terrorism and public insecurity*: The gap between the police and the military is being significantly jeopardized by terrorism (Waddington 1999). The threat of terrorism and aftermath of 9/11 and subsequent terrorist attacks in London, Madrid, Bali, and Mumbai have led to police forces in many countries adopting a military approach or a widened criminal justice model (Greene and Herzog 2009) towards terrorism by raising specialized units with training, capacity, and equipment to deal with terrorist threats of the most violent kind. The growth of special tactical groups and the resulting paramilitarization that are targeted towards countering possible terrorist activity have increased police violence in Australia (McCulloch 2000). Involvement of the civil police in covert counterterrorist activities might lead to an increase in the distrust and suspicion between the community and the police and drive a wedge in police-public relations. This has been demonstrated in Israel where shift in emphasis from low (community) policing to high (covert, antiterrorist) policing, where among other covert activities, special units have been empowered to shoot a suspected terrorist dead to prevent an attack, has led to a gradual distancing of the civil police from the community it polices (Weisburd et al. 2009).

Conclusions and Future Directions

Police use of firearms has been subject to intense debate, controversy, and scrutiny in many parts of the world. While the police are armed in a majority of countries, there is very little clarity on the subject of when and how they are to wield firearms uncontroversially. The law usually only permits police officers to use firearms to kill in self-defense or to protect someone else's life, or in a few countries while arresting an armed and dangerous offender. A police officer's decision to use firearms in real-life situations is thus based on her/his judgement of the situation and the danger they perceive to their own or someone else's life. However, this decision is subsequently subject to review with the benefit of hindsight, and often the officer's judgement is questioned or found wanting. Police shootings have caused public discontent and anger especially among ethnic minority communities who perceive the disproportionately high number of shooting incidents involving minority ethnic citizens to be racially motivated. Public riots, disorder, and demonstrations against perceived misuse of or excessive use of lethal force put a strain on police-community relations, which in turn has a detrimental impact on the police role of maintaining law and order. We need further research to understand and improve police decision making under stressful situations. This would also be beneficial in-educating the public about the dynamics of the decision-making process and also explain why police actions that appear to be racially prejudiced might not actually be so in some cases.

Various explanations have been put forward to explain police propensity to abuse or use excessive force. These explanations account for police violence at the individual level, at the organizational level, and at the social or structural level. To maintain harmonious police-public relations, police use of force – especially firearms – has to be made transparently accountable and subject to administrative control and review. We need further research to evaluate the effectiveness of these various interventions aimed at different levels and under different circumstances and contexts in order to understand what works best, under which circumstances, and why.

Growing terrorist threats and increasing public insecurity have led the civil police in many countries to adopt a more paramilitary role, with specialized units armed and trained to deal with emerging terrorist threats. The inevitable and inexorable paramilitarization of the civil police under these circumstances has placed additional strain on police-public relations. We need to understand how police counter terrorist responses can be inclusive of community policing rather than alienating the community via “high policing” tactics. A related issue is the demand for arming of unarmed police especially in the UK. The agenda for arming the police, or specialized police units, is driven by a perception of wider social violence in general but more specifically by particular incidents. We need a better understanding of what the outcomes of the incident-driven nature of further arming the police might be with an eye to the possibility of embarking upon an ever spiraling cycle of violence, given the fact that disarming an armed police force is rarely ever an option.

Overview

A growing body of policing research demonstrates that procedurally just approaches to policing – including satisfaction, trust, and confidence – improve citizen perceptions of police, thereby influencing perceptions of police legitimacy and facilitating the capacity of police to maintain order and control crime. This entry draws from a systematic search of police legitimacy and presents a qualitative overview of 104 evaluations of policing interventions that sought to improve police legitimacy. Mazerolle and colleagues (2013) used content analytic methods to synthesize the extant literature, examining studies that used either a process- or instrumental-based approach to enhance perceptions of legitimacy. In this entry, it is shown that some interventions, notably those that are police-only type interventions, seek to influence legitimacy primarily through their efforts to be more effective. In contrast, interventions that involve partnership approaches tend to directly influence perceptions of legitimacy by increasing efforts to enhance positive perceptions of police. Overall, it is shown that different process- and instrumental-type policing strategies seek to improve police legitimacy in a variety of ways.

Fundamentals

An extensive and growing body of international research focuses on police legitimacy: that is, the expectation that the police will be obeyed, over and beyond the threat of punishment or expectation of reward (Tyler 2006). Several theoretical pathways have been proposed for the relationships between police activity and police legitimacy. The process model of police legitimacy holds that when police use the key ingredients of procedural justice – allowing citizens to participate in decision-making, treating people with dignity and respect, maintaining neutrality, and acting with transparent motives – this leads to enhanced citizen perceptions of police, including trust, confidence, and satisfaction with police, and thereby increased levels of police legitimacy

(Hinds and Murphy 2007; Mastrofski et al. 1996; McCluskey 2003; Reiss 1971; Sunshine and Tyler 2003; Tyler and Fagan 2008; Wells 2007). Increased police legitimacy then encourages compliance with both police directives and the law, thus indirectly affecting crime and disorder (Tyler and Fagan 2008; Tyler and Huo 2002). The instrumental model of police legitimacy, in contrast, posits that police effectiveness in controlling crime and disorder is a key antecedent to police legitimacy, and thereby perceptions of effectiveness influence citizen perceptions such as satisfaction with, and trust and confidence in, the police (Sunshine and Tyler 2003).

The causal pathways proposed in these legitimacy models show that police use a number of different intervention strategies – which are either process-focused or outcome-focused – in their efforts to enhance perceptions of legitimacy. One way to situate the variety of police interventions that seek to enhance police legitimacy is to use a typology developed by Weisburd and Eck (2004). These authors describe policing strategies on two dimensions: diversity of approaches and level of focus. They identify four broad categories of police interventions: first, community policing, broadly defined as those interventions that involve police partnerships with the community, employ a highly diverse portfolio of approaches, and are loosely focused around general crime problems; second, problem-oriented policing, broadly defined as those interventions that, again, involve police partnerships but are highly focused on discrete problem people or places; third, hot spot policing, defined as those police interventions that are highly focused on problem people or places but have little diversity and few partnerships with other agencies; and finally, the standard model of policing, defined as police interventions that neither involve diverse partnerships nor a specific focus on problem people or places.

In this entry, the heuristic of the Weisburd and Eck (2004) typology of policing interventions is used to compare and contrast different policing approaches used to enhance citizen perceptions of police legitimacy, drawing from a systematic search of the extant literature that identified 163 studies out of over 20,000 abstracts reviewed that met the review criteria (see Bennett et al. 2009). Content analytic methods were used to group strategies, identifying a subset of 104 studies that included evaluation information that could be used in a narrative review. These interventions are examined, based on their area of focus and diversity of approaches, in order to illustrate the varying impact of process-focused or outcome-focused models of police legitimacy.

Key Issues

Scholarly interest in police–citizen interactions, perceptions of police treatment, and the legitimate authority of the public police is not new (e.g., Bayley and Mendelsohn 1969; Bellman 1935; Decker 1981; Parratt 1938; Reiss 1971). However, it is the contemporary stream of research by Tom Tyler and his colleagues that spearheaded renewed interest in police legitimacy and continues to shape the field today (see Tyler 1990, 2003, 2004, 2006; Tyler and Fagan 2008; Tyler and Huo 2002). This recent body of research finds that citizens are more likely to comply with police directives when they view police as legitimate. Tyler and his colleagues also show that police legitimacy encourages law-abiding behavior not just *during* a police–citizen encounter but also *outside* of encounters (i.e., in everyday life, such as abiding by traffic rules) (Sunshine and Tyler 2003; Tyler and Huo 2002). As Tyler (2004), p. 85 suggests, unless the police are “widely obeyed” by the public, the capacity of police to maintain order is compromised (see also Tyler 1990). Arguably, one of the most important contributions of Tyler’s research over the last 20 years is the deepening of our understanding as to how the efficiency and effectiveness of the order maintenance role of the public police is dependent upon the public’s support for, and perceived legitimacy of, the police.

Legitimacy is defined by Tyler (2006), p. 375 as “a psychological property of an authority, institution, or social arrangement that leads those connected to it to believe that it is appropriate, proper, and just." The key defining feature of a legitimate authority is that people feel obliged to voluntarily comply with the authority's directives as opposed to compliance out of fear of punishment or expectation of reward (Tyler 2006). In policing, legitimacy reflects a "social value orientation toward authority and institutions" (Hinds and Murphy 2007, p. 27), and evidence shows that it is a person's belief in the legitimacy of the authority or institution issuing a command that "leads people to feel that the authority or institution is entitled to be deferred to and obeyed" (Sunshine and Tyler 2003, p. 514).

Procedural justice refers to the use of fair procedures in the decision-making process (Hinds and Murphy 2007; Thibaut and Walker 1975). Scholars across many different contexts and disciplines (e.g., taxation compliance and organizational behavior) have studied the impact of a person's treatment in a range of different decision-making forums. In policing, renewed academic interest in procedural justice emerged during the late 1980s and early 1990s at a time of high-profile incidents of pervasive police corruption and police misconduct (e.g., racial profiling, excessive force) (Reiner 1985) and concerns about police inadequacies in dealing with upsurges in crime (Maher and Dixon 1999; Weisburd and Braga 2006), which led to a general loss of confidence in traditional police responses to crime (Weisburd and Eck 2004). These concerns created fertile ground for the study of police legitimacy and the concomitant study of police–citizen encounters based on fair and respectful processes and procedures. Tyler and colleagues identify four factors that define "procedural justice" in interactions between police and the public: citizen *participation* in the proceedings prior to an authority reaching a decision, perceived *neutrality* of the authority in his/her decision, whether or not the authority showed *dignity and respect* throughout the interaction, and whether or not the authority is perceived to have *trustworthy motives* (Tyler 2004; Tyler and Lind 1992).

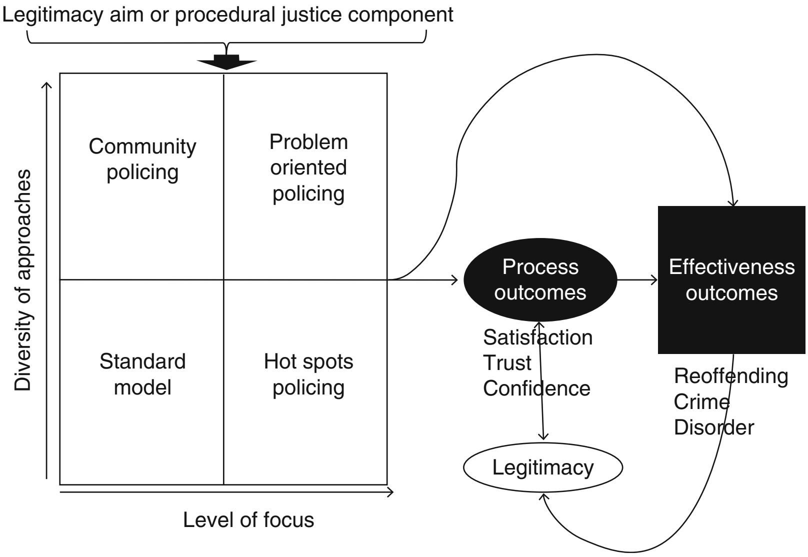
Researchers have sought to differentiate between the effects of police legitimacy on subjective outcomes, such as citizens' perceptions of police, or intent to comply, and objective outcomes, such as actual compliant behaviors or reoffending. The difference between citizens' perceptions and actions is a crucial consideration in the design of police interventions and evaluations of these interventions. While it is neither the purpose of this entry to explore the complex relationship between legitimacy and procedural justice further nor to compare operational definitions and measurement methods, this is a highly important area of research. In this entry, authors' identification of legitimacy and procedural justice is accepted and the distinction between process outcomes (such as citizen satisfaction) and instrumental outcomes (such as reoffending) is used to classify intervention strategies according to their underlying logic.

The Systematic Search Approach

The results of a systematic search conducted on behalf of the UK National Policing Improvement Agency (NPIA) (Bennett et al. 2009) were used to obtain a population of studies evaluating police-led interventions to improve legitimacy. The systematic search covered a range of databases for published journal articles, as well as a search of the gray (unpublished) literature including reports and dissertations. Search keywords focused on police legitimacy, effectiveness, and procedural justice. The systematic search identified over 20,000 abstracts on police legitimacy and related topics. Readers are directed to the NPIA report for a full explanation of the systematic search and document retrieval strategy (see Bennett et al. 2009).

Information on any evaluation of police-led interventions was gathered from the 20,000 plus abstracts. These interventions had to either (1) explicitly aim to increase legitimacy or, (2) in the absence of an explicit legitimacy aim, use at least one of the principles of procedural justice: citizen participation in decision-making, police neutrality, dignity and respect, and transparent motives. Information from descriptive studies was also recorded to gain an

Police-Led Interventions to Enhance Police Legitimacy, Fig. 1 A framework for categorizing legitimacy policing interventions (Source: Weisburd and Eck (2004))



understanding of initiatives that had been tried, even if they had not been evaluated. A pictorial explanation of the organizational framework (presented in Fig. 1) was used to guide coding and synthesis of the extant literature.

The systematic review of the identified abstracts revealed 163 sources that met the above criteria. Text analytics software (Leximancer: Leximancer software examines a body of text and produces a ranked list of concepts on the basis of word frequency and co-occurrence of usage (see https://www.leximancer.com/)) was used to create a map of the key concepts contained within the documents and to rank the most prominent concepts relating to policing within the body of text. The outputs from this analysis were used to compare whether, in the body of literature, the focus on the concept of legitimacy in the text matched the focus on the outcome of legitimacy in the evaluations. The conceptual structure of the 163 sources on police legitimacy interventions is presented in Fig. 2, below. As shown in Fig. 2, the central concept in the corpus of text was legitimacy, as would be expected given the goals of the search. The concept of legitimacy links directly to a large number of concepts, including the concept of police. The map suggests that within the body of studies, the concept of procedural justice is indirectly linked to legitimacy through the concept of policing. The semantic analysis showed that "crime" was the most prominent concept relative to the concepts of "police" and "policing." The second most prominent concept related to policing was the concept of "trust," with "justice" and "procedural" as the third and fourth most prominent terms, respectively. The most prominent compound term in the literature on police was "procedural justice," with a relative frequency of 29 % and strength of 38 %. The content analysis thus demonstrates the centrality of legitimacy as a concept within this particular body of literature.

Systematic Search Findings

Of the 163 selected studies, 104 of the studies reported evaluation findings. All of the interventions included in this subset of studies articulated that the intervention sought to improve police legitimacy. The studies referred to in the following section, and the complete list of 163 studies, can be found in the Campbell Collaboration systematic review on legitimacy in policing (Mazerolle et al. 2013). The subset of studies included in our narrative review is organized using the typology articulated by Weisburd and Eck (2004) as follows.

Police-Led Interventions to Enhance Police Legitimacy, Fig. 2 Concept map for legitimacy policing literature. The larger concepts are more prominent within the text

Community-Based Policing Strategies

Community policing strategies fall into the top left quadrant of the Weisburd and Eck (2004) typology, characterized by a high diversity of approaches but low level of place or person focus (see Fig. 1). The review uncovered a number of legitimacy-enhancing strategies that fell into this category, including community policing, but also included interventions that were not strictly community policing interventions. These approaches tended to focus on the process model of increasing legitimacy directly through procedurally fair operations. Evaluations of these strategies therefore tended to focus on "soft" outcomes such as citizen confidence, satisfaction, and/or trust in police; perceptions of procedural justice; and police legitimacy. The following section discusses each strategy grouping in turn.

Community Policing

Community policing refers to a group of strategies that emphasize high-quality police–citizen interaction, especially in nonemergency situations, where police and community share responsibility for crime prevention and control (Bell 2004). Community policing is hypothesized to provide benefits over traditional policing methods, including increased public trust, satisfaction, and confidence in police; higher reporting of crime; more effective crime prevention; and better police–community relations (Bell 2004).

Community policing has been variously described as a philosophy, a strategy, or a series of tactics. For the purpose of the review, a number of elements commonly found in community policing strategies were drawn out. While most community policing strategies use one or more of these elements, not all elements are required for a strategy to be termed community policing. Skolnick and Bayley (1988) separate community policing elements into four categories. First, community-based *crime prevention* includes initiatives such as neighborhood watch, police safety seminars, and supplying security material to citizens (Bell 2004). Second, an emphasis on *policing nonemergency situations* includes routine motor, foot, or bicycle patrols and door-to-door activities. Third, increasing *police accountability* strategies include the development of specialist liaison officers for communication with minority groups, and programs that allow citizens to observe the police at work. Finally, *decentralizing command* within the police force and giving more power to officers actively policing the community is a key element of community policing. Other authors have identified additional elements, including the long-term assignment of officers to beats (geographic areas), community consultation to define community problems, reducing fear of crime, extended foot patrols, and an emphasis on nonconfrontational officer–citizen interactions (Fielding 2002).

The systematic search located 70 articles and reports on community policing-type strategies that fit within the Weisburd/Eck typology of *diversity of approaches/low level of focus*. The strategies included community policing grants and directives, reassurance policing, beat policing, proximity policing, contact patrols, ombudsman policing, mini-police stations and shopfronts, and neighborhood watch programs.

Overall, community policing was found to have a positive effect on a range of process outcomes, including citizens' confidence in police, satisfaction with police, and perceptions of police effectiveness. Community policing initiatives also affected police officers' views and internal processes such as increased levels of officer monitoring and accountability and holding positive views of mini-police stations. The successful creation of partnerships with community agencies was another benefit identified in the literature.

Not all evaluations were positive, however. For example, one researcher found that the introduction of proximity policing resulted in a decrease in confidence in police, due in part to an increase in administrative tasks to the detriment of time spent on physical patrols.

Evidence was mixed regarding instrumental outcomes for community policing. In terms of positive effects, several studies found a decrease in citizens' perceptions of crime overall, disorder, and fear of crime. Others found decreases in perceptions of particular crimes. For example, some scholars found a decrease in the perceived levels of vandalism and graffiti, home burglaries, and drug dealing. Some social observational studies found a decrease in citizen noncompliance behaviors with police and also that citizen cooperation was higher for encounters with beat police compared to traditional patrols. In a series of evaluations of the Weed and Seed community policing grants, researchers found decreases in citizens' self-reported revictimization in nearly all program sites, a finding paralleled in an evaluation of reassurance policing in English cities. Other measures of community policing effectiveness included citizens taking steps to improve their home security.

Again, however, not all studies found positive instrumental effects for community policing. One study found an increase in perceived crime levels, a decrease in perceptions of police fairness, and a large decrease in perceived safety. Other community policing evaluations found that community policing had no effect on either perceptions of safety or levels of official reported crime. One study found that an increase in official crime reports at sites with police shopfronts was due to the increased willingness of shopkeepers to report crimes, rather than an increase in victimization.

Finally, the experimental literature is sparse and ambiguous regarding the effect of community policing on police legitimacy. Some authors have found no effect of community policing on legitimacy, while others have found a decrease in perceptions of police legitimacy after the implementation of a community policing intervention. Notably, these findings are contrary to nonexperimental survey research on procedural justice and legitimacy such as that of Sunshine and Tyler (2003).

School-Based Interventions

A second category of interventions that fell under the *high diversity of approaches/low level of focus* was school-based policing interventions that seek to reduce delinquency, antisocial behavior, and truancy by increasing police legitimacy through both process and instrumental paths. The review located six such interventions. Two of these described police officers whose activities were based primarily within one or more schools and who formed partnerships with the school community to enhance law enforcement, education, and counseling. Two sources described a program in which police officers visited schools and gave a talk on resisting gangs. One intervention focused on schoolchildren interacting informally with police officers in a nonconfrontational situation to increase children's perceptions of police legitimacy, thereby increasing their willingness to assist police in the short and longer term. Finally, one source described a nonpunitive truant recovery program. Few implementation problems were reported for school-based interventions.

The overall evidence for school-based interventions was mixed. School-based interventions tended to measure success using instrumental outcomes, including willingness to assist police, grades and truancy, and police contacts and arrests. The truant recovery program decreased the number of fail grades, unexcused absences, school sanctions, and disciplinary reports for children in the program. However, school-based interventions had no significant impact on willingness to assist police, police contacts, or arrests. Further, schools assigned a police officer tended to have greater prevalence of truancy than schools without one, although the causal direction of this effect is not explicated in the group of studies collected. The informal contact program found a null effect on students' perceptions of police legitimacy.

Interagency Collaboration

Another group of interventions falling into the *high diversity of approaches/low-focus* quadrant are those focusing on interagency collaboration, where police used formal arrangements with another organization (often a social service) to improve service delivery. These included police collaborating with a community mental health unit, with social workers following up on police domestic violence investigations; a multi-jurisdictional task force established for broad-based service provision; outreach workers working with sex workers at risk of violence; and a localized initiative aimed at reducing the prevalence of street walkers.

While interventions involving collaboration between multiple agencies frequently reported problems in implementation arising from differences between the agencies involved – such as different reporting policies and information retrieval systems – several studies reported improved information sharing and closer relationships between agencies as a result of the intervention.

The studies evaluating interagency collaboration effects on legitimacy tended to focus on instrumental outcomes rather than process outcomes. The intervention aimed at reducing the number of street walkers in an area was seen to be largely successful in achieving its goals, as well as improving police–community relations, and decreasing recorded street crime and fear of crime. Households that received a follow-up call from a social worker after a domestic violence incident were no less likely to experience violence than households that did not receive the call, but they were more likely to report new incidences of violence. The intervention encouraging sex workers to report violent clients achieved an increase in reporting and contributed to the arrest and conviction of two violent clients.

Restorative Justice Conferencing

Given their explicit focus on enhancing legitimacy (Daly et al. 2006) and improving both victims' and offenders' perceptions of procedural justice, restorative justice conferencing programs were included in the systematic review of police legitimacy. According to Marshall (1999), p. 5, “Restorative justice is a process whereby parties with a stake in a specific offence collectively resolve how to deal with the aftermath of the offence and its implications for the future.” When interventions are facilitated by police, improved perceptions of police procedural justice can lead to improved perceptions of police legitimacy.

Most empirical research on restorative justice processes has been conducted on those processes that involve a face-to-face meeting between the offender, victim, and supporters. Although conferences can be mediated by either a police officer (the Wagga model: Moore and O’Connell 1994) or a nonpolice officer trained for the purpose (the New Zealand model: Daly et al. 2006), the systematic review focused on the former, more clearly police-led interventions because the police, as conveners, have direct power to enforce the outcomes of the conference (Moore and O’Connell 1994).

The systematic search located a number of articles reporting on studies of police-run restorative justice conferences, as well as restorative cautioning, and a program that trained police officers in mediation skills and gave them the opportunity to refer parties to a local mediation facility during an incident.

The review found that, overall, police-run conferences had a positive impact on process outcomes for both offenders and victims. The police-led conferencing model has also been observed to prompt a shift from a retributive, adversarial policing culture to one focused on restoration and harm prevention (Moore and O’Connell 1994), although this was not observed in all cases. One study measured the effects of restorative justice interventions on perceptions of police legitimacy and found a substantial effect across participants and crime types.

The effect of restorative justice on instrumental outcomes is less clear. While some scholars have found that conferenced offenders had lower recidivism than court-processed offenders, the difference was not large enough to be significant and varied greatly across different types of offence. Others have similarly found that individuals who were cautioned using restorative justice procedures were less likely to reoffend than individuals cautioned using traditional police methods.

Problem-Oriented Policing

Problem-oriented policing strategies fall into Weisburd and Eck’s (2004) top right quadrant of *high diversity of approaches/high level of focus on a particular problem* (see Fig. 1) and generally fall into the instrumental model of police legitimacy. The systematic search uncovered a diverse range of problem-oriented policing interventions in the context of police legitimacy, including large-scale initiatives focused on violent crime in general, gun violence, youth gun violence, and juvenile curfews. Other interventions included community alarm systems, specialized task forces for drug reduction, concentrated traffic enforcement, crime prevention through environmental design, training for liquor licensees and bar staff to recognize fake identification, grants to enhance gender-based violence prevention efforts, and vehicle safety programs. Several sources described general problem-oriented policing programs, referred to variously as problem-oriented policing, problem-solving policing, and risk-focused policing.

Study authors identified a range of issues with the implementation of problem-oriented policing interventions, including lack of a single responsible managing agency, citizen anxiety about police and social services becoming involved in their personal lives (e.g., community alarm system case), difficulty with sustaining a high level of focus over time, inability of police to fulfill their commitments according to the program, and difficulty enforcing collaboration between police and partner agencies.

The review showed that only a few problem-oriented policing strategies used the process model of legitimacy, as evidenced by a lack of attention to process-related outcomes in the group of interventions. These included community support, citizen perceptions of procedural justice, interagency communication, and job satisfaction.

Instead, problem-oriented policing strategies identified in the review that articulated measures of police legitimacy tended to measure outcomes related to effectiveness. In particular, the studies reported measures that captured the problems the interventions were trying to address. These measures included improving police legitimacy through improving police effectiveness and impact on violent crime, gang crime, homicides, severe road accidents, speed-related accidents, traffic violations, street crime, burglary, arrests of juveniles, self-reported delinquency, reoffending, calls for service, and citizen perceptions of safety.

Hot Spot Policing

Hot spot policing strategies fall into the *high focus/low diversity of approaches* typology. This type of strategy is generally implemented by police alone in a small geographic area, with the aim of reducing crime and improving police legitimacy through improved effectiveness. The search located only two evaluations of interventions that could be described as hot spot policing aimed at enhancing legitimacy. Both interventions implemented increased enforcement rates and penalties for disorder crimes in a small geographic area. One evaluator commented that the program, while successful in reducing crime, had created a large number of fugitives from the justice system. The other evaluation found that enforcing disorder crimes had no effect on levels of more serious crime (aggravated burglary and robbery) in the target area.

Clearly, a much larger literature exists on the effectiveness of hot spot policing interventions. However, the sufficiently different language and terminology used in the literature around legitimacy policing and the literature around hot spot policing led to the exclusion of most of these types of interventions from the review. Moreover, either the researchers or police have not viewed hot spot policing as the type of intervention that could enhance police legitimacy. This does not mean that hot spot policing *cannot be used* to enhance perceptions of legitimacy. Rather, the studies are silent on how hot spot policing could be used to enhance legitimacy.

Standard Model of Policing

The standard model of policing includes interventions that are *low in diversity of approaches/ low in focus*. Several such strategies were found that authors linked to police legitimacy. Standard model policing interventions tended to focus broadly on instrumental outcomes and police effectiveness, although this varied among interventions.

Specialized Teams

Several studies described police units that had created specialized teams of officers focused on a particular type of crime, including child protection, domestic and family violence, mental health, drug crime, homicide and violent crime, gang crime, disorder crimes, and automatic number plate recognition intercept teams for traffic violations.

Evaluations of specialized teams often commented on the importance of the commitment of individual officers, especially the commitment of senior officers in their support of the specialized team in accessing information and resources. Interventions in which the team consisted of members from multiple agencies sometimes encountered problems in communication. This was largely due to differences in management structures and decision-making styles between police departments and other agencies, leading to a low level of honesty and trust in working relationships within the teams. Other evaluators commented that the goals of national-level programs did not always match the goals of individuals implementing the intervention in the field. One study found that reassigning officers into structured and response teams was confusing for the officers involved due to a lack of clearly stated objectives for the two groups. Another study found that a particular issue for specialized units was the potential for the unit members to legitimize their role by creating and reinforcing myths concerning the problem they were established to address.

Specialized team interventions generally focused on increasing legitimacy through improving instrumental outcomes, although some interventions did report process outcomes. Several evaluations found that specialized teams were positively received by community members, clients, and community leaders. One study found that it increased positive attitudes of police officers toward their jobs.

Evaluations of specialized teams also tended to emphasize instrumental outcomes, with mixed results. For example, a proactive multiagency mental health unit had a substantial impact on the number of arrests and involuntary hospitalizations made in mental health-related calls for service. In geographic areas assigned a specialized homicide and violent crime task force, rates of violent crime and homicide decreased, although the design of the evaluation prevented authors from attributing this effect directly to the intervention. Domestic violence suspects visited by a specialized domestic violence unit had a lower prevalence of reoffending than suspects visited by regular patrol officers, although frequency and severity of reoffending were not affected for suspects who did reoffend. Less positively, one evaluation found a higher rate of reoffending in suspects visited by a special family violence response team, compared to controls. Another evaluation of a crisis intervention team for domestic violence found that the crisis team generated more arrests than regular officers in domestic violence cases but that victim cooperation was lower in cases visited by the specialized team than in other cases.

Targeted Enforcement

Targeted enforcement covers a range of strategies aimed at reducing a particular problem by increasing detection of the problem and enforcement of penalties. Targeted enforcement falls under the standard model of policing and can be separated from problem-oriented policing because of its low diversity of approaches and sole implementation by police agencies, with no collaboration between police and citizens or other agencies. Enforcement strategies tended to target particular crimes such as sales of alcohol and tobacco to minors. One targeted enforcement strategy used enhanced forensic science techniques in investigations.

The systematic search found few evaluations of this type of intervention that articulated to the legitimacy theme. As such, little information was gathered on the process of implementing these interventions. The standard policing interventions generally focused on instrumental outcomes, to the exclusion of process-type outcomes. The evidence for the effectiveness of these strategies was not very positive. For example, in one case in which enhanced forensic science techniques were implemented as a strategy, the researchers found that rates of case closure were no higher than in other cases, and the special forensic science technology was very expensive to use. A strategy targeting tobacco sales to minors found that although targeted communities improved their compliance with tobacco sales laws faster than control communities, adolescents' self-reported access to, and use of, tobacco was not affected. Another intervention involving undercover police checks of licensed premises failed to produce any significant deterrent effect on future sales of alcohol to minors.

Officer Training

One of the primary sources for improved police legitimacy is citizens' day-to-day interactions with the police, independent of any large-scale initiative. Police can implement training interventions to increase the likelihood of a positive outcome in officers' encounters with members of the public. Although evaluations of this type of intervention are rare, Hails and Borum (2003) suggest that internal training to improve legitimacy is carried out by many police forces. Legitimacy training initiatives are distinct from other types of police training focusing on combat or responding to hostile situations. The search discovered several different citizen-focused police training initiatives, including community policing training, diversity training, leadership training, life skills training, crisis intervention training, and victim-focused training.

The overuse of force and arrest against particular sections of society by police (e.g., ethnic minority groups), and the overrepresentation of these populations within the prison population compared to society in general, represents a key weakness of the criminal justice system and a significant challenge to its legitimacy in many countries. Legitimacy training may thus include specific training to help officers respond to the needs of populations they are not familiar with, for example, victims of domestic violence or people with a physical or mental disability. It is hypothesized that specialized training for particular population interactions enables police officers to respond to the needs of these populations in crisis situations, thereby reducing the officers' need to resort to arrest or force (Hails and Borum 2003).

Implementation issues identified in police training generally focused on the occasional discrepancies between officers' training and expectations of their performance in the field. For example, a community policing training program evaluation found that although the training was successful in teaching officers about community policing, their ability to implement their training in practice was constrained because of performance indicators that focused on instrumental outcomes, such as arrests and tickets, rather than the process-type outcomes promoted in community policing.

Police training interventions tended to focus on the process model of legitimacy and generally reported positive results for process-type outcomes, particularly those relating to police perceptions. Officers trained in crisis intervention tended to give themselves more positive ratings for handling cases than did officers who did not receive the training. Similarly, command staff who participated in diversity training reported an increased ability to communicate effectively; police who received victim-focused training reported more favorable attitudes and behavioral intentions toward victims than did untrained officers; and officers who underwent training in life skills reported increases in self-confidence and lower dogmatism compared to untrained officers. An exception to the generally positive results was a study evaluating police leadership training which found no effect of the training on police leadership styles.

Officer training programs had mixed impacts on process outcomes regarding citizen perceptions of police. Clients of the crisis intervention training program were happier with the service provided by trained officers than that of untrained officers, but an evaluation of victim-focused training found no effect on victim perceptions of police or fear of crime. Instrumental outcomes were not generally measured by police training interventions. The crisis intervention training program produced a null effect on the rate of return calls to the same address.

Discussion and Conclusion

Police legitimacy is important to maintaining order and ensuring compliance with laws and police requests. If people feel the police have legitimacy, they will voluntarily obey police, freeing police resources from enforcing compliance based on fear of punishment or anticipation of reward. While there are multiple pathways to improving police legitimacy, including improving police performance and enhancing the nature of police–citizen encounters, the focus of this review was on strategies that sought to improve police legitimacy either (1) explicitly (as identified by the authors of papers and reports on the intervention) or (2) implicitly through the use of procedural justice elements in policing.

The systematic review found 163 studies that evaluated policing interventions articulated as approaches seeking to enhance perceptions of police legitimacy, of which 104 studies with sufficient data are used in this essay to show the breadth of research in this area. For the population of 163 studies, text analysis shows that the term "legitimacy" is indeed a key concept within the policing literature. A map of the conceptual structure of the body of police legitimacy evaluation literature revealed that legitimacy was the central underlying concept, with strong links to the concepts of policing and procedural justice.

However, while legitimacy was central in the text analysis, it was clearly not an outcome routinely measured or considered to be of primary importance by study authors. Interventions tended to measure effectiveness using process-type outcomes, such as citizens' perceptions of the fairness of police decisions, or instrumental outcomes, such as citizens' perceptions of police effectiveness, but rarely did they measure the apparently central concept of legitimacy. Thus, this review concludes that the enthusiasm for police legitimacy as a construct in the theoretical and survey literature is not matched in the evaluation literature.

The preponderance of these 163 legitimacy-enhancing police interventions was in the two quadrants that Weisburd and Eck (2004) identify as *diversity of approaches*, including community- and problem-oriented policing approaches. Community policing types of interventions that sought to enhance legitimacy tended to use the process model of legitimacy, in which citizens' perceptions of police legitimacy are influenced by their perceptions of the process of policing, rather than police effectiveness. In contrast, problem-oriented policing types of interventions tended to use an instrumental approach to legitimacy, in which increased police effectiveness leads to increased legitimacy.

This overview suggests that while many policing interventions, including community policing, problem-oriented policing, hot spot policing, and standard model policing, may be useful for improving police legitimacy, these approaches are rarely explicitly articulated as legitimacy-enhancing interventions. In theory, previously evaluated interventions may have influenced legitimacy in multiple ways, through improving citizens' perceptions of police processes or through improving police effectiveness. However, in practice very few evaluations measure legitimacy as an outcome. It is suggested, therefore, that evaluators need to carefully focus on measuring a wider range of outcomes in addition to the more commonly reported process and instrumental outcomes.

Policing in Britain c.1750–1829

David G. Barrie
Discipline Group of History, The University of Western Australia, Crawley, WA, Australia

Overview

The last few decades have seen a dramatic change in the manner in which police history in Britain has been analyzed and interpreted and in the level of interest it has provoked. Once the almost exclusive preserve of former officers and civil servants, the development of the so-called "new" police in the nineteenth century has increasingly drawn the attention of professional scholars from the fields of history, sociology, criminology, and legal studies. In so far as the police serve as a mechanism for enforcing the law and utilizing state force, the emergence of the "policeman state" must be regarded as one of the most profound institutional developments in recent history (Gatrell 1992). The introduction of modern policing was crucial not just to the evolution of modern criminal justice systems but also for developing an understanding of the construction, distribution, and operation of power – social, racial, and gender – in government and society (Reiner 2000; Westmarland 2002). As this entry shows, the fundamentals of modern policing had been established in Britain long before central government introduced the 1829 Metropolitan Police Act – once widely regarded as representing the birth of modern policing (Critchley 1967).

Key Issues in Police Historiography

In older, institutional police histories, the 1829 Metropolitan Police Act – which established a full-time, uniformed police force to prevent crime in the metropolis of London – was a watershed in law enforcement (Ascoli 1979). Introduced in response to an unprecedented rise in crime, the inefficiency, inadequacy, and corruption of existing law enforcement arrangements and the pioneering influence of police reformers, the "new" police that took to the streets were a marked improvement on their predecessors and quickly became an example for provincial centers, counties, and other countries to follow. What distinguished the new police from their predecessors, according to this view of police history, was the high standards of professionalism and efficiency to which they were subject: Metropolitan police officers were carefully selected, full-time, salaried, organized, and disciplined, while law enforcement arrangements were rationalized and coordinated. Officers were the embodiment of a "new science of policing," charged with preventing crime through their uniformed presence and a beat patrol system of policing rather than merely responding to it. In such histories, police reform is viewed in a favorable, inherently progressive light – as an unproblematic, linear development beginning with the earliest police reformers, like Henry Fielding and Patrick Colquhoun, and culminating with the architect of the Metropolitan Police Act, Sir Robert Peel.

In the 1960s and 1970s, this conservative, consensual model of police history was challenged by a revisionist interpretation (Silver 1967; Storch 1975). Far from being a marked improvement on their predecessors, the "new" police were shown to have suffered from the same problems and weaknesses as the "old" police, as chief constables struggled to instill discipline and professionalism in a profession undermined by high turnover rates and low pay (Taylor 1997). What was "new" about the new police introduced in London in 1829 and then in provincial towns and counties over the next two decades was not the police's enhanced efficiency, discipline, and professionalism but rather their role and function in society (Hay and Snyder 1989). The new police represented a new, bureaucratized form of social management designed to penetrate civil society with the values of the state through continuous surveillance of working-class society. Influenced by Marxist thought, this view argued that the new police were introduced to meet the needs of a class-based capitalist society and to respond to threats of political unrest and industrial militancy. They were the product not of growing criminality but rather of class antagonisms, changing middle-class perceptions of the sprawling masses, greater demands for urban order, and the erosion of traditional forms of social control that accompanied the transition to urban, industrial society. Fighting crime, in other words, was less important to police reformers than keeping the lower orders disciplined and under close surveillance, and ultimately safeguarding private property, the status quo, and the interests of one section of society over the other.

In recent years, a plethora of studies has nuanced and challenged both of these "problem-response" interpretations of police history. Scholars have questioned whether the police were introduced on a scale capable of disciplining and controlling the working classes, the degree of consensus that existed among men of property as to the merits of reform, and just how far the "new" police were introduced in response to the failures of the old system. Indeed, much scholarship has pointed to the degree of innovation in law enforcement *prior* to the so-called birth of modern policing in London in 1829. Far from heralding a new style of policing, 1829 was, in many ways, the culmination of a long period of reform from at least the mid-eighteenth century in London and provincial English centers. Moreover, the major cities and towns of Ireland and Scotland have been shown to have been at the forefront of innovation, introducing police acts some time before their larger and more widely acclaimed neighbor (Palmer 1988; Barrie 2008). Predating, in many cases, the full-scale introduction of capitalist working practices and industrialization, advances in law enforcement before

1829 point to the need to appreciate more fully broader social, demographic, intellectual, gender, and civic influences behind the birth of modern policing than the pioneering traditional/consensual and revisionist/conflict models – for all their merits – have hitherto done. Recent studies have also situated reform within wider changes to criminal justice systems, addressed the impact of Enlightenment thought, and emphasized the multi-faced nature of police work and the differing police typologies under which police officers function (See, for instance, Emsley 2007).

Fundamentals of Premodern Law Enforcement

There was no single model of law enforcement in mid-eighteenth-century Britain. There were variations between and within national borders, which were determined by long-standing national and local charters and customs, demography, and urban–rural practices. Differing legal systems also affected how the law was enforced. Scotland, for instance, had a public prosecutor who would carry out preliminary investigations of reported crimes to establish whether a case was worth prosecuting; in England and Wales, the overwhelming majority of prosecutions were brought by victims themselves. There were also, however, a number of similarities in the different parts of the British Isles. In most small parishes, amateur parish constables carried out policing responsibilities under the authority of local justices and magistrates. Drawn predominantly from men of the middling ranks, and elected by local boards and trustees, parish constables were expected to serve for 1 year and would often carry out their duties on a part-time basis in conjunction with other employment. They received no formal training or, in most parishes, annual salary, although many constables were able to make a decent living by collecting rewards and expenses. Those who refused to serve as constables were expected to pay for a substitute or face formal prosecution. Constables tended to be reactive rather than proactive. They would not patrol or seek to prevent crime by their visible presence and would only carry out extensive criminal investigations if the victim was willing, and had the financial means, to pay for it. In most cases, victims would have to take the time and trouble to investigate crime and identify offenders themselves before constables would get involved.

In urban centers, the office of constable was sometimes supplemented by watch forces that would patrol the streets at night. In certain parts of the country, local male householders would, like the office constable, perform this task on an unpaid basis as part of their civic duty to the local community. The system, though, was inconsistently and unevenly applied, with local justices invoking ancient statutes that governed “watching and warding” during periods of heightened tension with law and order. In the large centers, local authorities, or men of property, sought to put arrangements on a more permanent footing by employing paid watch forces. The various parishes and districts of London in the late eighteenth century employed several thousand watchmen between them (Paley 1989; Reynolds 1998), Dublin several hundred (Palmer 1988), and Edinburgh relied upon an Old Town Guard to police the dimly lit nighttime streets of Scotland’s capital. The role of such forces, though, was fairly limited: they would protect property, assist magistrates and constables in the exercise of their duties, and apprehend suspicious persons or those committing public order offenses, but they did not investigate and detect crime.

Influenced by the eighteenth- and early nineteenth-century criticisms of police reformers, older police histories perceived such arrangements as being inefficient, inadequate, wretched, and, in some cases, corrupt. It is certainly the case that many watch forces were staffed by old, sometime infirm, ex-soldiers and struggled to attract good recruits because of low pay. It is also the case that some constables, such as the notorious Jonathan Wild in London, were involved in criminal activities. Moreover, as constables and watchmen lived in the communities they served, there was often a reluctance to enforce unpopular legislation or laws that would provoke the wrath of the general populace. Whether or not a crime was investigated, or indeed taken seriously, by local law enforcement officials was often dependent upon the character, social background, and gender of the victim; the nature of the alleged offense; and, above all, the capacity of the victim to fund a criminal investigation and prosecution.

For the most part, though, mid-eighteenth-century policing arrangements functioned adequately. Far from being unreliable and of suspect character, research has shown that the majority of constables were sober, conscientious, and civic-minded individuals who took their responsibilities seriously (Morgan and Rushton 1998). Although in principle an amateur system of law enforcement, arrangements were not necessarily unprofessional in their workings. In some parishes, the position of constable appears to have become almost semipermanent and salaried. Constables were often retained in office after their annual service was up, thereby increasing their experience and expertise. As John Beattie's work on the policing of the City of London, 1660–1750, has shown, the authorities pioneered a number of policing initiatives in an effort to turn this area of historic civic importance into a prosperous symbol of security in an expanding commercial world (Beattie 2001). A perceived rise in property crime, sensationalized in a burgeoning print culture, combined with a desire better to control and regulate the "night" heralded significant reforms to the quality of London's watch system. Moreover, in the overwhelming majority of Scottish towns, local elites had such confidence in existing policing arrangements that they excluded watching and constabulary provisions from local police and improvement legislation for the bulk of the eighteenth century.

To the pioneering scholars of police history, writing over 200 years later, such arrangements appeared backward and inefficient when compared to modern policing practice, but they were perfectly suited to meet the needs of the time, the existing social and religious power structures, and the ethos of criminal justice systems. This was a system of law enforcement that was valued by local justices because it was cheap to administer and it conveyed upon all the legal participants a degree of discretion and influence. While a number of histories have shown that all sections of society made use of local courts (King 2000; Gray 2009), it was also common for disputes to be resolved informally or through extra-judicial means. Indeed, recourse to the law was often the last resort – and an unaffordable and burdensome one at that. This was especially the case in Scotland where local criminal courts in many parts of the country would sit infrequently and at irregular intervals (Barrie and Broomhall 2012a). Indeed, Scots were more likely to be brought before a Church Court – where the local Kirk Session would be actively involved in regulating the behavior and morality of parishioners – than a criminal court in the eighteenth century.

Judicial discretion and exemplary punishment, rather than certainty of prosecution, were the hallmarks of the unreformed eighteenth-century criminal justice systems in both Scotland and England. In pre-Enlightenment Britain, punishing a small number of offenders in a severe, exemplary manner was, it was believed, the best safeguard against future criminality. This, along with a long-standing unwillingness to pay for full-time police forces that might threaten individual liberty, and the status, power, and authority of local elites (Philips 1980), underpinned the workings of eighteenth-century law enforcement. Men of property would respond to periods of disorder and rioting through paternalism or by recourse to military or auxiliary forces, or to periods of heightened concern with crime by voluntarily subscribing to watch forces or associations for the prosecution of felons. But, for day-to-day law enforcement, the mid-eighteenth-century system of parish constables delivered what it was expected to – it responded to reports of crime and brought suspects before local justices, rather than seeking to prevent, investigate, and, in most cases, prosecute crime.

This was a system of policing, though, that was suited to the modest expectation of law enforcement at that time and to small, sparsely populated preindustrial parishes. It was not a system that was able to meet the changing needs of a rapidly urbanizing, commercial society, the challenges brought about by large-scale political protest and unrest, and a growing desire among the middle ranks for better protection of private property and uniformity in practice and performance. As the subsequent section examines, these social, economic, intellectual, and political drivers would stimulate a wide array of local policing innovations and experiments throughout Britain, which would ultimately lay the foundations for greater central government direction from London in the nineteenth century.

Key Issues: Policing Innovations and the Drivers Behind Reform, c.1750 to 1829

Given its size and importance as Britain's leading center of commerce and governance, it should come as no surprise that London pioneered innovations in law enforcement on a more regular basis from the mid-eighteenth century onward. John Beattie's recent work on the Bow Street Runners has shown that the system of criminal investigation established in 1750 by the Middlesex magistrate Henry Fielding, and later by his half-brother John Fielding, developed the Bow Street Magistrates' Office into a leading center for policing and prosecution in the metropolis (Beattie 2012). The officers appointed, under the control of Bow Street magistrates, were detectives in all but name, highly skilled in investigating crime, in hunting down and arresting offenders, and in securing convictions in London's main criminal court, the Old Bailey. Introduced in response to ongoing concerns about property crime, the work of the Fieldings, and the officers they (employed) was important to the way that policing in London developed over subsequent decades. It helped to spread the idea that crime could be reduced through efficient and quick detection, and in doing so, it offered an alternative vision of how to control crime other than through exemplary punishment (Rawlings 2002, p. 96).

In provincial areas, criminal detection in the second half of the eighteenth century was facilitated by the growing use of thief takers, who would pursue suspected offenders for financial reward (for more on the issues discussed in this paragraph, see the collection of essays in Hay and Snyder 1989). Also important was the rise in print advertising offering rewards for information on crime, which was greatly facilitated by the expansion of the provincial press, and the spread of associations for the prosecution of felons, which raised funds through subscriptions to defray the costs of investigating and prosecuting crime. These initiatives, which often developed in response to perceived rises in criminal activity, were symbolic of the fact that among the rising middle ranks there was a growing intolerance of property crime and a growing willingness to seek legal redress rather than settle matters informally. The reimbursement of expenses for successful prosecutions in England in the mid-eighteenth century provided a further stimulus to legal action, while the courts' declining use of capital punishment relative to the number of capital convictions in the second half of the eighteenth century – and the emergence of new forms of punishment such as transportation – encouraged more victims to seek legal redress safe in the knowledge that they would not have to carry the burden of having someone executed for a relatively minor crime.

These developments were carried out against an intellectual backdrop that was slowly beginning to question not only traditional forms of policing and law enforcement but also the ethos and purpose of the criminal justice system itself and how its institutional structures should function. Arguably, the most famous treatise of the time, the Italian philosopher Beccaria's essay *On Crimes and Punishment* (1767), argued that certainty rather than severity of punishment was a more effective deterrent to crime (Draper 2000). Beccaria's theories were quickly incorporated into English penal theory debate and utilitarian thinking and permeated to some degree middle-class discourse on the hallmarks of civilized society. Although by no means universally accepted, his ideas, and the way in which they were picked up and developed by police and penal reformers in England, helped to stimulate debate and lay the intellectual foundations for new thinking on crime control. Ideas about the merits of preventative policing and controlling crime through patrol and surveillance started to become more popular in London in the 1780s (Beattie 2012). This new wave of thinking was perhaps best exemplified by Patrick Colquhoun's *Treatise on the Police of the Metropolis* (1796), which went through seven editions by 1806 and stimulated discussion on policing in the capital. In it, Colquhoun advocated a "new science" of policing, shifting emphasis away from apprehending and severely punishing criminals once a felony had been committed to preventing it from happening in the first place. He called for the creation of a centralized police force in London to prevent and detect crime, as well as the establishment of a public prosecutor in order to relieve victims of the trouble and expense of prosecuting criminals. Ward constables were to maintain a "general superintendence" of their districts, and there was to be a separation between police and judicial powers. Crime, he argued, was a product of indigence, ignorance, and immorality and needed to be tackled through the poor law and education, as well as police reform.

However, Colquhoun's plan was never fully implemented due in no small part to local opposition to his centralized model and the threat it would pose to the power and status of vested propertied interests and because (as is revealed below) the existing system was working much better than Colquhoun claimed (Gray 2009). Nonetheless, his influence was much more important than recent historians have acknowledged. *Treatise on the Police* was widely and enthusiastically acclaimed in the press and Parliament, had a significant impact upon middle-class thinking, and put the issue of police reform on the political agenda. Not long after it was published, Colquhoun was invited by local businessmen to establish the privately funded Thames River Police to prevent dockland crime – a topic close to Colquhoun's heart from his time in Glasgow, where he established the world's first Chamber of Commerce in 1783. The Thames scheme was established in response to a perceived rise in dockland crime, but its creation was also indicative of the crucial role of the redefinition of crime and the reformulation of employer-employee relations played in shaping police reform. The Thames police officers were largely engaged in clamping down on the customary practice of taking perquisites from workplaces as a supplement to their wages – a practice that was being challenged in business circles and by business leaders seduced by the free-market notions of Enlightenment thinkers, not least another influential Scot, Adam Smith, in his famous *Wealth of Nations* (1776). The "new science of policing" that was slowly evolving was not just about crime and its control; it was about responding to wider structural changes in the economy and society and to the interests of the propertied.

This was a period of significant innovation in policing in the metropolis. In the early 1790s, seven police officers under the control of stipendiary magistrates were established in Middlesex, which was an important milestone for expanding the capacity of summary justice to deal with more offenders and forged an important link between the police, reported offenses, and the criminal courts (Paley 1989). According to Gray, city officials, and not just the Bow Street Runners, became more proactively engaged in investigating and detecting crime in this period (Gray 2009). Moreover, night watch forces – both in London and the larger provincial towns of England – were professionalized over the course of the late eighteenth and early nineteenth centuries in response to mounting fears of property crime and disorder, especially during the periods of economic downturn that followed the end of the American Revolutionary (1775–1783) and the Napoleonic (1793–1815) Wars when concerns with law and order intensified. Far from being an inadequate, wretched mess as police reformers argued, many of these forces not only performed preventative police functions through beat patrolling – the hallmark of Peel's so-called new police – they also introduced a tiered command structure and put in place a plan for the "new" model which would be initiated in 1829. Indeed, according to Reynolds, Sir Robert Peel's 1829 Metropolitan Police Act centralized policing arrangements in the capital rather than created them (Reynolds 1998). Modern policing in the capital therefore evolved out of the old watch system through the efforts of local officials rather than politicians in central government. Moreover, as Palmer has pointed out, Peel's blueprint for the Metropolitan Police drew heavily on his years serving as secretary of state for Ireland, where full-time, professional, armed policed forces were introduced in Dublin in 1786 and in provincial Ireland in 1787 in response to concerns with Irish nationalism (Palmer 1988).

Urban and commercial expansion, allied with an increasingly free-market economy, not only loosened the social and paternal bonds that had provided an important safety valve and form of control in many parts of preindustrial English society, it also provided an environment in which more crime, immorality, and drunken disorder could flourish. However, whether crime was actually on the increase in the late eighteenth and early nineteenth centuries is debatable. There was certainly a disproportionate rise in recorded indictable property crime relative to population growth in this period, but this is likely to have reflected to some degree the growing willingness of victims to prosecute due to legal and administrative reforms, changing expectations of law enforcement and a hardening attitude among the emerging middle ranks toward property offenses (Gatrell 1992). Moreover, the expansion of middle-class newspaper readership and the annual publication of criminal statistics from the early 1800s fuelled middle-rank concerns about crime and its control (Lemmings and Walker 2010). They made crime appear more visible and helped to strengthen not just the resolve of police reformers to implement change but also the case for it – something that was ruthlessly exploited by Peel in London and provincial police reformers throughout England. As Emsley has pointed out, it was the perception that crime was on the increase that was important, not whether it actually was or not (Emsley 1996). At the same time, social and cultural habits were changing in the late eighteenth and early nineteenth centuries. Towns, especially those in the first phase of industrial expansion, were becoming larger, more rowdy, and more difficult to control at a time when the rising middle classes were demanding higher levels of urban order and discipline from the expanding urban masses. It was a demand for order in civil society that would result in watch and police forces being introduced and professionalized across in the great municipal towns of England and time-honored, popular working-class pastimes criminalized as a desire to control public space and the built environment became a preoccupation for men of property.

Scotland, with own distinct legal system and legislative tradition, was also at the forefront of policing innovations. In the 1780s, the rapidly expanding mercantile and manufacturing center of Glasgow was home to Patrick Colquhoun, who served as Lord Provost of Glasgow between 1782 and 1783 and as a Lanarkshire Justice of the Peace for much of the 1780s. Protecting private property and controlling urban rioting were a major concern for Colquhoun and his civic counterparts, and a number of policing proposals were put forward and experiments implemented to effect these aims. In 1788, magistrates appointed an "intendent of police," a police clerk, and a number of "police officers" "in order to detect and prevent crimes" and divided the city of Glasgow into nine districts, each with "ward superintendents" – a concept that would resurface in Colquhoun's *Treatise*. The initiative was innovative and forward thinking in seeking to prevent crime by establishing a degree of community supervision over local residents and was indicative, in many ways, of Colquhoun's notion (espoused in his famous *Treatise*) of establishing a "general superintendence" of local districts. Its underlying premise was that a successful scheme of police required locally appointed ward superintendents with intimate knowledge of suspicious characters and crimes. The scheme coincided with mounting concerns about crime, vagrancy, and rioting in the city, but underlying them was a growing recognition that a more professional system for investigating and detecting crime was necessary for such a large and prosperous city. It was accompanied by a sustained campaign to acquire a statutory local police act which illustrated just how far the new thinking of preventative policing had permeated the discourse of the city’s business community. In discussing a proposed police bill in 1789, the Trades’ House – which represented craft interests in the city – argued that the law enforcement clauses would prove ineffective as they were designed only “for the detection and punishment of crimes once committed” and fell “exceedingly short of that much more important object of preventing the increase, and removing the possible cause of the crimes” (Barrie 2008) The ensuing discourse on law enforcement in the city exposed not only a growing intolerance of crime but also the growing problems of investigating and detecting it. There was growing resentment in middle-rank circles that victims were expected to take the initiative in bringing legal action against offenders, and new ways were being sought to defend private property more effectively by making it easier to bring criminals to justice.

In his famous *Treatise*, Colquhoun drew inspiration from policing systems in France and Dublin, as well as his experiences serving as a magistrate in London. It is also possible, though, that developments in his native city provided an intellectual influence on his thinking. Colquhoun came from a background that was questioning the existing system of criminal investigation and prosecution and looking at new ways better to protect private property. A number of the ideas he expressed in *Treatise* bore a striking resemblance to the political discourse surrounding police reform in Glasgow in the late eighteenth century and to a wider intellectual culture of Scottish Enlightenment thought on the rule of law, jurisprudence, and civic governance. How much influence Colquhoun was able to exert over policing arrangements in Glasgow is impossible to say. What is clear, though, is that Colquhoun’s self-proclaimed “new science of policing” was being discussed and debated at length in middle-rank circles in Glasgow several years before it made its appearance in *Treatise*, which raises the possibility that his Scottish heritage and the intellectual and philosophical discourse which emanated from the Scottish Enlightenment influenced, to some degree, subsequent thinking in London.

In 1800, Glasgow finally acquired its first police act after years of protracted debate and political infighting among urban elites over issues of control and cost. The city’s lead was followed by a large number of Scottish burghs, including Greenock (1801), Edinburgh (1805), Paisley (1806), and Dundee (1824). Indeed, 23 Scottish burghs in total introduced police acts between 1800 and 1826. These statutes were similar to, and influenced by, eighteenth-century English improvement legislation in that they covered a wide array of powers relating to the general well-being and good ordering of local communities and included provision for full-time, paid watch forces. They did not represent the triumph of a new police model but rather the expansion of a model that had been introduced in English towns and was familiar on continental Europe (Dodsworth 2004). “Police” in early nineteenth-century urban Scotland, in keeping with the concept’s European origins, was defined broadly as a form of civic administration for the common good. The intention behind these acts was to levy assessments, elect commissioners, enlarge judicial boundaries, and obtain and extend powers for regulating the civil and criminal affairs with the intention of promoting cleanliness, health, security, and good order.

However, although public amenity provisions featured prominently in these acts, it would be wrong to regard them as having little significance for the evolution of modern policing or being merely an offshoot of English practice. In many cases, provision was also made for police forces under a hierarchical command structure for the prevention of crime under the management of locally elected police commissioners. This new, bureaucratic structure of law enforcement was an important step in the professionalization of law enforcement and in associating “police” with crime control. Moreover, in the larger cities, police courts were set up to expand the capacity of summary justice with senior police officers taking on the role of public prosecutor for minor crimes, offenses, and misdemeanors – a role the “new police” in England would not take on until the second half of the nineteenth century (Barrie and Broomhall 2012a). These courts came to be integral to the smooth running of towns, the maintenance of urban order, and the development of the Scottish criminal justice system. They were the principal local courts before which people were likely to be summoned and interact with the law and were instrumental in bringing about a massive increase in the number and type of crimes and offenses that were dealt with and punished in a summary manner. They were therefore an essential component of the emergence of the "policeman state" (Gatrell 1992).

The economic and social profile of "improving" burghs consisted mainly of expanding manufacturing centers, such as Glasgow, Paisley, and Airdrie; buoyant sea ports, such as Port Glasgow and Leith; and flourishing commercial centers, such as Dumfries. Many had western coastal locations, which suggest that police reform in urban Scotland was closely associated with urban growth, demographic change, and the development of trans-Atlantic trading. As in England, urban growth and changing work practices brought growing concerns with crime and its control. There were acute periods of heightened tension with property crime, vagrancy, and urban order, especially during periods of economic downturn. The post-Napoleonic years were also marked by political radicalism and industrial militancy. Relations between employers and employees became increasingly fraught in the face of changing work practices and declining wage levels, which accompanied the move toward a more market-orientated system of production. As in England, middle-class attitudes toward crime and the expanding, industrial urban masses were hardening. Men of property were becoming increasingly intolerant of urban disorder – partly because it was becoming more prevalent as rapid urban expansion and economic takeoff in expanding Scottish burghs brought more and more migrants and social problems and partly because an effective system of police was deemed essential to the progress of civil society. The 1800 Glasgow Police Act, for instance, was introduced not long after a major disturbance in the city, while the 1805 Edinburgh Police Act of 1805 was framed within the context of heightened anxiety over public safety, growing intolerance of public begging, and mounting criticism of the problems victims faced in bringing offenders to justice.

The inclusion of watching provisions in local police acts, however, also reflected an expansion of late-night entertainment and a growing reluctance among men of property to carry out their time-honored watching duties. Indeed, some police acts included a provision for watching by proxy in lieu of personal attendance. Other towns embraced reform because their neighbors had done so. What is particularly striking about the pattern of police development in Scotland in the first few decades of the nineteenth century is its clustered nature. Burghs within the same region tended to introduce improvement and police legislation around the same time. Acquiring statutory police powers set new standards that were likely to have made provisions in neighboring towns appear backward, as what was once acceptable quickly became unacceptable in light of competing models. Indeed, far from London providing the main driver for reform, provincial elites throughout the United Kingdom often looked to each other's models for inspiration. It was not uncommon for improvement commissioners in English northern towns to look to Scottish practices or police commissioners in Glasgow and Edinburgh to look to policing arrangements in Manchester or Liverpool whenever the issue of reform was on the agenda. Indeed, in 1806, commissioners in Edinburgh ruled out looking at London as a model for police reform on the basis that its size and significance were unique in a United Kingdom context.

There were similarities here with the policing of rural England. As Philips and Storch have shown, traditional forms of law enforcement in the second quarter of the nineteenth century came to be viewed as inefficient and ineffective when compared with the Metropolitan Police, and in the face of mounting criticism of its deficiencies in government circles, even though, in practice, they were functioning fairly effectively (Philips and Storch 1999). Luddite disturbances, rural riots, the erosion of paternal authority, a perceived rise in crime, and changing expectations of the criminal justice system caused men of property in rural England to think of better ways to defend their property and resulted in the introduction in the 1820s of new policing initiatives based on the underlying principles and ethos of the old constabulary system (Philips 1980). Indeed, far from being a radical departure from what had gone before, opposition to the introduction of the new police from the propertied ranks in rural England in the 1830s and 1840s was somewhat reduced because it was not fundamentally new but rather a product of earlier innovation and experimentation. In many English towns and counties, the "new police" were often staffed by the same men who had served in the "old police," while in other parishes, constables continued to play an important role in the apprehension of criminals long after their so-called demise. The transition from "old" to "new" in rural England after 1829 was not, therefore, necessarily a product of the failure of the system but rather has to be seen in the context of long-term transformations of the local state and a changing social outlook and administrative philosophy of the ruling elite – a philosophy which prioritized a bureaucratic system of stipendiary magistrates and paid police in order to meet the new expectations of law and order associated with the Metropolitan Police and to respond to heightened sensitivity about crime, order, and public decorum.

Therefore, even although it is difficult to define exactly what constitutes modern policing, it is highly unlikely to have begun in 1829. Many of its recognizable characteristics – such as crime prevention and detection, police-led prosecutions, and police courts to administer summary justice – were in operation in different forms and in different parts of mainland Britain long before Peel's police officers took to the streets. Modernization had a long history and many layers – a history of debate, experimentation, and reform which is extremely difficult to periodize in any precise manner and which did not evolve in a vacuum from wider thinking of other branches of the legal system. Police culture was, and indeed continues to be, heavily influenced by traditions, customs, and practices (Williams 2010).The 1829 Metropolitan Police Act was still of historic importance and would, according to Philips and Storch, become the main model for law enforcement against which others were measured in England following its introduction (Philips and Storch 1999). But it was not the historic turning point that was once claimed in traditional/conservative histories, especially in Scottish towns where it had little significant impact at all beyond providing – in the form of the Metropolitan Police – a pool of officers to recruit when required.

In the large, expanding commercial and industrial cities of mainland Britain, structural changes within society and the economy, and concern with industrial militancy, disorder, and radicalism, would come to play an increasingly important role in strengthening the resolve of men of property to improve law enforcement arrangements as the nineteenth century progressed (Carson and Idzikowska 1989; Storch 1975). But, there were sufficient innovations in nonindustrial areas to caution against overstating social-control, class-conflict revisionist models that locate the emergence of police to the problems thrown up by industrial society. In some of the smaller Scottish burghs, police reform, and the wide-ranging municipal powers that were acquired under police legislation, was indicative of changing attitudes associated with civic consciousness and urban refinement. Indeed, for a town to seek statutory policing powers was by no means always an admission of social problems; in some cases, it was indicative more of the concept of a new civil society beneath which many forms of improvements could be introduced and administered. Similarly, eighteenth-century English improvement commissions, with their wide-ranging municipal powers, were rooted in Enlightenment notions of improvement for the common good, even if, as in Scotland, men of property had a self-serving notion of what constituted the common good. This points to the need to locate police reform in British cities more fully within the context of the long history of municipal governance, Enlightenment thought, and changing attitudes toward, and expectations of, the built environment and the criminal justice system and what these should deliver, rather than merely the viewing it as being the knee-jerk response to a specific problem. Concerns with crime, disorder, and unrest might have helped strengthen the resolve of men of property to introduce reform, but, in many cases, it had been on the local agenda for a considerable period of time and for a variety of different reasons.

Conclusions: Future Directions on the Evolution of Modern Policing

While recent years have witnessed the emergence of major studies of policing in nineteenth-century urban Scotland and provincial England, more attention needs to be devoted to the policing of eighteenth-century English towns, rural Scotland, and Wales (which has been well served by David Jones's studies on nineteenth-century police and crime but less so for the eighteenth century; Jones 1992). Such concentration will not only address major gaps, it also has the potential to further understanding of an historiography (pre-1829) that has been largely preoccupied with London and which might have skewed a wider national picture. It is certainly the case that London's problems had a disproportionate role in shaping national policy and government thinking on English criminal justice matters, but eighteenth-century provincial towns and cities were by no means incapable of independent action. Indeed, as Peter King recently pointed out in his study of the English criminal law and courts, eighteenth- and nineteenth-century justice was often made from the margins by local elites rather than by Parliament in London (King 2007). Throughout Europe, states and cities studied each other's police systems (Emsley 2007), but how much intellectual transfer there was in municipal and rural policing in eighteenth century in Britain is yet to be fully investigated. As in the early nineteenth century, it is possible that civic rather than metropolitan emulation was a fundamental driver of reform – a fact which has significant implications not just for police reform per se but also for a wider understanding of the construction and dissemination of police typologies, civic governance, and the relationship between the center and the localities.

While a number of studies have explored the relationship between the eighteenth-century summary courts (Gray 2009), much more, surprisingly, is needed on the police courts that were introduced in the nineteenth century. What work has been done in a British context has, with a few exceptions (Barrie and Broomhall 2012a; Godfrey 2008), been London centered, with attention focusing on the reform to the Bow Street Police Offices in the 1790s and the extent to which London police courts provided a poor man's system of justice (Davis 1984). But these courts have captured the imagination of historians far less to date than the eighteenth-century English "Bloody Code," despite the crucial role they played in the expansion of summary justice and the police's regulation of nineteenth-century urban societies. Examining the relationship between police courts, police forces, and police magistrates will provide a fuller understanding of the extent to which police development was interconnected with wider changes in the criminal justice system and how the different branches of police regulated urban and industrial society.

Recent years have also seen greater attention being devoted to the historical relationship between police, gender ideologies, and power structures, and especially how they have impacted on police culture, the experience of female officers (Jackson 2006), and how ideas about masculinity have shaped police culture, practice, policy, and institutional organization over time (Barrie and Broomhall 2012b). Yet, much more needs to be done, especially on the ways in which policing reflects, sustains, embodies, and enforces ideas about masculinity given the gender imbalance that still exists within police forces. Indeed, the paucity of studies which have stressed the importance of gender in shaping eighteenth- and nineteenth-century systems of policing relative to class-based interpretations is surprising given that police institutions not only incorporate changing models of male authority but also are closely intertwined with the distribution and operation of power within society. As Barrie and Broomhall have recently argued, a greater appreciation of masculinity has significant implications for the historian's understanding of the birth of modern policing and police typologies. In historical studies of policing that prioritize gender as a key focus of analysis, conceptualizations of "old" and "new" police models cannot be sustained as all models of policing – including the eighteenth-century old parish system and the reformed bureaucratized model that replaced it in the nineteenth century – have linked their justification and practice of control over communities to concepts of masculinity. Indeed, rather than holding up the Metropolitan model as a template for modern policing practices throughout the world as many studies have done, Barrie and Broomhall have stressed the importance of different models in shaping international institutional policing structures and practices – models that were shaped by conceptions of masculinity and which have been subject to change in different historical and geographical settings (Barrie and Broomhall 2012b).

Lastly, critiques of traditionalist and revisionist accounts of police history as outlined above have encouraged many historians to abandon overarching structural interpretations of reform in favor of local variation. There has, in recent years, been a move away from attempting to pinpoint a particular incident, individual, or social interest as the main driver for police reform (Emsley 1996). However, although recent empirical research and local histories have been extremely valuable in highlighting the complex ways that modern policing evolved, there is a danger, as Philips and Storch warn, of failing to give sufficient historical context for wider, national moves for reform and how these relate to wider changes in the economy, society, and governance of British towns and cities (Philips and Storch 1999). Preoccupation with local diversity, while providing a useful corrective to oversimplified explanations, runs a risk of becoming too specific and neglecting not only the wider context in which reform emerged but also the common problems found in different circumstances (Taylor 1997). The major future advancements in the field will not come from scholars who engage in myopic empiricism alone but rather from those who seek to locate their research in wider theoretical frameworks and ideologies of, among others, class, gender, race, and ethnicity; from those who are attentive to national, intellectual and political developments; and from those who seek to explain diversity rather than using it as the basis for abandoning general, theoretically informed explanations.

Policing in Developing Democracies

Nathan W. Pino
Department of Sociology, Texas State University-San Marcos, San Marcos, TX, USA

Overview

Throughout the global South, countries are struggling to build new democracies. Under the liberal democratic model, the police are regarded as central to the establishment of social order and to the preservation of fundamental democratic rights and freedoms. Unfortunately, developing democracies tend to exhibit certain characteristics that pose challenges for developing democratic forms of policing, and the police in developing democracies often act as they did under their colonial period, engaging in abusive and repressive behaviors that threaten security and political stability. Forces largely outside a developing democracy's control such as neoliberal globalization and the hegemonic behavior of powerful states (involving the domination of weaker states without direct military force) present further challenges for reform and are often not taken into account by academics or practitioners seeking to reform the police in these young democracies. When powerful Western states or organizations attempt to reform police systems in developing democracies, their efforts often fail for a number of reasons, including lack of adequate knowledge of the country receiving aid, the coercive implementation of aid resisted by the recipient country, reforms that benefit the donor more than the recipient, weak recipient capacity or willingness to implement reforms sustainably, and the inadequate participation of local actors in reform planning and implementation. Suggestions provided in the academic literature for overcoming the above challenges are presented and discussed.

Introduction

Since the great wave of democratization in the late twentieth century, many countries are in various stages of democratic development. Democracies at a minimum have a constitution (including uncodified ones as in the United Kingdom), fair electoral systems, multiple political parties, and mechanisms of accountability (Plattner 2008). Developing democracies that survive exhibit good governance in part by implementing sound economic policies that benefit the majority of their citizens, who then view the government as legitimate (Kapstein and Converse 2008). Liberal democracies have certain attributes that set them apart from simple electoral democracies, such as a free press, a respect for civil liberties, and adherence to the rule of law. In order to gain legitimacy in established liberal democracies, the police are expected to be accountable and transparent, uphold the rule of law, preserve social order, protect fundamental democratic rights and freedoms, and understand that their authority derives from their fellow citizens. Developing democracies are also expected by the international community to instill in their police these liberal democratic ideals while changing police policies regarding political activity, political prisoners, and the rights of the accused. Unfortunately, developing democracies tend to have characteristics that present numerous challenges to police development and reform. Democratic societies have an authority granted by law to maintain a democratically determined order, but if the power of the police is misused, this abuse of power is potentially harmful or even destructive to the structure and processes of democratic societies.

Characteristics of Developing Democracies and How They Present Challenges for Policing

Democratic institutions and norms in numerous developing democracies have been eroding. Many countries that gained independence from the barbarism of colonization emerged with illiterate, rural populations with few opportunities for personal advancement (Pinkney 2003). In addition, these transitional and developing societies are experiencing rapid change associated with modernization and globalization, particularly in urban areas. These rapid changes are in part responsible for the numerous social problems these countries face and are less able to contend with, such as economic inequality; rapid rural to urban migration; the influx of refugees; increases in the proportion of adolescent and young adult males in the population; decreases in job opportunity; inadequate health and educational services; rapid changes in family and neighborhood structures; the proliferation of organized crime; and the legacies of ethnic and other forms of conflict (Neild 1999). The police cannot be expected to control crime or contend with these social problems alone, but the presence of these problems in the absence of a strong democratic state increases the likelihood that the police will resort to repressive measures and support their regime rather than their fellow citizens.

Developing democracies tend to suffer from weak democratic institutions, including those meant to institutionalize police accountability and responsiveness, a lack of commitment to the rule of law, corruption, fraudulent elections, high levels of crime and societal instability, significant levels of poverty and inequality, and poor police-community relations (Hinton and Newburn 2009). Many of these countries still have authoritarian provisions in their constitutions with too few safeguards against control by militaries or the elite, and parliaments and legislatures may not act independently from the executive branch. Governments will therefore be less responsive to citizen demands, allow higher levels of police indifference and abuse, and offer fewer chances for economic development or trust in government. In other words, while these countries are engaging in democratic transitions, they are not necessarily ripe for democracy. Countries ripe for democracy possess, among other things, a stable middle class; an active, engaged, and educated civil society; and elite commitment to democratizing institutions (Pinkney 2003).

A number of transitional and developing societies could be considered weak states, which are countries without social cohesion or the state capacity or willingness needed to protect citizens as they live their daily lives (Goldsmith 2003). Weak states can contribute to the erosion of citizen safety by giving regime stability and narrow sectional interests based on ethnicity, religion, or some other category more attention than considerations of general public safety. In post-conflict situations, weak states can collapse without developing democratic institutions when crime rates are high (Neild 1999).

Transitional countries ideally seek to balance the need to encourage economic growth on the one hand and the need to discourage economic concentration and other forms of inequality on the other. Unfortunately, the capacity of emerging democracies to balance these needs is hampered by low levels of education among their citizens and little if any independent development opportunities owing to the marginal positions of these countries in the global economic system. Economic concentration occurs with regularity in these countries, which weakens the capacity and participation of civil society, corrupts politicians, and influences the police to act as protectors of the rich by aggressively policing the poor. Deepening inequality can lead to increases in violent crime and terrorism committed by concentrations of young unemployed males. State sovereignty and capacity are also weakened by the privatization of state enterprises, reduced regulations on business activity, and the ceding of authority to global institutions of governance such as the World Trade Organization. These neoliberal activities allow for the development of illicit economies and opportunities for criminals to participate in government, increasing corruption and weakening legal, judicial, and policing systems (Aas 2007). In highly unequal countries, citizens are more willing to accept authoritarian rule and politicians are more easily able to violate human rights and the law as well as weaken justice systems. In poor countries with high crime rates, the police are politicized and are used to crack down on minority groups and the lower classes (Hinton and Newburn 2009).

Violent and protracted ethnic conflicts are more likely to occur after colonial rule and this is another reason why post-colonial states have difficulty transitioning democratically (Stavenhagen 1996). Police violence, human rights violations, and other forms of police deviance, particularly by special units, increase as a result of these conflicts, as we have seen in Somalia, Cambodia, El Salvador, East Timor, Kosovo, Macedonia, and elsewhere. When ethnic conflict is a central component of social life in developing democracies, ethnicity itself becomes a politically mobilizing force and ethnically based political parties often develop (see Stavenhagen 1996).

High rates of conventional street crime are also typical of developing democracies, particularly in the low-income countries of Africa, Latin America, the Caribbean, and the Middle East, particularly among their minority populations (Neild 2001). Sources of crime in transitional societies are as complex as in developed societies, and internal as well as regional factors must be taken into account when assessing causes of crime in any particular country. Authoritarian elements in government create social control systems designed to maintain the authority and control of the regime, leading to police training that fails to prepare police to contend with conventional street crimes adequately. Increases in crime and feelings of insecurity coupled with a weak or repressive police response can weaken police legitimacy and lead to the privatization of security, death squads, and vigilante actions by citizens (Neild 2001).

Characteristics of the Police in Developing Democracies

Most developing democracies were once colonies, and the legacies of colonialism impact policing just as they impact other social and governmental institutions. While scholars have observed some similarities among colonial police systems, such systems were still unique due to local factors and relations with the colonial state. For example, some police systems were organized around the annexation of territories for the purpose of settlement, resulting in civilian police systems (North America, Australia), while others were developed in order to subdue colonies annexed primarily for trade, leading to paramilitary policing on the continents of Africa, Asia, and Central and South America (Cole 1999). In the latter case, police leaders were often recruited from imperial armies, and police forces and militaries worked alongside one another. Sometimes private companies were established to maintain law and order, defend colonial territories, suppress political activities, supply cheap labor, and to hold rights over land and people.

In post-conflict or post-colonial situations, it is expensive and time consuming to create a new and inexperienced police force from scratch. Therefore, the composition of the police in a transitional period might be composed of former police and military officers from the colonial period as well as members of ex-insurgent or guerrilla forces, some of whom might have committed human rights violations in the past (Neild 2001). In post-conflict environments, institutional weaknesses, authoritarian nationalist cultures, apathetic or weak civil society groups, and the difficulty of imparting skills to new officers all work to hinder the police reform process (Neild 2001). Police institutions are not well defined and the lines separating police and military forces are blurred (Hills 2000). Citizens often view the police as weak and ineffective, and public demands for order can motivate repressive policies that erode citizen rights and militarize the police. In addition, political leaders in many of these countries from previous autocratic periods have converted themselves into supposed democratic leaders during democratic transitions, leading to a continued lack of legitimacy for both governments and their police (Hills 2000).

Regime policing – policing oriented toward the regime rather than citizens – easily flourishes in weak post-colonial states that are under-resourced, and contain authoritarian and paternalistic institutions, including paramilitary police agencies (Neild 1999). During democratic transitions, these post-colonial or post-conflict police agencies tend to shield themselves from democratic accountability, and even though Western countries have provided police reform aid, police systems have generally not evolved in any meaningful way (Hills 2000). Police officers tend to experience low socioeconomic status and are often viewed by citizens as no different from criminals.

Neild (1999) traces how security debates tend to unfold in post-conflict societies. After a period of regime policing as described above, human rights and civil society groups engage in collective action to criticize policing and call for the democratization of policing. In some cases, police reforms following this activity center around building security and stability, but in most unstable democracies, more time is devoted to civil-military relations than to changing police institutions and practices. Next, as crime and crime control become more pressing concerns, the legacies of regime policing reappear in order to crack down on crime, though this threatens the democratic transition process. In response to these previous developments, some countries engage in reform efforts that create new models of democratically based security, but many developing democracies have not yet reached this point, leading to a continuation of the status quo of militarized regime policing, vigilantism, and the proliferation of private policing. Marginalized groups, such as trade unionists, the unemployed, students, children and adolescents, and the homeless, remain targets of police activity. Thus, even after reforms are instituted, demands for order-restoration lead to the return to old practices, and crime rates in the poor countries rise as ineffective and under-regulated police forces engage in old tactics (Neild 1999).

Police-community relations in much of the developing world are characterized by violence and repression, and policing is often used as an instrument of state violence and corruption.

The socioeconomic inequalities in these countries are taken advantage of by state actors as certain sectors of the population are criminalized and therefore brutalized by the state. There is little-to-no community involvement with the militarized police and there are few if any genuine accountability measures. Newly democratic governments, such as those in Hungary, South Africa, and Brazil, have increased rather than decreased police powers such as the ability to detain suspects longer, to search and seize property, and to conduct undercover surveillance (Stone and Ward 2000).

The way that other components of criminal justice systems evolve or get reformed in democratic transitions can also hinder police reform efforts. For example, judicial reform tends to occur more slowly than police reform, and if the justice system fails to engage in legal tactics such as issuing warrants, the police might resort to illegal actions to carry out regular functions (Neild 2001). Various nation-building activities, legal aid, and good governance initiatives have not promoted development or created a legal framework that supports democratic policing or criminal justice reform in these countries (Hills 2000). Police and judicial processes remain abusive, corrupt, and ineffective in the developing world even though many of these countries have gone through democratic transitions. Neild (1999) describes these democratic countries with abusive justice systems and state failure to provide protection and services as uncivil or low intensity democracies.

Ethnic, sectarian, and other schisms negatively impact police behavior, recruitment, and training as well. Numerous ethnic recruitment policies occur around the world, and those organizations that engage in those policies are more likely to have paramilitarized forces, where training is in a military style, numerous rapid deployment forces that protect regime control are operating, and police and military roles are blurred even though civilians tend to head police services (Hills 2000). Centralized police forces are often less able to contend with local problems and priorities, and accountability and effectiveness are made more difficult due to a lack of quality statistical data and inadequate or politically motivated resourcing (Hinton and Newburn 2009).

Given the economic problems these countries face, the police suffer from a lack of resources, faulty-equipment, low salaries, and poor working conditions (Hills 2000; Neild 1999). These conditions undermine morale and self-efficacy (belief in one's competence); and increase the likelihood of corrupt behaviors that weaken their legitimacy (Hills 2000; Uildriks and Van Reenen 2003). Low levels of satisfaction with the police among populations in developing democracies cannot be underestimated. Citizens often find the police illegitimate, unaccountable, ineffective, brutal, and violent. In the developing world, victim dissatisfaction with the way in which police handle reported cases of victimization and the ways in which the police control crime measure higher than in the developed world (Zvekic and del Frate 1995). Police in these countries continue to be distanced from the civilian population, leading to a mutual lack of trust and lowering the chances that genuine democratic policing can emerge or that victims will report crimes. Citizens indicate that their distrust stems from perceptions of corruption, unprofessionalism, unwillingness to protect citizens, and abuse of authority, which limits the willingness of citizens and civil society groups to work with the police (Uildriks and Van Reenen 2003). Human rights groups, for example, are reluctant to work with police forces in ways other than establishing watchdog groups on police abuses. Police officers in turn feel mistrusted by the public, forsaken by the government, and distrusted by their supervisors and other criminal justice system agents.

One major consequence of crime is fear, which has important reciprocal effects on communities and neighborhoods. Violence and the fear of it limits economic and physical well-being, restricts movement and access to jobs and schools, weakens social ties and interaction, deters investment and reduces economic output, weakens legitimacy in social institutions, and threatens the rule of law (Neild 1999). Fear of crime and lack of police legitimacy lead to the increased use of under-regulated private police forces sometimes staffed by demobilized soldiers, which increases inequalities by physically separating the rich from the non-rich and can lead to various kinds of repressive policing (Neild 2001). Private security is pervasive in the developing world and generally has a negative influence on the conventional police and justice system to fulfill their missions. Even public policing can become privatized in the sense that the wealthy and politicians can buy police presence while the poor suffer further as the non-policed areas in which they live become taken over by gangs, death squads and organized crime syndicates, all of which are often linked with the police (Hinton and Newburn 2009).

Other Challenges to Establishing Democratic Policing

Policing scholars and practitioners are often guilty of failing to place policing in developing democracies in its proper historical, economic, political, and social contexts, treating policing as if it occurs in a vacuum and leading to one-size-fits-all reform strategies that frequently fail to meet expectations. There are a number of factors that may hinder a developing democracy's ability to implement a democratic policing strategy. In varying degrees, these factors include underdevelopment, a lack of sufficiently democratic institutions (including criminal justice agencies), a weakened and unempowered civil society, low levels of social and other forms of capital, pressing crime and other security problems, social and cultural conflict, political instability, a lack of legitimacy in social and political institutions, and international pressures that weaken the capacity of states (Pino and Wiatrowski 2006). In addition, pressure from foreign states, a lack of social cohesion, shortages of resources and functioning equipment, and political instability threaten the democratization of policing (Goldsmith 2003; Neild 2001). These various problems promote abusive, corrupt, neglectful, indifferent, and ineffective policing by negatively impacting training, morale, and operations.

Neoliberal globalization, championed by Western capitals and global cities, has had a decidedly negative impact on police reform efforts. In neoliberal thought, markets govern social institutions and a culture of market-oriented behavior in individuals is promoted to weaken the influence of states in the economic and political sphere. Capital flows, labor markets, and international trade are deregulated and then reregulated in a business-friendly way, and social and public services are privatized, enhancing the influence of transnational corporations over state policies (McMichael 2008). The USA has prescribed a set of policies to developing countries, known as the Washington Consensus, which spreads neoliberal practices globally (Williamson 2000). These policies include reducing public expenditures that subsidize social needs such as infrastructure, health care, and education; weakening labor, environmental, and legal protections; liberalizing trade and foreign direct investment; privatizing public enterprises; reducing marginal tax and interest rates; extending private property rights; and deregulating economic activity.

International Monetary Fund (IMF) and World Bank structural adjustment policies are integral to the neoliberal agenda and the Washington Consensus, and these policies have had damaging effects on economies by increasing inequality within and between nations, leading numerous scholars to argue that neoliberal globalization has replaced older forms of imperialism to make developing countries economically dependent on Western powers (James 1997; McMichael 2008). IMF-mandated public spending cuts often reduce police officer salaries, spawning further corruption, and both retired and active-duty police officers might supplement their incomes by working as private security guards or participating in death squads (Hinton and Newburn 2009).

In addition, by promoting economic insecurity and therefore fear of crime, neoliberal globalization compels states to increase coercive powers while taking a more limited role in the economy, creating a market for policing and other security reforms. In fact, police reform is increasingly conducted by private non-state actors

(Kempa et al. 1999), leading to the weakening of state policing institutions across the globe. While precise numbers are difficult to come by, it is now known that private security personnel are more numerous than state police (Aas 2007). Policing is less rooted in the nation state because of privatization, transnationalization, and the development of a transnational police subculture. These developments, including intelligence sharing between countries, moving some forms of police authority in Europe from nation-states to the European Union, and other formal and informal agreements, threaten the democratic nature, accountability, and legitimacy of policing (Loader 2002).

Since the end of the cold war, international financial institutions such as the IMF and powerful states – particularly the USA – have been increasingly showing interest in security sector reforms based on Western models, and coercing governments in developing democracies to adopt Western models and practices. For example, owing to the fact that police can hinder development by ignoring the rule of law and acting independently from their governments, the IMF and World Bank have been making the strengthening of governance one of their mandates for securing loans (Ball 2001). Police aid has become a major global export (Bayley 2006; Brogden 2005; Ellison 2007), involving private corporations who train community policing officers, private consultants who market themselves as gurus or experts, international governmental and nongovernmental organizations, and Western overseas development agencies. Numerous agencies such as the United Nations Development Program (UNDP), the US Agency for International Development (USAID), the Department for International Development (DFID), the International Criminal Investigative Training Assistance Program (ICITAP), and various nongovernmental organizations (NGOs) work to diffuse police concepts and practices between nation-states and supra-nationally above individual states in the case of Interpol (Goldsmith and Sheptycki 2007).

The USA has played a major role in these developments. As an important component of its foreign policy, the country has sent more police abroad, trained more police, and has signed more bilateral law enforcement treaties than any other country (Andreas and Nadelmann 2006). The USA usually dictates the processes and practices of these agreements and the contents of laws, and while elites in developing countries participating in these agreements claim they are now meeting international standards, they can utilize the agreements to meet various domestic agendas (Andreas and Nadelmann 2006).

One cannot assume, therefore, that the aid provided by Western experts is solely for the recipient's benefit. During the cold war, for example, institutions and public order policies implemented abroad were intended to protect pro-US military regimes instead of the citizenry, leading to militarized police forces that engaged in abuses and repression (Goldsmith 2003; Neild 1999). When paramilitary units are created instead of democratic forms of policing in order to defeat political enemies, drug traffickers, or terrorists, it contributes to goal deflection, the overdevelopment of special units, undemocratic and dependency-driven reform and training, and insufficient participation by local actors and civil society groups. Local actors and stakeholders such as NGOs, local governmental leaders, and the citizenry are usually not consulted or part of the process of police reform in any meaningful way (Hills 2000). Donors attempt to instill Western values and principles where they may not apply on the ground, and during times of reform, there is a strong emphasis on nonpartisan, high-tech, information-driven policing as a way to shield police from democratic forms of accountability (Neild 2001).

Police reform within nation-states rarely involves meaningful forms of civilian oversight, resulting in police control over reforms. Since many populations seeking changes are marginalized and lack access to participating the process, the chances for genuine reform can appear highly unlikely. While activism and resistance by citizens, politicians, external donors, and civil society groups can influence reform efforts, poverty and inequality reduce the efficacy of these efforts since many citizens are busy with subsistence and survival concerns, and politicians can easily purchase votes with jobs, cash, and various services (Hinton and Newburn 2009). NGOs have difficulty collaborating in reforms because of their tenuous relationships with governments, and if many reform changes take place within police management, it is unlikely NGOs will have much access to or input on those decisions (Neild 1999). NGOs tend to be inexperienced in a number of countries and need more assistance if they are to participate. Police reform tends to be slow, erratic, and partial, and as NGOs attempt to assist the police while monitoring them, there is more opportunity for weakened relations between the police and NGOs. In addition, the obstacles to female citizen participation in co-productive activities with the police are rooted in the varied patriarchal structures of societies (Pino and Wiatrowski 2006). There are low levels of female participation in decision making in general and women suffer distinct harms disproportionately from crime (domestic violence, rape, etc.) and social and ethnic conflict. Low female participation fails to tap into the local knowledge of crimes and other problems that confront them in their communities. Because women are vulnerable to victimization in many developing democracies, their children are also at risk, limiting social activities that can be used to improve livelihoods.

A common problem is that donors have been largely uninformed about a recipient country's history, political and ethnic problems, and cultural scripts for negotiating and implementing agreements, leading donor agencies to act with incompetence regardless of the quality of the plans put in place. In many endeavors around the globe, donor governments and their various participating agencies have not followed-through on their commitments and have failed to cooperate well (Muehlmann 2008). Many people hired to work on the ground with local actors lack expertise or knowledge of the country and culture, and when multiple agencies are involved in providing reforms, as in Iraq and Afghanistan, there are blunders in coordination and failures to meet funding guarantees. Planning and implementation are often rushed, and as Bayley (2006) has mentioned, many donors conduct most of their work via simple fly-bys and drop in and out visits. At a conference in the Caribbean, the author heard more than one local scholar call those that engage in such practices "tourist criminologists."

Another donor-related problem is that Western democracies do not always agree on appropriate police standards. There appears to be no global consensus emerging on appropriate policing practice, use of force, or effectiveness (Hills 2000). When supposed universal policing standards are implemented, they often do not convincingly match the rhetoric due to local political, historical, and cultural dynamics that are not properly accounted for in preparation for or during reform efforts. If state-builders retreat from democratization efforts for short-term gain, lower their expectations, fail to accept responsibility, or over-emphasize local capacity and ownership from the beginning before capacity is developed, it will likely lead to ineffective service and higher levels of corruption and abuse (Kahler 2009).

The most popular policing export from the West to developing democracies is community-oriented policing (COP), but the effects of COP in developing democracies have been mixed at best. On the positive side, there have been numerous improvements in the treatment of female victims, police visibility, and citizen perceptions regarding fear of crime, but there are serious problems that have hindered successful implementation (Brogden 2005; Pino and Wiatrowski 2006). It is questionable whether COP is suitable for export to foreign countries in the first place owing to the problems associated with implementation in the USA. While the concepts and theories behind COP are popular among academics and practitioners alike, it is conceptualized and practiced differently in every community it is implemented, the status quo is often maintained in terms of police behavior, co-productive activities between the police and citizens are usually limited to nonexistent, and those that need police reform and improved police-community relations the most often receive the least of them (Pino and Wiatrowski 2006). Many of the problems associated with community policing in the West also occur in transitional societies, such as a lack of participation and social capital to sustain reforms, lack of assessment and other forms of evaluation, continued police abuses, lack of organizational change in police departments, and others. Furthermore, when donors state they will implement community policing but engage in goal-deflecting activities such as creating paramilitarized special units to fight terrorism, battle well-armed drug traffickers and the like, or do not take the time to learn the local context and other realities, any hope for developing democratic forms of policing can be squandered (Pino and Wiatrowski 2006).

Another factor to consider is the willingness and capacity of the country receiving aid to actually carry out the reforms. Many recipients are willing if they see an economic or political benefit from doing so, but the capacity of countries to implement reforms, even if they are willing, varies. For example, owing to the legacies of colonialism and conflict, there are few local experts in many countries, such as policy makers, academics, NGOs, and other civilians with expertise that can assist with reforms, leading to reform efforts being dictated solely by donors, and in spite of the numerous pressures donors place on countries to engage in reform, there are various ways that recipients resist this pressure (Andreas and Nadelmann 2006; Neild 1999). Recipient countries can decide to implement only the aspects of reform they like after donors leave, resources can be diverted, and reform can be used as catalysts for political gain.

Reform requires political stability and favorable relations between federal, regional, and local governments, but these conditions do not exist in many countries. In numerous developing democracies, police are under the influence of individual politicians instead of being institutionally accountable (Hinton and Newburn 2009). Police commissioners are replaced regularly and tenure is often most dependent on loyalty to a political party or regime. In these cases, corruption is rampant, accountability mechanisms are weak, and police officers engage in violence and other forms of crime. Bureaucratic organizations are penetrated by neopatrimonial politics that make little-to-no distinction between the public and private sector, creating the personalization of political power into one individual who engages in clientalist politics that encourage corruption and the use of state resources and coercion to enhance authority and legitimacy (Hills 2000).

We do have to keep in mind, however, that sometimes the process of creating a new force works fairly well. Police reform in post-conflict societies making democratic transitions is more successful when the international community supports the peace process and provides assistance to public security reforms (Neild 1999). In countries such as El Salvador and Guatemala, local communities appeared at the time to welcome these new police forces and see them as an improvement over previous forces (Neild 2001). Still, very quickly, these forces can be corrupted, unless they are placed in a framework that emphasizes their role in terms of a democratic society.

Suggestions in the Literature for Overcoming Barriers to Sustainable Police Reform

The literature has offered some advice on how practitioners can improve policing in developing democracies in terms of practical and technical issues, but also in formulating ways to contend with the daunting challenges presented by neoliberal globalization on police reform efforts. Some argue that scholars and practitioners should pragmatically embrace and work within the realities of neoliberal globalization and American foreign policy objectives by utilizing top-down strategies and Western expertise, but to do so with better preplanning and coordination within and between countries, agencies, and private contractors involved in providing the aid, improving oversight and regulation of private actors, increasing transparency, and engaging in some collaboration with local stakeholders (see Bayley 2006).

Other scholars such as Loader and Walker (2007) question the underlying policy objectives of the USA and other Western countries and emphasize strengthening state capacity to manage economies and provide security democratically without relying on private contractors. In their view, states should be allowed to develop their economies independently and provide what Loader and Walker (2007) call thick security, which they define as security that is seen as a communal public good and provides a civilizing effect on political discourse, therefore strengthening democratic institutions. Others such as Goldsmith and Sheptycki (2007) want to help develop a transnational ethic for the provision of security that promotes peace and security in a democratic fashion rather than based on dictates from powerful states in a neocolonial fashion. This type of effort compliments the desire for thick security and independent development.

Yet another set of scholars argue for strengthening the capacity of civil society groups and the development of bottom-up strategies for reform, drawing from indigenous knowledge and the strength of NGOs to emphasize local needs (see for example Hills 2000; Pino and Wiatrowski 2006). While bottom-up strategies ensure that local actors are able to participate in the process, one must keep in mind that local leadership and capacity may be too weak to spearhead all initiatives depending on the context, and reliance on the private sector or civil society groups for security would not be an effective replacement for state-managed police forces due to the internal conflicts, inequalities, availability of small arms, and other difficulties that normally require states with the adequate capacity to manage (Goldsmith 2003). Civilian review boards are a popular method for involving citizens in the police reform process, influencing internal police discipline, and providing analysis, but success requires strong leadership, analytical capabilities, political support, resources, and minimal police resistance (Neild 1999). Female participation is needed as well to ensure that the needs and concerns of women and their children are addressed and because women have valuable local knowledge about local problems that can inform police reform and crime reduction efforts.

Scholars are still struggling with these issues involving police reform and neoliberal globalization, the proper roles and obligations of donors and recipients, and the extent to which civil society groups and private actors participate. Nevertheless, it appears from the above review that at the very least reform efforts require effective planning and coordination among all actors; significant local participation, including that of civil society groups; adherence to funding and other commitments made in agreements; an equal emphasis on both human rights and security; accountability and transparency among all actors involved; and an emphasis on long-term goals and planning. However, before any planning or coordination begins, certain conditions should be in place if sustainable reform is to be achieved. Reforms should only be attempted in relatively stable, non-repressive states ripe for democracy with the resource and capacity potential to maintain reforms sustainably and provide essential services. Reforms should be mutually sought rather than coerced or paternalistically dictated, and donor states or organizations should only utilize competent actors with knowledge of and expertise in the country receiving assistance. Reform also requires strong and legitimate police leadership eager and willing to carry out reform efforts and to participate in the process. Finally, police reforms should be part of a comprehensive approach that seeks to strengthen multiple democratic institutions simultaneously, such as other criminal justice systems, the educational system, militaries, and political and economic systems.

Policing of Peacekeeping

B. K. Greener
Politics Programme, School of People, Environment, and Planning, Massey University, Palmerston North, New Zealand

Overview

Policing has become an important part of peace and stability operations. This entry briefly outlines the rise of policing in peacekeeping before highlighting some of the difficulties met in efforts to deploy civilian police personnel to peace and stability operations. Alarmingly, such difficulties have helped motivate increased military and Formed Police Unit (FPU) involvement in policing tasks. The implications of this trend are wide-ranging, suggesting that limits for military, FPU, and civilian police involvement in operations need to be more clearly defined.

Key Issues

Policing has become an integral part of contemporary peace and stability operations. In 2011, for example, there were: approximately 14,500 UN police (UNPOL) deployed in places as diverse as Timor Leste and Chad (UNDPKO 2011); EU police (EUPOL) could be found operating in the Palestinian territories, Afghanistan, and elsewhere; a Participating Police Force (PPF) drawn from the Pacific Islands Forum countries were still policing in the Solomon Islands; and national contingents engaged in other bilateral or multilateral arrangements all around the world. Ideally such policing would be carried out by qualified civilian police personnel, but at times, military personnel have been tasked with components of the police function in some of these operations, and more militarized police units are increasingly being utilized in such operations too. There are a number of practical reasons behind this trend, but there are also weighty normative reasons to be cautious about such developments.

This entry sketches the rise of the importance of policing in peace operations and considers some of the problems that have developed with the rise of international policing. It then outlines two reasons as to why military personnel and Formed Police Units have increasingly been involved in such tasks: quantity issues and the mission environment. The entry then assesses some of the implications of this particular development, concluding that, despite growing proponents of military involvement in policing, care needs to be taken to avoid any moves toward the militarization of policing in peace operations and more needs to be done to address this situation.

International Policing

The current international policing agenda has a fairly recent history if we exclude the role of colonial policing. Initial post War policing efforts in occupied Japan and Germany focused on rebuilding and tweaking structures that had existed prior, while Cold War peacekeeping policing tasks focused on fairly uncontroversial Support, Monitoring, Advising, Reporting, and Training (SMART) type activities. Policing in peace operations during this phase tended to revolve around monitoring of security situations and ceasefires, as exemplified by the UN deployment to Cyprus. Post-Cold War scenarios, however, saw the UN and other regional or bilateral policing agencies becoming involved in ever more complex arrangements as the need for the restoration of law and order has come to be seen as vitally important for post-conflict peacekeeping, peace enforcement, and peacebuilding (Greener 2009).

The move toward peacebuilding and statebuilding, the convergence of security and development agendas, and increasing challenges to the nonintervention principle have all underwritten developments in the burgeoning field of international policing. This new policing agenda has therefore been driven by the complex demands of peace operations as they have evolved past initial peacekeeping concepts throughout the post-Cold War era. Increasingly comprehensive and extensive attempts to prevent a resurgence of violence in post-conflict sites, and the drive to rebuild states in particular, have helped amplify demands for the implementation of the rule of law and the restoration of law and order – demanding involvement that goes beyond the mere provision of a security pause. In addition to this, post-9/11 demands to prevent or respond to the failure of states, to counter terrorism (and potentially related transnational crime), and to shore up controls over illicit and insurgent activity have all contributed to an increasing demand for police as well as military involvement in international security affairs.

It is due to such developments that policing has become an increasingly important part of peace operations. Instances of such policing may involve either more "active" roles particularly in the stability phase of operations (roles such as those which occur where there is an executive policing mandate whereby external police have the power of arrest in situations where local law and order has broken down), or it can involve a range of other less obviously interventionist roles in later or more permissive stages (roles such as monitoring, training, mentoring, capacity building, or programs to "reform, rebuild, and restructure" existing police capabilities). Executive missions have become somewhat less prevalent but capacity-building programs currently abound – both through UN or regional auspices as well as through bilateral arrangements.

There have been a number of relevant concerns raised about the rise of this policing agenda. There are salient concerns about how police personnel from outside a jurisdiction could possibly hope to successfully police a population or reform a local police service in an area that they are not connected to nor necessarily very familiar with. Further complicating this picture is the fact that one of the major problems with international policing efforts so far has therefore been the quality of that policing provided. Variations in civilian police policies, practices, and abilities have also caused difficulties, as individual police services around the world vary greatly in their expertise, ethos, and capabilities. Problems with a lack of cultural sensitivity and language barriers, as demonstrated in Timor Leste (Peake 2009) or Solomon Islands (Allen 2006), are significant enough, even without the concern that police operating overseas may both be getting paid very well while feeling less ethical constraints and being less accountable to oversight mechanisms. Experiences in Bosnia, Sudan, and elsewhere have demonstrated that the ideals of human rights centered democratic policing where police "protect and serve" the local population have not always been adhered to, with a number of charges of abuse of office, unwillingness to carry out policing tasks, or corrupt, immoral, or illegal behavior being reported.

In spite of these particular concerns, however, international policing efforts seem set to continue well into the future (Bayley 2001). This notion is borne out by contemporary conversations as to possible mission deployments to Libya. Concerns over the international policing project itself have often been elided over as internal and external security agendas increasingly merge (Rubenstein 2010), but more specific criticisms about the way in which such policing efforts are undertaken are being taken into account. Efforts are therefore underway to try to standardize training, improve policing standards to help offset current critique (Rotmann 2009; Goldsmith and Scheptycki 2007). The UN Police Division, in particular, has set about trying to improve the current policing practice of UNPOL personnel through standardizing some pre-deployment training and drawing up new professional standards documents. Questions of local versus international ownership are also being discussed in more detail (Hansen 2008).

These efforts may help mitigate some of the concerns about particular aspects of international policing, such as the quality of the policing that is delivered. However, as noted below, in addition to this quality control problem, there also remain concerns about attaining enough *quantity* of personnel to actually undertake those policing missions abroad. (This concern over quantity is in fact slightly ironic given that concerns over quality of policing available in international operations have often led police managers to suggest a better job could be done with less but better quality international police personnel (i.e., police personnel who are ethical, professional, trained in the task at hand and fully accountable for their actions)). And, as we will see below, this particular issue has had a significant knock-on effect.

The Quantity Issue

Although numbers of UNPOL personnel have increased exponentially, and a number of national governments such as Australia and regional institutions such as the EU have created specialized policing deployment pools or groups in response to the demand for international policing capabilities, there are still difficulties in deploying enough civilian police to post-conflict settings. Put simply, there are never enough civilian police to deploy on international operations in a timely fashion. In Africa, in 2009, for example, the UN Security Council (UNSC) had authorized the use of approximately: 6,400 police for the UN–AU Hybrid Operation in Darfur (UNAMID); 1,400 for UN Organisation Mission in the Democratic Republic of Congo (MONUC); 1,200 for the UN Mission in Liberia (UNMIL); 1,200 for the UN Operation in Cote d'Ivoire (UNOCI); and 700 for the UN Mission in the Sudan (UNMIS), but most of these were operating with major shortfalls in numbers (i.e., around 3,000 of the 6,400 were operating in Darfur, while only approximately 600 were operating in the Democratic Republic of Congo) (Williams 2009). And although a number of efforts have been made in recent years to boost international policing capacity in Africa itself, it has been said that:

> Police in general are difficult to recruit to international missions, because they are needed at home. African police are no exception. Many African countries suffer from high crime rates, making it difficult for them to "spare" police for external missions. (Levine 2008, p. 35)

The issue of getting enough police on the ground, particularly within short time frames, therefore continues to bedevil the planners of peace missions and is a product of the place and primary purpose of civilian police. The fact that police are typically being used in a domestic setting, and therefore much planning and resourcing must be in place to release such police, means that those attempting to organize deployments continue to struggle to get enough police into the field.

This issue impacts upon the ability to police in peace operations with civilian police rather than alternative agencies. It is partly this issue of releasing enough numbers of individual civilian police officers for timely international deployment, combined with other mission factors that will be described below, that has encouraged the use of more militarized Formed Police Units (FPUs) or even military personnel for the taking up of policing-type roles as these are institutions that have the ability to deploy mobile units of personnel quickly.

FPUs are often drawn from constabulary forces such as the French *gendarmerie* or the Italian *carabinieri*, forces which are paramilitary in terms of their organization and weaponry. The "Multinational Specialist Units" (MSUs) that were developed by NATO for use in Bosnia in order to help bridge military and civilian police capabilities demonstrate the key roles of FPUs as these particular MSUs consisted of:

> Police Forces with military status who perform duties including civil disturbance operations. This type of force focuses on the civilian population, employs minimum force and often employs small units to accomplish the mission. However, the MSU is not a replacement for the [Bosnia and Herzegovna] Police Forces and does not conduct criminal investigation beyond the scope of the SFOR mandate. (NATO 2004)

Indeed this quote highlights the fact that some FPUs, such as those drawn from the European continent, have additional policing capabilities such as investigative capabilities. Some other FPUs, however, are predominantly riot control or public order management units only. All generally have more "hardware" immediately at hand than civilian police in that such units have access to a range of riot equipment such as shields, batons, capsicum spray, "flashbangs," tear gas, water cannon, rubber bullets, or shotgun bean bag rounds. FPUs are trained in a range of public order management techniques and can operate as a complete, mobile, expeditionary unit.

The use of FPUs in international peace operations since their introduction in Kosovo and Bosnia has increased markedly. In the UN case, for example, FPUs were only brought into UN missions just prior to 2000, by April 2002, about 1,000 of 7,000 UNPOL deployed were members of FPUs, while in April 2009, that proportion had risen to approximately 7,000 of the 17,000 UNPOL deployed in peace operations (Carpenter 2010). This is in part due to the easily deployable and flexible nature of such units. For example, the EU has developed a specialist group out of four continental forces from Spain, France, Italy, and the Netherlands called the European Gendarmerie Force (EUGENDFOR). The EUROGENDFOR can deploy 800 officers in 30 days, and given its nature "can carry out all types of missions in crisis management operations, taking part in the military phase of a crisis, acting during the transition period from a military to a civil operation, and participating in prevention missions" (Ministeria de Defensa de Espana n.d.) In particular, EUROGENDFOR's police function can "be developed under civilian or military chain of command," whereby: during the initial phase of the operation the EGF could "enter the theatre along with the military force in order to perform its police tasks"; during the transitional phase could "continue its mission alone or together with a military force, facilitating co-ordination and co-operation with local or international police units"; and during the military disengagement phase could "facilitate the handing over of responsibilities to civilian authorities and agencies taking part in the co-operation efforts, if necessary" (EUROGENDFOR n.d.). This means that the EU can deploy 800 personnel quickly, with the ability to utilize them in different roles.

In addition to the rise in use of FPUs, the use of military personnel for policing-type activities in international operations has some historical precedent but again, due in part to their deployability and the demands for policing capabilities, has also increased dramatically in recent years. In Panama, for example, "the US military, as the only entity in the country with the capacity to provide the level of stability required, had to deal with the lack of a viable and functioning [host nation] security and [law enforcement] apparatus," (Jayamaha et al. 2010, p. 21). In Kosovo, the USA used their military police as a constabulary type force. The involvement of military personnel, particularly MPs, in traditional policing roles has continued in recent years, with the US military playing "a key role in law enforcement and related issues, even if not specifically tasked with a law enforcement mandate" (Jayamaha et al. 2010, p. xiii) and with undertaking the tasks of police training, mentoring, and institutional reform – mainly in Iraq and Afghanistan (Keller 2010).

Difficulties in getting civilian police to international deployments have therefore helped encourage the use of FPUs or military personnel in policing peace operations, as both of these types of organizations deploy personnel in larger units that have expeditionary capabilities which are more readily released for service than their civilian police counterparts. However, the complex nature of post-conflict environments has also been a motivating factor in the increased involvement of military and FPU personnel in policing or policing-type activities.

The Permissibility Factor

The complex nature of peace operations has also created concerns about whether or not civilian police can in fact operate in more difficult or "hot" security situations (Bayley and Perito 2010). This concern over the safety of civilian police has at times seemed to require military involvement in policing, particularly if state or private police are unable or unwilling to operate in "nonpermissive" environments (Keller 2010). Perhaps more markedly, the concerns over the ability of civilian police to operate in difficult security environments have also, in particular, again also promoted the use of FPUs in policing peace operations.

Contemporary peace operations can involve significant levels of civil disorder, often involving armed protagonists. The problem with such scenarios is that a "capability gap" is perceived to exist between civilian police and the military when it comes to dealing with this kind of situation. Dziedzic (2003, p. 2) argues that:

> Military forces are ill suited to engage in confrontations with civilians because, with the exception of constabulary or military police units, they are generally not trained in the measured use of force, control of riots, negotiating techniques, or de-escalation of conflict. Individual [civilian police] are not capable of handling such large-scale, strategic challenges, either.

Instead, FPUs are thought to be a suitable halfway house in helping to police peace operations in that:

> International peacekeeping operations have in the past been labelled *constabulary* missions, calling for gendarme rather than military capabilities, although throughout the Cold War they were conducted primarily by military forces. Since 1996, beginning with the Multinational Specialised

> Unit in Bosnia, forces like the Italian Carabinieri and the Dutch Marechaussee have been in demand to deal with the combination of organised crime and ethnic extremism that complicates protracted social conflicts. (Mendee and Last 2008, p. 18)

Constabulary forces, then, can seem appealing in certain situations as they are seen as capable of performing both "cooler" military and "hotter" police functions and can be assigned "in either a military or civilian capacity" (Perito 2004, p. 47). EU member states therefore promoted the creation of the EUROGENDFOR as filling a perceived capability gap as well as helping the EU redefine and extend its contributions to peace and stability operations (de Weger 2009). And reports and observation from places such as Timor Leste have suggested that such units, in this case the Guarda Nacional Republicana (GNR), have at times been key in the restoration of security and order due to their ability to respond quickly and decisively to small crises to avoid escalation of localized conflict (see Lemay-Hebert 2009). Formed Police Units and military personnel are therefore being used with increased frequency to undertake policing in peace operations for a number of reasons. However, although the status of Formed Police Units is that of "police," there remain a number of salient concerns both about the increased reliance on FPUs and about the use of military police or other military personnel in some policing-type roles.

Concerns Over the Militarization of Policing

As Alice Hills has noted, although FPUS "make sense: they work" in terms of: their abilities to control crowds; the fact that they allow the UN in this case to expand the number of contributing countries and to get closer to gender targets in that there are all-female units that can deploy to help fill UN quotas; and because they are cheaper per person, the use of FPUS can also be problematic as "they are paramilitary and their composition and operations blur police/military boundaries" (Hills 2009, p. 309). This is particularly problematic in post-conflict situations where the ideal is to clearly demarcate policing and military roles to help demilitarize society and to exclude military from internal security roles. This creates a difficult situation. The security environment may require a "harder" approach to policing society so as to maintain order, but the transition to a less militarized environment becomes more difficult to achieve with such approaches in place.

Moreover, in addition to the provision of basic security needs, the institutionalization of a civilian police force that supports, protects, and serves the local population well is also key to broader democratic or human rights–centered approaches to the political and social situation at hand. After all, as Mercedes Hinton and Tim Newburn note in their work on policing developing democracies "if people can have trust and confidence in rules, institutions, and authorities, they are likely to believe that their long-term personal interests will be well served by voluntary compliance with the laws of the state" (2009, p. 4). If more aggressive paramilitary styles of policing inhibit this trust and confidence, the whole peacebuilding or statebuilding project becomes more tenuous.

However, one possible way to work around this problem could be to utilize FPUs for specialist roles in post-conflict sites that are *known temporary* measures for filling a capacity gap that utilize international units rather than locally sourced personnel. This has been suggested as a way to avoid besmirching the role of local civilian police who are ideally attempting to build legitimacy and consent-based policing models, therefore:

> It may be necessary to create a unique police force that can both provide security and also promote a transition to a more stable and accountable environment, thus allowing conventional police forces to focus on developing according to democratic values. . .. They will not make local police responsible for security functions that would otherwise result in their para-militarisation and the use of extra-legal means for controlling crime and restoring order. (Wiatrowski et al. 2008, pp. 1 and 11)

However, this may also be problematic due to the potential for alienation of the population should the timing or operationalization of this phase be misapplied. The fact that FPUs are typically under military command can have ramifications for command and control, and for how they are therefore related to the issue of governance of the mission though, as noted above, they can also be deployed under civilian control.

In addition to these particular concerns about the heavy use of FPUs in peace operations, additional significant disquiet regarding the use of military in law enforcement-type tasks also remains as while they may be in situ with useful capabilities, policing activities are *not* the core business of the military. Policing skills and mindsets are developed over time and then consolidated on a daily basis through the activities, interactions, and ongoing training of police personnel – such skills or mindsets cannot be internalized quickly, rather this process takes some time to embed to result in a maturity of approach toward complex issues. There therefore remain a number of important distinctions between police and military personnel. In a recent American study, which outlined a number of these important differences between street cops and combat troops, for example, it was found that:

> Although both jobs are in protective service occupations, they differ significantly in terms of specific tasks and expectations. While police officers patrol and investigate wrongdoing, combat rifle crewmembers destroy or capture enemies; while police officers inspect, warn and arrest; rifle crewmembers fortify, camouflage, and repair weapons; while police officers report hazards, disperse unruly crowds, and write daily activity reports, rifle crew members place antitank mines and fire machine guns, and so on. (Campbell and Campbell 2010, p. 339)

It is due to these differences in training and ethos that the authors also argue that when military units are required to undertake policing roles, they focus primarily on developing relevant skills, while police taking on more military-oriented tasks tends to focus less on skill development and more on attitude adjustment (2010, p. 343).

These constitute reasons to be wary of military personnel playing a wider role in training and mentoring police forces too (Mobekk 2005, pp. 5–6). Overly militarized approaches to training local police forces (including the mentoring of police officers by members of the military) can lead to the police force itself taking on militaristic features and militaristic priorities (Sedra 2006, p. 95; Bayley and Perito 2010, p. 4). Much of the literature therefore demonstrates some level of concern about the involvement of military forces in police training and reform, yet this involvement is still occurring and being encouraged in some situations – particularly in Iraq and Afghanistan. This is in large part capability-driven, in that the military tends to have the capabilities or the funds to undertake such a mammoth task, but unless there were significant changes to military forces – changes which would inevitably have a negative impact upon their ability to play their core roles – there will remain a reason to maintain the police–military divide both at home and in operational contexts. This principle is blurred somewhat by the security gap issue that commonly arises in post-conflict situations, and it therefore seems plausible that some military roles might usefully be played *in support of* law enforcement. However, such roles need to be clearly defined and understood prior to deployment, and clear plans made to withdraw military or more militarized policing units from civilian policing tasks at the first possible moment.

Conclusions

In summation, policing has become a key part of international, regional, and bilateral efforts to stabilize and improve post-conflict situations. Policing in peace and stability operations has also become much broader and deeper in terms of the types of tasks and roles police play. There are a number of critiques about the rise of the international policing agenda, but concerted efforts are underway to try to improve the operational aspects of such policing. The ability to generate enough good civilian police for international deployments has constituted one part of such recent efforts, as the lack of available civilian police has at times helped prompt the use of FPUs and military personnel in undertaking some policing functions which has brought its own concerns.

FPUs are, by most definitions, at least a form of "police" and operational experience suggests that they can provide a useful capability, provided they are used wisely. However, there remain some reservations about their use in post-conflict peace operations in particular, and the use of military personnel to perform policing functions too brings a number of additional problems. In addition to simple capability differences (i.e., the training, equipment, situational awareness, etc., will differ for police versus military personnel), there are a number of broader ramifications. In particular, a major goal of most peace operations is the demilitarization and de-escalation of the local environment, as well as the embedding of particular political contexts; therefore, the use of military (or highly militarized FPUs for that matter) for policing functions can blur the democratic ideal of military as external actor and police as internal actor.

The debate over the practical and ethical issues of military or militarized police units undertaking civilian policing in peace and stability operations therefore looks set to continue until a more ideal division of labor can be clearly conceptualized of, internalized by the agencies involved, adequately resourced but, most importantly of all, sited within a more general conversation about the broader ethical and normative shifts that this trend embodies. It is likely that planners of peace and stability operations will look to utilize three main security actors – military personnel (including military police), FPUs, and civilian police – in a more systematic way in future. The limitations, both practical and ethical, of using such agents in particular roles need careful forethought. FPUs deployed for public order maintenance roles, for example, may have a place in plugging the capability gap in less permissive environments, but should be removed as soon as possible to encourage demilitarization of society. Military police may be preferable to infantry for training police in nonpermissive environments, but if military police rather than civilian police are the ones providing training for this reason then the question must then also be asked as to whether or not the situation can actively support a civilian police force at that point in time. Creating a highly militarized police force in a post-conflict or potentially still conflict-ridden environment may simply be creating another destabilizing force in country.

There are practical concerns about securing civilian safety in peace and stability operations that need to be met. However, there are also larger concerns about keeping the military out of internal security roles in burgeoning democracies, or about demilitarizing a traumatized post-conflict environment, that mean that decisions to use agents other than civilian police for internal security must be weighed and measured carefully. Future research needs to look at what patterns of policing have worked in what types of environments, and needs to probe beyond practical concerns to the larger political and normative background against which such technical and operational tenets sit.

Acknowledgments Some of the research for this entry was undertaken as part of the “Civil-Military Interactions in Peace Operations” project that was funded by the Asia Pacific Civil Military Centre of Excellence, Queanbeyan, Australia, and part of this entry draws on an initial working paper: B.K. Greener and W.J. Fish, *The Development of Civilian Policing: Lessons for Contemporary Post Conflict Operations*, Occasional Paper 4/2011, Canberra: APCMCoE. However, the views expressed in this piece are those of the author alone. The author would also like to thank all of those police and military personnel who have given so willingly of their time to discuss their experiences as part of this project.

Policing Special Populations

Garrett Grothoff
School of Criminal Justice, University of Cincinnati, Cincinnati, OH, USA

Overview

Society expects that the police manage a wide variety of problems. Compounding these expectations are special populations that create unique situations that the police must deal with. The nature of these populations as small subsets of society makes them an understudied area in criminal justice research. However, they present important issues for law enforcement, policy makers, and academics. As such, this entry addresses a number of these populations, including domestic violence offenders, persons with mental illness, juveniles, and immigrants, specifically focusing on the control of discretion associated with them. This entry begins with a discussion of the factors that influence discretion in cases of domestic violence and follows by overviewing limitations to discretion during these interactions. Next, it describes the interaction of the police with the mentally ill and the impact of discretion on their decision-making in this context. Then the discussion of juveniles highlights both the formal and informal decisions influenced by discretion. Finally, the interaction between police and immigrants is overviewed in the context of profiling and police perception.

Fundamentals

Domestic Violence

In the United States, domestic violence became a topical issue in the late 1970s. At this time, feminists and women rights advocates started to draw attention to domestic violence as it related to the lack of attention by the police. These groups wanted a response from the criminal justice system to address the concerns they had with police choosing not to arrest. This sparked a push from many police departments to take an aggressive stance toward domestic violence, creating mandatory arrest policies rather than the more traditional responses of advising, mediating, or separating disputants (Robinson and Chandek 2000).

Prior to mandatory arrest and aggressive policies being commonplace, research shows mixed results between the police's use of discretion and domestic violence cases. In an attempt to reduce the problems associated with domestic violence, academics attempted to identify the causes of police discretion. Traditionally, serious violent crimes have been one of the strongest predictors of arrest. However, the police approach domestic violence as a private family issue and have been very reluctant to make an arrest and intervene. This unwillingness to arrest coupled with the belief that domestic violence is a private issue led to the development of a leniency thesis by academics and advocate groups. The leniency thesis proposes that the police are less likely to arrest spouses who assault their wives, compared to other domestic violence victim-offender relationships.

Currently, there is no consensus on whether the leniency thesis reflects reality. However, there are consistent findings that police officers are unlikely to make an arrest in domestic violence cases. Although research on the leniency thesis is mixed, it has helped to shed light on the overall amount of discretion that is exercised by officers in domestic violence cases.

Critics contend that attempts by the police to limit discretion are based on more than just the goals of reducing violence and protecting victims. The police also consider crime control, liability issues, and public opinion. To provide a clear picture of the factors that influence the decision to arrest, it is best to categorize them into demographic, attitudinal, and situational characteristics.

There are three primary demographic characteristics that research focuses on: race, age, and sex. These demographic characteristics are assessed for the responding officer, victim, and offender. The literature on race has not been able to draw firm conclusions. In certain instances, the findings show that minority victims are less likely to have an arrest made on their behalf compared to whites (Black 1971; Ferraro 1989; Smith 1987). However, research does not produce consistent findings when assessing the race of the suspect.

The literature on age and sex characteristics shows that on average, females are less likely to make an arrest than males and older officers are less likely to make an arrest compared to younger officers (Martin 1993; Stalans and Finn 1995). The findings produced by this body of research show that these characteristics might influence officer discretion and should be included in future analyses.

Two primary factors influence the attitudes and discretion of police officers in cases of domestic violence: likelihood of the victim to drop the charges and whether the victim prefers an arrest (Robinson and Chandek 2000). Logic should dictate that if a victim prefers an arrest that the police will be more likely to arrest. The research confirms this hypothesis; however, other situational factors can influence this decision. If the victim used drugs or displayed a negative demeanor, officers were less likely to follow a request (Buzawa and Buzawa 1993). In addition, a reduced likelihood of arrest is replicated in cases where the officer believes the victim will drop the charges.

Previous research on situational characteristics of domestic violence shows that legal rather than extralegal (e.g., attitudinal or demographic characteristics) variables are more important predictors of arrest. This research shows that the use of a weapon during the incident, seriousness of the offense, additional witnesses, use of alcohol or drugs, whether or not the reporter was a female, whether or not the victim was injured, and the incidence of repeat violence significantly increase the chance of an arrest (Avakame and Fyfe 2001; Berk and Loseke 1981; Ferraro 1989; Robinson and Chandek 2000; Worden and Pollitz 1984; Worden 1989). In contrast, if the victim and offender are married, or the suspect leaves the scene, the chance of an arrest decreases.

Attempts to control discretion started from a push to find new ways to reduce domestic violence. The Minneapolis Domestic Violence Experiment (MDVE) was the first attempt to address this by determining whether mandating arrest decreased future domestic violence in a controlled experiment. The Minneapolis experiment, conducted from 1981 to 1982, compared three police options to handle domestic violence situations. The officers were randomly assigned to arrest, remove, or counsel the suspect involved. These procedures were the three standard methods of police response to domestic violence at that time. The experiment was limited to domestic violence cases where both the suspect and victim were present. The results of the experiment indicated that among the three methods, arrest was the most effective at reducing future domestic violence. State legislatures, as a fast fix to the domestic violence problem, quickly adopted the results from Minneapolis. However, the replication of this study in different cities soon showed that the results were short lived.

Researchers began to find in the replicated studies that the deterrent effect of mandatory arrest would soon diminish after a short lag in time. The results after the lag proved contrary to the original finding in Minneapolis; mandatory arrest only increased recidivism rates. Overall, the results of the experiment in Minneapolis and its replications suggest that arrest can reduce domestic violence in some cities but not in others, that it reduces domestic violence among the employed but increases it for the unemployed, and that it has a short-term reduction effect but can increase domestic violence long term. A final point that persisted throughout the domestic violence experiments is the fact that the police in many circumstances can identify those people at risk of suffering future violence. However, the value of privacy and personnel freedom prevents proactive action (Schmidt and Sherman 1993). These studies are an example of an attempt to control police discretion during incidents of domestic violence. Their findings show that this is not an easy task. Controlling or limiting discretion can actually increase the frequency and severity of many problems.

Mental Illness

Police encounters with the mentally ill have increased due to the closure of psychiatric hospitals, overcrowded prisons, and growing population of inmates diagnosed with a mental illness. This population is a serious threat to the police based on the symptoms associated with many mental illnesses. Impaired judgment, disorganized thought, impulsivity, and an impaired ability to perceive risk and protect their person can increase levels of violence during police interactions. Reducing the potential for dangerous encounters is why it is important that the criminal justice system improve the understanding of the police's interactions with the mentally ill. The ability to understand how decisions are made and the use of discretion in these situations can help protect the police, the public, and persons suffering from mental illness. Ultimately a better understanding can lead to better policies and practices that reduce violence and dangerous encounters.

Prior research identified the police as a form of "street-corner psychiatrist" that describes their role as gatekeeper for both the criminal justice and mental health systems. Describing persons with mental illness as a special population refers to their vulnerability and unpopular stigma. Persons with mental illness in general are more prone to have substance use disorders, homelessness, and victimization. Research suggests that persons with mental illness suffer victimization from procedural justice due to their diminished capacity to understand and invoke the criminal justice system on their behalf, demonstrated by the lack of legal resources they are able to obtain. This highlights the duty and value of police officers as first responders to help persons with mental illness find the resources they need within the community (Gur 2010).

Egon Bittner, in the late 1960s, determined that the police, after contacts with the mentally ill, were more likely to use hospitalization or a psychiatric referral in the most severe cases. In general, however, research finds that the police take an informal approach to deal with mentally ill suspects, such as attempting to calm the person or take them home. These tactics used by police in the 1960s lead to the description of police contacts with the mentally ill as "psychiatric first aid" (Bittner 1967). The police were in a position to handle the immediate situation, but had few solutions to solve the larger problem of mental illness.

Two established principles that guide police discretion in interactions with persons with mental illness are the duties of removing dangerous people from the community and protecting citizens that are unable to help themselves. Police officers are primarily responsible for protecting the community first, before the individual from themselves. The police do not have a legal code that dictates how to resolve situations with the mentally ill. That is, there is no rule of law that determines the degree of mental illness and guides officer discretion. It is known that arrest is a rare disposition and informal dispositions are more common. Therefore, the police base their informal decisions on social and structural factors that occur during a situation, rather than the degree of psychiatric health of the suspect (Teplin and Pruett 1992).

Generally, after accounting for necessary control variables, the police are no more likely to arrest persons with mental illness than without. Applying this to encounters with the mentally ill, one finds that most encounters are order maintenance, which increases the amount of discretion used by the officer. Community context is a factor that should not be ignored. High levels of violence and availability of mental health services can affect the discretion used by officers when deciding whether to make an arrest. Compounding this problem, research shows that the mental health system is tougher for police officers to work with than the criminal justice system. In cases where the suspect appears dangerous, mental health officials are reluctant to provide services. Psychiatry research reports higher rates of arrest for persons with mental illness. In these cases, the discretion of an officer to recognize the symptoms of mental illness may be increasing arrests due to misidentification; police officers do not recognize that the suspect is mentally ill (Engel and Silver 2001).

A framework has emerged to describe the discretion used by police officers during encounters with the mentally ill. Morabito (2007) and Bittner (1967) explain that three "horizons," the scenic, temporal, and manipulative, influence police discretion. These three horizons include characteristics of the community, offender, and incident. The development of these horizons has indicated that research has focused primarily on mental illness as the sole predictor of arrest. Research in the field of criminal justice shows that there are many factors that influence police discretion when deciding to arrest. Researchers must also consider environmental and organizational factors when trying to determine the independent impact of mental illness on the decision to arrest. Not controlling for these other factors has oversimplified police discretion, a problem hopefully overcome by using the horizon framework to account for them.

There is a difference in the actions of police officers depending on who initiates the contact with a mentally ill suspect. A contact initiated by the police officer can involve more discretion due to the fact that the police officer's perceptions and attitudes can play a larger role because there is less oversight from supervisors or third-party citizens. In situations when the police respond to a call from a citizen, the wishes of the citizen must be recognized along with an understanding of the behavior that has already taken place (Lamb et al. 2002).

Researchers have also raised the question as to the extent of which mental illness should matter in the decision to arrest, especially in cases of serious crimes. Others maintain that persons with mental illness are not all dangerous. Persons with mental illness commit crimes with differing degrees of seriousness, just like persons free of mental illness. The challenge to the mental health and criminal justice systems is to hold these individuals responsible for their crimes while also providing treatment for those in need.

Extant research suggests that approximately 6–10 % of suspects encountered by the police suffer from a mental illness. The results show that a growing method to reduce police discretion with the mentally ill is the development of Crisis Intervention Teams (CITs). The primary focus of CITs rests on police officer characteristics and training, the goal of which is to reduce the number of mentally ill persons that enter the criminal justice system due to a lack of a better alternative. However, CIT models also incorporate organizational and environmental characteristics that help increase the available resources for police officers when confronting persons with mental illness. Research shows that these teams have a positive, short-term impact. However, for a better understanding of how this model controls discretion, these results must be strengthened; no direct test of the CIT model currently exists (Watson et al. 2008).

Explorations into the control of discretion reveal that mobile crisis teams consisting of police officers, mental health officials, or both can reduce the number of persons with mental illness from entering the criminal justice system. The police are essential in recognizing when persons with mental illness need attention and assisting those people to help find treatment resources. In some circumstances, the use of alcohol or drugs can mask the symptoms of mental illness. This can lead to police officers making an arrest on legal factors that may not be the true cause of the behavior. Compounding this problem even further is the likelihood that a person with mental illness is using alcohol or drugs, possibly intensifying their symptoms. Situations that cause the police to take physical action and subdue a suspect can also hide symptoms of mental illness. Any violence that is displayed during an interaction with the police will increase the likelihood of an arrest. A lack of alternatives leads the police to use an arrest out of mercy and as a final resolution for the problem. Still, when the police do determine that a suspect should be taken to a mental hospital, the mental health officials may present problems, including long waits for treatment that prevent the police from attending to other duties, questioning the judgment of the police that the person is mentally ill, and that the mental health facility may quickly release a suspect that the police view as a danger to society.

Police officers have three choices when handling mentally ill suspects; they can make an arrest, take the suspect to a mental hospital, or solve the problem informally. The situation increases the amount of discretion used by a police officer when making the decision to respond formally or informally. A formal response is either an arrest or hospitalization. Research shows that in most circumstances the first choice is to use an informal method to resolve the situation. However, mental disorder is associated with a higher likelihood of poor demeanor, and police are more likely to arrest a suspect with a poor demeanor. The criminal justice system is not set up for easy entry into the mental health system. Once a record is established, jail or prison is a more likely outcome. Unfortunately, jails and prisons are not the best environment for effective treatment for mental illness (Teplin 2000).

Mental illness is becoming more visible within the community. Although the number of mentally ill is increasing in communities, they are not responding with an increase in acceptance.

Discretion of police officers is limited through legal and bureaucratic restrictions. The mental health bureaucracy can complicate and impede the referral of suspects to service. Many psychiatric programs are cautious to admit dangerous suspects or those with many prior hospitalizations. The criminal justice system does not have the luxury of saying no to dealing with mentally ill suspects. Jails are turned into pseudo-mental health facilities. An increase in police training to help identify suspects that exhibit symptoms of mental illness will help to provide the best service to the right people. Negotiating with hospitals to reduce the number of declined suspects will also help. The best approach may be to take the least restrictive alternative to help control discretion and the criminalization of the mentally ill (Teplin 1984).

Juveniles

Juveniles are becoming a growing problem for the entire criminal justice system. In addition, the point of first contact with the criminal justice system for most youth is with the police. This places the police, as a gatekeeper, in the position to make the first decision on whether formal action should be taken against juveniles in the form of arrest or detention. However, the tradition of the criminal justice system is to treat juveniles more leniently due to a feeling that they are not culpable for their actions. This approach is further perpetuated when the courts choose to release juveniles to their parents, making it difficult for the police to remove troubling youth from the streets. Due to this lenient treatment, in many cases, it does not make taking formal action against juveniles worthwhile for police if there is an alternative solution available.

Coupled with the lenient approach from the system, recent focus on crime control strategies and a push to reduce crime have increased the courts willingness to sentence juveniles that are arrested as adults. The blend of crime reduction strategies along with a traditional lenient approach toward juvenile behavior creates unique problems for the police. The police are now forced to make the decision of whether formal or informal action is more appropriate to solve the situation. The officer making this determination exercises a large amount of discretion and can ultimately decide whether the juvenile will have a record or not.

Previous research on police encounters with juveniles shows that there are far more contacts between the two than what ultimately end up in juvenile court. Few data sets to date have collected information specifically on the interaction between the police and juveniles. Research past and present has relied on data collected on police encounters with juveniles during observational studies with patrol officers, as well as interviews with juveniles.

Encounters with juveniles tend to resemble encounters with adults (Pilivian and Briar 1964; Black and Reiss 1970; Worden and Myers forthcoming). The nature of these encounters is typically not serious, does not result in an arrest, and does not involve any action taken by police that is not based on observed legal factors. Officer-initiated encounters primarily occur as the result of officers seeing wanted youths, in response to reported offenses, or direct observation of law violation and suspicious behavior (Pilivian and Briar 1964). Citizens tend to initiate the majority of police-juvenile encounters. Police contacts with juveniles can also occur through referrals from school officials, parents, and others.

A growing body of policing literature demonstrates a wide latitude of discretion that exists during encounters with juveniles. Discretion as it relates to police encounters with juveniles often depends on the officer making the contact (Pilivian and Briar 1964). Patrol officers exercise different discretion than juvenile officers. Officers that specialize in juvenile cases take a stance that formal action, like an arrest, may do more harm than good. On the other hand, patrol officers are concerned with the demands of the complainant and the requirements needed to remedy a situation. The juvenile system also stresses that the officer uses individual characteristics as a determining factor when deciding to make an arrest. This shift from the offense to the offender increases the amount of discretion an officer has by adding more information.

Both situational and organizational factors limit the control of discretion (Lundman et al. 1978). Legal factors of the situation determine the majority of decisions made by the police when encountering juveniles. However, extralegal factors, like demeanor, still play an important role, especially when a disrespectful demeanor is shown toward the police. Organizational factors that limit police discretion result from departmental policies that require police officers to treat juveniles in a more lenient fashion. Departmental policy can also dictate the number of encounters with juveniles by taking a proactive approach. A proactive approach emphasizes the number of contacts the police have with juveniles, attempting to reduce the ratio of juvenile encounters with citizens and police.

There has been limited research on the control of police discretion pertaining to juvenile encounters. This is partly due to the nature of the juvenile court philosophy that more emphasis should be placed on the character and life situations of the juvenile rather than actual behavior. On the other hand, research shows that when the police do decide to apply formal sanctions to juveniles, they base these decisions on legal factors, such as seriousness of the crime and prior record. Therefore, the most discretion used by the police when encountering juveniles is the decision to invoke the formal criminal justice system or not (Pilivian and Briar 1964).

The recent adoption of community-oriented policing (COP) changes the dynamic between the police and juveniles. COP offers the police a new model to address juvenile crime. Community policing officers approach juveniles with a different attitude. This attitude is more proactive and places a greater emphasis on improving the situations of young people at the neighborhood level. The goals of these officers are to enhance prevention, further diversion efforts, and increase advocacy and parental support (Bazemore and Senjo 1997). However, research is unclear on whether community-oriented policing will result in more diversions or arrests of juveniles.

Another issue relevant to the control of police discretion during juvenile contacts involves the decision to interrogate (Feld 2006). Juvenile interrogations present the police with two problems: a lack of the understanding of the law by the juvenile and the ability to understand their Miranda rights. Psychological research examining juveniles competency of the law shows that youths 15 years of age and younger exhibit the greatest lack of understanding compared to adults (Bonnie and Grisso 2000). Psychology literature also reports that juveniles are more likely to defer, or waive, their Miranda rights due to the social pressure of cooperation with police officers and the misunderstanding that their Miranda rights that are granted to them can be taken away. The United States Supreme Court's rulings in *Yarborough v. Alvarado* and *Fare v. Michael C*. draw the line at 16 years of age for juveniles to be responsible to make the decision to waive their Miranda rights. Technology has increased the control of discretion and subsequently officer actions during interrogations. The taping or video recording of the questioning in interrogations serves as oversight to help protect the rights of juveniles. Some research also recommends that the length of the interviews be limited (Feld 2006). Limiting the length of the interrogation reduces the amount of stress the police can generate to coax a confession.

Immigrants

The legal and illegal immigrant populations in the United States over the past few decades have surged. This has created enclaves within communities with their own specific issues, forcing federal, state, and local law enforcement to adapt new methods of policing to attend to their needs. Census estimates show that Latinos are now the largest minority population in the United States, making up approximately 14 % of the population. However, immigration in the United States includes more than just Latino or Hispanic immigrants. Areas of immigrant populations are found across the United States comprised of people from around the world. Immigrants as a special population present the police with unique challenges, specifically with the use of discretion. There are many interactions with immigrants where the police can exercise discretion. These include racial profiling, search and seizure, and more recently the power to enforce federal immigration laws.

Profiling based on immigrant status and race is a continuing issue that the criminal justice system struggles to reduce. Research on race and police decision-making has shown that race is one of many factors that affect discretion. However, even though racial disparities exist in the criminal justice system, controlling for variables like officer and suspect characteristics, organizational structure, and situational and contextual variables diminishes any direct effects of race. The events surrounding September 11, however, have changed the United States' landscape affecting the use of police discretion toward immigrant populations.

In an effort to prevent another terrorist attack, after those of September 11, law enforcement at all levels is increasing their enforcement of immigration laws. These attacks have also increased the amount of discretion available to law enforcement, mainly through the USA PATRIOT Act of 2001. Local law enforcement now has a role in national security. This discretion is seen firsthand by many immigrants as their privacy in the United States has diminished. However, the extent to which local law enforcement has embraced this increase in discretion is minimal. Many cities with large immigrant populations have adopted mandates that explicitly state immigration enforcement is a federal mandate. Police departments cite many reasons for the adoption of these mandates that include a lack of resources and diminished trust among immigrant groups (Harris 2006).

With immigrant populations, the police may place a stronger emphasis on race. An essential part of any profile includes the race of an individual. The Supreme Court has upheld that the police can use race in combination with other factors to develop a profile. This enhances the amount of discretion afforded to the police when making decisions to stop and search Muslims in airport terminals or legal Hispanic citizens living along the US and Mexican border.

An increase in discretion and closer attention from law enforcement has stressed an already fragile police-immigrant relationship. Immigrant populations are already less likely than whites or blacks to report crimes to the police. This lack of reporting can lead to further reductions in police officers' ability to control crime. In addition, many immigrants carry with them distrust for the police from negative experiences in their home countries. For example, authoritarian governments and countries plagued by high levels of violence can influence immigrants' perceptions of the police in a negative fashion (Davis et al. 2001). These perceptions have led researchers to explore further the potential causes of negative perceptions in hopes of strengthening the police-immigrant relationship. As a result, research has identified three factors that affect the perceptions of immigrants toward the police: social networks, prior homeland experiences, and contact with US immigration officials (Menjiver and Bejarano 2004).

Perceptions of immigrants toward the police are important in how the police use their discretion toward immigrants. A negative perception can manifest into a negative demeanor in police-immigrant interactions. Demeanor is one factor that can persuade a police officer to use a formal rather than informal disposition, such as making an arrest versus writing a warning. Survey research targeting Chinese immigrants supports the claims that perception is important not only to the police but also to the immigrants. In general, these surveys find that a quality police contact was more important than the quantity of contacts. The views of the Chinese immigrants were that attempts to improve the quality of police services, increase police officers understanding of the language and culture, would increase immigrants' satisfaction with the police (Chu et al. 2005).

The police may have a difficult time addressing these views. Many attempts to improve police officer relationships with immigrant populations are accomplished through community-oriented policing strategies. Community-oriented policing strategies place the officers closer to the public and encourage interaction to address community problems directly. However, community-oriented policing increases the amount of discretion used by police officers, discretion that many immigrant populations are fighting to limit.

Perception and overcoming profiling are not the only immigrant concerns for the police. Language many times can force police officers to use more discretion with immigrant populations than with English-speaking citizens. This presents severe constitutional problems with the interpretation and understanding of suspect rights when an immigrant that does not speak or understand English is read the Miranda warning. However, police departments and officers have taken steps to account for the language barrier. Along the US-Mexico border, Miranda warnings are read in English and Spanish. Many departments in areas with large immigrant populations actively recruit bilingual officers. These have been accompanied with changes to interrogation policies and the presence of an interpreter if necessary.

Conclusion

Police discretion is ever present in the criminal justice system. Special populations of citizens present unique circumstances and situations that increase and decrease the amount of discretion police officers use. These populations include cases of domestic violence, persons with mental illness, juveniles, and immigrants. Research in these areas has unfortunately found that there is no easy way to control police discretion. In some circumstances, findings show that a certain amount of discretion is a positive. Discretion allows the police to invoke informal rather than formal sanctions that reduce the number of people entering the criminal justice system. Discretion also allows the police to direct offenders in need of special healthcare services to resources that can provide alternatives to jail or prison. In other instances, discretion has led to the potential of police infringing on citizens' constitutional rights. Finally, discretion leaves the police with a choice, one that in cases of domestic violence can leave a victim in a dangerous situation.

In all, the influences on police decision-making are both positive and negative making police discretion hard to control. The special populations here demonstrate these points. Future research should focus on managing discretion in a manner that best serves the public's interests. The police, guided by more research, must overcome the hurdle of managing discretion in a way that does no harm to the public or impedes officers from accomplishing their goals.

Policing Terrorism and Legitimacy

Tal Jonathan-Zamir
Institute of Criminology, Faculty of Law,
The Hebrew University of Jerusalem,
Jerusalem, Israel

Overview

Over the past decade police agencies in the democratic world have increased their involvement in counterterrorism. This new focus, in turn, has generated much debate (and limited empirical research) on the unintended outcomes of policing terrorism, such as its effects on the ability of the police to address crime and carry out other "classic" policing duties, and their relationship with the public. At the same time, discussions about the effects of counterterrorism policing on police-community relationships have focused primarily on minority, Muslim or Arab groups, while much less attention has been paid to *majority*, non-Muslim communities.

Nevertheless, the few studies that have tackled the effects of policing terrorism on the relationship between the police and majority groups indicate that there are important issues that should be addressed in this context. First, as reviewed below, research reveals that terrorism threats and police involvement in this domain, in the long run, bring about a drop in majority communities' assessments of the police. With regard to the impact of policing terrorism on the processes by which public evaluations of the police are formed, studies show that majority groups remain very much concerned with procedural fairness and police legitimacy, even when faced with intense security threats or when considering counterterrorism policies and cooperation with the police in their efforts to combat terrorism. These communities were also found to be aware of the potential negative outcomes of police focus on counterterrorism, such as neglect of "classic" policing duties and negative effects on the relationship between the police and Muslim or Arab communities, and, finally, research reveals that majority communities remain sensitive to procedural injustice in policing terrorism, even when directed at Muslim communities. Overall, and perhaps contrary to intuitive thinking, it appears that majority groups *do not* abandon considerations of fair policing in the context of counterterrorism and, while expecting security from the threat, remain equally concerned with procedural justice and place much value on the legitimacy of the police.

Background

Since the terror attack of September 11, 2001, police forces in the United States, as well as in other Western democracies, have become significantly more involved in counterterrorism and other security tasks in comparison to previous decades (Bayley and Weisburd 2009; International Association of Chiefs of Police 2005; National Research Council 2004). Because such responsibilities were relatively new for local police agencies in countries like the United States and not necessarily perceived as "natural" police roles (International Association of Chiefs of Police 2005; Weisburd et al. 2009a), this new focus on counterterrorism gave rise to much debate, speculation, and some empirical research about the effects these tasks may have on the police, their organization, priorities, performance and character, as well as their role in society more generally (e.g., Weisburd et al. 2009b).

One major concern raised by scholars focused on the potential effects of police involvement in counterterrorism on their relationship with the public. Bayley and Weisburd (2009), for example, have argued that extensive homeland security responsibilities may change the focus of the police from "low" to "high" policing (Brodeur 1983), which may affect both their goals and strategies and their character and interactions with citizens. The focus of "high policing" is on macro-level issues rather than local problems. The methods of this policing style are characterized by covert tactics such as surveillance and intelligence gathering, which are often less transparent and accountable, and associated with violations of human rights and procedural justice. Thus, they argue, "high policing" may change the orientation of the police from providing service and viewing citizens as clients to controlling the public and viewing citizens as suspects.

Mastrofski (2006) raised similar concerns in the context of the future of community policing. He suggested that police involvement in counterterrorism may subordinate the community to the police and undermine police accountability and responsiveness to the public. He further argued that focusing on counterterrorism may result in close association between the police and military or intelligence agencies, which may contribute to the militarization of the police, which, in turn, may hamper recent efforts to bring the police and the community closer together. Similar arguments and concerns were raised by other scholars as well (e.g., Hasisi et al. 2009; Murray 2005; Thacher 2005; Weisburd et al. 2009a).

Importantly, however, such concerns were generally raised with regard to minority Arab or Muslim communities. Scholars and practitioners warned that this sector may be perceived as the "enemy within" due to ethnic or national links to the source of the terrorism threat (Hasisi et al. 2009; Weisburd et al. 2009a), and thus their relationship with the police is particularly vulnerable (Henderson et al. 2006; Thacher 2005; Tyler et al. 2010). Much less attention has been paid to the effects of policing terrorism on *majority/non-Muslim communities* and their relationship with the police, possibly because of the common assumption that members of these communities and the police are "on the same side" in the struggle against terrorism, and thus there is no reason to suspect that the policing of terrorism would impact their partnerships. However, as detailed below, there are important reasons to suspect that this is not necessarily the case, and in fact numerous questions and concerns could be raised in this context. Studies that have examined some of these issues, and have indeed identified various effects (or lack of effects) of policing terrorism on public preferences, expectations of and general attitudes toward the police among majority communities, are reviewed in the following sections followed by an integrative discussion, conclusions, and suggestions for future research.

The Study of the Relationship Between the Police and Majority Communities in the Context of Policing Terrorism

What are the effects of police involvement in counterterrorism on the relationship between the police and majority, non-Muslim or non-Arab communities? What would this relationship look like in places or in times of intense terrorism threats or where the police devote much of their resources to counterterrorism? These broad questions may be broken down into many, more specific inquiries. One may wonder, for example, about the correlation between policing terrorism and public evaluations of the police. Does extensive police involvement in counterterrorism impact the image of the police in the public eye? If so, do evaluations improve or weaken? A different set of questions concern the effects of security threats and police involvement in counterterrorism not on absolute levels of support or trust in the police, but rather on the *processes* by which such evaluations are formed. When assessing police legitimacy in situations of threat, or when considering cooperating with the police in their counterterrorism efforts, do citizens take into account the same factors they would in the context of fighting crime or when there are no specific security threats in the background? Do they give these factors the same weight?

One may also ask if majority communities, while experiencing fear and vulnerability in the face of ongoing security threats, are also aware of the potential costs of police focus on counterterrorism, such as reduced emphasis on crime control or change in the nature of policing services they are receiving. A related question concerns the responses of majority communities to perceived mistreatment of minorities. If the police are viewed as treating minorities in an unfair or biased fashion while engaging in counterterrorism, would this impact their image in the eyes of *majority* communities? These issues, which have been examined by researchers, make up the current state of knowledge about the relationship between the police and majority communities in the context of policing terrorism. The studies that have tackled these questions are reviewed below, followed by an integrative discussion. It is important to emphasize, however, that the picture is far from complete, as many more questions could be asked and examined in this context. Some directions for future research will be discussed in the last section of the entry.

What Is the Relationship Between Police Involvement in Counterterrorism and Public Evaluations of the Police over Time?

Is there a relationship between the level of terrorism threats (and thus police involvement in counterterrorism) and public attitudes toward the police? If so, does focusing on counterterrorism improve or alternatively weaken public support? These questions were examined by Jonathan (2010) within the Israeli context, where the national police force is responsible for and treats all terrorist threats or attacks within Israeli borders. As reviewed by this author, prior to empirical examination both hypotheses appear plausible. On the one hand, scholars have argued that policing terrorism may weaken public assessments of the police, both as a result of change in the nature and character of policing and because the preoccupation with security tasks may come at the expense of handling local crime and disorder problems (e.g., Bayley and Weisburd 2009; Hasisi et al. 2009; Weisburd et al. 2009a, 2010).

On the other hand, there are also reasons to suspect that extensive involvement in counterterrorism could actually *improve* the public image of the police: in times of acute security threats, by focusing on counterterrorism the police may be perceived as responding to the problem that is mostly troubling the public; terrorism threats may encourage collaboration between the police and community members/organizations; security-related matters are often viewed as "high status" and "prestigious" by majority communities and may thus improve the overall image of the police; and, finally, the police may appear highly efficient and professional in their rapid, full-scale counterterrorism responses, which may enhance assessments of police competence (see Weisburd et al. 2009a, also see review by Jonathan 2010).

Following these mixed hypotheses, Jonathan (2010) examined fluctuations in numerous types of public attitudes toward the Israel National Police between 1998 and 2007 and, specifically, compared assessments across three time points, each representing a different situation of terrorism threats around the "Second Palestinian Intifada": 2000, before the outbreak of the Intifada; 2002, the height of the terrorism threats of the Intifada; and 2007, when terrorism threats returned to pre-Intifada levels. This author identified a rise in public assessments of the police following the rise in terrorism threats and a peak in public support corresponding with the peak in threat levels. However, once the threat began to drop, so did evaluations of the police, often to levels lower than those measured at the beginning of the decade, prior to the high-threat period of the Intifada.

These findings are attributed to the tendency for internal cohesion in the face of an external threat (e.g., Stein 1976) and, specifically, to the "Rally 'Round the Flag" Effect (Mueller 1970), according to which, in times of international crises, support for the national leader and for other public institutions increases, but only for a limited period of time. Once the crisis has passed or, alternatively, drags on longer than expected, support typically returns to earlier levels. The apparently conflicting hypotheses mentioned earlier also seem to be supported: in the short term, assessments of the police among majority communities improve as a result of police involvement in counterterrorism. In the long term, however, the negative effects appear to take their toll and bring about a drop in public evaluations. Importantly, similar fluctuations in attitudes were identified in the USA around the 9/11 terror attack (see Shaw and Brannan 2009).

Do Security Threats Impact the Factors Citizen Consider when Forming Evaluations of Police Legitimacy?

A second important question examined by scholars in the context of the relationship between the police and majority community in situations of threat concerns the factors citizens consider and value when assessing police legitimacy. The legitimacy of the police in the eyes of the public is frequently viewed as a key outcome of policing in democratic societies (National Research Council 2004). By "police legitimacy" scholars often refer to personal, subjective beliefs that the agency or the rule ought to be obeyed (see Weber 1968), or to "the belief that the police are entitled to call upon the public to follow the law and help combat crime, and that members of the public have an obligation to engage in cooperative behaviors" (Tyler 2004, pp. 86–87).

The critical importance of police legitimacy lays in both normative and instrumental reasons. In democracies, where the police receive their authority and powers from the public, it is expected that they would be perceived as an expression of the community, serving the public interest, rather than alien and distant from citizens and their needs. From the practical perspective, police legitimacy was found to result in numerous desirable outcomes, such as compliance with the law, acceptance of police decisions, and willingness to collaborate with the police, provide information, assist in solving crime and empower the police (e.g., Reisig et al. 2007; Sunshine and Tyler 2003; Tyler 2004, 2009; Tyler and Fagan 2008; also see review by the National Research Council 2004).

Given the importance of police legitimacy, scholars have devoted much attention to identifying the factors that shape legitimacy assessments. These studies have repeatedly shown that the extent to which the police are perceived as legitimate depends primarily on evaluations of *the fairness of the processes* by which they exercise their authority, or "procedural justice" (National Research Council 2004; Reisig et al. 2007; Tyler 2004, 2009; Tyler et al. 2010). A second important factor was found to be evaluations of the ability of the police to "bring results" – catch rule breakers, for example, or control crime. However, although playing an important role in predicting police legitimacy, these instrumental considerations were consistently found to be *secondary* to procedural justice in their importance (Sunshine and Tyler 2003; Tyler 2004, 2009).

Nevertheless, according to Jonathan-Zamir and Weisburd (2013), it should not be taken for granted that "procedural justice" would remain the primary predictor of police legitimacy when the public is faced with acute, ongoing security threats. They argue that under such circumstances, when citizens are experiencing insecurity, fear and vulnerability, they may be more concerned with end results, i.e. with the police handling the threat and providing security, and less worried about fair processes. Thus, under threat, the role of police performance in shaping legitimacy may rise, while the importance of procedural justice may drop. What is more, assessments of police performance may overtake procedural justice and become the primary antecedent of police legitimacy. Similar suggestions were raised by Huq et al. (2011), who argued that in the context of counterterrorism policing, non-Muslims may view the threat of terrorism as particularly dangerous or morally odious, or believe that only Muslim or Arab communities will bear the costs of policing terrorism, and thus these non-Muslim communities may become less sensitive to procedural fairness.

Jonathan-Zamir and Weisburd (2013) examined these hypotheses by comparing predictors of police legitimacy across two groups of communities in Israel: one facing immediate, severe security threats (missile attacks originating from the Gaza Strip) and the other facing no specific threats at the time. They found that while assessments of the performance of the police did rise in importance for the public in situations of threat, evaluations of the fairness of police processes *did not* decline in importance and, what is more, remained the primary predictor of police legitimacy in both conditions. These results suggest that security threats impact public expectations regarding the performance and efficiency of the police (which become more important in assessing police legitimacy). At the same time, they also reveal what *does not* change in situations of security threats: under such circumstances, majority communities *do not* become less concerned with fairness in police treatment, and these assessments remain the primary predictor of police legitimacy.

An analysis of survey data from New York City carried out by Huq et al. (2011) reveals similar results. Among non-Muslim communities, assessments of procedural justice in the *implementation* of counterterrorism policy were the primary predictor of police legitimacy, followed by evaluations of procedural justice in the *formation* of counterterrorism policy. Other potentially important factors, such as the extent to which the police make the respondent feel safe from terrorist threats or the effectiveness the police show in fighting terrorism, were found to be either statistically nonsignificant in predicting police legitimacy or significant but less influential than procedural justice assessments. These analyses clearly show that the importance of procedural fairness for the public, which has been repeatedly demonstrated in the context of crime control, does not decline for non-Muslim communities in the context of policing terrorism.

Which Factors Impact the Willingness of Majority Communities to Cooperate with the Police in Their Efforts to Fight Terrorism?

As mentioned above, the legitimacy of the police in the eyes of citizens was found to have important effects on their willingness to engage in cooperative behaviors, at least on the declarative level. Sunshine and Tyler (2003), for example, found among two samples of New York City residents that evaluations of police legitimacy were associated with willingness to report crimes to the police, provide information, take part in police-community activities, and empower the police. Similarly, Tyler and Fagan (2008) identified that individuals who viewed the police as legitimate were more likely to state they would cooperate with the police by fighting crime in their neighborhoods. These conclusions are supported by other researchers as well (e.g., Mastrofski et al. 1996; Tyler and Wakslak 2004).

At the same time, and similarly to the previous question about antecedents of police legitimacy, it cannot be taken for granted that assessments of police legitimacy would have the same impact on willingness to cooperate with the police in the context of combating terrorism. As argued by Huq et al. (2011), majority or non-Muslim communities are likely to perceive terrorism threats as particularly salient or harmful, and may hold different normative and ideological beliefs about terrorism (in comparison to crime). Thus, it is reasonable to expect that factors such as perceptions regarding the seriousness of the terrorism threat or the effectiveness of the police in addressing it, would become particularly salient in shaping cooperative behaviors.

Nevertheless, and similarly to studies carried out in the context of crime control, the analysis reported by Huq et al. (2011) reveals the critical importance of police legitimacy in shaping cooperation among non-Muslims in the context of policing terrorism as well. Assessments of police legitimacy were found to be the most important factor predicting the willingness of these communities to alert the police to potential terrorism risks, more influential than evaluations of police effectiveness in combating terrorism, the extent to which the police make the respondent feel safe from terrorism threats, or sociodemographic factors (although views regarding the seriousness of the terrorism threat were almost as important as assessments of police legitimacy). When predicting the willingness of non-Muslims to cooperate with the police by taking part in educational efforts about the dangers imposed by potential terrorists and by encouraging community members to cooperate with law enforcement officials in their efforts to combat terrorism, legitimacy assessments were found to be the second strongest predictor, surpassed only by race.

Assessments of procedural justice in both the formation and implementation of counterterrorism policies were also found to have direct and strong effects on overall willingness to cooperate with the police in their efforts to fight terrorism. It should be noted, however, that perceptions regarding the seriousness of the terrorism threat were the primary predictor in this analysis. Nevertheless, similarly to the results reviewed above regarding antecedents of police legitimacy under threat, the legitimacy of the police in the eyes of the public, as well as the fairness of the processes by which they exercise their authority, remains critical in shaping willingness to cooperate with the police among majority communities in the context of policing terrorism.

Do Majority Communities Consider the Potential Negative Implications of Police Involvement in Counterterrorism?

The research findings reviewed above raise another important question about majority communities and the involvement of local police agencies in counterterrorism. It is often assumed that majority communities desire and support harsh responses to terrorism threats (see, e.g., Gordon and Arian 2001; Huddy et al. 2005), and as reviewed above, there is evidence suggesting that members of these communities evaluate the police more positively in times of severe security threats, at least in the short term (Jonathan 2010). But at the same time, do they also consider the potential costs of extensive police involvement in counterterrorism, such as reduced focus on crime control, order maintenance and other "classic" police responsibilities, or change in the nature and character of policing in the direction of "high policing?" (see Bayley and Weisburd 2009).

Jonathan and Weisburd (2010) have examined this question using a large-scale community survey in Israel, and found that, overall, majority communities are indeed aware of and consider at least some negative outcomes of extensive police involvement in counterterrorism. Many respondents to their survey believe that policing terrorism negatively affects the relationship between the Israeli police and the public, particularly Arab communities. Respondents also expressed strong agreement with the notion that policing terrorism in Israel comes at the expense of other police responsibilities, such as fighting crime and enforcing traffic regulations. Moreover, many hold that counterterrorism is often used by the police as an excuse for weak performance in fighting crime.

These results suggest that majority communities are more sophisticated in their expectations from the police than is often assumed, and their desires are complex. While possibly supporting harsh counterterrorism responses (e.g., Gordon and Arian 2001; Huddy et al. 2005), these citizens are also well aware of the potential, unintended negative outcomes. Thus, it appears that in order to maintain public trust in the police and police legitimacy, even in the face of security threats the police cannot focus solely on providing rapid, forceful responses and abandon adequate performance in "classic" domains, fair processes and appropriate interactions with the public.

Are Majority Communities Affected by the Way Minority Groups Are Treated by the Police?

As reviewed above, majority Jewish communities in Israel were found to be very much aware of the potential negative effects of policing terrorism on the relationship between the police and minority Arab communities. However, Jonathan and Weisburd (2010) have not addressed the question of whether differential treatment of these minority communities affects the relationship between the police and *majority* groups. In other words, are majority communities sensitive to unfair treatment when it is directed at what may be perceived as an out-group, possibly associated with terrorism threats?

This effect, which was observed by Tyler and Wakslak (2004) in the context of crime control and termed the "spillover effect," was examined by Huq et al. (2011) in the context of policing terrorism. Survey data collected by these authors in New York City revealed that evaluations that the police are treating Muslims disrespectfully in their counterterrorism efforts, or that they are increasingly targeting Muslim communities, had significant and negative effects on assessments of both procedural justice and police legitimacy among majority, non-Muslim communities. Interestingly, beliefs regarding heightened suspicion of Muslims had no significant effects. Thus, simply viewing Muslim communities as a more risky group was not, in and of itself, a problem in the eyes of majority communities. However, disrespectful treatment or increased targeting of Muslims had a negative effect on how majority groups view the police. Finally, evaluations of procedural justice and police legitimacy among non-Muslims were also significantly and negatively affected by assessments of "public police intrusions" directed at minorities (public police activities, such as searching bags at train stations).

Huq et al. (2011) conclude that when the police, as part of their counterterrorism efforts, behave toward minority groups in a way that is perceived to be unfair, they lose legitimacy among *majority* communities as well. In other words, in the context of policing terrorism (as is the case with policing crime), it appears that the relationship between the police and majority communities is influenced not only by direct effects, such as reduced focus on crime control or a more militaristic style of policing, but also by perceptions regarding how the "other" group is being treated, even if that group is viewed as a potential source of threat. These results again highlight the importance of fair treatment in the context of policing terrorism.

Discussion and Conclusions

How does policing terrorism impact the relationship between the police and majority groups? What should local police agencies take into consideration when thinking about their partnership with these communities in "the new era of counterterrorism policing?" Before addressing the specific effects (or lack of effects) identified by scholars, it is important to stress that the studies reviewed above, first and foremost, draw attention to the importance of thinking about and investigating the relationship between the police and *majority* communities in the context of policing terrorism. To date, most discussions and empirical research on counterterrorism and police-community relationship have focused on minority, Muslim or Arab groups. While clearly important, propositions and hypotheses raised by scholars, as well as findings from the few studies that *have* included majority communities, highlight the importance of focusing on this group as well.

With regard to the specific implications of counterterrorism policing for majority groups and their partnerships with the police, studies have approached the topic from different angles and thus provide different answers to this question. At the same time, as detailed below, commonalities do emerge. First, majority communities' assessments of the police do appear to be affected by both the terrorism threat itself and by police involvement in this domain. In the short term, public support for the police and evaluations of their performance and legitimacy improve. In the long term, however, these assessments return to previous levels and, what is more, often drop to levels lower than those measured prior to the high-threat period.

One of the explanations offered for these fluctuations is that, over time, the negative, unintended outcomes of policing terrorism begin to take their toll and impact majority communities' attitudes toward the police. The survey specifically addressing perceptions of the costs of policing terrorism reinforces the premise that majority communities consider, or are at least aware of, some of the prices paid for extensive police involvement in counterterrorism. Whether it is reduced emphasis on crime control or a more militaristic, "high policing" style of policing, these costs appear to impact the views of majority communities, as evidenced by the drop in the public image of the police over time. Perhaps, the most critical is the drop in public trust in the police, which, in addition to being a cost in its own right, may significantly hamper public cooperation and acceptance of police authority (e.g., Tyler 2004, 2009). In this context, it should also be stressed that any immediate improvement in public attitudes toward the police in times of intense security threats should be viewed cautiously, as it is, in all likelihood, fragile, temporary by nature, and in large part a result of the threat itself rather than specific police responses. Such peaks in support may also result in members of the public temporarily ignoring or undervaluing police mistakes or mistreatment.

The second approach taken by scholars to the study of the relationship between the police and majority groups in the context of policing terrorism utilized the "legitimacy" or "procedural justice" model, as specified by Tyler (2004, 2009) and others (e.g., Huq et al. 2011; Reisig et al. 2007; Sunshine and Tyler 2003; Tyler and Fagan 2008). The main question here is whether the basic relationships of the model, as identified in previous studies in the context of crime control, hold for majority communities in the context of counterterrorism policing. Specifically, would "procedural justice" retain its importance as the primary antecedent of police legitimacy? Would legitimacy assessments, in turn, remain a major predictor of willingness to cooperate with the police? Finally, would evaluations of the way the police treat Muslim minorities impact the legitimacy of the police and assessments of their fairness in the eyes of majority groups?

As reviewed above, there are compelling reasons to suspect that the legitimacy model would work differently for majority communities in the context of policing terrorism, primarily because terrorism threats appear to bring about much fear, uncertainty and vulnerability, as well as ideological perspectives that are different from those generated by crime threats. Moreover, majority communities may believe that counterterrorism policing and any procedural injustice associated with it would not be directed at them, but at the minority out-group linked to terrorism threats. Thus, it is reasonable to suspect that considerations regarding the fairness of police processes or the legitimacy of the police more generally would decline in importance, while more instrumental, outcome-oriented concerns such as the magnitude of the threat or successes the police show in addressing it, would have the most salient impact on citizens.

At the same time, studies carried out both in Israel and in the USA reveal that, overall, this is not the case. Even when facing intense security threats or when asked specifically about counterterrorism policies, assessments regarding the fairness of police processes remain the most important antecedent of police legitimacy. While the performance or effectiveness of the police may rise in importance in situations of threat, it nevertheless remains secondary to procedural justice in predicting police legitimacy, as do other factors such as the sense of security the police are providing or sociodemographic factors. Police legitimacy, in turn, remains a major predictor of willingness to cooperate with the police in their counterterrorism efforts, including willingness to alert the police to potential terrorist threats and take part in educational efforts about counterterrorism (although other, instrumental considerations were also found to be important in this context).

Research findings also reveal that majority communities are not indifferent to the way the police treat Muslim minority groups, even if they are perceived as potentially linked to terrorism threats. In addition to being aware of the negative effects of policing terrorism on the relationship between the police and minority Muslim or Arab communities, beliefs that the police are treating minorities disrespectfully, or are increasingly targeting them, hamper the views of majority groups regarding police use of fair processes, as well as their legitimacy more generally.

In sum, it appears that, contrary to intuitive views, when faced with security threats or when considering counterterrorism in particular, majority groups *do not* put aside daily concerns with "ordinary policing" and fair processes and become solely interested in forceful, rapid responses. Importantly, this is not to say that instrumental considerations do not matter. The studies reviewed above reveal that majority communities *do* value police performance more under threat; support and evaluate the police more positively during high-threat periods; and, when considering cooperating with the police in their counterterrorism efforts, *do* value instrumental considerations, such as the seriousness of the terrorism threat.

At the same time, majority groups are also well aware of the costs of policing terrorism and their negative effects on fighting crime and police-community relationships, and their evaluations of the police, including perceptions of trust, procedural justice and performance, dramatically drop over time, perhaps, at least in part, because of these negative outcomes. Majority communities also desire and value fair processes *more* than end results when considering police legitimacy, even under situations of acute security threats or when specifically considering counterterrorism policing. Moreover, assessments of police legitimacy remain a major predictor of majority communities' willingness to cooperate with the police in fighting terrorism, and, finally, it appears that majority groups are highly sensitive to procedural injustice, even when directed at minority Muslim communities. Thus, it appears that majority groups are not willing to "give the police an exemption" in the face of terrorism just as long as they provide protection from the threat. Members of these communities still expect the police to address crime and other "classic" problems and, importantly, insist on fair, polite, respectable processes.

It should be noted, however, the picture is far from complete, as many more questions could be asked and examined in this context. For example, the relationships between the different components of the legitimacy model, as well as public assessments of the costs of policing terrorism, have been tested using public surveys, and thus, the findings reviewed above are based solely on citizens' statements. It is therefore not clear if, for example, we would actually find more cooperation with the police in their counterterrorism efforts in places or in times where they are perceived as more legitimate. We also know little about how citizens form their evaluations of police use of procedural justice in countering terrorism or assessments regarding the prices paid for police focus on counterterrorism. Are these evaluations based on personal experiences, the experiences of friends or family members, or media coverage of policing terrorism?

Hypotheses regarding the outcomes of policing terrorism and, in turn, their effects on police-community relationships also need to be tested. For example, does focusing on counterterrorism indeed change the nature and character of policing in the direction of "high policing?" Does it affect crime control? While there is some evidence supporting these propositions (e.g., Weisburd et al. 2010), they clearly need to be examined further. In turn, if these outcomes are indeed identified, do they actually affect the partnership between the police and the pubic in the real world, and, if so, in what ways? Finally, questions could be asked about mitigating the potential negative outcomes of policing terrorism. Given that local police agencies sometimes have no choice but to focus on counterterrorism, at least for limited periods of time, what measures can they take in order to preserve, and perhaps even strengthen, their relationships with majority groups while still engaging in effective counterterrorism policing?

Conclusions

While often not the focus of discussions or research, policing terrorism bears important implications for the relationship between the police and *majority* groups. Perhaps most significant are the research findings indicating that, contrary to intuitive views, even in the face of major security threats or in the context of policing terrorism more generally, and even when considering the relationship between the police and minority Muslim communities, majority groups *do not* abandon their concerns with fair processes and legitimate policing. Any preconceptions that when facing terrorism threats, majority communities become only interested in security and support forceful, rapid police responses no matter the cost are misleading, and if utilized as the basis for counterterrorism policies are likely to have negative effects on the relationship between the police and majority groups.

Political Crime

Jeffrey Ian Ross
School of Criminal Justice, College of Public Affairs, University of Baltimore, Baltimore, MD, USA

Overview

Political crime is often ignored or given minimal attention by criminologists especially in the traditional American criminology/criminal justice university curriculum. It is frequently and easily confused with issues dealing with how politics affects the passage of criminal laws or how politics shapes public policy in matters of criminal justice. Unfortunately, this interpretation is unnecessarily naïve, narrow, and safe with respect to understanding the relationship between politics and crime and criminal justice. In order to introduce the reader to the corpus of research on political crime, this entry contextualizes English language scholarly (and where appropriate popular) literature bearing on the subject of political crime looking at the categories that have been published. Despite their occasional utility, the review ignores the copious government reports that have been published in the form of senate or congressional inquiries, Royal Commissions, public prosecutions, and the like. This summary also does not include the numerous reports produced by activist organizations, professional groups, and consulting organizations that make their way into the public domain.

Definitional and Conceptual Issues

Before reviewing the concept of political crime, it is wise to settle on a relatively respectable definition of political crime. Although a handful of recognized scholars have proffered definitions of political crime, one of the best was provided by Beirne and Messerschmidt (1991, p. 240).

> . . . crimes against the state (violations of law for the purpose of modifying or changing social conditions). . .[and]crimes by the state, both domestic (violations of law and unethical acts by state officials and agencies whose victimization occurs inside [a particular country]) and international (violations of domestic and international law by state officials and agencies whose victimization occurs outside the US).

If anything remains true about the study of political crime and the production of scholarly knowledge on this subject, it is that the parts are infinitely greater than the whole. In other words, the majority of research on the phenomenon of political crime deals with its subcomponents (e.g., sedition, treason, state-corporate crime), rather than attempts to consolidate these disparate foci. Thus, we have numerous articles and chapters in scholarly books on espionage/spying and state-corporate crime, and book-length studies on treason and on political terrorism, but few attempts have integrated all political crimes. This observation is extended to political crimes' two major categories: oppositional political crime or state crimes.

Indeed, there are exceptions to this state of affairs. In terms of broad overviews that attempt to deal with the subject of political crime in a comprehensive manner, ten works stand out: Proal's *Political Crime* (1898/1973), Schafer's *The Political Criminal* (Schafer 1974), Turk's *Political Criminality* (1982), Kittrie and Wedlocks' *The tree of liberty* (1986), Ingraham's *Political Crime in Europe* (1979), Hagan's *Political Crime* (1997), Kittrie's *Rebels without a cause* (2000), Ross' *Dynamics of Political Crime* (2003), Head's *Crimes against the state* (2011), and Ross' *An Introduction to Political Crime* (2012). Although some of these treatments approach the subject of political crime with a rather narrow lens limiting their gaze to oppositional political crime, or a handful of prominent states (i.e., typically advanced industrialized democracies of one shape or form), others take a more broad brush approach.

Likewise, even though all of these books look specifically at oppositional political crime, all but a handful integrate the subject of state crime into their analyses. The disproportionate focus on oppositional political crime is predictable. Despite constitutional safeguards, especially the right to free speech engrained in most advanced industrialized democracies, many political activists, journalists, and scholars are downright timid about criticizing their government or assuming that the state can commit crimes against its own citizens.

As a reaction, since the early 1990s, some criminologists (typically critical criminologists) have produced books on state crime. Some of these contributions looked at the subject matter in the context of edited books with original chapters (e.g., Barak 1991; Ross 1995/2000, 2000; Chambliss et al. 2010). One of the earlier treatments was a collection of previously published journal articles (e.g., Friedrichs 1998a, b). More recently, books which have attempted to provide an integrated approach to the subject matter of state crime have been published (e.g., Rothe 2009).

Unfortunately, a considerable amount of scholarship in this field fails to build upon the work that has already been done. For example, much has been published in the English language legal journals on the subject of political crime but is frequently ignored by criminologists of political crime and vice versa because of unexplored and unexplained reasons, criminologists, sociologists of crime, and legal scholars rarely consult each others body of research. This scholarship is certainly relevant to the study of political crime, but it is not framed in the political crime context.

Assuming there is consensus on the previously mentioned definition of political crime and its subcomponents, then the following review attempts to look at the current state of research on this subject matter. With some notable exceptions (Alexander 1992a, b; Merton 1964; Moran 1974; Schafer 1974; Ingraham 1979; Turk 1992; Ross 2003, 2012), little of the research on political crime places the concept into a theoretical perspective.

Dominating the research on political crime are descriptive case studies, especially those focusing on political crime in advanced industrialized countries. The following reviews this work.

Case Studies

Occasionally articles and books about individuals charged and convicted of treason and sedition have been published. By far the greatest proportion of the literature (primarily written by journalists directed towards a popular audience) takes the form of case studies of individuals considered spies who have engaged in espionage. Numerous books covering both the activities of these unique political criminals operating in the United States (e.g., Ethel and Julius Rosenberg, Aldrich Aimes, Harry Gold, Robert Hanssen), Canada (e.g., Igor Gouzenko), and the United Kingdom (e.g., Anthony Blunt, Kim Philby) have been written, as have in-depth analyses of infamous political terrorists (e.g., Illich "Carlos the Jackal" Ramirez) and organizations such as law enforcement agencies, at both oppositional and state level, that have engaged in political crime.

In the United States, for example, many case studies examining the deviance, abuse of power, and/or crimes of the state criminogenic agencies have been produced. Federal agencies such as the Internal Revenue Service (IRS), the Federal Bureau of Investigation (FBI), the Central Intelligence Agency (CIA), and other prominent and selected national security/intelligence agencies/organizations have more generally been singled out for intense investigation.

In Canada, the United Kingdom, and Australia, we have a similar pattern with a smattering of articles and books focusing on intelligence/national security agencies and their misdeeds that have been published.

Country-Specific Studies

Whether because of access to data or simply an issue of differences and difficulties with understanding foreign languages, the majority of research on political crime focuses on its presence in the advanced industrialized countries. Countries that are the locus of political crime research are typically Australia, the United Kingdom, Canada, and the United States. This makes sense because looking at the country as an individual unit is more manageable.

United States

As with the larger study of political crime, there are few comprehensive studies (e.g., books) on the subject focusing on its occurrence in America. Two efforts stand out. The first is Roebuck and Weeber's *Political Crime in the United States* (1978). This book, though dated in content, provides a historical introduction to the subject matter. The other is Tunnell's, edited book, *Political Crime in contemporary America* (1993). This publication consisting of eight chapters looks at both theoretical issues, actions (e.g., terrorism, hate crime, worker safety), and controversial criminal justice policies and practices (e.g., death penalty) that have been unduly influenced by political concerns. Unlike Roebuck and Weeber, the collection emphasizes both oppositional and state crimes.

Other than these two books, there has been a disproportionate (but necessary) focus by scholars on most subcomponents of political crime. To begin with, a considerable amount of research has been conducted by reporters and scholars on the problem of oppositional political terrorism in the United States. In addition to a couple of comprehensive treatments, the work to date has covered domestic right-wing groups such as the Ku Klux Klan, Aryan Nations, and the Covenant, the Sword, and the Arm of the Lord. Books about the left-wing terrorist group Weather Underground have also been published, as have autobiographies by members of the organization.

Although a handful of broad-based historical treatments of state crime in the United States (though not labeled as such at the time of their writing) were produced during the 1970s, far more studies have been conducted on the subcomponents of these controversial government actions. Perhaps because of the dominance of the right to free speech, there have been numerous analyses of censorship.

Though not typically framed in the context of political or state crime, a considerable amount of literature exists on police activities of a questionable nature. Some of this research has focused on what some scholars call political policing (i.e., the use of illegal domestic surveillance and repression) (e.g., Theoharis 1978), the use of excessive force, police use of deadly force, and police corruption.

A focus on corruption both in federal government agencies, at the executive level (e.g., president), especially in connection with particular incidents (e.g., Watergate Affair, Iran-Contra) and with municipal police departments, has been dominant in the American literature. A handful of well-researched books, written by respected journalists, have told the stories of individuals accused of and/or caught up in corruption probes and/or periods of police corruption in major law enforcement agencies. Some of these incidents and studies have been the basis for movies produced by Hollywood studios for consumption by the general public.

Given the high levels of criminal violence that has historically plagued the United States, it is no surprise that political violence has been a subject of great concern. In addition to studies of political assassins and assassination, issues of oppositional political terrorism have been a staple of the political crime research in the United States.

The focus on the subcomponents of political crime is as true with oppositional crime as it is in state crime research. Much of the research focuses on case studies. The largest component has been the case studies of state-corporate crime (e.g., Michalowski and Kramer 2006), covering incidents such as the Ford Pinto design problems (1977), the Challenger space shuttle explosion (1986), the fire at the Imperial Chicken plant in Hamlet North Carolina (1991), nuclear weapons production, the crash of ValuJet 592 (1996), and the Bridgestone and Firestone tire controversy (2010).

Case studies and analyses of deviance and corruption in our correctional facilities, including the treatment of political prisoners and the use of excessive force in American jails and prisons, have also been important. Many of these studies have been idiographic/illustrative and not comprehensive in nature. Not only have jails and prisons been singled out as places where state crime has occurred, but in the past decade, America's participation in Abu Ghraib and Guantanamo has been selected for intense analysis.

Periodically the issues of slavery, racism, and genocide have been used as conceptual categories in which to analyze state treatment of its minorities, typically African Americans and American Indians.

United Kingdom

The problem of controversial police activities, especially corruption and use of excessive force, has been staples of contemporary British political crime research. Some of this has focused on the general topic of the policing of industrial disputes, while other scholarship has concentrated more specifically on the miners' strike (1984) and police involvement and reactions to race-related riots during the 1980s.

The problem of state crime in the United Kingdom has been dealt with in the context of illegal actions by state intelligence agencies (e.g., Thurlow 1994). One notable full-length treatment is Doig (2011). More prominent, however, are case studies of state-corporate crime (Tombs and Whyte 2003).

Canada

Unlike the United States, with the exception of a couple of chapters appearing in edited books, there are no book-length studies of political crime in Canada or oppositional political crime or state crime in this country. This is not because it does not exist, but more so because of the supply and demand kinds of dynamics in the country. Four areas seem to be the focus on research on political crime in Canada. Like the United States, Canadian legal scholars have examined issues connected to freedom of expression, censorship, and emergency legislation.

Also prominent concerns the issue of political corruption at the provincial and federal level. Both articles and book-length treatments of the subject have been done. The other area has been police abuse in terms of violence/excessive force and/or illegal domestic surveillance particularly looking into the Royal Canadian Mounted Police (RCMP). Other research has examined the frequency of political terrorism through the construction and analysis of events data bases. Some nascent literature looks at state crime in Canada (Corrado and Davies 2000).

Australia

Although no particular study focuses solely on political crime in Australia, Head's book uses many examples from history of political crime. As a corollary, the Grabosky's book *Wayward Governance* (1989) is a collection of case studies of well-known acts of state crime in Australia. He also provides a review of the literature on state crime and some initial thoughts on a theory of state crime and its control. Far more numerous are the case studies of state crime appearing as articles in journals or chapters in scholarly books. For example, because of its large aboriginal population, studies have been conducted on the fate of aboriginal deaths behind bars (e.g., Hazelhurst 1991).

Political Crime in Nonwestern Countries

By far the greatest shortcoming in terms of political crime scholarship has that which has occurred in nonwestern countries. This may be attributable to a number of factors including that studies may exist, but their accessibility to western researchers is poor and the fact that they are not written in English may preclude their integration into the larger body of work in English on political crime. One of the best collections of scholarship including nonwestern countries is C.E. S. Frank's *Dissent and the State* (1989). Although outdated, three chapters reviewed dissent in Eastern Europe (e.g., Braun 1989) and another on Latin America (Facher and Fitzgibbons 1989). By far the literature on political crime that has been available in English has disproportionately been in the field of political terrorism where we have analyses of terrorists, terrorists' organizations, and the causes and responses to this kind of political crime (Ross 2012).

Otherwise, linguist and political activist Noam Chomsky has produced a considerable number of books that look at state crime in countries and regions such as Indonesia and the Middle East. This has been done in the context of a critique of the questionable aspects of American foreign policy.

Again, case studies of numerous state crimes have been conducted by scholars and journalists, ranging from massacres to incidents of corruption to state-corporate crime.

Cross-National Studies

With the exception of the previously mentioned classic studies, few broad cross-national studies of political crime, whether oppositional or state, have been done. Attempts to provide this sort of thing have been done by authors of edited books (Barak 1991; Ross 1995/2000, 2000; Chambliss et al. 2010) in the concluding chapters of their books. Cross-national studies of a subcomponent of political crime, such as corruption, human rights violations, and oppositional political terrorism, are more common.

Explanations and Theories

With a subject that is as conceptually diffuse as political crime, it is not surprising that few experts have attempted to develop a holistic theory that explains the causal dynamics of this type of criminal/political behavior. In many respects, understanding how these actions emerge, who is involved, and why they take part is elusive. Needless to say, four attempts can be singled out. First, Merton (1938, 1964, 1966) provided one of the earliest explanations that, in part, touches on political crime. According to his anomic theory of deviance (i.e., strain theory), individuals live in societies that have a considerable amount of "structural dysfunctionalism." This, in turn, leads people to experience an ends/means discrepancy. These processes combined together create stress. In order to minimize the discomfort, individuals have five options, one of which is rebellion (nominally a type of political crime).

Second, Moran (1974) describes "sequential stages which in successive combination might account for the development of a political criminal" (p. 73). The first are what he calls "predisposing conditions or background factors, the conjunction of which forms a pool of potential political criminals. These conditions exist prior to an individual's decision to commit a political crime and by themselves do not account for his behavior" (pp. 73–74). The aforementioned conditions include the concept of strain and "a political problem solving perspective." The latter consists of "situational contingencies which lead to the commission of political crimes by predisposed individuals" (p. 74). Moran advocates a five-stage "developmental model" consisting of the following steps: (a) strain, (b) "political problem solving perspective," (c) a turning point event, (d) commitment to act, and (e) engaging in the political crime.

Third, Turk (1982) posits that although power and inequality are important factors in explaining political crime, the cultural gap between offenders and authorities is the primary factor that leads to the commission of political crime.

Merton's, Moran's, and Turk's theories are useful in describing, and in some cases explaining, various types of political crime, but they are not very helpful in accounting for all types of this phenomenon. The dynamic nature of such activities needs to be more thoroughly explored, and furthermore, the macro- and microlevel processes in political crime should be linked.

Thus, (Ross 2003, 2012), anchoring his explanation in Sutherlands' Differential Association Theory and Conflict Theory, developed the ISOR explanation. He argues that although many political crimes are committed by groups that are formally or loosely structured, whether oppositional in nature or formed by state organizations, these activities are, in the final analysis, committed by individuals. These people are working within the structural confines of both informal and complex organizations, political systems, political economies, and different cultures. They make decisions and act while often denying that any wrongdoing has occurred. In sum, according to Ross, political crime is the result of a complex interplay among individuals (I), situations/opportunities (S), organizations (O), and resource adequacy (R). These combined factors have been identified as the ISOR explanation. Ross argues that the ISOR relationship is not simply a resource mobilization theory or a crime prevention method brought into alignment with environmental design theories, but a more comprehensive explanation than previous attempts.

Research Methods

Similar to the previous comment made about theories of political crime, there is a shortage of diverse methods that criminologists (or other interested social scientists) investigating political crime have utilized. With the exception of a small but growing subset of studies of oppositional political terrorism using increasingly sophisticated quantitative techniques, the majority of research on political crime has used qualitative research methods, particularly single case studies. This is as true for journalistic accounts as it is those done by seasoned scholars.

Numerous reasons exist for this state of affairs. Political crime is complex and often requires cross-disciplinary knowledge. Additionally, no single database on political crime exists, nor will one be created in the near future. Thus, opportunities to test hypotheses, by mining an appropriate database are nonexistent. Moreover, the types of actions of political crime are so diverse and no single agency or organization collects this kind of information, so this presents numerous collection problems. Additionally, either scholars are timid about submitting proposals for funding to funding agencies or the agencies have not been enamored with the proposals they have received to agree to fund studies of political crime. Thus, what we have is a smattering of research studies that tend to be descriptive in nature with a shortage of empirical research methods.

Conclusion

Undoubtedly, this review has been limited by studies that have been conducted in English. It would be helpful for researchers to start moving to more integrative studies, beyond case studies of individuals and organizations and trying at the very least to do some cross-national studies. Similar critiques have been made by a collection of individuals who write in the field of state crime (Rothe et al. 2009). The production of this scholarship should not be interpreted in such a manner as to suggest that one country has more or less political crime than the other. Much of the choice of what gets researched, what gets submitted to journals, and what gets published is connected to the personal predilections of researchers, journal editors, and acquisitions editors with respect to what they think is interesting, their perceptions about the audience for their ideas, and the sophistication of the product submitted.

Overview

This entry discusses pornography and its importance in a variety of areas. First, a definition of pornography is discussed, followed by an examination of obscenity; the legal guidelines intended to differentiate between legally restricted, obscene materials; and pornographic materials that are protected under the First Amendment's protection of free speech. Conflicting feminist perspectives are also discussed. These perspectives largely focus on the question: Is pornography inherently harmful to women, or can it have a positive, potentially empowering influence on women, as well as other pornography viewers? Finally, the role of violence in pornographic material is discussed in depth followed by a brief note on Internet pornography.

Introduction

The production and sale of pornography is a highly lucrative industry in American society today (Eberstadt 2009). Due to modern technology, especially the Internet, pornographic material is available to a wide variety of individuals (Eberstadt 2009). In fact, pornography is the "single most searched-for item on the Internet," making it a pervasive part of American society (Eberstadt 2009, p. 4). The following sections discuss the features that differentiate pornographic materials from obscene materials, anti-pornography feminist perspectives, pro-pornography feminist perspectives, the relationship between violence and pornography, and the influence of the Internet on the development and dissemination of pornography.

What Is Pornography?

Pornography can be defined, at the most basic level, as explicit sexual material (Lindgren 1993). This definition, however, is overly broad. Such a simple definition would encompass a range of materials from classic Roman art to hard-core pornographic rape films. As such, this type of definition of pornography leaves many questions unanswered: Can a nude or sexual image be artistic, not pornographic? If so, under what circumstances does this occur? Is all pornography legal? When do the images presented in pornography or other obscene materials reach a level that is unacceptable to community standards?

In reality, pornography is a vague concept and one that is difficult to define. There is no consistent definition of pornography in existing empirical literature. Likewise, there is no universally accepted legal definition of pornography in the criminal justice system of the United States. Indeed, much pornographic material is not subject to regulation by criminal justice officials. Instead, much of the relevant literature and legal precedent related to the topic focuses on defining and regulating obscenity, not pornography.

Obscenity

While obscenity is a crucial concept in the discussion of pornography, pornography and obscenity are not synonymous (Lindgren 1993), as not all pornography is obscene. Thus, while obscene materials can be legally regulated, pornography, in general, is not considered illegal (Hoffman 1985). This is, in part, because the First Amendment guarantees the right to freedom of speech. The First Amendment guarantees not only the right to literally say things freely but it also guarantees the right to express one's self in a variety of ways. Although verbal speech, the printed word, art, and other forms of expression are protected by the First Amendment, there are limits to the types of expressions that may be afforded First Amendment protection. Specifically relevant to the discussion of obscenity and pornography is the United States Supreme Court's ruling in *Roth v. United States* (1957). In *Roth v. United States*, the Court ruled that obscene materials are a form of "unprotected speech." In other words, anything (e.g., literature, photographs, videos) that can be considered obscene is not protected under the First Amendment and is subject to legal regulation (Hoffman 1985). While the Court's ruling in *Roth* effectively outlawed obscene materials, a significant question was left unanswered: What materials can be considered obscene?

For more than a decade, the Supreme Court left this question unanswered. Finally, in *Miller v. California* (1973), the Court established specific standards that would be used to differentiate obscene material from constitutionally protected material. Three basic criteria are used to determine whether specific materials are obscene. The Court determined that a work could be considered obscene if:

> (a) . . . 'the average person, applying contemporary community standards' would find that the work, taken as a whole, appeals to the prurient interest,. . . (b) . . . the work depicts or describes, in a patently offensive way, sexual conduct specifically defined by the applicable state law, and (c) . . . the work, taken as a whole, lacks serious literary, artistic, political, or scientific value (Miller v. California 1973).

Under these guidelines, many forms of pornography are not considered obscene and are, thus, perfectly legal (Hoffman 1985). With regard to pornography, most "soft-core" less explicit materials (i.e., those that do not depict graphic sexual acts) are easily identifiable as constitutionally protected materials. On the other hand, extremely explicit "hard-core" pornography can be classified as legally obscene and subject to regulation (Hoffman 1985).

Even with the Court's three guidelines, however, it is difficult to definitively, and consistently, classify pornographic materials as being either obscene or legally acceptable. One of the biggest reasons for this difficulty is because the three guidelines provided in *Miller* v. *California* (1973) are inherently subjective. For example, with regard to the first criterion, contemporary community standards may vary from one place to another. Thus, what legally protected pornographic material in one state may be deemed obscene and, therefore, subject to regulation in another. Furthermore, images that may have artistic value to some may depict acts that offend state law in other areas. In sum, pornography is not a simple concept with an all encompassing definition. While obscene pornography is not subject to the protections of the First Amendment, there is a very fine line between pornographic materials that are obscene and those that are constitutionally protected.

Controversies in the Literature: Varying Feminist Perspectives on Pornography

Even beyond disagreements concerning the definition and identification of pornography versus obscenity, other controversies focus on the intrinsic value of pornography. Debate among feminist scholars concerning the potential harms (or benefits) created by pornography began to gain momentum in the 1970s and 1980s (Hoffman 1985). Many feminist scholars argued that pornography was inherently harmful to women because it encouraged the objectification and abuse of women and girls (Eaton 2007; MacKinnon 1989). Other feminist scholars argued that pornography is not always harmful to women. These researchers noted that pornographic materials can, at times, be positive and empowering (see, e.g., Rubin 1993). Despite decades of extensive discussion and empirical study into these issues, the debate surrounding the potential harms and benefits of pornographic materials has not been resolved (Eaton 2007). The following sections address several common arguments presented by scholars on either side of the ongoing debate.

Anti-pornography Perspectives

As mentioned above, some feminist scholars argue that pornography in inherently degrading and harmful to women (see, e.g., Eaton 2007;

MacKinnon 1989). These scholars have come to be identified as “antiporn feminists” (Eaton 2007). Antiporn feminists offer a variety of criticisms of pornography. One argument is that pornography is not focused on healthy sexual expression. Rather, it is a tool used to assert dominance and power (Hoffman 1985). More specifically, these feminists posit that pornography is used to assert males’ dominance and power over women (Hoffman 1985). MacKinnon (1989), for example, notes that pornography is a tool used to socially construct sexuality. She notes that pornography is primarily created for men and, as a result, illustrates the male ideal of sexuality (MacKinnon 1989). For example, she notes that pornography often depicts women as subordinate, less than human, and as creatures that exist to serve men and their sexual desires. In most cases, depictions of women in pornographic materials show them being violated and victimized, while men are shown as dominant and powerful (MacKinnon 1989). MacKinnon and other antiporn feminists seem to agree that

> pornography endorses [gender inequity] by representing women enjoying, benefiting from, and deserving acts that are objectifying, degrading, or even physically injurious and rendering these things libidinally appealing on a visceral level. And, as any advertiser will tell you, making something sexy is among the most effective means of endorsement (Eaton 2007, p. 682).

In sum, the perspective of antiporn feminists holds that pornography reinforces existing patriarchal societal values; pornography depicts male dominance as accepted and even desired by both women and men (Hoffman 1985; MacKinnon 1989). In this way, pornography is harmful to women because the patriarchal values depicted therein perpetuate assumptions that women are somehow less than men. Because women in pornography are often portrayed as enjoying themselves, pornography sends a message that women like to be used and objectified and that they welcome male power and control (Hoffman 1985). Furthermore, this perspective posits that pornography supports assumptions that women are supposed to be victimized and that female subordination is depicted as natural, normal, and even pleasurable (MacKinnon 1989). Such depictions undermine efforts to obtain equal power and equal rights for women and men.

Since their development in the 1980s, anti-pornography feminist perspectives have continued to evolve into the present day. For example, Eaton (2007) attempted to summarize and revise past antiporn feminist arguments into a “reasonable,” modern, antiporn perspective. Eaton (2007) acknowledged that some pornography may not be harmful in the way earlier scholars believed, such as being inherently violent or explicitly abusive toward women. Rather, Eaton (2007) focuses her attention on what she calls “inegalitarian pornography.” Inegalitarian pornography can be defined as “sexually explicit representations that, as a whole, eroticize relations (acts, scenarios, or postures) characterized by gender inequity (676).” Eaton (2007) argues, therefore, that while the effects of this type of pornography are different from those put forth by early antiporn feminist scholars, they are still damaging to women, though in more subtle ways. To elaborate, inegalitarian pornography may still reinforce inequitable gender stereotypes and promote the power and dominance of men over women (Eaton 2007). Eaton (2007) acknowledges that there are other factors that contribute to societal level gender inequality, but she maintains that inegalitarian pornography makes an important contribution. She points out that inegalitarian pornography may play a part in a dangerous “feedback loop.” Indeed, the images, attitudes, and actions depicted in inegalitarian pornographic materials may be rooted in existing gender inequality, but such pornography also promotes and contributes to the continuance of gender disparities (Eaton 2007).

Pro-pornography Perspectives

In contrast to the antiporn feminists, another body of feminist scholars argues that pornography, in and of itself, is not problematic. For example, while Rubin (1993) acknowledges that anti-pornography feminists identify important concerns about sexist attitudes and behaviors toward women, she argues that pornography is a “scapegoat.” In other words, Rubin (1993) posits that pornography is identified among antiporn feminists as causing problems it does not ultimately create. Specifically, she contests the perspective of anti-pornography feminist scholars who argue most pornography is violent. There are a majority of pornographic materials that, while sexually explicit, do not depict any acts of violence (Rubin 1993). To elaborate, the vast majority of pornography depicts common sexual activities more often than any form of "kinky" or violent sexual acts (Rubin 1993). Indeed, only specialized subgenres of pornography (e.g., sadomasochistic materials) depict violent acts. Furthermore, it is important to note that these subgenres make up a clear minority of all pornographic material (Rubin 1993). Rubin (1993) further notes that even in graphically violent pornographic materials, such as in depictions of sadomasochism, one should not assume that the individuals are victimized:

> Since SM often involves an appearance of coercion, it is especially easy to presume that the people doing it are victims. However . . . this is a false stereotype and does not reflect social and sexual reality. Sadomasochism is part of the erotic repertoire, and many people are not only willing but eager participants in SM activity (Rubin 1993, p. 248).

Rubin (1993) argues that pornography is no more violent than any other form of mass media and that individuals are much more likely to see the promotion of patriarchal values and violence against women (including rape and other sexual assaults) in mainstream television and movies than in pornographic material. Rubin (1993) concludes that it is the anti-pornography activists, themselves, who perpetuate harmful stereotypes. The assumption that pornography is inherently wrong breeds contempt for sex workers and reinforces assumptions that sex work is not legitimate or acceptable (Rubin 1993). Therefore, Rubin (1993) argues that feminist scholars should work to legitimize sex work and empower sex workers.

Other feminist scholars make arguments similar to Rubin's (1993) regarding the positive effects and female empowerment that pornography can provide, when utilized properly. For example, Sherman (1995) argues that pornography, as a whole, cannot automatically be dismissed as degrading and/or obscene. He argues that some types of pornography can have a positive and empowering influence for minority groups. Specifically, Sherman (1995) argues that homophobia is rampant in our society. He believes that both young gay men, as well as the society at large, are led to believe that homosexual encounters are dirty, debasing, and undesirable (Sherman 1995). His study of pornography created for gay male audiences, however, revealed that pornography can be a significant source of information about sex for gay males. Indeed, rather than reinforcing the homophobic notions prevalent in society, gay pornography seemed to demonstrate that sexual interactions between two gay men can be positive, healthy, and expressive (Sherman 1995). Thus, in a society steeped in homophobic values and images, pornography may offer the only positive depictions of gay sexual activity that a young gay male may have to rely on (Sherman 1995). Such positive imagery allows gay youth to learn about and accept their sexuality in a healthy, safe way (Sherman 1995). By lumping all pornography together and arguing that any form of pornography is harmful and degrading, anti-pornography feminists unwittingly affirm homophobic messages (Sherman 1995). In conclusion, Sherman (1995) argues that it is important that scholars not assume that all pornography is necessarily harmful. Instead, he argues that they must remain open to the possibility that pornography can be positive and empowering.

Pornography and Violence

Central to the arguments of both antiporn feminists and pro-porn feminists is the concept of harm. It is clear that there is a considerable debate regarding whether pornography is damaging to women. The most blatant form of harm that pornography may produce is actual physical and/or sexual violence against women. A number of scholars have examined whether pornography contributes to violence against women.

Pornography Has a "Cathartic" Effect

Although one of the most controversial debates over the last few decades has been the relationship between pornography and violence, the research findings regarding the link between pornography and aggression are conflicting, at best. Some scholars have posited that merely viewing pornography does not influence the attitudes that male and female research participants have about the acceptability of violence against women. One of the main arguments put forth by those who have found that pornography does not increase negative attitudes or behavior toward women is that pornography has a "cathartic effect" on viewers (see, e.g., Ben-Veniste 1971). The argument made by these scholars is that because pornography provides individuals with an outlet for sexual release, they are less likely to engage in acts of coercion or sexual violence in order to achieve sexual gratification (Ben-Veniste 1971). Thus, according to this perspective, an individual's exposure to pornography does not increase his or her likelihood to engage in acts of violence or overt aggression; rather, it decreases the probability of such behavior (see, e.g., Kutchinsky 1971). Empirical support for this contention has been found in a number of studies.

Two of the most important works relating to the "cathartic effect" of pornography, however, were conducted by Ben-Veniste (1971) and Kutchinsky (1971). The results from these analyses indicated that there was an overall decrease in the amount of sex crimes in Denmark after the government repealed laws that restricted the sale of pornography. Future studies, however, revealed that crime rates in Denmark only dropped for offenses such as voyeurism and exhibitionism, while rape and other sexual crime rates remained constant.

Pornography Enhances Negative Attitudes Toward Women

Because of these inconsistent findings, it is important to consider the equal number of researchers who have reported that exposure to pornography does make male viewers more likely to have negative attitudes toward women. These scholars are more likely to adhere to a social learning perspective, which posits that exposure to pornographic materials influences individual attitudes regarding appropriate sexual behavior as well as stereotypical male and female traits (Bergen and Bogle 2000). For example, it is no secret that women are frequently objectified in pornography. The images presented in pornographic materials focus explicitly on the woman's sexual organs and leave viewers with the impression that she is no more than an object to be used in order for the male to obtain sexual gratification. After repeated exposure to pornography, viewers may come to believe that women are merely sexual objects and, consequently, begin to treat them as such (Bergen and Bogle 2000; Flood and Pease 2009). Therefore, the overall "findings of this research support the idea that there is a relationship between pornography and violent against women" (Bergen and Bogle 2000, p. 232).

Pornography Increases Beliefs in Rape Myths

One of the most significant influences that pornography has is on attitudes is one's willingness to accept "rape myths" (e.g., women instigate or deserve their rape experiences because of the way they acted or the manner in which they were dressed, most women have a subconscious desire to be raped or engage in violent sexual activities) (see, e.g., Flood and Pease 2009; Russell 1988). Scholars have noted that men who watch pornography, especially if it features some element of sexual violence, are much more likely to believe rape myths than those who do not use pornographic materials. Mock trial studies have also presented interesting information regarding the treatment of women by those who view pornography (see, e.g., Russell 1988). These experiments generally expose one group of participants to sexually explicit films and one group to neutral films (such as psychology or nature videos), then present them with testimony or transcripts from actual rape cases. These studies consistently show that those individuals who were exposed to pornography rated the female victim as less believable, more responsible for her actions, and more worthless as a human being than did the individuals in the control group (Russell 1988). Furthermore, male acceptance of violence against women was shown to increase significantly when the woman was portrayed as unwilling to participate in the sex act, but was subsequently shown to be enjoying the experience (Weisz and Earls 1995).

Attitudes Are Linked to Aggression: Pornography Develops Aggressive Attitudes

It is important to consider the attitudinal changes that develop because of one's exposure to pornography because one's attitudes are linked to his or her future actions. For example, a number of experimental studies have shown that exposure to pornography increases aggression, and attitudes that are favorable to aggression, in males (see, e.g., Flood and Pease 2009). Over time, or after prolonged exposure to the messages presented in pornographic materials, individuals will eventually attempt to recreate the sexual acts they have seen. This is problematic when the acts they attempt to reenact include violence and/or the submission of an unwilling partner. Over the past few decades, research findings indicate that a significant number of males have reported that they either wanted, or had tried, to imitate acts that they saw portrayed in pornographic materials (for further discussion, see Russell 1988). Other studies have consistently revealed that between one-third and one-half of male research subjects admit that they would attempt to rape a female if they knew there was no chance of getting caught (Bergen and Bogle 2000). These findings are especially concerning because these attitudes are considerably enhanced in males exposed to sexually violent pornography (Flood and Pease 2009).

Pornography with Sexual Violence Is Particularly Damaging to Attitudes

Researchers studying sexual violence in pornography research have generally defined it as the overt use of physical force or psychological coercion to obtain sexual gratification; any nonconsensual sexual contact; the degradation, dehumanization, or objectification of one or more participants; and/or any form of copulation that is accompanied by acts of physical aggression or violence, such as whipping, punching, and/or bondage (Monk-Turner & Prucell 1999). Although scholars disagree about the prevalence of violence in pornography, they have consistently found that rape is the most common form of sexual violence depicted in these materials and that violent pornography creates more negative attitudes of, and behavior toward, women than nonviolent pornography. This is especially true among men who are high-frequency users of pornography. Studies have revealed that after viewing violent pornography, men who were not previously aroused by such images subsequently began fantasizing about, and becoming sexually aroused by, rape (see, e.g., Malamuth 1981).

With all of these studies, however, it is important to note that the most significant factor in pornography that shapes viewers' attitudes and beliefs is not the erotic nature of the content but the dehumanization and the degradation of women (Gray 1982; Russell 1988; Weisz and Earls 1995). In other words, when films contain acts of sexual violence, viewers' negative attitudes toward women are shaped more by the interpersonal violence that occurs in these films, rather than the erotic subject matter. A number of researchers have studied this phenomenon by exposing groups of viewers to films with neutral content, violent content, sexual content, and sexually violent content (see, e.g., Weisz and Earls 1995). These studies consistently find that the attitudes toward women were similar among those who viewed the violent content and those who viewed the sexually violent content. Furthermore, individuals in both of those groups had significantly more negative attitudes toward women than those who viewed either type of nonviolent film (Weisz and Earls 1995).

While these studies report that violent pornography increases aggression in most people, other studies have found that pornographic material containing sexual violence only increases aggression in individuals with higher predispositions toward aggressive behavior, or those who already feel anger toward a particular target (Gray 1982). This becomes dangerous when individuals are unable to distinguish whether it is the abuse and violence triggering their arousal or the sexual content of the pornography. Scholars have noted a high correlation between sexual fantasies based on deviant acts, such as rape, and subsequent deviant behaviors (Gray 1982). Not only, then, does sexually violent pornography reinforce preexisting ideas within individuals, but it may also provide them with new ideas (Russell 1988; Cramer et al. 1998). As noted above, many males admit that they have tried, or have been tempted to try, things that they have seen contained in pornographic materials (Russell 1988). However, this becomes problematic when their sexual desires include elements of unwanted sexual contact. Interviews with female rape and sexual assault victims revealed that the women who experienced the most frequent, and severe, cases of violence were those whose abusers asked or forced them to view or imitate scenes from pornographic material, to pose for pornographic pictures, or to create pornographic videos (see, e.g., Cramer et al. 1998). Therefore, it appears that in some contexts, pornography may teach individuals how to commit acts of sexual assault.

Pornography Influence on Youth

Although the link between pornography and violence is complex and multifaceted, there are noteworthy correlations that are hard to ignore. For example, a number of studies have focused on the impact of pornography exposure to youth. Some have found that a significant number of convicted rapists reported being exposed to more sexually explicit pornography before the age of 10, but reported less exposure to these materials than the average male during their adolescence and adulthood (Gray 1982). Furthermore, scholars have noted that in addition to less exposure to pornographic material, juvenile sex offenders also had parents who were more sexually restrictive. Goldstein and Kant (1974) posit that "pornography performs an educational function for men during their formative years; deprived of information about sex, rapists and pedophiles have few stimuli which portray society's definition of the 'normal sex act'" (as cited in Gray 1982, p. 392). Therefore, because sex offenders are largely denied access to pornography during puberty, they must rely on the pornography they viewed during their youth in order to form conceptions of "typical" adult sexual activity. However, because age influences one's comfort level with, interest in, and ability to fully understand material that is presented to them, these offenders will have inaccurate conceptions of "normal" sexual activity and, therefore, will be much more inclined to engage in deviant and/or violent sex acts (for further discussion, see Gray 1982).

Even though not all youth who view pornography will become sex offenders, pornographic materials still have an important influence on the development of individuals' later attitudes toward women and sex. There is evidence to suggest that frequent use of violent pornography is linked to high levels of sexual aggression, aggressive behavior, belief in rape myths, and fantasy about rape among adolescent males (see, e.g., Flood 2009). Not all youth who view pornography, however, become sex offenders, and there is evidence to suggest that a great number of youth are troubled when they encounter pornographic materials. Girls are much more likely to report feeling embarrassed or disgusted by pornography, while boys are more likely to become sexually aroused by these images (Flood 2009).

Although many would argue that it is a small minority of youth who are exposed to "actual" pornography, one must be aware that the same outcomes occur in studies of youth reactions to, and the attitudes that develop from, exposure to mainstream sexual media. As noted earlier, sexualized themes presented in advertising campaigns, television programs, and movies disseminate many of the same stereotypical and sexist messages as pornography, most strongly the idea that women are sexual objects (Flood 2009; Rubin 1993). These messages teach both girls and boys that a young woman's worth should be equated with her physical attractiveness which, in turn, influences how young people treat and respond to each other in their social interactions (Flood 2009).

Pornography Influence on Females

While most studies focus on the impact of pornography on male attitudes and beliefs, it is important to consider the effect that pornographic materials have on females. Overall, most studies find that, relative to women who are not exposed to pornography, females who view pornography are not more likely to develop negative attitudes toward other women, deepen their beliefs in rape myths, have negative body images, have lower self-esteem, or show more acceptance of violence against women (see, e.g., Linz 1989). In fact, most women were less accepting of rape myths and interpersonal violence after viewing sexually violent pornography than they were before (Linz 1989).

However, some studies have found that women who use pornography are not likely to engage in acts of physical sexual assault, but they may be just as likely as males to engage in acts of sexual coercion (see, e.g., Kernsmith and Kernsmith 2009). The reason for this may be because of the messages that pornography disseminates about "appropriate" actions and manners of behavior for women. Rarely are women in pornographic materials more physically aggressive than their male partner(s). More often, females use seduction or other manipulative behaviors to initiate sex. Therefore, women who are exposed to pornography may attempt to replicate these behaviors in order to achieve their own sexual conquests (Kernsmith and Kernsmith 2009).

Pornography Influence on Adult Sex Offenders

Studies have shown that pornography use is especially high among sex offenders (for more detailed discussions, see Gray 1982). In contrast to their rates of exposure to pornography during youth and adolescence, adult sex offenders report higher rates of pornography usage and masturbation than the general adult male population (Gray 1982; Marshall 1988). Approximately one-third of both rapists and child molesters report that they have been, on at least one occasion, prompted to commit a sexual offense based on what they observed in pornography (Gray 1982). Furthermore, nearly one-third of rapists and over half of child molesters noted that they specifically used pornography in preparation for their offense (see, e.g., Marshall 1988).

In sum, the scholarly research results concerning the link between pornography, aggression, and violence is unclear, at best. The findings presented in this section provide empirical support for the arguments made by both antiporn and pro-porn feminists. Some scholars have found that pornography had no influence on shaping attitudes toward women or one's likelihood to engage in violent behavior. Others have found that pornography does lead to negative attitudes toward women among men, women, and children, while still others report that pornography's influence on attitudes and actions depends on one's personal predispositions toward violence and male dominance. Therefore, it appears that this decades-long, multifaceted debate will not be resolved any time in the near future.

Current Issues: The Role of the Internet

Any discussion of the modern debates surrounding, however, pornography would be incomplete without some discussion of the Internet. Pornography has changed and thrived with the advent of the Internet. The overwhelming majority of Americans have an Internet-capable computer in their home or have Internet access via another source (e.g., a public computer, a school or work computer, a friend or family member's computer). The pornography industry has thrived on the Internet because it serves as a mechanism that provides more people than ever before with quick and easy access to pornographic materials (Eberstadt 2009). The ease of access to pornography and quick distribution to a wide demographic that the Internet provides has resulted in a greater social acceptance of pornography (Eberstadt 2009).

However, the Internet not only facilitates the distribution of traditional pornographic material, it also allows for the development or expansion of new types of pornography. For example, Paasonen (2010) discusses the Internet's facilitation of amateur pornography. While amateur pornography existed before the widespread use of the Internet, it was much less frequently consumed and distributed (Paasonen 2010). With the advent of the Internet, however, it was possible for nonprofessionals to not only create but also share their own pornographic material with a huge audience (Paasonen 2010). The Internet also made available alternative porn, or specific niches of porn available with great ease to a wide audience. Alternative porn was developed for specific subgroups (i.e., Goth or indie pornography) and depicts sexual lifestyles not often seen in traditional pornography (Paasonen 2010). In sum, the Internet not only made pornography available to a wider audience than ever before, but it also created an opportunity for the production and dissemination of new kinds of porn created by professionals and nonprofessionals alike. The Internet pornography industry will no doubt continue to develop and expand as technology further advances.

Conclusion

Pornography is a complex topic; its definition and legal standing continue to be debated. In addition, while scholars have long debated the merits of pornography, there is no consensus to date as to whether or not pornography is empowering, harmful, or even a catalyst for violent behavior. Such debate among scholars will no doubt continue as pornography continues to change and develop along with advancing technology and changing societal expectations.

Customary justice; Post-conflict justice; Transitional justice

Overview

Since the mid-1990s, there has been a proliferation of attempts to adapt and institutionalize forms of traditional justice as part of post-conflict policy. This has occurred in places as diverse as Timor Leste and Sierra Leone, Rwanda, and Afghanistan. While anthropologists have long been interested in traditional justice, and have emphasized it in studies of rapid social change and post-conflict reconciliation, it is a relatively new arena for transitional justice. Indeed, the foregrounding of traditional justice as a possible alternative to new international mechanisms seems to have come as a bit of a surprise to those promoting truth commissions, criminal courts, and tribunals. There are certainly paradoxical aspects to it, given that the shift of interest towards local accountability mechanisms is occurring at the same time as international criminal law is expanding its reach. However, both trajectories may also be viewed as being part of the same process in that they seek forms of viable justice that are less directly connected with the formal authority of sovereign states – authority which may be very partial and compromised in politically fragile post-conflict circumstances.

The actual content of the traditional justice category is rather vague. Other adjectives such as customary, informal, community based, grass roots, indigenous, and local are all sometimes used interchangeably. To a large extent, it has become a catch-all designation to describe procedures in those places that other kinds of justice provision cannot reach and also as an explanation for why more formal judicial mechanisms introduced in post-conflict setting seem to have such limited effects. It has been explicitly linked to the promotion of more relevant and grounded transitional justice, although the desire for a holistic approach – one that strikes a balance between meaningful customary practices and universal principles – is essentially an aspiration whose applicability and efficacy has rarely been tested. Aid agencies, human rights activists, and local power brokers are finding in traditional justice ways of furthering their diverse agendas. Yet, despite some grand claims, in reality, we still know remarkably little about the role and impact of informal justice processes in post-conflict situations (Kelsall 2009; Huyse and Salter 2008; Shaw et al. 2010). As so often in discussions of justice, normative notions of what is inherently believed to be right shape perceptions, rather than evidence about what has been occurring. One consequence is a tendency to misleadingly generalize about traditional justice as if it is some sort of cohesive and homogenized alternative to formal systems. Much more rigorous, nuanced and systematic research is required. Highlighted below are certain characteristics of the way in which traditional justice is currently discussed within the transitional justice literature and among transitional justice practitioners, followed by comments on important controversies.

Fundamentals

To begin with, it is helpful to place interest in the local dynamics of justice in conflict and post-conflict situations in a broader context. The World Bank's World Development Report 2011 draws attention to the paucity of information about what is happening on the ground in war affected and politically fragile locations. Meanwhile, other World Bank publications have been drawing attention to the need to take better account of cultural and ethnic diversity when designing and implementing development programs, including practices like witchcraft, spirit possession, and spiritual healing (Marc 2010, p. 4). Such a perspective remains controversial within the World Bank and in other development organizations such as the UK's DFID. Nevertheless, it is evidently the case that throughout the global south, there are vast regions in which the power and authority of state law is "nominal rather than operational" (Falk Moore 1986, p. 150). In 2007, the Organisation for Economic Cooperation and Development noted that as many as 80 % of the people in today's fragile states rely on non-state actors for various forms of justice and security (OECD 2007). In Sierra Leone, it has been estimated that some 85 % of the population does not have access to formal justice and relies upon traditional measures (Sriram 2007, p. 598). In Afghanistan, in those areas not controlled by the Taliban, an estimated 80–90 % of all disputes are mediated in the customary system (Wojkowska 2006). Local justice tends to be more accessible to the poor, relatively quick and cheap, and, crucially, the arbiter of issues of great social and economic concern, namely, land and family/lineage issues. In Kenya, for example, where land is frequently a source of private and communal disputes, traditional institutions are widely held to be more reliable in resolving conflicts than the state (WDR 2011, p. 134). In fact, customary tenure is said to cover 75 % of land in most African countries, affecting 90 % of land transactions in Mozambique and Ghana (Wojkowska 2006, p. 12).

Traditional and indigenous processes are currently receiving ever more attention in both state building and counter-insurgency policy (Branch 2011), while putative traditional governance systems are being foregrounded in a manner that has not happened since the era of colonial indirect rule. It is believed that embedding orthodox peace building approaches in local culture will enhance their legitimacy and efficacy, thereby providing an authentic and familiar environment through which popular participation might begin to flourish (Branch 2011). As one UNDP report notes: "Existence of these systems cannot be overlooked. We need to develop strategies to take advantage of the benefits of informal systems" (Wojkowska 2006, p. 13). In a similar way, the World Bank World Development Report 2011 notes that supplementing formal justice with traditional community systems can be a "best-fit" but with a revealing caveat: "the lesson here appears to be to use a process of recognition and reform to draw on the capacities of traditional community structures and to 'pull' them gradually in the direction of respect for equity and international norms" (WDR 2011, p. 167). Selective support for traditional justice here provides a sort of indigenous anchor: a means by which the broader, donor-supported accountability agenda can be grounded, authenticated, and legitimized.

The interest in traditional justice is also linked to perceived limitations in the initial formulation of the transitional justice concept. Transitional justice emerged largely as a socio-legal policy response to the so-called "dirty" wars in South America and was associated with transitions from authoritarian and oppressive states to democratic states (Arthur 2009). These were "states characterized by relatively high levels of horizontal and vertical institutionalization" (De Grieff 2011, p. 1). To a considerable extent that model applied in the South African case too, but what about northern Uganda or Southern Sudan, or the Democratic Republic of Congo? In those places, it has not been clear that the violence has been *mostly* linked to formal government forces, nor is it clear that there is a transition from oppressive authority to democracy. Rather these are territories characterized by hybrid authority structures, and the prospect of achieving stable, accountable, and representative governance is remote. In 2005, a rather poignant confessional was delivered by David Crane, the former Prosecutor of the Special Court for Sierra Leone: "Our perspectives are off kilter... we consider our justice as the only justice... we don't create mechanisms by which we can consider the cultural and customary approaches to justice within the region" (cf. Kelsall 2009, p. 11). This shortcoming had been acknowledged a year earlier by the UN Secretary General, Kofi Annan, in a report to the Security Council titled "The rule of law and transitional justice in conflict and post-conflict societies," in which he observed that: "due regard must be given to indigenous and informal traditions for administering justice or settling disputes, to help them to continue their often vital role. . ." (UNSC 2004, p. 12). Support for traditional justice provides much needed diversity in each context, guarding against what scholars have disparagingly termed the "templatization" and standardization of transitional justice or what the UN Security Council refers to as "one-size-fits-all" solutions (UNSC 2004, p. 1).

It is striking that the emergence of traditional justice as an alternative within a framework of transitional justice has actually been invigorated by the creation of the International Criminal Court (ICC). While it is the case that traditional justice was held up as an alternative to other international instruments, notably the International Criminal Tribunal for Rwanda (ICTR) and the Special Court for Sierra Leone (SCSL), the ICC cannot escape engagement with it. The reason for this lies in the wording of the Rome Statute. Multiple references to the requirement of the court to act "in the interests of justice," without explanation of what that means, have enabled lobbying groups to demand serious consideration of alternative conceptions. Furthermore, the Rome Statute has allowed space for arguments to be made about traditional justice in relation to the requirement of the court to act in a way that is complementary with local procedures. The ICC itself has been on something of a learning curve in terms of how to handle such pressure. A reflection of this are ICC statements like the one that appeared in a 2003 ICC policy paper, which declares that the prosecutor "will take into consideration the need to respect the diversity of legal systems, traditions and cultures" (Allen 2006, p. 129).

Many activists and some scholars believe that traditional justice is not just an alternative or possible supplement to more established processes. Rather they take the view that it is better, or at least that a fully integrated approach is the best option, one in which conventional legal processes are not privileged, and "multiple pathways to justice" can be "interwoven, sequenced and accommodated" (Roht-Arriaza 2006, p. 8).

The view is premised on an acceptance that not only formal trials but also truth commissions are insufficiently attentive to social integration and reconstruction. The latter have often been portrayed as somehow more culturally embedded, but critics have argued that they can be equally remote from local realities. As Priscilla Hayner notes, "indigenous national characteristics may make truth-seeking unnecessary and undesirable, such as unofficial community based mechanisms that respond to recent violence or a culture that eschews confronting reality directly" (Hayner 2010, p. 186). From Peru to Cambodia to Sierra Leone, scholars have highlighted the danger of what one termed the "tyranny of total recall" (Theidon 2009). These societies, it is argued, are characterized in varying degrees, by social ideas of forgiveness. Rosalind shaw, meanwhile, has traced the genealogy of truth commissions and finds their genesis in a Western tradition of confession that has no immediate resonance in contexts such as Sierra Leone, where "a factually accurate depiction of the past is less important to reconciliation than achieving a cool heart" (Shaw 2007; Kelsall 2009, p. 14).

The problem for transitional justice scholars and practitioners then is that internationally sponsored judicial and non-judicial processes and decisions appear to be making little sense and garnering very limited support from the very constituencies they are supposed to be benefitting. The appeal of a more locally oriented justice, in contrast, is claimed to lie in its potential to repair and restore communal relationships via familiar, locally grounded processes that all community members can associate with (Alie 2008; Latigo 2008). Traditional justice is laudable, so the argument goes, because it is culturally relevant. It draws upon authentic indigenous identities and rituals and "taps into profound spiritual worlds" based on non-Western concepts of community harmony and well-being (Roht-Arriaza 2006, p. 12). It is also suggested that justice built on established customs of reconciliation and compensation is more appropriate and pragmatic in close-knit community settings, where people remain dependent on continuous social and economic relationships with their neighbors

(PRI 2002). Thus, James Otto, the head of Human Rights Focus in northern Uganda, graphically expressed opposition to the ICC's intervention by explaining that: "there is a balance in the community that cannot be found in the briefcase of the white man" (Allen 2006, p. 134).
