The South African TRC along with many other transitional mechanisms carried the heavy responsibility of dismantling Apartheid as a governmental system that had defined deviance in an illegitimate way (the black majority was seen as deviant because of the color of their skin, their unwillingness to support the Apartheid enterprise, and their declared armed struggle against minority white rule). The African National Congress (ANC) government, voted into power in the first all-inclusive elections in April 1994, had the onerous responsibility to transform this racially discriminatory definition of deviance in a legitimate manner that would have impact across all sociopolitical spheres and societal sectors. This dilemma presented a quandary to the ANC who had politically declared themselves as a nonracial, democratic government and yet from an ideological perspective, the surest way to legitimize their freedom struggle was to declare their revolutionary violence as justified and therefore out of reach of the definitions of deviance.

However, the TRC using its legal standing as an autonomous structure (not aligned or controlled by any political party) determined to address the deviant violence of the past and not to favor any particular political affiliation in the process. The TRC significantly accomplished this by equally applying the international standard of deviant violence: gross human rights violations (GHRVs) to all armed political groups in South Africa. The five categories of GHRVs covered by the TRC were murder, attempted murder, torture, kidnapping/abduction, and disappearance. All other Apartheid government violations were outside the purview of the TRC. Every fighting faction no matter of what political or ideological persuasion was required to make legal application for amnesty with the TRC. This egalitarian approach to past deviant violence was a relief to the foot soldiers of the Apartheid security forces, but for the Liberationist groupings (freedom fighters) there was outrage and protest as they understood themselves to be fighting a just and upright cause regardless of the violent means utilized. However, what this insistence on equal treatment of all GHRVs accomplished was to send a strong signal to all aspiring governments, military formations, and the citizenry of South Africa that GHRVs would not be structurally or criminally tolerated in the future.

As was earlier indicated, the TRC did not grant “blanket amnesty” and instead instituted a conditional amnesty clause requiring all amnesty applicants to make full disclosure, establish political motivation, prove they were a member of a bona fide political organization, show that their activities were proportional to their goals, and ensure that their case(s) fell within the timeframe (1960–1993) and GHRV categories of the TRC. Upon the receipt of each amnesty application, statements were then formally investigated in order to correlate and substantiate the truthfulness of the evidence presented.

Particular issues emerged out of the context of the TRC which revealed the nuanced complexity of working within the specificity of legislated definitions of deviance. First, in the process of negotiating the TRC legislation the white-factions of the Apartheid system insisted that the TRC amnesty hearings be conducted in-camera thereby keeping the deviant violence of the Apartheid state hidden; covered-up except for only the designated few. The ANC flatly refused this demand on the claim that the granting of amnesty was already a significant political compromise. As a result, all amnesty hearings were held in public purview thereby opening up the space for the narrative discourse of the secret deviant political violence to be exposed and rearticulated in the shared memory of the national psyche.

Second, as result of these public hearings which were broadcast across the nation for the 2-year life-span of the TRC, social sanctions against the perpetrators were surfaced in the public domain. Many amnesty applicants stepped out of their positions in public office and were forced to search for employment in the private sector. Many changed identities, moved locations, and in essence went into hiding to start life over anew. This process of lustration and vetting sent a strong message to the present and future governing "powers" that deviant violence of this nature would not be tolerated in those leaders who have been entrusted with the stewardship of the "common good" of the country.

Third, as the amnesty hearings began to unfold increasing numbers of offenders began to claim Post Traumatic Stress Syndrome (PTSS) as the motivating rationale for their deviant behaviors. This trend, while substantiating a "legal argument" for impunity, caused considerable alarm in the victims' communities and among the psychological fraternity. From the professional psychological perspective, while the symptoms of PTSS are often found in common between both victim and offender in a traumatic encounter of violence, to manipulate the PTSS diagnosis as a legal justification for committing acts of violent deviance on a consistent and protracted basis over time (such as performing acts of torture on political prisoners for decades) was not scientifically acceptable. In this situation, other explanations for this form of systematic, repeated violent deviant behavior were required. One possible explanation could be the notion of anomie which refers to an individual lack of the internal sense of guiding social norms (Durkheim 1897). Other explanations have their origins in the research on various antisocial personality and psychopathic disorders that revolve around the searing of conscience, lack of empathic motivations, and the suppression of social "anchors" of right and wrong behavior appropriate to healthy relationships with others (Hare 1999; Checkley 2011).

Gacaca Courts in Rwanda

Building on the South African TRC experience, Rwanda took their transitional process a step further and engaged in a state-sanctioned hybrid model of justice which entailed incorporating a community-based approach called *Gacaca Courts* (*GCs*) which were mandated to run parallel (complimentary and supplementary) to the formal legal process of an International Tribunal that had already been launched in Arusha, Tanzania. The GCs represented an innovative justice project birthed in the midst of a prison over-crowding crisis in Rwanda following the 1994 genocide whereby 120,000 prisoners accused of crimes of genocide were being held. Based on a traditional custom of dealing with a range of community disputes, GCs involved the community electing civic leaders/traditional elders who functioned as the third-party judges in each case. These nine community arbitrators were tasked with gathering as much information as possible about the genocide activity in their local village. They then brought together the survivors, accused offenders, family support networks, and the community at large (at least 100 persons needed to be in attendance for a hearing to go forward). Truth-telling was core to the process with the use of witnesses to corroborate the findings. Opportunity for offender admission of guilt, confession, and apology were emphasized throughout the process with the occasional possibility of survivor-offender mediation and reconciliation resulting from the procedure. Forgiveness, reduced prison sentence, compensation, or punitive discipline was then decided on (official sentencing) by the community judges. With the closure of the GC process in April of this year (2011), the benefits of this process are believed to be myriad and the world is watching closely to see the long-term, potential success of this effort at building a sustainable climate of justice, healing, and reconciliation in Rwanda (Wolters 2005).

Some of the most stinging critique of the Rwandan experience of transitional justice has *not* been in relation to the internal-structure or effectiveness of the GCs hybrid justice approach, but instead the political *interference* of governmental ideology and policy that swirls around the national definition of "genocide" and as such the conception of deviant acts of violence. Vigilant against any language or action that smacked of "genocidal ideology," the current government in Rwanda outlawed the use of the ethnic designations of "Hutu" and "Tutsi," and to this day keeps a tight surveillance on any organizations that appears to only work with or favor one ethnic group to the neglect of the other. While this is quite understandable in lieu of the horrific nature of ethnic genocide that has transpired in that nation's history, it has had the unintended consequence of "silencing" a rigorous and honest debate about ethnicity and genocide deviance as experienced in that country (Tiemessen 2004).

On top of this, in an eagerness to exonerate itself from the violence of 1994, and suppress all hints of genocide ideology in the country, the ruling party has embarked on a rigorous campaign to carefully distinguish between the language of genocide (organized violence intent on eliminating an entire ethnic group) and all other forms of violence (mass killings or massacres). On the surface this linguistic differentiation seems straight forward; however, for the narrative discourse of deviance being discussed in this entry it has dangerous implications. First, it has allowed the ruling Rwandese Patriotic Front (RPF) government to excuse itself from implication in partaking in any form of deviant violence, claiming that whatever massacres or mass killings that may have transpired under its watch were strictly a consequence of war and in defense against the Genocide. Second, this clear definition of language infers that only Hutu people could have had genocide intentions and therefore they carry the responsibility for acts of past deviant violence. Third, as the GCs were set up to deal with the aftermath of the 1994 genocide specifically and not the historical violence in Rwanda generally, by implication the GCs appeared to carry a bias in favor of Tutsi and against Hutu (Mamdani 2001). Thus, with such a distinct political narrative of "genocidal ideology" as the only deviant form of violence and "massacres" and "mass killings" as justified forms of violent self-defense in the face of genocide, the conceptions of deviance have become partial and arbitrary for some communities in Rwanda. With over 100 years of genocidal history as a backdrop, a "thicker analysis" of the roots of genocide in Rwanda would need to take into consideration deviance as a product of "mimesis" especially as it relates to the deviance theories of social learning (Bandura 1977) and social disorganization (Kurbin and Weitzer 2003). Social learning theory emphasizes three critical phases: retention (observing deviant behaviors), reproduction (imitating deviant behaviors), and motivation (reinforcing deviant behaviors). Social disorganization theory speaks to the fundamental desires or needs for recognition, domination, and security that drive the performance of deviant actions especially as it relates to the phenomena of social stratification and enemy formation.

The pivotal learning here is that any process of transitional justice (whether in amnesty or prosecution) must hold an impartial interpretation of the deviant nature of violence to all persons or organizations involved in perpetrating gross human rights violations (GHRVs) regardless of the political-ideological persuasion, or whether or not one claims the "moral high ground" in the implementation of a militant struggle for freedom. While the process of the GCs allowed for a community-based micro-level complexity in the definition and management of criminal deviance to occur, at the macro-national level this contextualization of deviance was inhibited due to the government's interference in the definition of "genocidal ideology" and its labeling effect to one ethnic portion of the population. Without a demarcation against violence as deviation across the board, there will remain a mind-set of victors (nondeviant winners) and vanquished (deviant losers) which will only lend itself to continued revenge cycles in the future. Plus, the transitional justice movement runs the risk of sending the signal that certain violence is justified and permissible if it fails to hold all perpetrators of violence in equitable standing (Lemarchand 1994).

Fambul Tok in Sierra Leone

After a brutal terrorizing 11-year civil war, Sierra Leone negotiated a peace settlement in which all militia and rebel movements (including the Revolutionary United Front – RUF) were granted blanket amnesty. In response to this unconditional amnesty, the International Criminal Court (ICC) seized the moment and set up a Special Court to apply prosecution measures against the highest ranking leaders responsible for crimes against humanity perpetrated during the civil war. At a national level, a Truth and Reconciliation Commission (TRC) was instituted in a bid to promote healing and restoration across the country. The TRC embarked on a truth-telling exercise seasoned with a collective historical rewrite and the spice of public "confession-apology-forgiveness" transactions. Unfortunately, under the weight of a voluminous final report, limited funding, and ineffectual mobilization of the international and national commissioners, the TRC struggled to find innovative ways to inculcate the ownership of justice and reconciliation at a community grassroots level.

However, one of the most promising civil society responses to this dearth of community instituted justice and healing processes is the Fambul Tok (in the local Kriol language this is literally translated, "Family Talk"). Fambul Tok was launched in early 2008 by a Sierra Leonean human rights organization, the *Forum of Conscience* with long-term support from *Catalyst of Peace*, a foundation based in the United States. Fambul Tok is touted as a community-driven effort that claims no formal state sanctioning or governmental political interference in its pursuit of reconciliatory justice.

Fambul Tok boasts the following vision: "*Fostering sustainable peace in Sierra Leone through reviving our communities' traditions and values of confession, forgiveness and reconciliation*" (Fambul Tok, Annual Report 2008). The approach itself is based on traditional practices of resolving conflicts within the confines and safety of community-family networks. Planned, organized, and implemented within the local village context, the encounters integrate innovative measures of dialogical and relational justice in what is termed "truth-telling bonfires" and various traditional cultural cleansing ceremonies. These interactions are facilitated by local leaders and designated elders who provide the wisdom, moral structure, and social capital for the interface. Following these events, the momentum for reparations and reconstruction is capitalized on through practical activities of educational radio peace clubs, cross-faction football (soccer) games, and intercommunal farming projects.

Fambul Tok cases range from accusations of chicken theft during the war, serious assault, rape, and murder. The accused may be anyone from traditional community leaders, child soldiers, self-appointed militia fighters, and former army officers. For example, it was commonly known that some army officers played the role of soldier by day and rebel by night – they were euphemistically called "Solbels" by the villagers. This kind of layered violence is best understood through the social deviance theory of differential association (Sutherland 2006) and subcultural theory (Cohen 1955; Matza 1964). Differential association promulgates the idea that people will choose criminality if the balance of benefits for law-breaking outweigh the benefits of law-abiding. Subcultural theory grows out of delinquency research with urban gangs and suggests that societal subcultures form around values and attitudes that are conducive to crime and violence and as a consequence deviance then becomes the bonding agent for meeting the recognition and identity needs of individuals and groups.

Initially, 161 Fambul Tok ceremonies were planned at a chiefdom level around the country; however, the significance of this approach has spawned a great demand for this process at all levels of the society and as such there are plans to see thousands of these kinds of ceremonies conducted across the nation. With the Sierra Leonean TRC completed and the closure of the International Criminal Courts coming to an end, it is predicted that the process of Fambul Tok will play a leading role in securing a satisfying form of justice, healing, reconciliation, and ultimately durable peace in Sierra Leone for the future.

The significance of this transformative approach is described as follows:

> Fambul Tok . . . is a face-to-face community owned program that brings together perpetrators and victims of the violence in Sierra Leone's 11-year civil war through ceremonies rooted in the local traditions of the villages that were affected. It provides Sierra Leonean citizens with an opportunity to come to terms with what happened during the war, to dialogue, to experience healing, and to chart a new path forward – together. (Fambul Tok, Annual Report 2008)

A paramount learning from this case scenario is that Fambul Tok shows the potential of community-initiated programs to deliver a satisfying form of restorative justice across a nation. Despite government inabilities to translate the reconciliation experience from the top echelons to the ground, Fambul Tok illustrates the spark of innovation and the creative genius of civil society and local communities when allowed to dream and act out a better future for themselves. A cursory comparison of African customary law (indigenous justice) and restorative justice practice reveals a great deal of overlap:

- Both have the objective of reconciliation and restoration of peace and harmony in the community.
- Both share the function to serve the goal of restoring human dignity to all parties involved in the wrong-doing.
- Both promote a normative system which stresses an individual's duties, obligations, and responsibilities and not only their legal human rights.
- Both consider all offenses as human and personal wrongs against another person(s).
- Both employ procedures that are simple, cost-effective, and informal, yet powerful.
- Both encourage community participation and ownership of the process of justice; thus, those who have offended are more likely to be held accountable, to accept responsibility, apologize, and offer reparations/restitution for their wrong-doing.

Indeed, the very ideations surrounding the meaning and application of justice change in the process of reconceptualizing deviancy within the ambit of established community norms. When the significance of deviancy and the process of managing the consequences that result from deviant behaviors are placed within the worldview of broken relationships and breached harmony within community then justice becomes a socially constructed reality. Deviance and justice become contested subject matters that are negotiated through public participation, sustained dialogue, and deliberative spaces of narrative reiteration. In other words, an understanding of deviance that is embedded in human capital, social contracts, and community regulation is open to a whole new set of interpretations as opposed to the current justice system that defines deviancy in a particularly rigid, essentialist, and universal manner.

- In the first place, the definition of what qualifies as deviancy is much more flexible, nuanced, and complex in a community-based justice process than in our current justice system.
- Secondly, in a community-based justice process the understanding of deviancy becomes much more culturally appropriate and contextually situated and therefore can be more effectively sanctioned.
- Thirdly, the process of managing the consequences of deviancy is much more transitory (less legally binding and permanent) and less stigmatizing (it moves away from the current focus on labeling of offenders). Rupert Ross (1996) a Canadian magistrate writing out of the First Nations indigenous tradition where "sentencing circles" are used as a form of justice contrasts the current justice system (The Crown) as symbolic of an offender "degradation ceremony" whereas the "sentencing circles" are an example of an "reintegration ceremony."

Future Directions

Considering the novelty of this discussion on deviance embedded within a community-sanctioned process, there are numerous divergent routes that could be considered for future research:

1. Currently, there is very little debate or dialogue occurring between the legal fraternities and those working with indigenous justice processes. This is due in part to the fact that these two groups do not share a common language with which to talk about the meaning of justice and its applications. Further research is needed that will build "bridging" language between jurisprudence and the working values that guide indigenous justice processes so that a constructive conversation can be enabled between the two fields.
2. How to measure the "satisfaction" of indigenous justice processes has not been clearly defined or articulated. Research that could contribute to the development of standard frameworks for monitoring and evaluation of indigenous justice systems is of critical importance in order to give these new forms of justice the wide-spread attention they need (Van der Merwe et al. 2009). A starting point could be to borrow from research efforts in the restorative justice field such as work done by Skelton and Batley (2006) who propose four critical sets of interactions that should be used to assess the practice of restorative justice: *Encounter, Amends, Inclusion, and Reintegration.*
3. Other possible research topics to pursue relate to *recidivism* and decrease in deviant criminal behavior (longitudinal research on the impact of indigenous justice on recidivism rates is important), *scale* (can these indigenous justice systems be scaled-up to deal with the deviance of mass atrocities in a sustainable manner?), *structure* (what forms of hybrid western and indigenous models could be developed to more effectively contain deviance?), and *application* (What are the "intersectionalities" of micro and macro understandings of deviance and how can they be coordinated to efficiently administer justice?).

Conclusion

This entry has explored various applications of the definition and resolution of criminal deviance within the frameworks of transitional, restorative, and indigenous justice contexts. The contrasts and integrations of state- and community-sanctioned justice systems as well as hybrid models have been described and critiqued. Out of the various African transitional justice experiences discussed above, one could deduce that there are a number of critical elements to the process of identifying and transforming deviance that should not be overlooked. First, the definition and resolution of deviance is best served from within its own indigenous tradition by an "*insider-impartial*" (trusted "in-context" leaders) that can facilitate all the stakeholders to the conflict in a balanced manner. Second, deviance is best understood to be a breach of community harmony, well-being, and order and therefore to repair this corporate fissure the victims, offenders, extended families, and community networks must all be involved; it is a communal problem. Third, in dealing with deviance culturally appropriate platforms for truth-telling, confession, apology, forgiveness, and reconciliation should be explored throughout the process. Fourth, in dealing with deviance material forms of reparations, restitution, and compensation are expected as signs of peaceful goodwill and as indications of human responsibility and obligation to make right the wrong. Fifth, in dealing with deviation symbolic gestures of ritual healing, cleansing, and resolution are an important means of reintegration of offenders, release of the victim-survivors, and psychosocial closure for all who have been affected by the violence.

Transitional Work Programs for Ex-prisoners

Robert Apel
School of Criminal Justice, Rutgers University,
Newark, NJ, USA

Overview

Employment has the potential to be a major point of intervention in an offender's criminal career, particularly those who have recently been released from prison. Consequently, employment-based reentry programming has obvious appeal as a policy lever intended to slow the "revolving door" of prison. President George W. Bush (a Republican) and President Barack Obama (a Democrat) have both advocated for federal grants, under the Second Chance Act, to fund prisoner reentry initiatives with employment training provisions. This is the clearest illustration imaginable that resolving the employment challenges faced by ex-prisoners is a bipartisan issue.

From a theoretical standpoint, employment provides a means of strengthening prosocial and law-abiding behavior. Rational choice theory suggests that work experience is an important source of human capital that imposes "opportunity costs" on criminal activity. Social control theory posits that high-quality jobs are a potent source of "social capital" that can override natural temptations to violate the law. Routine activities theory proposes that working fosters changes in individuals' "unstructured socializing" outside of the workplace in ways that channel them into better supervised settings with law-abiding companions. Strain theory proposes that lack of success in the labor market can motivate individuals to "innovate" through criminal behavior as a way to acquire valued goals or to alleviate negative feelings. Learning theory suggests that the workplace provides a forum in which individuals are exposed to a variety of "models," "definitions," and "reinforcements" which are conducive to law-abiding behavior.

From an empirical perspective, it is not a stretch to say that literally dozens of studies demonstrate that employment, job stability, and work quality are inversely correlated with criminal offending. While this research cannot be considered in detail in this entry, the kinds of jobs which are most strongly correlated with criminal behavior tend to be ones in which individuals earn higher wages, work for longer duration, report higher satisfaction, and work in more prestigious occupations. Empirical research thus confirms the theoretical expectation that improvement in work prospects provides one avenue for offenders to give up criminal behavior.

The labor market, and crime prevention interventions based on it, is therefore viewed as a prominent institution in the desistance process. This entry is concerned with a specific kind of employment-based reentry program known as transitional work. It begins with a look at the underlying rationale and historical background of this class of employment programs. It then provides a review of contemporary transitional work programs, highlighting recent experimental evidence of their (in)effectiveness. Because many of these transitional work programs have shown limited potential, a number of plausible explanations will be considered for their poor record of increasing employment and reducing recidivism. This entry closes with suggestions for the future design and evaluation of transitional work programs.

Rationale of Transitional Work

The rationale of employment-based reentry programming is straightforward and goes something like this: incarcerated offenders have poor work prospects, which often predate their incarceration; imprisonment substantially worsens their work prospects, in part because of stigma; and these worsened work prospects exacerbate criminal recidivism. Each of these three claims will be examined more closely.

First, individuals with a criminal record serious enough to result in incarceration have well-documented employment problems. This is due, in part, to the fact that they tend to be unskilled and poorly educated – qualities that make them unattractive to potential employers. Nationally, just 35 % of jail and prison inmates have at least a high school diploma, compared to 82 % of the general population (Harlow 2003). And the employment problems experienced by such offenders tend to be long standing. For example, Apel and Sweeten (2010) demonstrate that young people who experience their first incarceration spell exhibit unstable work histories well before they receive their first criminal conviction, compared to young people who are also convicted but are not incarcerated. Namely, they are modestly less likely to have been employed prior to conviction (60 % vs. 67 %) and work fewer weeks when they are employed (29 vs. 33 weeks). Yet a more alarming finding is that to-be-incarcerated youth show weaker attachment to legal work, as indicated by their higher probability of labor force nonparticipation prior to the conviction that led to their confinement (76 % vs. 69 %).

Second, individuals with a prison record experience deterioration in their work prospects as a consequence of their incarceration. For one, a prison record stigmatizes individuals in the marketplace. Pager (2003), for example, reports 50 % lower callback rates among job applicants who report a prison sentence on their application. Many ex-prisoners invariably discover this from their own job search experience, reporting overwhelmingly that they feel their criminal record has hindered their ability to find a job (Visher et al. 2008). Besides the stigma that ex-prisoners face in the labor market, they also accumulate substantial human capital deficiencies as a result of their incarceration, as time spent in prison is time not spent acquiring work experience. And incarceration apparently weakens ex-prisoners' already tenuous attachment to legal work, by promoting illegal income earning and labor market dropout (Apel and Sweeten 2010).

Third, studies of the determinants of criminal recidivism indicate that employment reduces the probability of, and increases the length of time to, re-offending among recently released prisoners. For example, work by Uggen (1999; Uggen and Thompson 2003) demonstrates that ex-prisoners who spend more time employed, work in higher-quality jobs, and have higher legal earnings have a significantly lower probability of criminal behavior and illegal earnings. The obvious problem is that only 35–50 % of ex-prisoners are employed in the year following their return to the community. For example, in the Urban Institute's Returning Home Study, less than half (45 %) of ex-prisoners were currently employed by the eighth month following release (Visher et al. 2008).

In principle, then, sustained efforts to improve the employment prospects of ex-prisoners have the potential to lower their risk of criminal behavior and at the same time give them the capacity to earn a livable wage that lessens the attraction of the illegal market. Furthermore, considering that hundreds of thousands of such individuals return to the community each year from state and federal prisons, successful employment interventions have the potential to benefit society at large by increasing tax revenue, improving public safety, and lessening the burden of correctional spending. One viable strategy to overcome the difficulties experienced by ex-prisoners in the labor market is transitional work.

Background of Transitional Work Programs

The US Department of Labor defines transitional work in the following manner:

> A "transitional job" is generally defined as temporary, paid work experience intended to improve participants' employability, earnings, and opportunities for advancement, and to promote self-sufficiency and long-term success in the unsubsidized labor market. (Quoted from a solicitation for grant applications under the Enhanced Transitional Jobs Demonstration, posted by the Employment and Training Administration. Accessed online at http://www.doleta.gov/grants/pdf/SGA-DFA-PY-10-11.pdf on January 9, 2012)

Transitional work programs are rooted in the *supported work model* of employment services delivery. There are four key features of these programs (Bloom 2006, 2010):

1. *Temporary subsidized work* in a minimum wage job for a nonprofit or government agency typically in a small "work crew" that is intended to strengthen peer support for employment. The workplace introduces graduated stress that increases the amount of responsibility expected from the trainee, who undergoes routine performance evaluations by the worksite supervisor.
2. *Work support services* that facilitate on-site employment and industry- or firm-specific skills acquisition including such things as transportation assistance, job coaching, and occupational skills training.
3. *Skills development* that emphasizes training in "soft skills" and general "work readiness" and can include a variety of wrap-around services related to literacy educational certification, life skills, housing assistance, legal assistance, parenting skills, and substance abuse intervention.
4. *Unsubsidized job placement*, which often includes an assessment of core competencies as well as resume development and job search assistance. Incentives might be made available to promote job stability and retention.

These programs thus have a dual focus on employment and employability. In other words, the "give 'em a job" aspect of subsidized work is supplemented by efforts to strengthen the work orientation and work readiness of ex-prisoners. The most influential precursor of modern transitional work programs was the National Supported Work Demonstration of the 1970s. This program was targeted at hard-to-employ populations – welfare recipients, youth dropouts, former drug addicts, and ex-prisoners. The program was carried out from 1975 to 1980 and evaluated in ten cities across the United States. The total cost of the program and evaluation was $82.4 million, with contributions from a variety of public, private, and philanthropic agencies (MDRC 1980).

The population of interest to this entry was the group of participants 18 years of age or older who had been imprisoned in the 6 months prior to enrollment in the program and were currently unemployed with no more than 3 months of work in the preceding 6 months ($N \approx 1{,}500$). Participants who were assigned to the supported work intervention were assigned to supervised work groups in such activities as building maintenance and construction. They were guaranteed 12 months of subsidized employment with a starting wage at or just above the prevailing minimum wage (with provisions for bonuses and merit increases).

The ex-prisoners in the study were a highly disadvantaged group (see MDRC 1980). They were mostly male (94 %) and African American (84 %), with a 27 % high school completion rate and just over 10 years of schooling, on average. Half of the sample had either never worked (11 %) or had not worked for more than 2 years (39 %). Almost one-third reported daily recent use of heroin (31 %). The sample was also highly criminally involved, with a mean of more than nine arrests, three convictions, and 195 weeks (3.7 years) of accumulated incarceration time.

Concerning the success of the program at increasing employment and reducing recidivism among the ex-prisoners, the influential evaluation by MDRC (1980) revealed only limited impact. At 3 months post-baseline, the employment rate for the control group was 38 % (with a mean 37 h and $139 during months 1–3), compared to 94 % in the experimental group (with a mean 144 h and $447 during months 1–3). Yet by 12 months post-baseline, the employment differential narrowed to 39 % in the control group (with a mean 53 h and $221 during months 10–12) and 51 % in the experimental group (with a mean 74 h and $277 during months 10–12). However, the differentials disappeared entirely after the 12th month. Thus, the large and statistically significant employment differential observed early in the study period was attributable entirely to the unsubsidized work offer provided to the experimental group. But the program had no lasting impact on employment.

The findings with respect to recidivism were even less favorable. Nine months after enrollment in the study, 34 % of the control group had been arrested, a figure that increased to 46 % by 18 months. Among the experimental group, the respective figures were 32 % and 47 %. Therefore, even during the early part of the follow-up period, when the experimental group was benefiting substantially from the subsidized work offer, the program had no apparent impact on criminal activity.

There were other noteworthy findings concerning the ex-prisoners in MDRC's (1980) evaluation. First, there was a high rate of dropout from the program, as the ex-prisoners spent an average of only 6 months in the program, far less than the other high-risk groups targeted for study. A large portion of the premature dropout was attributable to being terminated from the program job, suggesting that ex-prisoners are a particularly difficult group to manage in the workplace. Second, a significant arrest differential in favor of the experimental group was found after 36 months. Because only the earliest cohorts to enroll in the study were observed for this length of time, it suggests that early enrollees might have benefited from subsidized work throughout the study period. Third, there was some suggestion from follow-up analysis that ex-prisoners over 25 years of age experienced lasting reductions in recidivism. This led some to suggest that older ex-prisoners may be more highly motivated to take advantage of opportunities to change (Bushway and Reuter 2004). However, this interesting finding was not observed among the other targeted groups in the study, rendering any interpretation of it inconclusive.

(In)Effectiveness of Modern Transitional Work Programs

An example of a modern transitional work program is the Center for Employment Opportunities (CEO), based in New York City. The CEO program has all four characteristics of the supported work model. (The ensuing description relies heavily on material provided on CEO's website [www.ceoworks.org] as well as a program description published by the National Institute of Justice [Finn 1998].) The program begins with 4 days of "life skills education" in order to establish work readiness. This includes instructional workshops related to resume writing, job search, interviewing, and workplace behavior. Following completion of the pre-employment course, participants spend 1 day with an employment specialist, who assesses the participant's interests and develops an employment plan.

At the start of the second week, participants begin employment in a subsidized job in a crew of about 5 workers. The work involves performing maintenance, janitorial, and grounds keeping services to city or state agencies and educational institutions. Workplace supervision is provided by a CEO staff member, who provides coaching in work performance as well as enforcement of rules of conduct (e.g., punctuality, dress code, workplace behavior). Participants are paid at the end of each workday. Four days each week are spent at the workplace, while the fifth day is spent in the CEO office with the employment specialist, who provides additional coaching. When participants are deemed work ready, they are matched with a job developer, who lines up job interviews in the private sector for positions which match the skills and interests of each individual.

For a period of 6 months after participants acquire an unsubsidized job, a CEO retention specialist continues to provide work-related counseling, career planning, and job search assistance. As an incentive for stable employment in a full-time job, and for up to 1 year, monthly bonuses are made available to participants who present their pay stubs. Throughout the CEO program period, moreover, specialized programs offer training in parenting skills.

An evaluation of 2-year CEO program impacts was conducted by Redcross et al. (2009). Almost 1,000 participants were randomly assigned to either receive the full complement of CEO program services or job search assistance only. The participants were largely male (93 %), African American (64 %), or Hispanic (31 %) and had either no educational certification (42 %) or only a GED certificate (43 %). While 81 % of the sample had ever been employed, just 61 % had worked for the same employer for 6 consecutive months, and only 24 % had been employed in the year prior to baseline in a job covered by the state unemployment insurance (UI) system. The average participant had over seven prior arrests (over four felony arrests), almost seven prior convictions, and had accumulated 60 months in state prison.

Examination of the filtering of the experimental group through the stages of the CEO program illustrates the challenge of retaining high-risk individuals in a transitional work program. Only 79 % completed the pre-employment course, 72 % worked in a subsidized job (for a mean 8 weeks), 57 % met with a job developer, and 30 % were successfully placed in an unsubsidized job, either through CEO or on their own initiative.

With respect to CEO program impacts on employment, the experimental group was far more likely to work in a UI-covered job (81 %) than the control group (57 %) in year one, as expected. However, the program had no impact on the subsequent likelihood of employment, as half of both the experimental and control groups worked in a UI-covered job during year two. Although not statistically significant, the experimental group did have higher UI earnings in year two than the control group ($5,167 vs. $4,670), for a difference of almost $500 in annual earnings. Apparently, the initial employment differential was attributable entirely to the subsidized job offer, as CEO had no impact on unsubsidized employment, even though monetary incentives were provided.

With respect to CEO program impacts on recidivism, the difference in 2-year arrest likelihood was not statistically significant, with 38 % of the experimental group and 42 % of the control group experiencing an arrest, a relative difference of 10 %. The experimental group also had a lower risk of conviction (31 % vs. 38 %) as well as a lower risk of incarceration (49 % vs. 55 %), differentials that were both statistically significant. The rate of incarceration for a new crime was also lower, although not significantly so, among the experimental group (14 % vs. 17 %). Interestingly, CEO program impacts on arrest and conviction were concentrated in the second year of the follow-up. For example, while there was no difference in arrest in year one for the experimental group (22 % vs. 23 %), there was a significant difference in year two (23 % vs. 27 %).

The perplexing finding from the CEO evaluation is that the employment differential was observed in year one, during the subsidized work phase, while the recidivism differential was observed in year two, during the unsubsidized work phase. Therefore, the impact of the program on recidivism was due to something other than the program's impact on unsubsidized employment, contrary to the theoretical model underlying transitional work programs. The authors of the evaluation speculated that the extensive wrap-around services (e.g., support and guidance provided by CEO staff), and not employment per se, was responsible for the recidivism reduction (Redcross et al. 2009). Irrespective of the underlying mechanism, though, the impact of CEO on recidivism was apparently long lasting.

As it turns out, the recidivism reductions observed in the CEO evaluation are the exception rather than the rule. Yet even the results from CEO are difficult to interpret. A recent evaluation of the Transitional Jobs Reentry Demonstration yielded no program impacts on either unsubsidized employment or recidivism (Redcross et al. 2010). A meta-analysis of employment-based reentry programs performed by Visher et al. (2005) concluded unambiguously that such programs were ineffective in increasing employment or reducing recidivism. The CEO experience aside, therefore, transitional work programs for ex-prisoners inspire little optimism about their utility as a policy option.

Why Transitional Work Does Not Work

Transitional work programs tend to produce large in-program effects on employment and earnings, but these gains tend to be lost during the post-program period. In fact, a year after the start of the program, transitional work participants are often indistinguishable from nonparticipants in their labor market experiences. In both cases, employment prospects remain dim. Nor is there a recidivism reduction, during either the in-program period or the post-program period. What could possibly account for this poor track record? There are a number of possibilities, only a few of which will be considered in detail here.

First, compliance problems tend to plague field experiments of the sort evaluated in transitional work programs. Individuals assigned to a control condition can seek non-program assistance or training on their own, while individuals assigned to an experimental condition can refuse to show up for training or subsidized employment. For example, among the ex-prisoners in the National Supported Work Demonstration, 33 % were fired from their program job, and another 20 % were terminated for other negative reasons such as reinstitutionalization (MDRC 1980). Noncompliance is problematic for evaluation of the "treatment effect" of transitional work. The problem arises from the fact that the causal estimand is the "intention to treat" (ITT), that is, the causal impact of randomized offers to participate in a work program. When there is substantial noncompliance with the program conditions, the ITT can be attenuated – often substantially so – relative to the "average treatment effect on the treated" (ATT), or the causal impact of actual participation in a work program. Therefore, the failure of transitional work programs may be more apparent than real, because a substantial portion of participants are either terminated from or voluntarily leave the program.

Second, ex-prisoners face inequality in the job search process. Recall from Pager's (2003) audit study that ex-prisoners had a substantially lower callback rate from prospective employers. Employer reluctance to hire individuals with a criminal record has also been confirmed by surveys of employers themselves. For example, Holzer et al. (2004) found that 62 % of the establishments they surveyed reported that they would "probably not" or "definitely not" have hired someone with a criminal record to fill their most recent job opening. Employer willingness to hire offenders (38 %) for low-skill positions was markedly lower than their willingness to hire welfare recipients (92 %), applicants with only a GED (96 %), applicants who had been unemployed for a year or more (83 %), and applicants with a spotty work record (59 %). Therefore, the failure of transitional work programs to improve the employment prospects of ex-prisoners could be attributable to demand-side preferences that severely penalize individuals with a prison record.

Third and finally, the time is probably right to consider the possibility that transitional work is based on a model of service delivery (and a theory of behavior change) that is outdated and outmoded, at least in the context of prisoner reentry. Visher et al. (2005), for example, lament that most of the programs in their meta-analysis are quite old. Bloom (2010) observes that transitional work programs are based to a large extent on a welfare-to-work model. While transitional work does have a good track record of improving the employment prospects of former welfare recipients, ex-prisoners represent a population with deficits that make them much harder to serve than welfare recipients. It might be that transitional work, as currently conceived, is simply not a good prison-to-work model. Furthermore, since the 1970s, when the basic features of modern transitional work programs were put into place, a much better understanding of "what works" in correctional rehabilitation has been acquired. Indeed, integration of modern correctional principles might inspire the design of future transitional work programs.

Conclusion

The theoretical rationale of transitional work programs for ex-prisoners is unassailable. Since ex-prisoners have long-standing work difficulties that are worsened by imprisonment, focused efforts to improve their employment and employability should produce lasting individual and societal benefits. Regrettably, transitional work programs have not been shown to uniformly increase employment and reduce recidivism. Indeed, evidence of effectiveness is the exception rather than the rule. And exceptional programs (e.g., CEO) tend to produce perplexing results, namely, recidivism reductions in the absence of better unsubsidized work prospects. A brutally honest assessment of the evidence therefore compels this author to conclude that "transitional work does not work," at least not in the context of prisoner reentry and not as currently designed. Claims to the contrary are Pollyannaish.

While this conclusion might be needlessly pessimistic, there are still good reasons to believe that transitional work programs can be salvaged. Collaboration between criminal justice officials, service providers, and academic researchers can help transform good intentions into good practice, with greater fidelity to the expanding knowledge base about "what works" in the design of correctional interventions. Successful efforts are likely to involve a combination of strategies, including integration of prison- and community-based services, experimentation with a variety of financial incentives for ex-prisoners as well as employers, and systematic efforts to address substance abuse and mental health problems.

The fact that more than one-half million individuals leave the nation's prisons each year lends urgency to a renewal of innovative employment-based strategies designed to ease their reentry into the community. Transitional work programs should be central to such efforts, and steps taken to understand why these programs are ineffective, and what can be done to make them effective, will yield dividends for future reentry policy. Such efforts promise to improve the lives of ex-prisoners, reduce their burden on the criminal justice system, and protect society at large.

Transnational corporate corruption

Overview

Large-scale investigations involving multinational corporations (MNCs) such as Siemens and BAE Systems – the former involved a system of slush funds used to pay bribes to win overseas contracts, while BAE was investigated by the UK Serious Fraud Office for alleged commissions and hospitality payments to Saudi officials involved in a major arms procurement – demonstrate how large commercial enterprises may be the subject of allegations of bribing public and private officials to further or maintain their business interests.

Some would accept that as the cost of development or the unavoidable interdependence between licit and illicit commerce in "gray" markets, others would argue that corruption and bribery have devastating consequences, in particular for developing countries where much corporate corruption is directed. Increasingly, the argument that corruption is very harmful is having a significant impact on the way international business is seen and has shaped legal frameworks and enforcement practices, particularly in terms of international conventions and business-focused initiatives. These, however, not only raise questions about definitions of what is corruption but also of the causes of corporate corruption. These questions are also central to an understanding of why and where corporate corruption occurs and whether control strategies would work and, if not, why not.

Addressing Transnational Corporate Corruption

What Is Corporate Corruption? Definitions and Disciplines

Bribery is only one offense within the wider term of corruption, as academics and commentators try and encapsulate into a single term that conduct and behavior which reflects private or other partisan interests over official duties in both public and private sectors. Defining "corruption," has long been the subject of conceptual and definitional debate, in part because of differing country and cultural perceptions and in part because of the wish to seek as near as possible universal definition that allows transnational applicability. The terms bribery and corruption are often used synonymously. Bribery is considered the main aspect of corruption, which is often interpreted more widely in terms of conduct that may be in breach of external criminal or regulatory requirements or deviates from the formal internal expectations, governing holding of an appointment in public or legal entities.

It is possible to locate such conduct and its control in the criminological literature within traditional conceptual debates around "corporate" and "white-collar crime" – the ground-breaking work of Edwin Sutherland (1883–1950) that pioneered criminological research into this area. Sutherland's investigation of business or corporate crime was based on studying the ways in which "crime" was learned by "differential association." His focus was very much on corporate wrongdoing in its widest sense (such as restraint of trade, unfair labor practices, and stock manipulation). His themes have been developed, expanded, and adapted by academics subsequently to include computer-related crime, management fraud, and corruption, with an emphasis on motivations, deterrence, criminality, offenders, and recidivism. Other criminologists study corporate corruption within the context of state-corporate crime, including state-initiated corporate crime and state-facilitated corporate crime. These argue that governments either (a) allow corporations to act deviantly on behalf of the former to achieve the former's objectives or (b) more generally work to minimize any regulation of the latter's deviant activities.

Whichever the intradisciplinary perspective within criminology, however, the specific topic of corporate corruption has not been successfully defined and conceptualized. Empirical *criminological* research into corporate corruption, with the exception of a few notable studies (see, e.g., Clinard 1990), is sparse, with most literature either analyzing the broader concepts of corruption and bribery found within other academic disciplines, such as political science, sociology, economics, and law, or taking a broader management handbook approach (see, e.g., Brytting et al. 2011).

Within the field of political science, Joseph Nye offered an early definition of corruption, seeing it as "behaviour which deviates from the formal duties of a public role because of private-regarding (personal, close family, private clique) pecuniary or status gain; or violates rules against the exercise of certain types of private-regarding influence" (1967, p. 419). The definition addresses the key distinction between private and official roles which has continued to be of significance and results in a primary focus on public officials, as can be seen in more recent practitioner definitions:

– **World Bank** (www1.worldbank.org/publicsector/anticorrupt/corruptn) – the term corruption covers a broad range of human actions. To understand its effect on an economy or a political system, it helps to unbundle the term by identifying specific types of activities or transactions that might fall within it. In considering its strategy, the Bank sought a usable definition of corruption and then developed a taxonomy of the different forms corruption could take consistent with that definition. We settled on a straightforward definition – the abuse of public office for private gain. Public office is abused for private gain when an official accepts, solicits, or extorts a bribe. It is also abused when private agents actively offer bribes to circumvent public policies and processes for competitive advantage and profit. Public office can also be abused for personal benefit even if no bribery occurs, through patronage and nepotism, the theft of state assets, or the diversion of state revenues. This definition is both simple and sufficiently broad to cover most of the corruption that the Bank encounters, and it is widely used in the literature.

– **Transparency International** (**TI**) (www.transparency.org/news_room/faq/corruption_faq) – corruption is operationally defined as the abuse of entrusted power for private gain. TI further differentiates between "according to rule" corruption and "against the rule" corruption. Facilitation payments, where a bribe is paid to receive preferential treatment for something that the bribe receiver is required to do by law, constitute the former. The latter, on the other hand, is a bribe paid to obtain services the bribe receiver is prohibited from providing.
– **INTERPOL Expert Group on Corruption** (www.interpol.int/Public/Corruption/IGEC) – corruption is any course of action or failure to act by individuals or organizations, public or private, in violation of law or trust for profit or gain.

A more sociological definition that focuses on the social relationships involved in bribery and corruption and develops the legal aspect is offered by Deflem, who defines corruption as a "colonisation of social relations in which two or more actors undertake an exchange relation by way of a successful transfer of the steering media of money or power, thereby sidestepping the legally prescribed procedure to regulate the relation" (1995, p. 243). This second definition highlights the key role of social interaction as well as developing a more normative aspect in relation to socially constructed laws. It also allows private sector-private sector corruption to be explored in a more balanced way.

In a preface to an edited volume of articles on definitions, however, Robert Williams noted: "the first volume in this collection, *Explaining Corruption*, is more conceptual then empirical. But despite the giant lava flow from the "corruption eruption", the literature on this aspect of corruption still generates more heat than light. Many contributions appear ideological in character and corruption remains a highly contested concept. We still lack firmly grounded theories of corruption and the shortage of analytically informed empirical inquiries continues. Too many participants in the contemporary corruption debate content themselves with resurrecting tired clichés about the topic or with slaying long-dead dragons" (Williams 2000, p. xi).

The difficulties of a definition with universal applicability moves toward subjective interpretation and country-specific relevance, where what may be seen as criminal in one context or country may be unethical in another or acceptable in a third (gift giving is one area where these issues are often debated). For such reasons, other organizations have chosen not to seek a general definition but imply a definition by content. Thus, the OECD argues that

> The OECD, the Council of Europe and the UN Conventions do not define "corruption". Instead they establish **the offences for a range of corrupt behaviour**. Hence, the OECD Convention establishes the offence of bribery of foreign public officials, while the Council of Europe Convention establishes offences such as trading in influence, and bribing domestic and foreign public officials. In addition to these types of conduct, the mandatory provisions of the UN Convention also include embezzlement, misappropriation or other diversion of property by a public official and obstruction of justice. The conventions therefore define international standards on the criminalisation of corruption by prescribing specific offences, rather than through a generic definition or offence of corruption. (OECD 2008, p. 22. **Bold** in original)

While specific, legally derived bribery definitions encompass the private sector, the wider definitions, as well as the emphasis on direct private gain, may be less clear (as is the active and passive distinctions and the specific transaction of a bribe for a specific advantage). In particular, taking the definition of bribery in the conduct of the enterprise's business in Transparency International's Business Principles for Countering Bribery, "the offer or receipt of any gift, loan, fee, reward or other advantage to or from any person," may be intended to be an inducement to do something which is dishonest or illegal, but it is not necessarily a breach of trust when the company itself decides to use bribes to secure contracts. Indeed, it should be noted that some countries do not criminalize bribery of the private sector, while others do not prioritize corruption in the private sector that does not involve the public sector. Such a decision may also not be related to a specific contract but to creating a climate of favoritism toward the company. An easier approach may be to view definitions through the OECD's definition of what is not acceptable:

> No offer, promise or give undue pecuniary or other advantage to public officials or the employees of business partners. Likewise, enterprises should not request, agree to or accept undue pecuniary or other advantage from public officials or the employees of business partners. Enterprises should not use third parties such as agents and other intermediaries, consultants, representatives, distributors, consortia, contractors and suppliers and joint venture partners for channelling undue pecuniary or other advantages to public officials, or to employees of their business partners or to their relatives or business associates. (OECD 2011, p. 45)

Given such a breadth of offenses and an increasingly subjective interpretation of corruption, a number of commentators distinguish between what might be considered the core corruption offense of bribery and other offenses (some of which, such as the inclusion of embezzlement or money laundering in the UN Convention against Corruption 2005 (UNCAC), would be termed and indeed prosecuted as fraud, economic crime, or financial crime rather than corruption). Certainly some countries and commentators would attach "corruption" to conduct that, while it may be considered self-regarding or in contravention of their official roles and responsibilities (such as the direction of state resources for election purposes), may be criminalized under general legislation (misappropriation) or may be considered unacceptable or unethical but not necessarily illegal depending on context, circumstance, or country (e.g., the traffic of public officials on resignation or retirement to private appointments in areas or activities relating to their previous employment; see, e.g., David-Barrett 2011).

Definitions of bribery direct us toward the key actors, relations, processes, objects, and employment settings that exist during the processes of what is essentially a transaction. Distinctions between "active" (i.e., giving, offering) and "passive" (i.e., soliciting, accepting) bribery, or otherwise thought of as "supply" and/or "demand" side bribery, are also made. So defined, bribery poses multiple complexities for international and state agencies aiming to legislate for, control, and regulate corruption, but these agencies and actors are largely concerned with illegal acts. Wider "abuse of public office" or violation of "trust" definitions fall into a gray area of bribery and corruption but, along with issues of non-contract-specific payments (such as the US Foreign Corrupt Practices Act 1977's reference to bribes to obtain or retain business, the use of facilitation payments or the UK Bribery Act 2010's reference to excessive hospitality), are also requiring moral definitions or subjective assessments to become more narrowly defined and restrictive legal interpretations.

Corporate Bribery and Corruption: Sources and Causes

One cause of the lack of systematic attention to corporate bribery and corruption is the absence of valid data on its prevalence and practices on which to base definitions and explanations. There is anecdotal information on both public-private and private-private sector bribery and corruption, although material on the latter is even thinner than that on the former. The latter, for example, is discussed in material available from consultancies (see, e.g., Control Risks 2009) and occasional academic research. Material on the former within a specific country is more extensive in that it relates to bribery of public officials; data may be obtained from a wide range of academic and practitioner institutions although most of the emphasis has been on the public sector than on the corporate sector.

One consequence has been that in attempting to explain the causes of corporate corruption, as with other corporate and white-collar crimes, the lack of empirical research in this area, particularly that which engages with the corporate perspective, makes any concrete analysis difficult and leaves researchers seeking to view corporate conduct through traditional explanations of crime. These have sought to explain crime through classicist or neoclassical models (e.g., rational choice theories), individual and sociological positivist theories (e.g., anomie, strain, learning and biological theories, social disorganization, subcultures), and later social constructionist notions (e.g., labelling perspective). Such theories largely neglected white-collar and corporate crimes, instead focusing on crimes occurring within lower socioeconomic areas by so-called conventional offenders. Corruption, however, could be explained through various sociological/criminological, cultural, political-economic, and structural approaches which resonate at the individual, organizational, and societal levels. Table 1 (below) illustrates these three dimensions although the examples here are not comprehensive and there may be significant interplay and overlap in any given act of corruption.

A number of these attempts to explain the causes of corruption have adopted rational, economic-based models tied in with the level of government intervention. A key example of this is Klitgaard's (1998, p. 4) corruption formula – "corruption equals monopoly *plus* discretion *minus* accountability" – which argues that, whether the activity is public, private, or nonprofit and irrespective of where it occurs, corruption will tend to be found when an organization or person has monopoly power over a good or service, has the discretion to decide who will receive it and how much that person will get, and is not accountable. Furthermore, "corruption is a crime of calculation, not passion" (1998, p. 4).

Transnational Corporate Bribery, Table 1 Explanations of corruption

Level	Causality	Examples/contexts
Individual	Economic rationality, pathology	Individual greed or individuals who think they can "get away with it"
Organizational	Complex corporate structures, devolved decision making, implied consent, organizational goals, ambiguous accountability	Direct – pervasive and organized, for example, company policy to use inappropriate hospitality or bribery to facilitate business
		Indirect – pervasive but unorganized, for example, managerial/cultural pressure to meet targets and profit margins
Social structural	Demands of/ opportunities within (export) markets, criminogenic political economy (i.e., promotion of economic power and profits)	Common and expected business practice to bribe in some overseas jurisdictions – "everyone does it"

Rational choice theory as applied by Shover and Hochstetler to white-collar crime would also argue that "all criminal decision making represents a single field of study and that much of what has been learned in studies of street criminals and their decision making almost certainly is paralleled in white-collar crime decision making" (2006, p. 3).

This ties in with Gottfredson and Hirschi's (1990) "general" theory of crime that also adopts this model of rationality, suggesting human nature is motivated by self-interest and a pursuit of pleasure over pain, therefore echoing the earlier classicist notions of Cesare Beccaria and Jeremy Bentham. They suggest the official crime data they analyzed showed few differences between "conventional" and "white-collar" offenders in relation to variables such as age, social class, and gender and that short-term gratification is a key feature of conventional and white-collar crime. Individuals' lack of self-control along with the absence of attachments to others and sufficient controls leads individuals to offend. This approach has been greatly criticized, most notably by Steffensmeier (1989), on the grounds that their sample of white-collar criminals was biased toward lower-class offenders, and by Slapper and Tombs (1999). The latter point out that explanations of crime in relation to human nature do not account for sociological, environmental, cultural, and social structural influences on behavior. In addition, such control theories neglect that organizational crime involves the pursuit of organizational goals ahead of individual gratification (Friedrichs 2007, p. 205).

Economic and individual rationality, then, should be considered only one perspective in understanding the causes of corruption as explanations of the causes of corruption can be found within legal, economic, social, organizational, and cultural reasoning. For example, other explanations of white-collar and corporate crime focus on pathologies at the individual level whereby individual characteristics and personality traits differentiate offenders and non-offenders. It has, for example, been acknowledged that corporations often put such wrongdoing down to "rotten apples in the barrel" albeit such explanations are seen as inappropriate and have little evidence to support any connection between white-collar crime and individual pathologies (see Croall 2001, pp. 83–85). Certain characteristics such as a tendency to take risks, recklessness, ambitiousness and drive, and egocentricity and a hunger for power have been associated with this type of offending, and as Friedrichs notes, "some white collar crime does seem to be difficult to explain without reference to personality and character" (2007, p. 203).

The work of Matza and Sykes (1961) that focused on "techniques of neutralisation" is one theory that has been applied somewhat successfully to corporate crimes where offenders justify or neutralize their behavior. Justifications include "denial of responsibility," "denial of injury," "denial of the victim," "condemnation of the condemners," and "appeal to higher loyalties." Such culturally based justifications can demonstrate corporate attitudes toward certain wrongful activities. For example, Chibnall and Saunders (1977), who examined business corruption and bribery in England in a different era, showed that business individuals, despite being fully aware of their illegal actions, were able to justify them by referring to the pervasiveness of such practices in business. As Clinard and Yeager note, "[a] variety of justifications are available to those executives who are confronted with doubt or guilt about illegal or unethical behaviour; these justifications allow them to neutralize the negative connotations of their behaviour" (1980, p. 67). Indeed, as Croall notes, "[s]ome illegal activities are regarded as 'normal' business practice and others are readily justifiable as being for the 'good of' the organisation" (2001, p. 94).

The Corporate Organization

Much of the organizational deviance literature looks at managers and executives who may not only act deviantly on behalf of the organization but also against it. In looking at the private sector, Punch discusses a number of contextual possibilities that may trigger corporate deviance. These may be structural – markets (either competition or anti-competition factors); size of organizations (which dilutes both control and responsibility); achieving organizational goals; opportunity; total loyalty to the company; corporate culture, and personal, depersonalization in deference to the corporate ideologies and practices; corporate-focused rationalization; business as war; risk-taking; dominant personalities; necessary dirty hands as part of corporate competition; pressure; and rewards, which lead to the development of a "corporate mind." The mind is attuned to the "signals" from the corporate environment (what they are expected to do, what others are also doing, or what it takes to succeed) that are set by the "fundamental concerns of senior management. . .centred on corporate survival, continuity, power, reputation/face, and profits. . ." (Punch 1996, p. 239).

The question might be asked – deviant in relation to domestic legal frameworks, to legal frameworks in export markets, or to conduct considered acceptable in domestic markets and replicated in export markets? Certainly recent work of criminologists on organizations, culture, and deviance would, as in the case of Clinard and Yeager (1980), argue a shift away from theories of deviance and crime applicable to individuals to a focus on the corporation as a complex organization. By doing so, they sought to adopt organizational theory in their understanding of corporate crime. They state:

> [t]he immensity, the diffusion of responsibility, and the hierarchical structure of large corporations foster conditions conducive to organizational deviance. In addition, the nature of corporate goals may promote marginal and illegal behaviour, as may the characteristics and the social climate of the industries within which the firms operate (1980, p. 43).

Organizational understandings of corporate crime, and therefore corporate corruption, take into consideration individual, organizational, and sociological factors which can influence corporate offending, and Schrager and Short succinctly explain this relationship when they state that

> . . .preoccupation with individuals can lead us to underestimate the pressures within society and organisational structures which impel those individuals to commit illegal acts. . .recognising that structural forces influence the commission of these offences does not negate the importance of interaction between individuals and these forces, nor does it deny that individuals are involved in the commission of illegal organisational acts. It serves to emphasise organisational as opposed to individual etiological factors, and calls for a macro sociological rather than an individual level of explanation (1977, p. 410; see also Punch 1996).

Further certain intradiscipline perspectives argue that such factors cannot be viewed in isolation from the wider political and economic context. Thus, the state-corporate approach "directs attention toward the way in which deviant organisational outcomes are not discrete acts, but rather the outcome of relationships between different social institutions. Second, by focussing on the relational character of the state, the concept of state-corporate crime foregrounds the ways in which horizontal relationships between economic and political institutions contain powerful potential for the production of socially injurious actions. This relational approach, we suggest, provides a more nuanced understanding of the processes leading to deviant organisational outcomes than approaches that treat either businesses or governments as closed systems. Third, the relational character of state-corporate crime also directs us to consider the vertical relationships between different levels of organisational action: the individual, the institutional, and the political-economic" (Kramer and Michalowski 2006, p. 22).

A more extreme analysis within this perspective would propose the organization as reflecting macrolevel influences, which ties in with social structural theories explaining corporate criminality as well as with theories from Marxist scholars who argue that capitalist economic structure and ideology itself is criminogenic. For example, Durkheim's "anomie" and later strain theories have been applied to white-collar criminals in relation to "boundless aspirations" and "greed" that affect all individuals (see Croall 2001, p. 91). Furthermore, in terms of the economic structure, Slapper and Tombs (1999, p. 141) argue that corporate offending is endemic to capitalism. This creates "amoral" corporations that are focused on profit above business ethics, although ethical business activities may be used as a means of creating profit. On the other hand, other criminologists would argue that it is not:

> convincing to assume that all businesses act as "amoral calculators" and would choose to offend but for the availability of serious sanctions. . .The desires to continue in business and to maintain self-respect and the good will of fellow businessmen, go a long way to explaining reluctance to seize opportunities for a once-only windfall. . .Trading competitors (as well as organized consumer groups, unions, and others) can serve as a control on illicit behaviour for their own reasons. Law-abidingness can often be definitely in the competitive interests of companies. Marxist theory has no need to assume that all business crime will be tolerated. Many forms of business misbehaviour made into crimes may reflect changing forms of capitalism or inter-class conflict. At any given period, some corporate crimes, such as anti-trust offences, will not be in the interest of capitalism as a whole, so it is important to distinguish what is in the interests of capitalism from what suits particular capitalists. Even if the latter may succeed in blocking legislation or effective enforcement, at least in the short term, this does not prove that it is capitalism as such which requires the continuation of specific forms of misbehaviour (Nelken 2007, pp. 747, 748).

As Slapper and Tombs note, however, while it is difficult to pinpoint why a company at a point in time may opt for corrupt business dealings or to understand why "normal" rather than pathological organizations should act this way, societal context or culture is crucial: "a capitalist economy constantly pushing people with targets to hit, promotions to seek and emotions to avoid, recessions to try and survive, and so on, can thus be seen as a society likely to engender corporate crime" (Slapper and Tombs 1999, pp. 161–162).

On the other hand, given Nelken's comments, assumptions about likelihood do not address the *absence* of corporate corruption in some companies and/or in some countries. Part lies with the increasing extraterritorial reach of developed countries' law enforcement and justice bodies; part lies with the promotion of international instruments to foster cooperation, asset recovery, and so on. Part lies in the increasing influence in some countries of the corporate governance agenda which sees both corporate value and profitability in promoting corporate social responsibility, environmental protection, fair trade, and organizational standards. In part, it may also be the consequence of other (often related) factors, such as government's interests, the specific markets in which the companies are working, and the often asymmetrical and inefficient nature of market competition which are likely to impact more on countries exporting internationally than on those with limited exposure to more volatile and corruption-prone contexts.

Countries, Contexts, and Consequences

It is clear that a number of theoretical perspectives and ideas can be relevant to explanations of corporate corruption. Also clear is the complexity between individual, organizational, social structural influences, as well as the legal, economic, and cultural frameworks within which transnational corporations operate. Thus, Slapper and Tombs suggest corporate offending can only be understood in the context of wider political economy and that any theoretical analysis of corporate crime should include various social structures in relation to capitalism and inequality. They suggest that

> [k]ey aspects of any such analysis would integrate understandings of the general state of national and the international economy, the nature of markets, industries, and the particular products or services with which particular corporations are involved, dominant ideologies and social values, formal political priorities and the nature of regulation, particular corporate structures, the balances of power within these, the distribution of opportunities within and beyond these, and corporate cultures and socialisation into these (1999, p. 160).

This takes us to corporate bribery and corruption in terms of the international dimension, where the volume of academic and practitioner material is much more extensive. Two points are worth making. First, as discussed below, the anticorruption drivers in terms of corporate bribery and corruption derive from international organizations as part of their development agenda. As a consequence, developed countries associated with that agenda have been those who have increasingly required domestic business to adhere to domestic legislation not to engage in bribery. On the other hand, businesses from emerging economies are also heavily involved in lesser developing countries but whose governments are less committed to enforcement of anticorruption measures (e.g., those of China, India, and Russia have been identified (see Transparency International's 2008 Bribe Payers Index)). Second, reflecting on Slapper and Tombs' comments, how business behaves in its domestic market and different international markets may depend significantly on country, context, and product, as well as the propensity of the industry or sector itself to dishonest practices in pursuit of markets and profitability.

Thus, the World Health Organization (WHO) has reported in 2009 that "the medicines chain refers to the steps required for the creation, regulation, management and consumption of pharmaceuticals. Corruption in the pharmaceutical sector occurs throughout all stages of the medicines chain, from research and development to dispensing and promotion. . .countries with weak governance within the medicines chain are more susceptible to being exploited by corruption. These countries lack: appropriate legislation or regulation of medicines; enforcement mechanisms for laws, regulations and administrative procedures; conflict of interest management" (WHO 2009). Similarly, the arms trade is known for not only the interdependence between companies and governments, whether through lobbying, revolving appointments, party funding, and export subsidy, or a focus on export-led production, often involving exports to those countries, as one of the few inquiries into international arms trafficking noted, where "the age-old pressures of human nature, greed, the thirst for power and finally unbridled corruption" (Blom-Cooper 1990, p. 131) continues to adversely affect "open societies, the rule of law and national security" (SIPRI 2011, p. 5).

At the same time, countries with poor governance frameworks often provide permissive environments for domestic and international companies, as well as for the behavior of those domestic companies when they too operate in the international markets. Thus, networks and payments in China have provided a means for domestic and international business "to negotiate the unstable and complicated world of China in the early market reform era." Nevertheless, the traditional *guanxi* practice which "allowed actors to construct social networks and build relationships of trust, which encouraged investment and facilitated the rise of small businesses,. . .also encouraged a conducive environment for rent-seeking, bribery, collusion and exploitation" (Smart and Hsu 2007, p. 186). When the United Nations undertook its major investigation into the oil-for-food scandal, Chapter III of the report provided a detailed analysis of the individual roles of 23 companies that participated in the payment of kickbacks on humanitarian contracts. The inquiries not only showed a refusal by companies (including European as well as Russian and Chinese companies) to cooperate with the inquiry but an unwillingness to acknowledge that the payments were either known to senior management or were, if known, illegal (see Independent Inquiry Committee 2005).

The apparent continuing absence of business to act responsibly in such markets has also been the subject of a number of international organizations and NGOs, covering healthcare, mineral resources, and oil. Such reports often emphasize the consequences. Thus, in relation to natural resources in one country, the 2009 Human Rights Watch report on forestry in Indonesia estimated that the Indonesian government lost $2 billion in 2009 due to illegal logging, corruption, and mismanagement. The total includes forest taxes and royalties never collected on illegally harvested timber, shortfalls due to massive unacknowledged subsidies to the forestry industry (including basing taxes on artificially low market price and exchange rates), and losses from tax evasion by exporters practicing a scam known as "transfer pricing." It went on to note that forestry sector corruption has widespread spillover effects on governance and human rights:

> The individuals responsible for the losses are rarely held accountable by law enforcement and a judiciary deeply corrupted by illegal logging interests, undermining respect for human rights. In addition, the ability of citizens to hold the government accountable is curtailed by a lack of access to public information. And the opportunity costs of the lost revenue are huge: funds desperately needed for essential services that could help Indonesia meet its human rights obligations in areas such as health care, go instead to line the pockets of timber company executives and corrupt officials (2009, p. 39).

Indeed, attempts to reduce carbon emissions through deforestation by international and regional aid agencies have already been identified as likely to cause further corruption place in countries where corruption is pervasive through the illicit purchase of land and carbon rights by developers and logging companies (see UNDP 2010).

Control Context: Legislation, Conventions, and Initiatives

It has been this level of continuing the failure of business (and on occasion the governments of their home countries) to act "responsibly" at an international level which has led to pressure to criminalize such conduct. A number of countries, primarily in the developed world, have taken steps to regulate corruption in their domestic markets; a lesser number also have regulatory agencies to address corporate standards. Nevertheless, in terms of international corruption, multilateral and bilateral agencies have not only sought to manage corporate misuse of their own funds but also, under continuing pressure from international NGOs, such as Transparency International, Global Witness, and so on, have sought to institute more effective control environments. By doing so at international level, however, the intention has been to address domestic legislation in a way that addresses not only bribery abroad but also the question of domestic jurisdictions being responsible for such extraterritorial conduct.

The international measures include the Organisation for Economic Cooperation and Development's (OECD) Anti-Bribery Convention (the OECD 1997 Convention on Combating Bribery of Foreign Public Officials in International Business Transactions), the UN Conventions (including the United Nations' 2003 Convention against Corruption [UNCAC] and, in part, the 2000 UN Convention against Transnational Organized Crime [UNTOC]), and numerous regional and EU-level Conventions (including the 1999 Council of Europe Criminal and Civil Law Conventions on Corruption and the 1995 EU Convention on the protection of the communities' financial interests and the fight against corruption, First and Second Protocol; and the 1997 EU Convention on the fight against corruption involving officials of the European Communities or officials of Member States 1997).

These provide anticorruption frameworks within which to tackle these crimes (although public discourse often refers to corporate "wrongdoing," "misbehavior," and so on, rather than "crime"). Furthermore, monitoring and evaluation of national anticorruption policies takes place in the form of UNCAC peer reviews, the Group of States against Corruption (GRECO), and the OECD's Working Group on Bribery, among others, which highlight inadequacies and subsequently recommend legislative, institutional, practical, and structural improvements.

The three international conventions that significantly influence the control of corporate corruption at the national level are the OECD Convention, UNCAC, and UNTOC:

The OECD Anti-Bribery Convention

The OECD Convention was the first and remains the only legally binding instrument focusing on the *supply side* of bribery. The Convention deals with what is termed "active bribery" in contrast to "passive bribery." This means the focus is on the offense committed by the person who promises or gives a bribe. That said, the Convention does not use the term "active bribery" in order to avoid nontechnical readers mistakenly viewing the briber as taking the initiative and the recipient as a passive victim (OECD Convention 1997, p. 14, paragraph 1): it is often the case that the recipient will have induced or pressured the briber and thus be more "active." The Convention seeks a "functional equivalence" among the measures taken by the parties to sanction bribery of foreign public officials and therefore does not require uniformity or changes in fundamental principles of a party's legal systems (e.g., there is corporate criminal liability in the UK but not Germany). The Convention is highly focused and targeted toward those countries that account for the majority of global exports and foreign investment and introduced the required specific criminalization of the bribery of a foreign public official in international business transactions. It provides a broad and inclusive definition of foreign public official. Senior politicians through managers at state-owned organizations to local police officers would all fall within this definition.

UNCAC

The UNCAC is the first global legally binding instrument in the fight against corruption. It requires the States Parties to implement numerous and detailed anticorruption measures impacting upon their laws, institutions, and practices. The purpose is to aid prevention, detection, and sanctioning of corrupt practices and encourage the cooperation of States Parties. The Convention requires States Parties to establish a range of offenses associated with corruption and attaches particular importance to prevention and the strengthening of international cooperation to combat corruption. It also includes "innovative and far-reaching" provisions on asset recovery and technical assistance and implementation. UNCAC follows an almost identical definition of the term "foreign public official" to that of the OECD Convention but includes also any person holding an "executive" office of a foreign country.

UNTOC

Although UNTOC is the primary international tool for tackling organized crime, it also acknowledges the significant role of corruption in transnational organized crime and therefore requires corruption to be addressed as part of combating organized crime. It focuses only on domestic bribery. UNTOC covers public sector corruption. Of most significance, the Convention requires States Parties to criminalize corruption, with a focus in particular on public sector corruption and bribery of public officials. It further requires effective measures to detect and punish such corruption and significantly requires public authorities to be provided with adequate independence in order to deter the exertion of inappropriate influence of their actions.

Signatories to all such Conventions are required to translate the mandatory components into domestic legislation. All three mention money laundering (although UNCAC makes asset recovery a fundamental principle) and argue for international cooperation in investigating and sanctioning offenders registered in their jurisdiction.

There also a range of corporate-focused initiatives to support corporate anticorruption implementation. Some provide guidance to business, such as the *OECD Guidelines for Multinational Enterprises* intended to provide voluntary principles and standards for responsible business conduct consistent with applicable laws and the TI *Business Principles for Countering Bribery*, or specific guidance, such as ICC *Guidelines on Agents, Intermediaries and Other Third Parties*. Others are more specific and applied. The Global Compact (GC) is a UN initiative to encourage corporate responsibility among private sector companies by asking them to sign up to a set of core values in the areas of human rights, labor standards, the environment, and anticorruption. The World Economic Forum has set up Partnering Against Corruption Initiative (PACI). This engages with chief executive signatories of industry-leading companies in the implementation of a zero-tolerance policy toward corruption and bribery. Other initiatives are directed at specific industry sectors, such as the Global Infrastructure Anti-Corruption Centre, the Medicines Transparency Alliance, and Publish What You Pay; the two major initiatives are the EITI and Collective Action in which the first seeks publication by extractive companies of their payments to host governments and the second provides an anticorruption resource for business by focusing on fighting corruption jointly with other companies and stakeholders, including government.

Control Context: Impact and Implications

Much of the international approaches rely on advocacy and influence; international law and international judicial institutions effectively have no jurisdiction in relation *trans*national and *multi*-jurisdictional corporate crimes. Sovereign states, despite agreeing to ensure their domestic legislation allows for extra-jurisdictional policing, face significant difficulties. Anticorruption authorities, limited by procedural, evidential, legal, and financial obstacles, as well as interstate cooperation, are thought to be easily outflanked by corporations that bribe as part of international business transactions. Enforcement frameworks at the national level largely reflect "command and control" regulatory approaches that exercise influence through enforcing standards supported with criminal sanctioning – albeit corporations rarely face criminal liability, instead negotiating civil settlements with prosecutors and enforcement agencies.

Historically, however, there have been numerous debates between regulators and between academics as to the most appropriate approach to effective regulation. On the one hand, there are those who believe that compliance to the law requires a punitive policing approach incorporating the use of severe sanctions and criminal prosecution. On the other hand, there are those who advocate an approach more in line with the persuasion of businesses to comply with the law. These polemical approaches have been referred to as models of “deterrence” as opposed to models of “compliance” (Reiss 1984) although some analysts have argued it is a question of “when to punish; when to persuade” (Ayres and Braithwaite 1992, p. 21). It is this latter perspective that largely reflects contemporary thinking on regulation (see, e.g., Black and Baldwin 2010). Enforcement practices alone, however, are insufficient, with more preventive mechanisms required to ensure behavior change within corporations and business. It is here where initiatives such as GC and PACI (see above) can influence the broader regulatory landscape.

The final question is whether or not such initiatives – whether focused on criminalization and sanctions or on voluntary agreements – are effective in managing or reducing corporate bribery and corruption. A number of more mainstream criminologists would argue that the undifferentiated assumptions that see all business is potentially criminogenic all of the time “as an inevitable consequence of capitalism” are too sweeping a generalization. They suggest that “it is well to bear in mind some reservations about the idea that capitalism as such is criminogenic. The argument appears to predict too much crime and makes it difficult to explain the relative stability of economic trade within and between nations, given the large number of economic transactions, the many opportunities for committing business crimes, the large gains to be made, and the relative unlikelihood of punishment” (Nelken 2007, p. 747).

Certainly, policing of corporate offenses both domestically and internationally varies significantly, depending on country, context, and purpose – whether the role of the Elf Aquitaine oil company in party finance in France or the 15–20 % of the Iraq Relief and Reconstruction Fund ($3–5 billion) “wasted” by US companies according to the Special Inspector General for Iraq Reconstruction (Tarnoff 2009, p. 20) – and how far governments balance their various interests, such as trade, influence, and oil, with commitment to international standards. In terms of the OECD’s own figures on criminal or administrative sanctions, three countries – Germany, Italy, and the USA – were responsible for nearly two-thirds of the cases (232 from a total of 310 between 1999 and 2010 with 38 countries responding).

This raises questions about the geopolitics of integrity because a pragmatic approach by developed countries rules out large areas of the world, including a number of Caspian, Caucasian, and Middle East countries where, as the *Economist* pointed out, “oil and ethics mix about as well as oil and water” (10 May 2003), those countries whose corruption is overlooked in the continuing pursuit of greater political objectives (whether arms sales, the war on drugs or regional spheres of influence), those countries too big to influence and too powerful to want to listen (such as Russia), or those who are written off as failed states with no strategic or geopolitical value.

Of course, some would argue that the overall developmental agenda that includes the current anticorruption approach is itself shaped by multilateral and key bilateral donors’ perception of the wider developmental trajectory of and objectives for the donor-aided countries and influenced through the uses and conditions attached to their aid and support to achieve this. In terms of both, the preferred direction is toward the “standard liberal democratic practices and norms – representative and responsible government, the rule of law, and the absence of corruption. But it also appears to privilege a neo-liberal faith in the superiority of market economies and in the importance of introducing market mechanisms into the public sector” (see Bevir 2004 p. 2) which benefit developed economies’ businesses as much as, if not more so, developing economies’ businesses. Whether that would resolve the issue of corporate corruption, certainly in export markets, is another question.

Conclusion

This entry set out to discuss corporate corruption in the context of bribery of public and private officials. Corruption and bribery are broad concepts that incorporate a diverse array of activities, actors, and social relations. Endeavors to conceptualize their meaning and extent, their perpetrators and victims, their regulation and control, or even whether they constitute crime, deviance, immoral behavior, or common business practice have been faced with significant theoretical, conceptual, and methodological challenges. The lack of empirical data adds further to these complex phenomena, as do variations in understandings of the problem within different social contexts and jurisdictions.

Distinctions between “active” and “passive” bribery and “public” and “commercial bribery” at the “international” or “domestic” level create a useful analytical framework for understanding how corporations can use corrupt practices in the context of commerce. But the organization of such complex and serious crimes creates significant challenges for control agencies limited by their jurisdictional boundaries and their traditional enforcement approaches. International conventions have attempted to harmonize the problem through their legal frameworks, using content definitions, rather than analytical definitions, that can be operationalized at the national level. Principles of “functional equivalence” that place emphasis on “goals” rather than “means” ensures the fundamental beliefs of nation states’ enforcement systems remain. How sovereigns deal with the problem of corporate corruption can therefore vary greatly. Sanctioning alone, however, may be insufficient, as long-term behavior change within businesses and corporations that use bribery requires a broader regulatory approach incorporating nonenforcement mechanisms such as self-regulation and anticorruption initiatives. Measuring the impact of such prevention-focused approaches, however, is a difficult task in itself.

Transnational Exchange of Forensic Evidence

Carole McCartney
School of Law, University of Leeds, Leeds, UK

Synonyms

International evidence exchange; Transnational policing

Overview

Policing and judicial cooperation across international borders is now an expectation. Strategies to combat terrorism, organized and serious crime, as well as domestic crime problems, increasingly incorporate the exchange of forensic information and intelligence between national institutions and agencies. While networks of policing cooperation are not novel, their powers and capabilities have been growing in recent years and bilateral and multi-lateral agreements to exchange data between countries proliferate apace. With increasing demand and capacity for the extra-territorial exchange of evidence under mutual legal assistance, as well as direct and more informal exchanges of data between law enforcement professionals there are increasing numbers of criminal investigations where evidence may have been collected, examined, or interpreted across national borders. Since the Prüm Treaty of 2005, automated exchange of DNA profiles, dactyloscopic data (fingerprints) and vehicle registration data has become mandatory across the EU. These institutional developments highlight broader concerns raised by the exchange of scientific evidence for use in criminal proceedings in a different jurisdiction from that where the evidence originated. As well as presenting technological challenges of effective and secure information exchange, mutual judicial assistance in evidence-gathering poses questions of principle demanding urgent consideration, given that international exchanges of forensic information and intelligence are set to increase exponentially.

Institutional Context: Mutual Judicial Assistance and EU Criminal Policy

The modern escalation in the mobility of goods and people across international borders has not been limited to those legally permitted to travel. While governments encourage goods and individuals to cross borders for economic gain, this comes at the cost of needing to protect national borders against the illegal movement of goods and people. The benefits to be accrued from crossing borders have been capitalized upon by organized criminals, terrorists, and human traffickers. In addition, many ordinary criminals have gained an advantage over law enforcement agencies, avoiding detection by committing offences in different legal jurisdictions. In response, States have likewise had to work across borders in order to combat these illegal activities. As such, international judicial cooperation has become not merely desirable, but essential in those countries in the European Union that share borders. In 1985, the Schengen Treaty paved the way for the creation of a "borderless" Europe and facilitated (some would say necessitated) transnational exchanges of information on European citizens and visitors.

Policing and judicial cooperation across countries is not a new phenomenon. Older informal networks became formalized with the creation of Interpol in 1923. Within (what is now) the EU, the anti-terrorism focused group "TREVI" was created in 1975. The Maastricht Treaty of 1992 subsequently formalized policing and judicial cooperation within the "Third Pillar" of the EU's constitutional framework relating to "Justice and Home Affairs." Europol was then created in 1995, becoming operational in 1999. The Amsterdam Treaty of 1999 created an "Area of Freedom, Security and Justice," strengthening Europol and continuing the trajectory of expanding legal and judicial cooperation across the EU. The Treaty of Amsterdam endorsed: "The principle of mutual recognition which... should become the cornerstone of judicial cooperation... in criminal matters within the Union." This was boosted by the Hague Programme of 2004 which propounded the "Principle of Availability" of law enforcement information. This principle, adopted in November 2004 (Brussels European Council, 4/5 November 2004, Presidency Conclusions), anticipated that: "throughout the Union, a law enforcement officer in one Member State who needs information in order to perform his duties can obtain this from another Member State and that the law enforcement agency in the other Member State which holds this information will make it available for the stated purpose, taking into account the requirements of ongoing investigations in that State." This aspiration was realized across the EU in 2008.

In 2006, the "Swedish Initiative" marked a significant step towards implementing this Principle of Availability, with the adoption of Council Framework Decision 2006/960/JHA on simplifying the exchange of information and intelligence between EU Member States' law enforcement authorities. Adopting a broad and inclusive approach to information exchange, 49 different types of relevant information were identified, including DNA and Fingerprints (CRIMORG 7, 5815/2/05), the underlying principle being that national parties should apply the same criteria to international exchange across the EU as they do to information-sharing between criminal justice professionals at the national level. Transnational exchanges of information could take place through any of the existing channels of mutual judicial cooperation, including Sirene Bureaux (utilizing the Schengen Information System, SIS), Interpol National Contact Bureaux (NCBs), Europol National Units (ENUs) or Europol Liaison Officers and Bilateral Liaison Officers.

Despite these organizational developments and political exhortations to increase criminal justice cooperation, most day-to-day policing remains a national matter. This truism necessitates that policing efforts to detect criminals whose activities cross borders must primarily focus on sharing information and intelligence. Mutual assistance treaties have made provision for information exchange between law enforcement agencies and judicial bodies across the EU Member States. One of the first treaties was the 1959 European Convention on Mutual Assistance in Criminal Matters (20 April 1959, ETS No 30), which came into force on 12 June 1962, and provided for the transfer of information on previous convictions. This treaty set out the rules for the enforcement of letters rogatory issued by a "requesting" State, to procure or communicate evidence for the purposes of criminal proceedings being undertaken in that State from another State. Requirements were specified for requests for mutual assistance, including who was permitted to make a request, the language to be used and under what circumstances mutual assistance could be refused.

The 1999 Amsterdam Treaty and Tampere Programme for policy development and implementation laid down more precise provisions for cooperation between EU police authorities. These instruments boosted inter-governmental co-operation within the EU on policing matters, while endorsing "mutual recognition" as a cornerstone of European integration. In 2001 a detailed programme of measures was set out in the European Convention on Mutual Assistance in Criminal Matters (Official Journal of the European Union 2001, C326), which introduced a suite of practical tools for enhancing cross-border cooperation, starting with the European Arrest Warrant, later adding the European Evidence Warrant, and most recently the European Investigation Order (Mitsilegas 2009). Co-operative efforts have not stopped there. Nijboer (2009, p. 23) predicts that "the next development will be the EU members" mutual recognition, not merely of court decisions, but also of investigative results such as forensic experts' reports'. The Lisbon Treaty, which came into force in 2009, took the final constitutional step of abandoning the "three pillar" structure introduced by the Maastricht Treaty, placing criminal justice policy on an equal footing with other core business at the heart of the EU's activities.

Transnational exchanges of forensic science data and intelligence between EU member states take place within this evolved institutional framework. Resort to forensic science by national intelligence services and by EU and other international security agencies is increasingly frequent. Rapidly evolving strategies to tackle transnational crime foster the exchange of information across borders as well as the linking of databases of different provenance (Lewis 2007). Indeed, international utilization and exchange of forensic intelligence has become a firm expectation of the sector, matched by burgeoning expansion of the mechanisms needed to achieve it. While there have long existed informal professional networks between law enforcement authorities facilitating cooperation across international borders (Loader 2002), modern developments in ICT have produced increased automation of information-sharing and paved the way to multiple-country access to large databases.

An important distinction needs to be drawn at this point in the exposition between the sharing of raw forensic data and exchanges of scientific reports incorporating evaluative expert opinions. Often the two go hand-in-hand, but data and its interpretation do not always coincide and they might not be contributed by the same individuals or institutions. It is far more likely that exchanges of forensic data could be standardized and automated, whereas sharing forensic expert opinions across national borders and legal jurisdictions is a significantly more complex and challenging endeavor. The following discussion will consider each type of information-sharing in turn, drawing out its further implications for principles of mutual recognition and mutual judicial assistance in European criminal proceedings.

Forensic Science Data-Sharing

Direct law enforcement co-operation, or cross-border evidence exchange during investigations and pre-trial processes concerning known crimes or individuals, has been increasing for many years, gaining impetus from the terrorist attacks of 9/11 (Loof 2011). Interpol initially drove the technological phase of international cooperation involving DNA on a global scale. Resolution No. 8 of the Cairo General Assembly in 1998 articulated an aspiration to harmonize DNA profiling and quality assurance systems internationally and recommended that its member countries should create national DNA databases. The Interpol DNA Gateway, created in 2002, enabled its member countries to search unsolved crime-scene profiles and search against DNA profiles from other donor countries using the Interpol Standard Set of Loci (ISSOL). In July 2006, it went online via Interpol's I-24/7 global police communications system. The DNA Gateway does not hold any nominal (demographic) data but acts simply as a conduit between countries who can follow-up any "hits" independently. The DNA Gateway is available for use by all 190 Interpol countries. It can only be used by police forces, however, and this excludes from the system countries (e.g., Belgium and the Netherlands) in which DNA data are classified as judicial information: that is, the information is collected, managed and used by magistrates or prosecutors rather than police agencies. One consequence of these domestic institutional arrangements is that data can be shared internationally only through judicially controlled mechanisms. For this and other reasons, there has consequently been a low submission rate, possibly also attributable to practitioner scepticism that submission will reap much investigative reward (Johnson and Williams 2007, p. 108).

In 1997, the EU adopted Council Resolution 97/C193/02 on the exchange of DNA, recommending the establishment of national DNA databases and the standardization of DNA technology to facilitate information exchange between EU member states. In 2001, Council Resolution 2001/C 187/01 further recommended the limitation of DNA analysis to "non-coding" regions as well as the ongoing standardization of reporting and recording, and the creation in each member state of single national points of contact. This programme was designed to promote harmonization of DNA analysis and the procedures necessary for information exchange and data-sharing. Informal exchange of DNA "in the absence of a supranational authority to govern" was sporadic at this formative stage (Johnson and Williams 2007).

The Prüm Treaty, concerned with increasing the exchange of EU law enforcement data in order to combat terrorism, illegal immigration, and cross-border crime, was signed in 2005. The original signatories were Austria, Germany, the Netherlands, Luxembourg, Belgium, France and Spain, who were subsequently joined by six others. The Treaty was transposed into EU law in 2007 (Decision (2008/615/JHA; 2008/616/JHA), at which point all 27 member states committed themselves to working within the treaty obligations by August 2011. The adoption of the Treaty into the EU *acquis* (legal framework) created, for the first time, a requirement that member states establish an infrastructure to permit the exchange of DNA, fingerprint, and vehicle registration data. This implies the creation of national databases as a necessary precondition to data-sharing, which some member states still do not have. By January 2012, twelve EU countries were actually exchanging DNA information (with ten exchanging fingerprints and vehicle registration data). The Prüm Treaty thus represents a partial step towards the realization of the Hague Programme's aspiration of free-flowing law enforcement information between EU States under the "Principle of Availability." The ultimate objective is "a virtual EU-wide database for law enforcement that makes an entry loaded onto any forensic database in any EU country potentially accessible to every police force in the EU" (Human Genetics Commission 2009, para 5.10).

The Prüm Treaty stipulates that automated searches by other member states are conducted on a "hit"/"no hit" basis. Only after a "hit" has occurred will there be an exchange of personal (demographic) details and case information via existing mutual legal assistance channels. The second step of the exchange process then falls back on national legislation, affording discretion to each country to decide whether or not to exchange demographic data. To satisfy the stipulated standard for information-sharing, DNA profiles must contain at least six of the seven European Standard Set of Loci (ESSL) for known persons or a minimum of six loci (of any type) for crime scene stains. Mixed profiles are excluded. So also, for speculative searching, are profiles derived from crime stains that have already been "matched" to a particular person. A country may make some profiles unavailable for searching (e.g., profiles of criminal justice personnel compiled for elimination purposes). Declaration of a "match" requires at least six fully matching loci (one mismatch is permitted, to accommodate "near" matches; and one base-pair difference is permitted to allow for microvariants that could be artefacts of the profiling process). A report following a Prüm search will include details of: the responding country; the type of "match" (full or near); the characteristics of both matching DNA profiles; the crime stain or reference sample; and the sample code to facilitate follow-up requests for further details via mutual legal assistance mechanisms.

Introduction of the Prüm automatic information exchange system has been credited with notable operational successes. After less than 2 months of a trial period of information-sharing between Austria and Germany, for instance, the German authorities had obtained 1,510 "hits" for DNA profiles from unsolved cases against data held by the Austrian authorities, leading to 710 detections (including, 41 hits in homicide cases, 885 hits in theft investigations, and 85 hits relating to robbery or extortion) (House of Lords European Union Committee 2007, pp. 15–16). Advocates, no less than critics, of the Prüm system recognize that these impressive immediate gains partly represent a one-off windfall. When a country first initiates data exchange, large amounts of information about earlier crimes will become available to the prosecuting authorities for the first time (House of Lords European Union Committee 2007, p. 16). It remains to be seen how effective EU data-sharing will be in terms of producing new "hits" leading to detections and prosecutions on a more sustainable, on-going basis.

The biggest practical limitation of the Prüm information-sharing framework is geographical, being restricted to EU member states (plus a few additional signatory countries such as Norway and Switzerland). There were soon calls for exchanges of DNA data, in particular, to be extended internationally. The UK's presidency of the G8 in 2005 inaugurated a project to identify the requirements for greater international exchange and propose technical solutions. The "DNA Search Request Network" (DNA SRN) was duly established, utilising Interpol's I-24/7 secure email network to send search requests to other G8 countries. Pilot testing began in 2007 with search requests sent to national DNA Bureaux from the USA, Canada and the UK. Japan has since joined the original trio and all four countries have commenced sharing crime scene DNA profiles. The nature and extent of these exchanges has not been made public, however.

Sharing Expert Opinions

Forensic data might consist of nothing more than raw scientific test results. Such information is readily amenable to automatic recording and transmission. For these data to become "evidence," however, a further vital step is required, that of "interpretation." Interpretative conclusions may be offered by qualified scientists and other experienced forensic practitioners, but they are also routinely contributed by non-scientific personnel, including police and prosecutors, in many countries. Within the EU, such data fall under the umbrella term "intelligence." They are transmitted via a range of policing communication channels, including Sirene Bureaux (within the Schengen framework), Europol National Units and Europol Liaison Officers, Interpol National Centre Bureaux, and bilateral mutual assistance arrangements. Such channels are open to the transmission of almost any type of law enforcement data (Gill 2008, p. 143). It is anticipated that the flow of forensic science intelligence will increase within the Schengen system once "SIS II" is brought online, with this express objective.

International policing networks, such as Europol and Interpol, are increasingly focusing efforts on the production and sharing of "forensic intelligence." It is intended that "the accurate, timely and useful product of logically processing forensic case data" (Ribaux et al. 2003) will inform policing tactics, operations and strategy. In 2002, Europol's mandate was extended to cover all serious forms of international crime (including crimes against persons, financial crime and cyber-crime) perpetrated by organised criminals, or where more than one EU Member State is directly affected. Europol Liaison Officers (ELOs), based in The Hague and representing their respective national law enforcement agencies, form bureaux to exchange a range of law enforcement information and intelligence, either on a bilateral or multi-lateral basis. They also share information and intelligence with other competent national authorities, such as customs officials, border control agencies, etc. Each Liaison Bureau contains a Europol National Unit, which acts as a gateway to supply Europol with information and intelligence for its databases. In addition, Eurojust, established in 2002, is tasked with fighting serious crime in the EU by stimulating judicial cooperation and the coordination of investigations and prosecutions which involve more than one Member State. Eurojust aims to improve cooperation by facilitating international mutual legal assistance in order to make cross-border crime investigations more effective. There are also cooperation agreements in place with Norway, Iceland, the USA, Switzerland and Croatia. The organization collates forensic intelligence as part of its mandate as a centre of terrorism-related expertise.

Beyond raw data exchange, it is the further step of interpreting forensic data and producing “intelligence” within the context of a particular investigation that perhaps poses the greatest challenge to effective cross-border information-sharing. Suppose, for example, that DNA profiling produces a database “hit” indicating an association with a crime scene stain from another country. This “hit” then requires further interpretation and investigation, and may prompt further forensic processing. These steps will determine whether and to what extent the declared “match” between two profiles is relevant and sufficiently reliable to inform the course of criminal investigations and, perhaps, to be used later as evidence in criminal proceedings. The standards for this interpretation, who conducts the interpretation, and the amount of further information required will all have an impact upon the “strength” of the evidence and the reliance that can reasonably be placed upon it in criminal investigations or prosecutions. However, there are currently no standardized protocols or mechanisms of international quality assurance governing forensic scientific interpretation or the formulation of expert opinions. Furthermore, there are huge variances across the globe, and even within the EU, in who can offer expert opinions in courts and the stringency of the tests that expert opinion must undergo before being admissible at trial. The degree of critical scrutiny afforded to admissible expert evidence is also highly variable across legal jurisdictions. This degree of variability naturally generates concerns about the quality of scientific evidence being proffered by experts and relied on by courts in different countries. In the context of mutual judicial assistance and intelligence-sharing, it raises the spectre of flawed scientific opinion or misinterpreted forensic data spreading miscarriages of justice across borders.

Key Issues/Controversies

Forensic Data Exchange

Information exchange under the Prüm Treaty typically *precedes* the institution of formal criminal proceedings, since the national authorities will usually have evidence of suspected criminality but, at this stage, no identified suspect. Investigators hope that intelligence sharing will produce an identifiable suspect, e.g., through a matching DNA profile or vehicle registration records. Since information shared through mutual judicial assistance is therefore often pivotal to the progress and outcome of an investigation, ensuring its integrity and reliability is vital to the proper administration of criminal justice. The need for such guarantees is all the greater in relation to evidence widely considered inherently reliable (such as fingerprint and DNA evidence), as domestic courts (and juries) may be in the habit of taking its reliability on trust.

There are rudimentary quality controls in place. For example, there must be compliance with ISO 17025 or equivalent standards for all laboratories processing DNA profiles. No personal data is transferred between member states, via mutual legal assistance channels, until a "hit" has been declared. There must be a commitment to the European Data Protection Directive (or equivalent national law) and also an estimation of the number of adventitious matches expected after a search (Van der Beek 2008). This "two-step" approach is intended to provide an opportunity to assess domestic legislation and gauge whether the exchange falls within legal parameters and whether data protection measures are in place prior to the exchange of personal data. It also provides an opportunity for a "near match" to undergo further testing by the country reporting the "hit" prior to the recipient country relying upon the "hit" to commence investigations.

Widespread distribution of automated database searching could potentially generate candidate match overload. Such problems were anticipated by the European Network of Forensic Science Institutes (ENFSI) DNA Working Group in 2009 (ENFSI 2009). The Working Group concluded that while the current ESS loci are capable of handling occasional exchanges of DNA-profiles between countries, the much higher volume of profile-sharing and searching made possible by the Prüm Treaty means that the chance of adventitious or false matches may significantly increase. An adventitious match occurs when the DNA profiles of two individuals (who are not identical twins) genuinely match (theoretically a rare, but not impossible, occurrence with the latest, highly discriminating, DNA profiling systems). A "false match" is a match declared in error, where closer examination shows the result to be invalid (e.g., owing to laboratory contamination or interpretational errors). Investigators will often be able to eliminate adventitious or false matches when it becomes apparent that the individual concerned had nothing to do with the crime. However, those wrongly suspected may have suffered considerable intrusion into their private lives before the confusion was resolved. The reverse situation – a false elimination – may be almost equally damaging for the administration of justice. With increasing horizontal integration of criminal justice data, international liaison officers could be overwhelmed by information and in major investigations may experience considerable pressure to confirm "near matches" as reliable leads. As Schneider (2009, p. 1) explains: "When massive exchanges of DNA profiles are undertaken. . . the seven ESS loci will not be sufficient because the chance of adventitious matches will no longer be negligible." Both Germany and the Netherlands have reported having to undertake extensive re-testing when matches are identified, to exclude adventitious and false matches. The Netherlands now refuses to release demographic data for "near matches" without the assurance of confirmatory testing (Van der Beek 2008).

The Interpol International Gateway was a relatively low-cost initiative for information searching. The political momentum driving Prüm clearly envisages much greater investment to facilitate multiple database searching and the generation of new data, as well more effective exchange of existing data. Germany claims that it cost less than €1 million to set up its national Prüm data exchange system. However, the UK government estimate a start-up figure of some £31 million (including £2.5 million first-year operating expenditure) (House of Lords European Union Committee 2007, pp. 23–24). This does not include the additional costs of tracing suspects, their arrest, detention and deportation, following "hits" identifying foreign nationals or fugitives residing overseas. In 2009–2010 UK authorities effected the arrest, detention and extradition of 1,032 people under the European Arrest Warrant framework, prompting some commentators to question why UK taxpayers should foot the £25 million annual bill for sending individuals abroad for trial The UK police process 20 times as many arrest warrants as they submit (Slack 2011).

Even greater obstacles confront fingerprint data exchange, since there is no accepted international standard for declaring valid matches. Transmission of raw data and the preparation or presentation of information for analysis, theoretically at least, presents fewer technical problems. However, use of the best quality images is crucial for fingerprint comparison. An international standard for minimum pixel quality would be desirable, for example, but little progress has yet been made on devising any international standards for transmission of fingerprint data, beyond the specification of an agreed file format. Meanwhile, proprietary search and image capture systems are being developed with little regard for interoperability.

Responding to threats of "match overload" and excessive strain on examiners required to analyze thousands of prints, the EU has placed limits on the number of searches that can be conducted of fingerprint databases (Document 5860/5/10 REV 5 JAI 92 CRIMORG 16 ENFOPOL 29). Dror and Mnookin (2010) argue that the scale and speed of automated database searching inevitably increases the risk of erroneous identifications by multiplying the number of candidate matches based on incidental similarities, some of which may be artifacts "both of the relative similarity of the patterns being compared and of the human cognitive architecture involved in pattern matching" (Dror and Mnookin 2010, p. 56). This parallels the problem of DNA "near matches," and may similarly require significant investment of resources to re-check and eliminate specious "hits." Reliance must be placed on national authorities to be diligent in undertaking the necessary re-testing to confirm initial results, before treating shared fingerprint "matches" as a reliable basis on which to initiate criminal prosecutions.

Laboratories developing imperceptible latent prints from crime scenes must satisfy the rudimentary quality controls required for accreditation under ISO 17025. However, police fingerprint bureaux are exempted, placing Automatic Fingerprint Identification Systems (AFIS) outside this quality framework. The UK Association of Chief Police Officers (ACPO) has declared its aspiration to ensure that all fingerprint bureaux are accredited to ISO 17025 by 2020. In the meantime, fingerprinting, like DNA profiling, is widely perceived as reliable and routine. This may foster the impression that regulatory frameworks are equally robust and unproblematic, reinforcing implicit faith in these types of evidence. However, the regulation and governance of both fingerprint and DNA data in England and Wales, and internationally, have attracted critical scrutiny in recent years (see e.g., Nuffield Council on Bioethics (2007); Human Genetics Commission (2009); House of Commons Home Affairs Committee (2010); McCartney et al. (2010)). More effective regulation of the forensic sciences in general has been demanded for many years. Regulatory initiatives in England and Wales were recently expanded EU-wide under the Council Framework Decision 2009/905/JHA on the accreditation of forensic service providers carrying out laboratory activities (EU Council 2009a).

Exchanging Expert Opinions

Scientific data are virtually meaningless unless interpreted within the context of other information. As we have seen, this interpretation can be undertaken by forensic science practitioners, police or prosecuting authorities, often in a different country from where forensic data were originally generated. It is therefore important to ensure the integrity of systems of accreditation of forensic experts in various countries, and to set appropriate international standards for interpreting forensic data. While forensic laboratories may be accredited to ISO 17025, this standard does not guarantee the quality of individuals' case-work nor does it govern activities outside the laboratory (e.g., crime scene investigations). Accreditation of individual experts remains a major unresolved issue, which has been addressed in a variety of ways, and with varying success, by different countries. The Council for the Registration of Forensic Practitioners (CRFP) was established in the UK in 1999 to accredit individual experts for forensic work, but this encountered various practical problems and was disbanded in 2007, largely on economic grounds. Subsequently, the Netherlands Register of Court Experts (NRGD) was set up in 2009 to provide Dutch courts with a register of scientific experts whose professional quality can be relied upon (see http://english.nrgd.nl/home/). However, these are exceptional efforts in international terms. Few other countries have introduced similar mechanisms or systems to gauge the professional competence of scientific experts. There is consequently significant variation in the use of forensic expertise in criminal proceedings, much depending on individual trial judges' discretion.

Yet judicial evaluations are often largely based upon an expert's formal professional qualifications or training, a poor substitute for a thorough examination of the competence of individual experts and of the reliability of their methodology, data and conclusions. Rarer still are sanctions for an incompetent expert or one who provides flawed testimony in court. In the absence of international standards for interpreting forensic data, it is almost impossible to harmonise the format or substance of expert reports.

Future Directions

The Human Genetics Commission (2009, p. 84) noted the growing pressures for sharing information:

> [T]here are . . . substantial pressures to create the conditions for the horizontal integration of criminal justice databases, and the sharing of information between national jurisdictions. Whereas the exercise of law enforcement powers of European Union (EU) member states are confined within national borders, for the transfer of information relevant to law enforcement these borders are increasingly dissolving. We identify three developments in the 'third pillar' of EU policy (police and judicial co-operation in criminal matters) that have contributed to the cross-border linking of forensic bioinformation: the establishment of a system of co-operation based on a central information system making use of electronic databases; the creation of a presumption and then an obligation in favour of data sharing; and the commitment of the UK and other member states to align with such a system.

The UK Government previously explained how the Prüm Treaty would "speed up and improve the quality and quantity of information exchanged" about DNA, fingerprints and vehicle registration in order to identify and bring to justice terrorists and criminals. Ministers stated that the Government had negotiated hard "to get an outcome that enables [the UK] to sign up to Prüm and get all the benefits in terms of fighting cross-border crime and counter terrorism where so much depends on good data exchange and intelligence led policing" (House of Lords European Union Committee 2007, Ev.1-2 and Q8). In reply, parliamentarians and ethicists emphasized that "privacy-related issues concerning the use and transfer of DNA and other data for inter-jurisdictional criminal matters must be considered and agreed in parallel with arrangements for availability, exchange and linkage" (Nuffield Council on Bioethics 2007, p. 105). The UK has yet to announce when it expect to be taking part in information-sharing under the Prüm Treaty.

For the time being, mutual judicial cooperation and data exchange in relation to DNA and fingerprints remains on a fairly modest scale, compared with efforts to detect criminals travelling with stolen or lost travel documents. At the end of 2011 the Interpol Stolen and Lost Travel Documents (SLTD) database held 31 million records, accessed by 161 countries (see http://www.interpol.int/@en/INTERPOL-expertise/Databases). The database can be made interoperable with national border control data systems. In 2008 law enforcement and border control officers carried out 25 million international searches of the database. This resulted in the identification of more than 5,000 individuals travelling on fraudulent documents (McCartney et al. 2010, p. 44).

In 2011 the Polish EU presidency called for a "Vision for European Forensic Science 2020." Building on increasing police cooperation and in recognition of the demands of maintaining and developing the EU as an area of "freedom, security and justice," the EU is working to create a "European Forensic Science Area" by 2020. This policy programme aims to "ensure the even-handed, consistent and efficient administration of justice and the security of citizens," by accrediting forensic institutes and laboratories and conducting international proficiency testing, establishing minimum competence criteria for forensic practitioners and introducing best practice manuals for laboratory case-work. There will also be minimum quality standards for examining crime scenes and managing the production of scientific evidence, from the crime scene to the courtroom. Duplication of effort in different countries should be minimized through mutual recognition of testing and processing of forensic data, and the sharing of forensic databases.

These objectives are laudable and, if implemented successfully, would go some way towards overcoming current obstacles to effective forensic data exchange and intelligence sharing. As things stand, enormous differences in national modes of data production and intelligence generation, coupled with markedly discrepant regulatory regimes, conduces to an extremely complex environment in which to attempt to foster mutual judicial cooperation (Gill 2008, p. 132). These complexities are overlaid by major differences in national legal traditions and judicial systems, which are far from being comprehensively harmonized (even supposing this to be desirable). For example, in almost all of the initiatives, mechanisms and organizations which seek to build collaborative links and facilitate forensic data and intelligence sharing, the emphasis has been squarely on policing and prosecutorial cooperation. There is almost a complete lack of attention to defence rights and interests. Procedural safeguards for defendants in criminal proceedings and equivalent access to evidence for the defence have largely been ignored in the drive to re-arm investigators and prosecutors in the fight against cross-border crime. These deficits are likely to become more salient in the coming months and years, as the provision of adequate procedural rights for the defence rights rises up the EU criminal policy agenda (see, in particular, EU Council 2009b).

Conclusions

All forms of human cooperation and collaboration require mutual trust. The EU's 2009 Stockholm Programme, which promised to deliver "An Open and Secure Europe Serving and Protecting Citizens," stressed that mutual trust was "the basis for efficient cooperation in this area. Ensuring trust and finding new ways to increase reliance on, and mutual understanding between, the different legal systems in the Member States will thus be one of the main challenges for the future" (EU Council 2010, para.1.2.1). However, significant obstacles to effective cross-border policing cooperation have yet to be overcome. Immediate practical difficulties such as language differences, time limits and technical legal constraints (e.g., the doctrine of double criminality in extradition law) seem to preoccupy policymakers, at the expense of more fundamental considerations of proportionality, necessity, and public acceptability. The Stockholm Programme did acknowledge that "[i]n order to improve cooperation based on mutual recognition, some matters of principle should also be resolved" (EU Council 2010, para 3.1.1.). Yet "principled" considerations have largely been absent from much subsequent debate.

Pressing issues demand resolution prior to further expansion of international exchanges of forensic data, information, and intelligence. The existing fragmentary regulatory framework must be developed to set international quality standards to ensure the competency of individual forensic practitioners and the scientific validity and reliability of their results. Agreed protocols for data interpretation and report writing need to be adopted, and issues of training and resources addressed. At a more fundamental level of principle, urgent consideration must be given to implementing procedural safeguards and equivalent powers for the defence, to ensure that transnational data and intelligence sharing does not undermine the accused's fair trial rights. Most "cooperation" instruments are silent on these matters. Robust rules need to be in place to ensure that evidence exchanged across borders is relevant, reliable and not obtained through illegal or unfair means. The exchange of evidence between national authorities should not provide an excuse to drive down procedural standards to the lowest common denominator, nor to enable prosecutors to gain access to evidence that would have been legally unavailable to them in their own jurisdictions. To the contrary, mechanisms of mutual judicial assistance should be used to establish and promote best international practice in evidence gathering, production and presentation.

Perhaps most important is the oversight of these transnational flows of law enforcement information. The process lacks transparency, and consequently citizens' ability to challenge exchanges of their personal data is almost nonexistent. Concerns raised by den Boer (2002) that policing networks sit outside political frameworks of democratic governance and accountability remain apposite. Simply ensuring that the system "works" for the law enforcement professionals involved is inadequate for maintaining public confidence. Transparency and accountability are key to the long-term acceptability of expanded networks of data and intelligence sharing across national borders and mutual recognition of judicial evidence. As Professor Spencer explained to a House of Lords Select Committee: "What is done in trans-border cases has to be acceptable to public opinion, not just prosecutors and people who work the system. If there are dysfunctions in the criminal justice systems of some other Member States. . . they are not likely to be sorted out just by people getting to know each other. . .Unless these matters are addressed, public opinion will not accept the too ready functioning of cross-border criminal justice" (House of Lords European Union Committee 2012, p. 11).

► Transnational Exchange of Forensic Evidence

Treating Mentally Ill Offenders

William B. Lawson
Department of Psychiatry and Behavioral Sciences, Howard University Health Sciences, Washington, DC, USA

Overview

Prisons and jails now include a substantial number of individuals who are mentally ill or substance abusers. This entry reviews how offenders with mental health and substance abuse disorders are handled for their behavioral health disorders. More importantly, the overrepresentation of minorities in the correctional system presents challenges to diagnoses and treatments offered, given the disparities in health care in the community. The importance of medications, and the continuation after release from prison or jail, is emphasized as a necessary tool to safely manage and assist individuals with behavioral health disorders. The failure to provide adequate diagnoses and treatment in confinement facilities, as well as in the community, has implications for efforts to reduce the demand for incarceration.

Introduction

The United States has shown a substantial increase in its correctional population, with much of it due to the “war on drugs” increasing the incarceration of the mentally ill and substance abusers. This special population often requires unavailable treatment. Moreover, minority and poverty-stricken populations make up the majority of the correctional population and face the same disparities in access to care as these individuals see in the noncorrectional population. Diagnostic concerns, lack of access to psychotherapy, and pharmacotherapy are quite prevalent. Nevertheless, treatment availability can improve the correctional environment and has positive consequences for recidivism and the larger society. Moreover, substance abuse treatment can reduce the spread of diseases such as AIDS. Approaches such as drug courts and integrated programs have helped to improve access to treatment and maintain adherence to care in the community.

Prisons and jails now include a substantial number of individuals who are mentally ill or substance abusers. Estimates of the inmate population that is severely mentally ill range from 15 % to 30 % (Fazel and Seewald 2012). Fifty percent to 65 % of state and federal prisoners and jail inmates have a diagnosis of mental illness (James and Glaze 2006). Jails and prisons are now the largest provider of mental health services in the country, serving more mentally ill than any public mental health hospital or clinic. Half of the correctional population meets standard diagnostic criteria for drug dependence or abuse (Mumola and Karberg 2006).

Unfortunately, individuals in the correctional system are often underdiagnosed and undertreated. Once incarcerated, inmates have little chance of accessing mental health services with fewer than 17 % actually receiving services. Moreover, individuals are under-referred for mental health services and correctional systems lack the professional staff to address mental disorders, such as providing evidence-based psychotherapy (Foulks 2004). The culture of corrections further complicates the problem since the need for security and control supersedes the need for treatment. Nevertheless, the need for treatment services is well documented. Consequently, many correctional settings offer treatments of various types or at least make an attempt to manage those mentally ill individuals or substance abusers who are clearly behaviorally disturbed or suffering from intoxication or withdrawal.

Treating Mentally Ill Offenders, Table 1 Comparison of the correctional and mental health systems

Correctional system	Mental health system	Consequence
Focus is on security	Focus is on treatment	Treatment needs often have to be sacrificed for security
Abnormal behavior considered to be manipulative	Abnormal behavior considered to be an illness	Dealing with willful disobedience is a priority over care
Management of overt behavior considered important	Diagnosis considered relevant	Diagnosis or the need for diagnosis ignored or minimized
Hierarchy relationships are maintained for order	Seeking therapeutic alliance	Lack of trust and need for security overrides therapeutic considerations
Medication needed for control	Medication needed for treatment	Therapeutic benefits have less priority than the need for order

Barriers to Treatment and Services

The correctional system as an institution has a different perspective on the role of treatment, as shown in Table 1.

The correctional system is a punitive system with a focus on security. In such a setting, a therapeutic alliance, while possible, is sacrificed to the need for order; trust is secondary. Interventions necessarily are focused on control rather than therapeutic improvement and treatment needs are sacrificed for security.

There are also key staffing issues. Jails and prisons face multiple challenges in providing inmates with adequate care because of several reasons. One such challenge is the lack of knowledge of treatment histories or medications. Second, jail and prison officials do not have access to medical records. Finally, there is an inability to communicate with providers because of confidentiality restrictions.

Demographics are also important. The incarcerated are disproportionately poor and minority. African-Americans are disproportionately represented in the criminal justice system – 10 % of African-American men between ages 18 and 34 were in prison in 2005 (three times the rate of Hispanic men and seven times that of White men). African-Americans and Latinos make up over half the prison population, which is a far greater representation than in the larger society. For example, African-American juveniles with conduct problems are sent to youth detention while their White counterparts receive treatment. In addition, African-Americans arrested for possession are more likely to be incarcerated than their White counterparts (Iguchi et al. 2005).

Disparities in services for the poor and minorities in the general population are well documented (Kessler et al. 2005; Primm and Lawson 2010). African-Americans with depression are only half as likely to get treatment services even when they are appropriately diagnosed. Incarceration can contribute to these disparities as inmates are less likely to get treatment, or have difficulty linking to services after release due to structural issues related to incarceration (Springer et al. 2012). Outside of the correctional system, less than a quarter of African-Americans receive evidence-based treatment for most mental disorders in any setting.

Consequences of Lack of Treatment

The need for treatment is also related to the fact that most incarcerated individuals are ultimately released. The failure to treat mental illness and substance abuse contributes to recidivism, trapping individuals in an endless cycle of mental illness and incarceration. This cycle appears particularly prominent among African-Americans (Primm and Lawson 2010). African-Americans are more likely to be underserved in correctional settings (Hartwell 2001) and due to their overrepresentation, their release greatly affects the African-American community that often is one with limited resources and high rates of poverty.

Moreover, prisons have become vectors for chronic diseases such as AIDS, Hepatitis C, and treatment-resistant TB (Springer et al. 2012). Recently released inmates have been found to be infected with HIV and continue to be involved in risky behavior such as high-risk sex or drug abuse. These disorders can be spread to the general population through high-risk behavior if the individuals are not treated for both the underlying mental illness or substance abuse and the chronic illness.

Mental disorders can be associated with violence when untreated. Yet when treated, individuals with mental disorders are no more violent than the general population. Substance abuse can also be associated with continued criminal behavior. Treatment of substance abuse reduces the risk of such behavior in the community and reduces crimes rates. Lack of access to treatment therefore affects both the incarcerated and general community.

The First Step: Accurate Diagnosis

Misdiagnosis and underdiagnosis is common in correctional settings. Moreover, the poor and ethnic minorities are probably more likely to be underdiagnosed or misdiagnosed, given the findings from the non-correctional community. Outside of the correctional system, clinicians tend to grossly overdiagnose ethnic minorities with relatively uncommon disorders such as schizophrenia at the expense of much more familiar ones, such as mood and anxiety disorders (Strakowski et al. 2003). This underrecognition of some mental disorders and excessive misdiagnosis of others contributes to treatment disparities among African-Americans and Latinos. Such disparities also contribute to the failure of recognizing these disorders in the prison system. Mentally ill, underrepresented minorities are often not recognized as having a disorder and are instead arrested, which further contributes to the increase in mental illness within the prison population (Foulks 2004).

Anxiety Disorders

Anxiety disorders are less likely to be observed in the community for African-Americans diagnosed by clinicians without the use of assessment instruments, which are related to misdiagnosis and underrecognition of symptoms. However, anxiety disorders such as generalized anxiety disorder or posttraumatic stress disorder (PTSD) are among the most common mental disorders and may show a higher prevalence among those in the correctional system because of the correctional setting itself. Prisoners can and do exploit each other, and the problem of violence and victimization within the correctional system is well documented. Mentally ill prisoners are far more likely to be victimized and exploited (Crisanti and Frueh 2011).

Many individuals enter the correctional setting with preexisting lifestyle factors that are similar in the inner city. Individuals are often exposed to violence if not victimized themselves, and PTSD is widespread in inner cities where minorities and the poor are over-represented (Alim et al. 2006). PTSD is both underdiagnosed or misdiagnosed, as those with the disorder tend to be hypervigilant, and show autonomic hyperactivity and emotional numbness, which could be interpreted as psychotic or antisocial (Lawson 2009). African-Americans are generally at risk of being perceived as guilty or troublemakers, and those with suspicious behavior, such as the hypervigilance and emotional numbness associated with PTSD, are often perceived as being criminals (Hicks 2004). The result is delayed or no treatment.

Depression

Depression is among the most common disorders in the correctional system (Baillargeon et al. 2000). Although depression is often treated in the correctional system, there is a large unmet need as suicide rates are higher in the prison system than in the community (Rabe 2012). Failure to recognize depression may arise from a lack of awareness of African-American and Latino culture (Primm and Lawson 2010). Moreover, low income individuals and many ethnic minorities, especially males, do not report sadness and often will focus on the vegetative or physical signs of depression, including sleep or eating disturbance, and somatic complaints. The problem is further enhanced by the failure of many inmates to recognize depression. Gang members may show their depression by "acting out" and commit antisocial or violent acts.

Suicide is an important consequence of depression. Suicide and suicide attempts have been recognized as a worldwide problem in correctional systems. It is clearly more common than in the general community, perhaps due to the high rates of victimization as well as unrecognized psychopathology (Crisanti and Frueh 2011). Early recognition and treatment of depression is one essential approach to reducing the suicide risk.

In the past, suicide was thought to be rare among ethnic minorities. However, recent studies have shown young African-American males do not differ in rates from their White counterparts, while Native Americans have among the highest rates in young men (Joe et al. 2006).

Bipolar Disorder

Misdiagnosis of bipolar disorder is common, and these individuals may instead be diagnosed for years with schizophrenia and/or depression (Lawson 2005). African-Americans are much more likely to be under- or misdiagnosed and often receive a diagnosis of schizophrenia instead of bipolar disorder. It is also under-recognized in the correctional system with a third of inmates having unrecognized bipolar disorder (Kemp et al. 2008).

Recognizing and treating bipolar disorder is extremely important in the correctional system. The symptoms of the disorder involve impulsivity, pleasurable high-risk behavior, and irritability. Impulsive violent behavior, drug use, overspending, sexual assault, gambling, and disregard for the rights of others are all common in a manic episode and make these individuals especially vulnerable to arrest (Lawson 2005). The increased underdiagnosis among African-Americans makes the risk for arrest far greater than the likelihood for treatment. Secondly, bipolar disorder has been found to be the most single important factor in recidivism in jails (Quanbeck et al. 2005).

Schizophrenia

Individuals too impaired to make it in society may result to criminal activity to survive, resulting in the severely mentally ill ending up incarcerated. Many are regarded as criminals or psychopaths, and often the first time, a mental illness is diagnosed in jail or prison. Symptoms, such as impulsivity, poor judgment, callousness, a blunted affect, command hallucinations, and delusions, may be interpreted as antisocial or criminal especially for minorities. Once in the correctional system, individuals with schizophrenia are at great risk for being victimized. Upon release, transition to the outside world is especially difficult, leading to readmissions and recidivism especially when the diagnosis is not made. In addition, African-Americans are at increased risk of being perceived as hostile, further reducing the likelihood of treatment (Lawson 2007).

Preventing Misdiagnosis

Prison officials must be made aware of the risks associated with a misdiagnosis. A missed diagnosis increases the inmates' risk of exploitation and suicide, and the correctional staff's ability to prevent risks to themselves and other prisoners. Secondly, cultural awareness is important. Stereotypes about the rates of illness based on race must be discarded. An appreciation of cultural issues can increase diagnostic accuracy (Lawson 2005, 2007).

Language issues must be addressed as well. Many Latinos speak English as a second language. Outside of the prison setting, patients who speak English as a second language are more likely to be misdiagnosed as having schizophrenia when they have depression and may report different symptoms in their primary language. Limited English proficient individuals may be misdiagnosed, ignored, victimized, lack adherence to treatment, or may not receive appropriate and necessary treatment in the correctional system (Foulks 2004).

The use of screening tools can also be effective. Screening tools used with clinical judgment can lead to a greater likelihood of a valid diagnosis. Screening has been found to be effective in primary care settings which have successfully used various instruments to identify mental health illness (Gilbod et al. 2002). These instruments can be very brief and self-administered and often have good validity and reliability, although not all have been standardized in ethnic minority populations.

Non-pharmacological Management

Psychotherapy can be effective in the correctional setting. Some contend that the practice of psychotherapy in prison is an unethical endeavor due to a lack of trust or confidentiality between the therapist and client and the possible threat of coercion. However, if these issues are addressed directly, a therapeutic relationship can be established. In fact, when therapy was provided, mental health providers offered a full range of services with goals that include mental illness recovery, emotions management, institutional functioning, reentry, risk-need, and personal growth, with the main focus being mental health recovery (Bewley and Morgan 2011). Moreover, many systems offer special areas of treatment that are key in the correctional system including: (1) management of self-mutilation, posttraumatic reactions (e.g., prison rape survivors), terminal illness, and crisis intervention, (2) maintenance of psychotic and major affective disorders, (3) outpatient therapy on adjustment issues and elective psychotherapy, and (4) treatment Programs for sex offender therapy and chemical dependency.

Moreover, various therapeutic approaches have been found to be effective. Meditation-based programs including Transcendental Meditation, mindfulness-based stress reduction, and 10-day Vipassana retreats have been found to enhance psychological well-being, decrease substance use, and decrease recidivism (Himelstein 2011).

Dialectical behavioral therapy has been used effectively as well. Various cognitive behavioral therapy approaches and interpersonal therapy have been shown to be effective in depression and anxiety disorders. Psychosocial interventions such as cognitive behavioral therapy (CBT), family interventions, and education programs have been found to be effective in maximum security settings (Walker 2004). Modified therapeutic communities modified for the correctional setting have been shown to be effective.

Pharmacotherapy

Despite the strong evidence for the effectiveness of psychosocial interventions, medication treatment is the primary mode of treatment within the correctional system (Thornburg 1995). Part of the reason may be the absence of personnel trained in psychosocial interventions. Another reason may be due to ethnic minorities who outside of the correctional system are thought to be poor psychotherapy candidates (Primm and Lawson 2010), leading to a decrease in the utilization of different types of psychotherapy.

Pharmacotherapy

One of the most prescribed medication groups are benzodiazepines which are safe, effective, and have less abuse potential than their older counterparts for anxiety and sedation. In the correctional system, benzodiazepines are used to address behavioral problems and a wide range of psychiatric disorders (Lerat et al. 2010). However, their overuse could lead to problems in the correctional system. The medications tend to contribute to disinhibition and tolerance is quickly acquired, making their use for many behavioral and psychiatric problematic. In an older study, violent or aggressive incidents occurred significantly more frequently in inmates on psychotropic medication than inmates who were not on psychotropic drugs. Of these, antianxiety agents (diazepam in 81 % of the cases) appeared to be the most implicated, with 3.6 times as many acts of aggression occurring when inmates were on these drugs (Workman and Cunningham 1975). Apparently the benefits were outweighed by the disinhibiting effects on behavior.

While these agents are less likely to be abused than most street drugs and older sedative/hypnotics, overuse and dependence often occur. To maintain control and order, hypnotics and sedatives such as benzodiazepines are often prescribed and their use is widespread among prisoners. Both illegal and medical drug use can occur in prison. Moreover, in this population in the jail/prison setting, drug-seeking behavior is frequently encountered. Prescribers usually take into account the potential for abuse before prescribing pain medications, benzodiazepines, and other hypnotic/sedative drugs, and they will reduce their use with guidelines and education. Nevertheless while agents such as SSRI are more likely prescribed by psychiatrists in the community to treat anxiety disorders, use of these agents to treat disorders in prisons remains widespread.

Some prescribed agents may not be abused in the community, but they are frequently abused in prison. Practitioners appear less likely to consider medications such as atypical antipsychotics and antidepressants as having the potential for abuse or dependence. Quetiapine (Seroquel®), an atypical antipsychotic, and Bupropion (Wellbutrin®), an SSRI antidepressant, have been identified as possible drugs of abuse within the correctional setting (Del Paggio 2005). Abuse was indicated by: (1) clinical presentations atypical at best; (2) doses that would be considered subtherapeutic for control of the reported "psychotic" symptoms; (3) refusal to consider other treatment options for their symptoms; (4) asking specifically for Seroquel® and Wellbutrin®, and (5) clinical presentations frequently suggested malingering of symptoms. Educational programs and close monitoring is often effective to combat this abuse.

As noted above, depression is common and often treated with antidepressants (Baillargeon et al. 2000). Antidepressants are effective in the correctional setting when the diagnosis is appropriately made, as shown by their increased use relative to other agents such as antipsychotics despite their cost and relatively strong adherence (Baillargeon et al. 2000). Although African-Americans are more likely to receive antidepressants in the correctional system, they are still less likely to receive them compared to Caucasians and more likely to receive them compared to Latinos.

Depression is strongly associated with suicide which is unfortunately not uncommon in the correctional system. As such, effective treatment of depression should have a positive effect on suicide rates within the correctional system. In fact, a marked decrease of suicide rates occurred after the introduction of SSRIs, and a significant association was seen between SSRIs, other new-generation antidepressants, and lower suicide rates, while TCAs are associated with higher suicide rates (Gibbons et al. 2005).

Antipsychotics have been widely used because of the incarceration of the severely ill and the need to treat aggressive behavior. The comparatively high acquisition costs of the newer antipsychotic medications have caused the mental health community to look closely at their potential benefits. Initiation of the atypical olanzapine therapy was associated with favorable clinical outcomes with the incarcerated mentally ill, particularly in patients with a formal diagnosis of thought disorder. The decline in total resource utilization was not statistically significant, although it may be of practical importance (Del Paggio et al. 2002).

Mood stabilizers have been useful as well because they are effective in treating both bipolar disorder, which disproportionately affects recidivism and aggression. Medication adherence is important in preventing re-incarceration and homelessness for those patients incarcerated with bipolar disorder and treated with mood stabilizers (Copeland et al. 2009). Lithium has been found to reduce aggression in a variety of settings including corrections (Müller-Oerlinghausen and Lewitzka 2010). Divalproex is effective in reducing impulsivity and mood liability in bipolar and non-bipolar patients. However, the impulsive/aggressive subgroup was the only non-bipolar subgroup in which DVX yielded clinical benefit (Kamath et al. 2008). The author found that divalproex was effective in reducing disruptive behavior in both groups (Lawson and Nanos 2008).

Ethnopsychopharmacology

Ethnic differences have been reported for the metabolism of many psychotropic medications. Given the large ethnic minority populations in the correctional system, such findings are extremely relevant. African-Americans may require less medication than Caucasians due to differential pharmacological response (Bradford 2002). For instance, African-Americans may require lower doses of antipsychotic and antidepressant medications than Whites. Cytochrome P 450 enzymes metabolize over 90 % of drugs in clinical use including antipsychotic and antidepressant medications, and individuals with relatively inactive CYP2D6 alleles (which account for 25 % of metabolism of commonly used drugs) tend to have higher plasma levels of antipsychotics and antidepressants (Bradford 2002). However, 50 % of people of African ancestry have reduced functioning or nonfunctioning alleles, which lead to slower metabolism of older antipsychotics or tricyclic antidepressants and higher plasma levels. Chronically higher plasma levels may be associated with an increased risk of side effects, such as intolerance of the medication, which in turn can lead to poorer adherence to treatment. African-Americans are also more likely to develop tardive dyskinesia when receiving first-generation antipsychotics (Lawson 2007). A noted disparity in the provision of treatment is that African-Americans are more likely to be prescribed antipsychotics and are less likely to be prescribed newer antipsychotics or antidepressants (Lawson 2007). As mentioned above, African-Americans are also less likely to be offered different types of psychotherapy.

Many clinicians are unaware of potential racial/ethnic differences in pharmacological responses. For example, many anticipate that African-Americans will respond to medication similarly as other racial/ethnic groups do since considerable genetic similarities exist across such groups. Many also feel that African-Americans require more medication based on the misconception that African-American males are more hostile (Lawson 2002). However, the evidence suggests otherwise. Since the older medications are more likely to be metabolized by the CYP2D6 enzymes, African-Americans may be at greater risk of experiencing side effects when given the same dose as Whites because the drugs are metabolized more slowly. Moreover, since African Americans are more likely to be perceived of as being hostile or having schizophrenia, they may end up in receiving even higher doses and ultimately less likely to adhere to treatment after release.

Substance Abuse Pharmacotherapy

Substance abuse treatment has become an important intervention for reducing recidivism among inmates, especially since substance abuse is a major factor in the growth of US prison populations. However, pharmacotherapy has become an effective treatment in addressing drug abuse. An estimated 12–15 % of inmates have histories of heroin addiction (Mumola and Karberg 2006) and not surprisingly much of the research has involved opiate pharmacotherapy. The full agonist methadone and related agents have been found to be effective in addressing drug use problems in the correctional setting and post-release. Methadone treatment begun in prison and continued in the community upon release extended the time parolees remained in treatment, reduced further drug use, and produced a threefold reduction in criminal activity (Kimlock et al. 2009). A review of current studies showed that prerelease opiate maintenance therapy (OMT) was significantly associated with increased treatment entry and retention after release if arrangements existed to continue treatment. For other outcomes, associations with prerelease OMT were weaker but included postrelease reductions in heroin use. Evidence regarding crime and re-incarceration was equivocal, but as noted above, some studies found positive results.

Buprenorphine is a long-acting partial agonist that acts on the same receptors as heroin and morphine, relieving drug cravings without producing the same intense "high" or dangerous side effects. Congress passed the Drug Addiction Treatment Act, permitting qualified physicians to prescribe Schedule III–V narcotic medications for the treatment of opioid addiction. This legislation created a major paradigm shift by allowing access to opiate treatment in a medical setting rather than limiting it to federally approved opioid treatment programs. Buprenorphine has advantages over methadone including less associated stigma; fewer regulations, which permit its use outside opioid treatment programs; and lower risk of overdose. Its combination with naloxone reduces the likelihood of intravenous abuse of the medication. It can be a valuable tool in addressing the problem of adherence since in 85–90 % of such persons relapsing to opioid use within 1 year after release, regardless of duration of incarceration (Kinlock et al. 2002). Overall, Buprenorphine has been found to be effective during incarceration and for post-release (Sullivan et al. 2006).

Corrections and Public Health

Since the first reports of HIV/AIDS occurring in US prison populations were published more than 25 years ago, epidemiologic studies have consistently documented a high prevalence of HIV infection and AIDS among prison inmates. The most recent estimates show that the prevalence of HIV infection in the US prison population is more than three times higher than that of the general population (Spaulding et al. 2009). Moreover, one-sixth of all infected individuals in the USA pass through the criminal justice system annually (Spaulding et al. 2009). Consequently, interventions are urgently needed for individuals with HIV disease who are transitioning back to the community. Moreover, 20 % of HIV-infected inmates released from prison were re-incarcerated within 3 years of their release date, creating a cycle of reinfection (Balergeon et al. 2010). Buprenorphine was associated with reduced relapse to opioid use and sustained viral suppression among released HIV-infected prisoners meeting criteria for opioid dependence (Springer et al. 2012) which helps combat this cycle of reinfection.

The impact of HIV infection and the cycle of reinfection on the African-American community is especially important. African-Americans have both higher HIV infection rates and have a greater representation in the correction system (El-Sadr et al. 2010). African-Americans have less access to services upon release (Primm and Lawson 2010).

Mental disorders also contribute to the spread of AIDS. Depression has been linked to disease progression in HIV, risky behaviors, and medication non-adherence. Moreover, treatment of depression leads to better adherence of HAART medications (Walkup et al. 2008). Unfortunately it is well documented that ethnic minorities have limited access to treatments for affective disorders which may further exacerbate the risk of the spread of AIDS in the African-American community (Primm and Lawson 2010).

Need for Integrated Treatment

Treatment in the correctional system must address the complex problem of substance use comorbidity. Because drugs of abuse affect similar brain circuits or receptor mechanisms proposed for mental disorders, they can cause drug abusers to experience one or more symptoms of mental illness (Lawson et al. 2011). When substance abusers present with similar symptoms of mental disorders, an underlying mental disorder may be missed and a drug abuser may be incarcerated rather than provided treatment. The result could be misdiagnosis and inappropriate treatment. Additionally, individuals with overt, mild, or even subclinical mental disorders may abuse drugs as a form of self-medication (Lawson et al. 2011). As a result, the mental disorder is considered yet another symptom of substance abuse, resulting in a delay in or absence of treatment for the mental disorder, especially in the correctional settings. Substance abuse adds to the burden by exacerbating mental illness and leading to a poorer outcome. In correctional systems, co-occurring disorders greatly exacerbate the rate of recidivism (Baillargeon et al. 2010). And, those with co-occurring substance abuse disorders are more likely to be held in jail longer than other inmates charged with similar crimes (McNiel et al. 2005). The combination of mental illness and drug abuse contributes to a revolving door of incarceration.

HIV means that many of these inmates may have three disorders, a triple whammy. It has already been noted that drug abuse worsens the outcome of HIV. Untreated mental illness is also associated with poor outcome for HIV. Treatment for comorbidity is inherently more difficult and often requires specialized services. Yet, such treatment is important and perhaps necessary to improve outcome and protect the community.

Ensuring Treatment

Mental health and drug courts are a valuable and effective source for early detection, referral, and navigation of services (Gallagher et al. 2011). They offer fresh insight into the potentially beneficial and detrimental effects of legal decisions and view one of the roles of law as that of a healing agent. At present, several states have instituted mental health courts based on these concepts; incorporating previous drug court experiences (Gallagher et al. 2011) in their development. Their goal is to avoid the criminalization of the mentally ill and their recidivism through the creation of special programs.

Mental health courts promote a non-adversarial atmosphere in which participants interact directly with the judge and in which praise and encouragement are issued far more often than sanctions. One program reported a significant drop in psychiatric hospitalization days for mentally ill participants and a decrease in positive drug and alcohol tests. Another mental health court program in Nevada reported successfully keeping mentally ill offenders out of the correctional system while concomitantly improving their mental condition. Mental health courts have been found to lower posttreatment arrest rates and days of incarceration (Steadman et al. 2010). While mental health and drug courts are not in and of themselves treatment and depend heavily on existing treatment resources, they are an important first step to providing services to improve adherence and linkage to post-release services.

Conclusion

The changing inmate population in the correctional system makes treatment essential to prevent recidivism and protect the community. We now have treatments that are effective in addressing mental disorders, substance abuse, and general medical problems such as AIDS. Most importantly, these treatments are shown to be effective in the correctional system and show strong benefits post release. Unfortunately, the issues that limit treatment in the community at large also impact the correctional community. As in the community, a large minority population, problems with disease recognition, need for integrated treatments, and barriers to treatment adherence exist in the correctional setting. Moreover, the culture of the system and financial challenges limit access to evidence-based treatment. Yet the need for ongoing and integrated treatment cannot be more urgent. For many with mental illnesses, substance abuse problems, or medical issues, the correctional system provides treatment opportunities for the first time in their lives. When they are released, it is essential that the cycle of high-risk behavior and recidivism is broken, both for the individual and the larger community. Educating the correctional system administrators and the general public on the benefits of evidence-based treatment is more important than ever. Recognition of mental disorders and substance abuse early in the process is crucial. Integrated service approaches combined with mental health/drug courts may produce the effective outcomes necessary for changing the life trajectories of former inmates. Dual diagnosis programs have now been introduced in many settings often with excellent results. However, many of those with comprehensive services in the correctional system discontinue them when released, which is why programs that promote adherence and linkage to services are essential (Foulks 2004). Providing early detection, personnel education, alternatives to incarceration, evidence-based treatment in corrections, and strong aftercare will be economically feasible and may help to reduce the disparities in health outcomes seen in ethnic minorities.

Sexual offender treatment (SOT)

Overview

This entry gives a brief overview on the effects of sexual offender treatment drawing on evidence from a number of meta-analyses and systematic reviews. Overall, this research reveals a positive effect on sexual reoffending. The syntheses suggest a mean effect of approximately $d = 0.20 \pm 0.10$. Because of the low base rate of sexual reoffending, this equals about 25 % less recidivism of treated offenders as compared to untreated groups. However, the studies and findings are extremely heterogeneous and outcomes vary depending on many program, setting, offender, and methodological factors.

Unfortunately, the quality of the majority of evaluation studies on sex offender treatment is rather weak. However, the overall design quality is not consistently related to effect sizes, and the same applies to various other methodological and content characteristics. Cognitive-behavioral treatment, relapse prevention, and programs that adhere to the Risk-Need-Responsivity Model show relatively consistent positive effects, although even such interventions sometimes fail to demonstrate positive effects. Hormonal medication for subgroups of sexual offenders is promising, too, but it needs more methodologically sound evaluations on this topic. By trend, programs in ambulatory settings, with some individualization and proper implementation, and for offenders at higher risk of reoffending, show above-average effects.

The small number of methodologically sound studies with specific characteristics and confounded moderator variables makes it difficult to draw robust conclusions. Despite practical problems in undertaking randomized experiments in this area, more high-quality evaluations are highly needed.

Introduction

In many countries sexual offending is a topic of particularly high concern in the general public and the media. Accordingly, governments implemented two main strategies to deal with sex offenders. On the one hand, they put into effect tougher sentences and security measures for this offender population. On the other hand, they invested in sexual offender treatment programs to reduce reoffending. Although treatment of sexual offenders became common in many Western countries, there is much controversy about its effectiveness (Marshall & Marshall 2010; Rice & Harris 2003). A consensus on "what works" in sexual offender treatment is complicated by various issues. First, sexual offending is a very heterogeneous category that contains, for example, various forms of child molesting, rape, exhibitionism, distribution, and consumption of child pornography in the internet. Second, there are very different types of sexual offenders such as those with or without a deviant sexual preference (paraphilia), an antisocial personality, an opportunistic orientation, and neuropsychological deficits. Third, although much research on risk factors for reoffending and structured assessment instruments has been carried out, the evidence on the causal mechanisms is less clear. Fourth, treatment approaches are very heterogeneous ranging from cognitive-behavioral programs and relapse prevention over psychodynamic approaches and multi-systemic therapy to hormonal treatment by medication or surgical castration, and some of these categories embrace rather different approaches in themselves (McGrath et al. 2010). Fifth, sound treatment evaluation of routine practice is difficult because in many jurisdictions serious sexual offenders cannot simply be left untreated in control groups and sexual reoffending requires rather long follow-up periods.

Accordingly, compared to general or violent offender treatment, methodologically sound evaluations of programs for sexual offenders are less frequent, particularly outside North America (Lipsey and Cullen 2007; Lösel 2012). However, since the 1990s, controlled evaluations have increased and a number of systematic reviews and meta-analyses could be carried out. Table 1 summarizes important features and findings of 12 reviews and meta-analyses that (a) mainly addressed adult sexual offenders, (b) used sexual reoffending as outcome measure (e.g., arrest, conviction, incarceration, or self-reported offenses), and (c) calculated effect sizes (ES) or at least provided systematic data that can be used for effect size estimations. Concentrating on meta-analyses reduces problems of selective file drawing and subjective evaluation. A focus on effect size instead of mere statistical significance provides more adequate information because many sex offender treatment studies contain rather small samples and thus lack statistical power. The remaining entry will provide a brief overview of the main findings and the controversies that arise from those research integrations. Although there is overlap between these syntheses, they vary substantially with regard to the included primary studies, categories for coding, methods of data analysis, calculation and integration of effect sizes, and investigation of outcome moderators.

Some meta-analyses concentrated on psychotherapeutic/psychosocial interventions only. Others also included hormonal treatment by medroxyprogesterone-acetate or cyproterone-acetate to reduce male sexual hormones as well as surgical castration. In the general category of psychotherapeutic/psychosocial interventions, the individual treatment programs vary considerably and contain interventions such as behavior modification, cognitive-behavioral treatment (CBT), relapse prevention, psychodynamic approaches, social therapy, or multi-systemic therapy. [a] Rating on the Maryland Scale of Methodological Rigor (1 = No CG, 2 = Non-equivalent CG, 3 = Indicators of equivalent CG, 4 = Matching procedures, 5 = Randomized Control Trial)

[b] In meta-analyses that included primary studies on Level 1 of the Maryland Scale, the reported data refer to the studies with CG only

[c] ESs were transformed to Cohen's *d* for comparability when another effect size measure was reported in the original meta-analysis. In reviews that did not report ESs, we used the available information provided to estimate *d*- and the *n*-weighted overall ES

[d] The differences between program types are not always significant, but show a systematic tendency

[e] It includes analyses of Schmucker and Lösel (2008) that addressed the same set of primary studies

these intervention types share similarities. For example, the contents of CBT (e.g., reducing deviant sexual attitudes, improving self control, enhancing social skills, promoting perspective taking, or coping with stressors) overlap with those of relapse-prevention programs that focus more strongly on risk situations and fantasies of offenders with a deviant sexual orientation (paraphilia). And multi-systemic therapy for young sexual offenders and social therapy/therapeutic communities make particular use of the social context of the clients but also incorporate elements from CBT or psychodynamic approaches. Hormonal treatment is primarily used for those offender subgroups who are mainly motivated by sexual drive (and not by dominance, etc.), but the medication is often accompanied by CBT or other psychosocial interventions.

Table 1 also presents the methodological quality of the included primary studies using a slightly modified version of the Maryland Scale of Methodological Rigor (MSMR; Farrington et al. 2002) which has five levels: *Level 1*: Only treatment group (TG) data, no control or comparison group (CG); *Level 2*: Nonequivalence of TG and CG, differences on relevant variables effecting recidivism are reported or are to be expected (e.g., treatment dropouts or nonstarters); *Level 3*: Incidental assignment but equivalent CG, sound statistical control, or empirical data on equivalence in relevant variables; *Level 4*: Matching procedures, systematic strategy to attain equivalence of TG and CG; and *Level 5*: Random assignment of subjects to TG and CG, no selective dropout.

Most meta-analyses contain a majority of studies that are rather weak methodologically (Levels 1 and 2). This is a serious problem because the results from such studies can be distorted. However, while high internal validity is a precondition for any causal inference and generalization, an exclusive reliance on randomized controlled trials (RCTs) would lead to a very narrow database. For example, a Cochrane review of RCTs on sex offender treatment ended up with only three studies on very different modes of treatment (White et al. 2009). Thus, hardly any conclusion could be drawn except stating the lack of RCTs. A review of Brooks-Gordon et al. (2006) contained nine RCTs, but the majority did not use reoffending as outcome measures. Most recently Schmucker and Lösel (2013) found six RCTs on sexual offender treatment with offending as outcome. However, the findings of these studies were very different and did not reveal a clear picture that could guide practice and policy making. It is necessary to conduct more RCTs in the evaluation of sexual offender treatment. But one has to be aware of the practical problems in implementing *and* maintaining an RCT in this research area. One should also take into account that methodological quality is a multidimensional category and sound quasi-experiments can provide useful information (Lösel 2007). Against this background it seems helpful not yet to ignore findings from suboptimal studies on sexual offender treatment.

In total, the meta-analyses indicate a substantial increase of evaluations in the 1990s and 2000s. The large number of studies and high *n* in Alexander (1999) is due to the inclusion of methodologically weak studies without comparison groups. The increase in evaluation research is also accompanied by better design quality. As the most recent review of Schmucker and Lösel (2013) shows, nearly half of the studies at Level 3 or above of the MSMR have been published in the 2000s. Perhaps, the public concern about sexual offending led to more interest in sound evidence and research funding in this field. However, one must bear in mind that even the recent evaluation reports do not necessarily address the most recent programs. Sexual reoffending has a relatively low base rate and often only occurs after rather long time periods. Therefore, many evaluations of sexual offender treatment have rather long follow-up periods. Whereas in the evaluation of general offender treatment a follow-up of 1–2 years is frequent, the average follow-up in most meta-analyses reported in Table 1 is clearly over 4 years, ranging to more than 20 years for individual primary studies. This is a positive feature of the respective primary research, but it also has the implication that completed evaluations often address programs that have been revised in the meantime.

In all meta-analyses, except for Lösel (2000) which integrated German studies, the majority of included evaluations came from North America. This may be partially a consequence of the focus on English-language reports by native English-speaking authors. However, similar to other fields of correctional treatment, the dominance of the United States and Canada also reflects a stronger evidence orientation and research activity in the Anglo-American World. It is good news that some meta-analyses on sexual offender treatment also found sound evaluation research in other parts of the world. For example, in the most recent review, approximately one third of the eligible studies stem from outside North America. Despite this positive tendency there are still too few studies from different countries to draw conclusions about the impact of the cultural or legal framing conditions on the effects of sexual offender treatment.

Overall Effect

All meta-analyses suggest a desirable mean effect of sexual offender treatment. The average rates of sexual recidivism in treated offenders varied between 8.2 % (Furby et al. 1989) and 19.3 % (Lösel 2000). In contrast, in the comparison groups, they varied between 12.4 % (Schmucker and Lösel 2013) and 27.4 % (Grossman et al. 1999). In the various meta-analyses the recidivism rates for the TG were approximately 1–10 percentage points lower than the rates for CG. Although, such differences may look small at first glance, one must take the relatively low sexual recidivism rates in the CG into account. For example, Hanson et al. (2002) reported an average sexual recidivism rate of 12.3 % for TG and 16.8 % for CG. This difference of 4.5 percentage points translates into a reduction of 27 % as compared to untreated offenders. The absolute difference between 9.0 % (TG) and 12.4 % (CG) in the meta-analysis of Schmucker and Lösel (2013) was even smaller than in Hanson et al. (2002); however, the reduction in percent was the same (27 %). Of course, one must take into account undetected or unreported recidivism so that the "real" reoffending rates may be higher than those presented in Table 1. However, this is a general criminological problem that even may have decreased a bit in sexual offending because in many countries victims are more encouraged to report to the police or aid organizations.

Computing an overall ES from the various reviews is problematic because of the overlap between the reviews, different sample sizes, methods of analysis, and other issues. However, scanning the reported overall effect sizes across the different meta-analyses reveals that most of them are in the range of $d = 0.10$–0.30. Therefore $d = 0.20$ plus/minus 0.10 (approximately $r \sim 0.10$; odds ratio ~ 1.5) seems to be a realistic estimate of the effect that can be expected on average. This ES range of sexual offender treatment is similar to the ESs reported in the much more comprehensive research on general offender treatment (e.g., Lösel 2012). It is noteworthy that sexual offenders do not only reoffend with sex offenses. In fact, the meta-analyses show that the recidivism rates of sexual offenders were higher for nonsexual offenses. For example, Hanson et al. (2009) reported 31.8 % (TG) versus 48.3 % (CG) and Schmucker and Lösel (2013) reported 24.0 % (TG) versus 32.4 % (CG). This indicates that sexual offender treatment has a broader effect as well.

Treatment Characteristics as Moderators

Mode of Treatment. Nearly all meta-analyses show that cognitive-behavioral treatment (CBT) and relapse-prevention approaches (RP) exhibit larger effects than unspecific psychosocial or psychodynamic interventions. This result is in accordance with general offender treatment (Lipsey & Cullen 2007; Lösel 2012). But although CBT is shown to be effective in principle, this program type does not guarantee reduced sexual reoffending. In well-controlled evaluations the effects of similar CBT programs ranged from strong positive over nearly zero to even negative effects (Schmucker and Lösel 2013; see also individual studies in Hanson et al. 2009).

Beyond the evaluation of specific psychotherapeutic "schools," the literature on "what works" in offender rehabilitation developed broader program characteristics such as the Risk-Need-Responsivity Model (Andrews et al. 2011). Similar to the findings from general offender treatment, Hanson et al. (2009) demonstrated that programs that fulfill all three principles are most successful for sexual offenders, while treatment that does not meet any of the three criteria even shows a slightly negative effect.

Those meta-analyses that also include hormonal therapy via antiandrogen medication and/or surgical castration suggest relatively large effects for this kind of treatment. However, hormonal interventions are only indicated for a subgroup of offenders who are primarily motivated by sexual drive. Surgical castration is now rarely used because of legal and ethical reasons (Weinberger et al. 2005). The respective evaluation studies are of older date and they do not contain equivalent untreated groups. The respective CGs seem to be a negative selection of offenders not motivated for this kind of treatment or rejected by the decision committees. None of the studies reaches Level 3 of the MSMR (Lösel and Schmucker 2005). Although the designs of hormonal medication evaluations are somewhat stronger, they also fail to meet the Level 3 eligibility criterion of Schmucker and Lösel (2013). Furthermore, hormonal therapy has the highest refusal and dropout rates (e.g., Hall 1995). In these cases, those offenders who remained in treatment may have been a highly motivated selection. More sound evaluations of hormonal medication are necessary. One must also bear in mind that hormonal medication is rarely applied as a stand-alone measure but is normally combined with some form of psychosocial intervention. In that sense, these primary studies evaluated the effects of medication added to psychotherapeutic measures. Combinations of CBT and RP approaches with pharmacological treatment are promising for some groups of sex offender, and such approaches would be in accordance with common practice in other fields such as the treatment of depression.

Treatment Setting. Most meta-analyses report a tendency for larger effects in community than in custodial programs. However, some syntheses did not observe this difference (e.g., Alexander 1999; Hanson et al. 2002; Hanson et al. 2009). In principle, one would expect better effects of interventions in the community because treatment progress can be directly tested in risk situations, whereas the transfer of what has been learnt in custody is a key issue in resettlement and relapse prevention. However, the offender populations in both settings are not the same. No study compared treatment in institutional and ambulatory settings for the same type of sexual offenders. As more high-risk cases are to be expected in custody, the outcome differences between settings may be confounded with other features. When institutional treatment is further differentiated into prisons and forensic hospitals, some data suggest that the latter goes along with larger ES (Lösel and Schmucker 2005; Schmucker and Lösel 2013). In contrast, Alexander (1999) found larger ESs for prison compared with hospital settings, but this synthesis contains many methodologically weak studies.

Other Treatment Factors. In addition to treatment mode and setting, only a few other features of program delivery have been addressed in some meta-analyses. For example, Schmucker and Lösel (2013) found that programs with a group format were less effective than programs that included individual sessions or were fully individualized. Although there are plausible arguments for treating sexual offenders in groups (Ware et al. 2009), this finding suggests that some differentiation according to specific offender needs is valuable (see also Marshall 2009).

Surprisingly little is known about the impact of the quality of program delivery. Only few primary studies report data on this issue so that it could not be addressed in the meta-analyses. Research in other areas of correctional treatment has shown that quality of delivery and program integrity are highly relevant for effectiveness (Goggin and Gendreau 2006). However, this issue needs to be investigated more systematically for sexual offender treatment, too. This also applies to the impact of therapist characteristics and the therapeutic relationship. Although research on general psychotherapy has shown that such features are as important as the treatment content, there is only little research on this issue in programs for sexual and other offenders.

Offender Characteristics as Moderators

Offense or Offender Types. The meta-analyses report only few differences in ES for different types of sexual offenses or offenders. For example, Gallagher et al. (2000) and Hall (1995) found no significant differences between various offense types. Alexander (1999) revealed larger ES for non-incest child molesters with male victims and the smallest ES for rapists. Lösel and Schmucker (2005) reported significant effects for all offense categories except intra-familial child molesting. The unsatisfactory state of systematic knowledge about this issue is due to a lack of detailed diagnostic information in the primary evaluation studies.

Research on sex offender recidivism has shown that specific offender and offense characteristics such as use of violence, type of victims, general psychopathology, and paraphilia correlate with reoffending (Hanson and Morton-Bourgon 2005). However, most treatment studies differentiate only according to the index offense between child molesters, rapists, and exhibitionists or even use the summary characteristic of sex offender. Some narrative reviews suggest better success for CBT of child molesters and exhibitionists (e.g., Marshall et al. 1991), but the evidence is rather scarce and as yet there are no well-replicated results on differential indication from the treatment evaluations.

Risk Level. There is a clearer picture of findings with regard to offenders' risk of sexual reoffending. Two recent meta-analyses showed that ESs are larger for groups at higher than lower risk (Hanson et al. 2009; Schmucker and Lösel 2013). A simple explanation for this finding is that the base rate for sexual reoffending in low-risk groups is so low that even successful programs cannot further reduce them. In part, this finding may also be confounded with the age of offenders.

Age. According to the age-crime curve, young offenders have a higher risk of reoffending. Therefore, young age is included in evidence-based actuarial risk assessment instruments for sexual offenders. Although the present entry focuses on the treatment of adult offenders, some of the meta-analyses also included studies on juveniles. Lösel and Schmucker (2005) and Schmucker and Lösel (2013) found a tendency of larger ES in studies that addressed adolescents only. In contrast, Hanson et al. (2009) reported an opposite trend of larger ES in adult samples. Due to the small number of primary studies that specifically addressed adolescent sex offenders, the respective differences in all three meta-analyses did not reach statistical significance. However, two meta-analyses on the treatment of juvenile sexual offenders support the assumption of larger effects in these target groups: Walker et al. (2004) found a mean effect of $d = 0.54$ and Reitzel and Carbonell (2006) a mean of 0.47. With the exception of Gallagher et al. (2000), both ESs are clearly above those in the meta-analyses of mainly adult offenders (see Table 1).

Treatment Motivation. The motivation to engage in treatment and avoid reoffending is seen as a key factor for success. However, in contrast to classical psychotherapy treatment, motivation is no longer seen as an all-or-none category and a more or less static characteristic of the offender, but as a dynamic concept of interaction between the offender and his social context (McMurran 2002). Therefore, similar to interventions for drug-addicted patients, the treatment of sexual offenders is not only a voluntary offer. Recent findings support this view. Whereas Lösel and Schmucker (2005) found a somewhat (but not significantly) larger effect in voluntary than in mandatory programs, Schmucker and Lösel (2013) revealed nearly identical ESs for both approaches to treatment participation.

Methodological Features

Although practice is primarily interested in program and offender factors that moderate treatment effects, characteristics of the evaluation method are also very important. In the meta-analysis of Lösel and Schmucker (2005), methodological characteristics of the primary studies even explained the largest amount of ES variation. However, in the field of sexual offender treatment, it is difficult to disentangle the independent influence of a factor because the subsamples with a specific characteristic are small and there are often confounded variables.

Design Quality. Table 1 suggests that the methodological quality varied substantially both within and between meta-analyses. In general it is still not satisfactory. The findings on the relation between design quality and the effect of sexual offender treatment are mixed. The two meta-analyses with a large portion of uncontrolled outcome studies showed the smallest effects (Alexander, 1999; Lösel, 2000). The Gallagher et al. (2000) synthesis of studies with relatively sound designs reported the largest mean effect. However, the latter meta-analysis also contained studies that used not only official recidivism as outcome data but also self-reports, family reports, or other information. As these studies revealed relatively large effects, ES differences between meta-analyses do not necessarily depend on a single dimension of methodological rigor. The other meta-analyses on relatively sound studies revealed ESs that are lower. All three reviews found a mean ES at around 0.20 (Aos et al. 2001; Hanson et al. 2009; Schmucker and Lösel 2013).

There is also no clear picture on this issue *within* the various meta-analyses. Some syntheses observed a tendency of lower ES in studies with weaker design (e.g., Gallagher et al. 2000; Polizzi et al. 1999). Others found an opposite tendency (Hanson et al. 2002, 2009) or no systematic relation between design quality and ES (Hall 1995; Lösel and Schmucker 2005; Schmucker and Lösel 2013). The same was the case with regard to RCTs versus other designs. In reviews on general offender treatment, there is also no clear relation between overall design quality and ES (Lipsey and Cullen 2007; Lösel 2012). This finding deviates from studies on a broader range of criminological interventions where rigorous designs often go along with lower ES (Weisburd et al. 2001). However, multivariate analyses of the impact of methodological quality on the ES in sex offender treatment are hindered by lacking information and the small number of RCTs. The relation between ES and design quality may even depend on the use of a fixed versus random effects model of ES integration (e.g., Hanson et al. 2009). In some meta-analyses, results depended on whether a single study with extreme effects was included or not (e.g., Gallagher et al. 2000; Lösel 2000).

Sample Size. The problem of disentangling moderators is also relevant with regard to sample size. Similar to findings on general offender treatment (Lipsey and Cullen 2007), some meta-analyses reported the largest effect in very small samples. This may be due to better program implementation in small studies, in particular when the evaluation was carried out in a demonstration project and the authors evaluated an own program. However, the impact of sample size could also reflect a publication bias because smaller studies require a larger ES to get a significant result. Accordingly, Gallagher et al. (2000) and Hanson et al. (2009) reported larger effects in published studies, however, the latter authors for the fixed effects model only. In contrast Hanson et al. (2002) found larger effects in unpublished studies and Lösel and Schmucker (2005) even observed a somewhat greater moderator effect of sample size in unpublished studies.

Length of Follow-Up. Although the rate of recidivism increases with the length of follow-up, the ES in treatment evaluations seems not to decrease generally over time. For example, Lösel and Schmucker (2005) and Schmucker and Lösel (2013) found no significant correlation between ES and follow-up time. Gallagher et al. (2000) and Hall (1995) even reported that the length of follow-up related positively to ES. This contradicts results on general offender treatment (Lipsey and Cullen 2007) but may have been due to outliers with very long follow-up periods and very high ES. Very long periods of follow-up might also cause problems because data may have been erased from official registers for some (inactive) offenders.

Other Methodological Moderators. There are many other potential moderators of ES. However, they were not systematically addressed across the various meta-analyses. For example, Gallagher et al. (2000) and Lösel and Schmucker (2005) found that *official recidivism* showed lower ESs than other outcome measures (i.e., self-reports or composite measures). Perhaps, official data are less sensitive to change but such effects are difficult to demonstrate due to confounding with other variables. *Attrition rates* also seem to be relevant for ES. High attrition rates may indicate a low quality of program implementation and also lead to lower effects when the dropouts are counted as part of the TG in an intent-to-treat analysis (Lösel and Schmucker 2005).

A particularly important issue is the transparency of the report on the evaluation. Although the concept of *descriptive validity* (Lösel and Köferl 1989) is not a characteristic of the evaluation process itself, it shows substantial correlations between $r = 0.24$ and 0.50 with ES (Lösel and Schmucker 2005; Schmucker and Lösel 2013). It can be assumed that a detailed and transparent documentation of the treatment concept, implementation, outcome measurement, and statistical analysis indicates a good overall quality of the respective evaluation. Therefore, it is strongly recommended that program evaluations pay more attention to this issue.

Conclusions

This brief review of meta-analyses on the effects of sex offender treatment revealed an overall positive effect on sexual reoffending and various characteristics of the most promising interventions.

However, the heterogeneity of study outcomes accompanied by a lack of detail in the documentation of programs, offender populations, setting variables, and other features as well as often weak study designs leaves many questions open. A further increase of high-quality primary studies and the systematic integration of their results are crucial to answer open questions and help turn suggestive findings into confirmed knowledge. Such studies should also focus on more homogeneous and well-assessed subgroups of sexual offenders and provide sound information on the treatment process. This would lead to a more solid and differentiated evidence base about what works for whom, under what conditions, in what contexts, and with regard to what outcomes. As sexual offending is a topic of much public concern, such evaluations are particularly important to replace stereotypes and opinions in policy making by sound evidence.

Overview

The ancestor of Chinese triad society is Hung Mun, which was originally a loyal and righteous society. It was a secret society whose members, bound by oaths of blood brotherhood, were pledged to restore the ancient Empire, the Chinese Ming Dynasty, to the throne by overthrowing the foreign conqueror, the Munchow Qing Dynasty. Being a massive and highly coordinated political and military organization, it had a clear structure of commanders, officers, rank and file, and followers. Its members were all brave heroes rather than groups of criminals or vandals. Since China became a Republic in 1911, such loyal and patriotic nature had gradually diminished, leading to the disintegration of Hung Mun into dozens of separate triad societies engaging in criminal activities. The political turmoil in China between the two world wars, including the Japanese invasion and the rise of

Triads and Tongs, Fig. 1 The four largest triad consortiums in Hong Kong

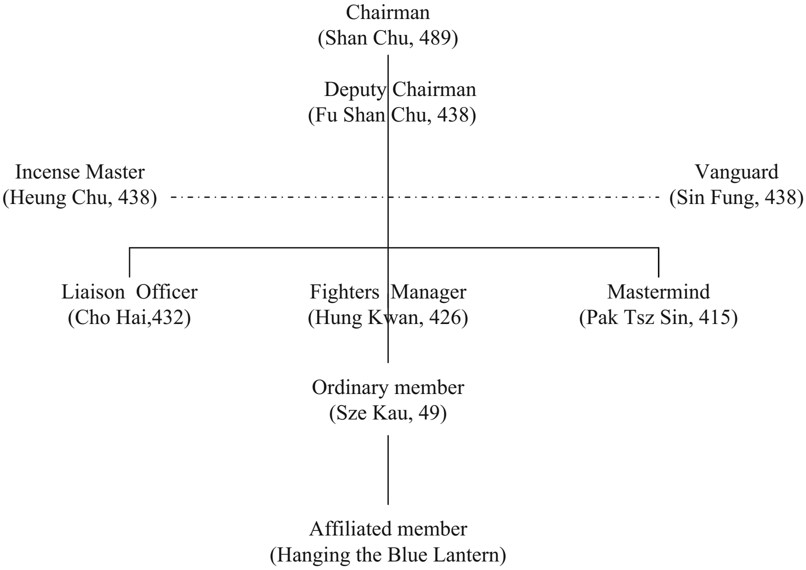
the Communist Party, forced the triads to retreat into Hong Kong. In 1960, the then Police Commissioner of Hong Kong made such a remark, "Of the approximately 3,000,000 inhabitants of Hong Kong it is estimated that about one in six is a triad member" (Morgan 1960:ix). Hong Kong is undoubtedly the capital of triad societies, which serves as the best venue for the study of triad structure, subculture, and transformation. Today, triads are criminal organizations acting independently of each other and use triad names and rituals for their own benefit. Although they are not as powerful as before, the problem still exists and the heroic figures presented by triad members in movies and cartoons have won the heart of working class youth (Lo 2012a).

Fundamentals

Organizational Structure

The triads in Hong Kong were originally affiliated to four large triad consortiums (see Fig. 1). Take the Wo group, one of the largest and oldest triad consortiums, as an example. It was formed by many triad societies, such as Wo

Triads and Tongs, Fig. 2 Structure of a traditional triad society by rank



Shing Wo, Wo Shing Yee, and Wo On Lok. The 14K was formed by such branches as Yee, Hau, Yan, and Yung (Cheung 1987). Their internal structure was characterized by a parent and branch relationship. Each triad society was controlled by an administrative headquarters whose authority extended to the branches and sub-branches formed from them. As one of the functions of the headquarters was arbitration when interbranch or inter-society warfare occurred, the office bearers appointed to the headquarters were usually senior officers of various branches whose standing could command a measure of respect and influences onto other members.

Traditionally, triad activities were facilitated by an established organizational structure (Fig. 2). The chairman of a triad society was known as Shan Chu (secret triad code 489), who was assisted by the Deputy Shan Chu (438) and had the authority in making final decisions in all matters relating to the triad. Assisting him were two officers of equal standing, Heung Chu (Incense Master, 438) and Sin Fung (Vanguard, 438), who had seniority in ranking and age. Their duties were to hold initiation and promotion ceremonies as well as recruitment and expansion of the triad (Morgan 1960). On the middle-level were three officers: Hung Kwan (426), Pak Tsz Sin (415), and Cho Hai (432). Hung Kwan in Chinese means “red pole,” signifying a weapon used in fighting. This officer is well-trained in Chinese martial art or tough and brave in fighting. He is the leader of fighters during triad warfare and also responsible for inflicting punishment on traitors. Pak Tsz Sin in Chinese means “white paper fan,” usually used by ancient Chinese intellectuals. This officer is the mastermind of the triad and normally appointed from among the most intellectual and educated members. His role is an adviser, thinker and planner. Cho Hai in Chinese means “straw sandal” which was frequently used by messengers and travelers of ancient time. Being the liaison officer of the triad, he becomes the intermediary between the headquarters and its branches. At the bottom of the hierarchy is Sze Kau (49) or ordinary members (Morgan 1960). Under the Sze Kau, there is a group of affiliated members called Hanging the Blue Lantern. The former has undergone a formal initiation ceremony in order to become a formal triad member (Sze Kau), while the Blue Lantern has not. But both of them are now used to identify generally triad members of the lowest rank.

In postwar decades, triad societies had undergone organizational transformation. The headquarters had no control over branches and procedures on promotion and recruitment had not been adhered to. Incidents of internal conflict always emerged. As time passed, the four large

triad consortiums outlined in Fig. 1 dissolved. The triad societies were highly autonomous and used their own triad titles in the underworld. Some large triads have their own central committee to take care of their sub-branches and staff promotion. Some of the triads became inactive or faded out (e.g., Wo Yat Ping, Wo Yee Ping, Wo Kwan Ying), while some new criminal gangs emerged. A study in 2002 (Lo and Kwok 2012) confirmed that the following triads existed in Hong Kong:

- 14K – Hau, Tak, and others
- The Wo Group – Wo On Lok (Shui Fong), Wo Hop To, Wo Shing Wo, Wo Shing Yee, Wo Yee Tong, and Wo Kwan Lok
- The Chiu Chau Group – Sun Yee On, Fuk Yee Hing, and Hwok Lo.
- The Big Four – Tan Yee, Luen Kung Lok, Luen Ying Sh'e, Chuen Yat Chi, Lo Tung, Li Kwan, and Lo Wing
- Gangs emerged in the 1990s – Big Circle Gang and Hunan Gang

Following the disorganization of traditional triad structure, some triads adopted a more flexible hierarchical structure. Some ranks such as Shan Chu, Sin Fung, and Cho Hai became inactive. Pak Tsz Sin has also lost its popularity (Chu 2000). Yu (1998) interviewed triad officers and members in jail and found that 14K had already discarded the rank of Cho Hai. The ranks in existence today are Hung Kwan, Sze Kau, and Hanging the Blue Lantern (Chu 2000). These three ranks are still widely used in modern triads. The headquarters is turned into a central committee and much simplified, composing of Cho Kun (chairman), Cha So (treasurer), and probably Heung Chu (Incense Master), usually elected among triad officers (Fig. 3). Taking the leadership role in the triad, this central committee has the authority to control promotion, enforce discipline, and settle disputes, but it often does not assign illegal activities to its members. In fact, the leaders in the central committee do not get any bonus from the activities that members engage in. Rather, the leaders only obtain money from occasions such as Chinese New Year, initiation ceremonies, and promotions, in the form of “red packets” (lucky money) (Chu 2000). However, the reputation of being a Cho Kun of an active triad in Hong Kong would help solicit both licit and illicit business opportunities in mainland China and overseas countries.

Another part of a triad is the mid-level area-focused sub-branches led by Hung Kwans (Red Pole) and followed by Sze Kau members and Blue Lanterns (Fig. 3). The gangs are organized by area and occasionally if the area is large enough, one or more gangs may occupy the same area but under different area bosses. They engage in criminal activities on the street level and their influences are extended to local youth gangs by means of a “Dai Lo–Lan Tsai” (Big Brother–Follower) relationship (Lo 2012a). This line represents a type of fictive kinship between them. The Dai Lo is normally a Hung Kwan or Sze Kau, who commands a triad located in the area. Under this relationship, a Lan Tsai becomes a Blue Lantern and can seek protection from his Dai Lo. He can claim the name of Dai Lo and the triad he belongs to during a conflict with another gang. On the other hand, the Dai Lo has the right to order the Lan Tsai to perform any tasks for him. The Blue Lantern (affiliated member) can become a Sze Kau (formal member) if he has accumulated sufficient criminal experience and attended an initiation ceremony. Through this “Dai Lo–Lan Tsai” relationship, a process of *triadization* (Lo 2012a) occurs whereby the youth gang members assimilate triad subculture and learn crime techniques from their seniors.

In addition to the above organizational structure, different triads have their own uniqueness. For instance, Sun Yee On, the most cohesive triad in Hong Kong, adopts a hereditary system in leadership succession and is managed by the “Heung” family. The 14K, the largest triad in terms of the number of members, is a loosely organized society, consisting of different street gangs under the control of their own area bosses who cooperate with one another on an ad hoc basis even though they share the same triad name. Wo On Lok, one of the powerful triads in the Wo Group, is still managed by a central committee, which controls promotions, supervises internal discipline, and settles internal and external disputes. It is led by a Cho Kun (chairman) and Cha So (treasurer), who are elected at biennial meetings. The chairman and committee officers are usually the most influential or wealthiest office bearers of the 426 rank (Chu 2000).

Rituals and Subcultural Values

Triad subcultural values include loyalty to the gang, eye for an eye, secrecy, and sworn brotherhood (Booth 1990; Morgan 1960). Triad members are required to regard themselves as one family and blood brothers; they are expected not to do harm to their brothers even under untoward circumstances and to sacrifice themselves for their group (Chin 1990; Lo 1984). There are rules, rituals, oaths, codes of conduct, and chains of command, as well as rigid control over the behavior of triad members, who have to follow triad norms that reflect sworn brotherhood (Lo 1993):

1. Don’t “cal dai” (過底, don’t join other triads).
2. Don’t be a “yee ng tsai” (二五仔, no squealing against the triad).
3. Don’t “po wong” (報皇, don’t report anything to the police).
4. Don’t “ngau dai” (淆底, don’t be scared in committing crime).
5. Don’t “tuk pui chek” (篤背脊, don’t spread disadvantageous information against other triad brothers behind their back).
6. Do obey Dai Lo.
7. Do “bong tall” (幫拖, help triad brothers in fighting).
8. Do “chow kei” (籌旗, give financial help to other triad brothers in times of trouble).
9. Do “fuk cheuk” (覆桌, take revenge if the triad was attacked by rivals).

The essence of sworn brotherhood is also reflected in the triad initiation ceremony. Chu (2000: 32) highlighted 18 steps commonly used in the ceremony: “(1) tapping the new recruit’s left shoulder, (2) dashing the joss stick, (3) covering with the yellow gauze quilt, (4) passing through the Heaven and Earth ring, (5) passing through the fiery pit, (6) passing the two plank bridge, (7) eating the five seasonal fruit, (8) drinking the three river water, (9) smashing the bowl, (10) chopping off the chicken's head, (11) pricking the middle finger of the left hand, (12) drinking the Read Flower wine, (13) eight-step worshipping in front of the altar, (14) old and new members bowing to each other, (15) washing the face of new recruits, (16) teaching triad hand signs, (17) bowing to the officer-bearers, and (18) giving lucky money to protectors." All these rituals carry special meanings. The first eight steps highlight the process of entering into the Hung Mun and worshipping its ancestors, signifying the new recruits are going to join the triad concerned like their ancestors. Steps 9 and 10 emphasize that traitors will be punished with death. Steps 11–14 indicate blood brotherhood in the triad, signifying that after the members drink the wine that mix with the blood dripped from their fingers, they become blood brothers. Steps 15 and 16 signify that the new members will start a new life and learn the triad ways of communication. In the last two steps, 17 and 18, the new members thank their Dai Lo for recruiting and protecting them to round up the initiation ceremony.

In recent decades, there have been radical changes in the ideology and aims from those of traditional triads. Rituals and initiation ceremonies have been greatly simplified or even abandoned in order to avoid police targeting (Bolton et al. 1996). There has been a decrease in the use of hand signs and poems as secret methods of communication (Morgan 1960). The traditional triad principles of brotherhood and loyalty have more or less disappeared or modified, depending largely on particular Dai Lo's interpretations of them. Members' loyalty and righteousness have begun to diminish. The triads are no longer cohesive as the senior triad officers fail to control the middle and lower ranks, and conflicts between branches of the same triad often occur (Chu 2005). Moreover, triad members can cooperate with members of other triads to pursue their own financial goals if opportunities arise, which was previously regarded as a taboo.

There are several reasons for the gradual disorganization. The long chain of command and hierarchical structure increases the risk of exposure of triad activities. As triads are moving towards entrepreneurship, members from different triads, or triad members and ordinary businessmen, could work together to achieve the same moneymaking ends, while triad brotherhood is a less-valued subcultural element nowadays. Benefits and profits become a drive for bonding criminal partners instead of emphasis on brotherhood, which make triad rituals and values less appealing. In addition, the rituals of triads could be used as evidence in the prosecution of triad-related offenses (Kwok and Lo 2013). Consequently, the rituals do not help in smoothing operation but pose a risk to the triad. In view of the government's increased control of triad activities and fast changing social environment, triads have to be flexible in their operational strategies and responsive to market demands and social conditions (Broadhurst and Lee 2009).

Triad Territory and Crime

Territoriality is a key element of triad organized crime. Even today, different triad societies have their own turf or monopolize certain economic sectors, without interfering with one another. They extort or provide protection services to shops, restaurants, hawkers, construction sites, wholesale and retail markets, bars, karaoke, and nightclubs which are located inside their territories (Broadhurst and Lee 2009). Clashes and violence occur when rival triads cross the line and step into their territory (Lo and Kwok 2012). Triads also operate different kinds of lucrative illicit trades, including but not limited to prostitution, pornography, soccer and other forms of gambling, human, cigarette and fuel smuggling, selling of counterfeit products, drug dealing and trafficking, and loan sharking (Broadhurst and Lee 2009; Curtis et al. 2002).

In addition to conventional criminal activities, some triads also engage in other forms of legitimate business, such as monopolizing the home decoration services in some housing estates, film and entertainment industry, car valet services, waste disposal industry, mahjong parlors, and nonfranchised minibus routes (Broadhurst and Lee 2009). Since the 1990s, triads have been found involving in insider trading and financial crime. Lo (2010) reported such a crime committed by the powerful Sun Yee On triad in collaboration with a Hong Kong listed company. The Sun Yee On leader and his associates used the privileged business information they "manufactured" in mainland China to drive the stock market crazy so as to obtain huge financial gain through insider trading and market manipulation.

International Perspectives

Mainlandization and Patriotic Triads

Since the 1990s, Hong Kong has experienced a process of mainlandization of its political, economic, and legal systems (Lo 2012b). Triads have also gone through a similar process of mainlandization as a result of China's economic growth and rising demand for limited goods and services. Mainlandization is defined here as a process of making Hong Kong triads more reliant on mainland China for financial gain through social networking with Chinese officials, enterprises, and criminal syndicates and taking advantage of the rising legitimate and illegitimate business opportunities. In view of increasing licit and illicit opportunities in the mainland (the pull factor), triads have gradually shifted their moneymaking focus on China. The traditional triad rituals are now replaced by a business approach to crime. Chu (2000, 2005) observed that triads have increasingly invested in legitimate businesses and teamed up with entrepreneurs to monopolize the newly developed mainland market. In the illegal side, triads have also forged cooperative relationships with mainland criminal groups, trying to capitalize in the booming underworld (Broadhurst and Lee 2009). They provide their Chinese counterparts with crime techniques and intelligence, in return for cheap labor, sex workers and dangerous drugs to be consumed in Hong Kong.

In 1992, Tao Siju, the Minister of Public Security of China, remarked that some triad members were patriots. Tao even suggested that Deng Xiaoping had made a similar remark back in the 1980s because the triads protected him during his visit to the USA in 1979 (Arsovska and Craig 2006: note 127; Liu 2001). In 1993, Ye Xuanping, the vice-chairman of the National Committee of the Chinese People's Political Consultative Conference, was seen officiating in a mainland film production center owned by the Sun Yee On triad, with two of its leaders, Jimmy and Charles Heung, standing beside Ye (see Picture 1 in Lo 2010). The National Committee is one of China's highest political bodies, and the presence of its vice-chairman in such an event confirmed the "united front" tactic frequently used by the Chinese Communist Party to incorporate opinion deviants into the establishment.

The Chinese national leaders applied the united front tactic on Sun Yee On to serve three political functions (Lo 2010). First, it was to close the Yellow Bird Action in which over 150 prodemocracy leaders and student activists were smuggled out of China with the assistance provided by Hong Kong triads after the Tiananmen crackdown on democratic movement in Beijing in 1989. Second, it was to uphold Hong Kong's law and order in the run-up to 1997 when the people doubted whether "one country, two systems" would work and whether the rule of law would be upheld after China's takeover of Hong Kong in 1997. The Chinese government was also concerned with the threats of the triads to Hong Kong's social order, and thus the united front tactic was applied to recruit them to its side. Third, it was to prevent the infiltration of Taiwanese secret societies (e.g., the Bamboo United) into Hong Kong because of Taiwan's model of *heijin zhengzhi* (or black-gold politics), where criminal gangs (black) join hands with businessmen (gold) to penetrate into the political arena and obtain power through local elections (Chin 2003). If the Chinese leaders aimed to maintain political control in Hong Kong after 1997, they could not allow prodemocratic forces in Hong Kong to join hands with any Taiwanese forces to take part in the elections.

In order to control Hong Kong's political arena and social stability, China had to ensure that the most powerful triads were friends not enemies. Consequently, the triad leaders were included into the establishment by the label of patriotic triads and simultaneously performed some law and order functions for the communist state in exchange for business opportunities. Thus, triads played the roles of both angel and devil (Lo 2010). On the one hand, they served national interest and complemented established political and social structures. On the other hand, triad leaders used this label as a passport to expand its business network with mainland enterprises and criminal groups to further their interests, posing serious threats to the legal order.

Tong

Traditionally, a tong (堂) was a place for Chinese people with the same ethnicity, trade or industry to assemble for social interaction and recreational activities, settle interpersonal disputes, and gain mutual assistance and support from each other. In every village of China, there was a "che tong" (祠堂) which serves the above functions. In Hong Kong, "tong hau" (堂口) is constantly used to describe triad societies, such that "which "tong hau" one belongs to" is used to ask "which triad one is affiliated with." In fact, some triads have the word "tong" in their name, such as Wo Shing Tong, Wo Yee Tong, Tung Yee Tong, and Tung Lok Tong. Chu (2000:19) contended that "numerous triad societies were set up simply because their original members were victimized by triads. In about 1910 the Tung Lok Tong triad society was established by coolies of the government hospitals in the Western District in order to protect the coolies against extortion by members of the Wo group....The Wo Yee Tong triad society was founded in 1940 in Kennedy Town area of Hong Kong Island. It originally consisted of hawkers and stall-holders who banded together in defense against exploitation by triads."

Tongs also exist in Chinatowns of the UK. For instance, the "Zhi Gong Tong Chinese Association (UK)" was found in Liverpool in July 2012, with the following introduction printed on a street board at the entrance of Chinatown: "The Origin of the Association had a strong link with Dr Sun Yat-sen, often referred to as the "father of modern China," it supported the overthrow of the Qing Dynasty in 1911. The association has branches across the continents. The association in the UK was set up to unite overseas Chinese and provide support to each other. It is one of the oldest Chinese community organizations in Liverpool. The association organizes transport for their members to the Everton and Anfield cemeteries twice a year to pay respect to Chinese ancestors, including those who had no family in the UK." The above introduction indicates that tongs were patriotic, welfare and mutual-help organizations that were active in Europe as early as the beginning of the twentieth century.

In the USA, tongs appeared in the Chinatown of San Francisco as early as the 1850s. The US Chinatowns had the characteristics of transitional zone, such as poverty and heterogeneous cultural background among residents. The local governments failed to provide effective social services to assist Chinese immigrants. Due to the lack of formal social services and resources within the towns, the tongs became the only self-help organizations that provided assistance and welfare, such as job referral, housing, networking and entertainment activities, to this group of socially excluded Chinese. They also acted as mediators in individual and group conflicts within the Chinese communities, as well as liaison between local government agencies and Chinese citizens in the constituencies (Chin 1990). Over the years, the power of tongs grew rapidly due to the constant social exclusion of Chinese immigrants and unrestricted recruitment of members. In recent decades, the tongs have been transformed from social service providers and self-defense organizations to illegal service providers. Their victims are mainly Chinese immigrants who have language and cultural barriers, thus being alienated from the mainstream society (Chin 1990, 1996).

Within each tong, there are many factions. Although there is a headquarters above these factions, it has no actual power over them. Most tongs have an elected president, but he only serves as a puppet controlled by the powerful officers and members in the headquarters, which consists of the president, vice-president, secretary, treasurer and auditor, and several public relations officers (Chin 1990). Ordinary members have to pay fees regularly, but they are not involved in any daily affairs and have no decision making power.

It has been argued that Chinese street gangs are affiliated with tongs. They provide protection services for tongs' gambling business (Chin 1990, 1996; Chin et al. 1998; Curtis et al. 2002; Kelly et al. 1993). However, the relationship between tongs and gangs are complicated and indistinguishable. For example, tongs' elders are involved in resolving conflicts between cliques within the gangs. Being the mentors of gang members, they transmit triad subculture and values to them and provide financial support and recreational venues. Their relationship is intertwined as some gang leaders are officially recruited into tongs, thus having dual membership. Some also introduce their followers into tongs. As a result, the elders of tongs can control gang members indirectly through the gang leaders, who serve as a broker between the tong elders and the street soldiers (Chin 1990). In addition, tongs also support street gangs through other means. For example, the tongs' youth activity coordinators serve as the middlemen between tongs and gangs, sponsoring the sports activities of youth members of the tongs, including gang members. Tongs also provide job opportunities for the youth in their gambling houses, and offer financial compensation to gang members or relocate them to other cities when they are in trouble.

Despite such close relationships, mistrust and misunderstanding between the two parties are rampant. Many tongs use the gangs as a tool to commit crime so that they can be insulated from the criminal activities, but they do not truly regard the gangs as part of the organization. On the other hand, some gangs do not want to be controlled by tongs. They do not feel compelled to follow the command of tongs and want to be independent (Chin 1990). Therefore, the relationship between tongs and street gangs is never static and monolithic.

Tongs differ from triads. Triads are illegal organizations, but tongs are legal entities although they consist of both law abiding and law breaking members and provide both licit and illicit services to the Chinese communities. With their original goals of self-protection and mutual assistance, tongs were not established exclusively for criminal activities. As such, law enforcement agencies tend to chase after individual criminals of the tongs rather than the tongs. Therefore, even if the criminals are arrested, the tongs will still survive and recruit new blood to replace the caught members (Zhang 2012).

Triads, Tongs, and Transnational Organized Crime

Before China resumed the sovereignty of Hong Kong in 1997, there was serious concern that the communist takeover would lead to a mass exodus of Hong Kong triads to the West (Kenney and Finckenauer 1995). However, Lo (1995) argued that due to the increase of both licit and illicit business opportunities in mainland China, the possibility of such exodus was slim; rather, it was the internationalization of triad activities that should be of major concern to the western nations. Reports from Southeast Asia, North America, and the UK revealed that triad organized crimes, such as drug trafficking and human smuggling, were on the rise in these jurisdictions (Curtis et al. 2002). Since some individual triad members migrated overseas in fear of the communist rule, they become Hong Kong triads' overseas trustful partners. They possess the necessary skills, experiences and triad values. Therefore, criminal partners at the two ends of the international servicing channel collaborate with each other, sharing the same goal, subculture, and norms.

Zhang and Chin (2003) argue that the traditional structure of triads facilitate them to commit crime in local territories but hinder their involvement in transnational criminal activities. Despite the increasing number of reports indicating triads' or tongs' involvement in transnational organized crime, such as human smuggling and narcotics trafficking (Curtis et al. 2003), the findings remain inconclusive, and the role of triads and tongs in transnational crime is still unclear. There is no credible evidence to prove their collective involvement in narcotic trafficking

(Chin 1996). Empirical research found the involvement of triads and tongs in smuggling is only restricted to individual members and operated in a disorganized basis (Zhang 2007). It was observed that many heroin trafficking and smuggling cases were conducted in dynamic form involving multi-criminal groups, legitimate business, and other social sectors, rather than monopolized by a single triad or tong (Chin and Zhang 2007; Zhang and Chin 2003; Zhang 2007).

Zhang and Chin (2003)'s structural deficiency perspective shed light on the reason why triads and tongs, being territorial-based criminal organizations, fail to expand their operations into the arena of transnational organized crime. Their hierarchical structure, preservation of continuity and group identity, restricted membership, monopolization in activities, and preferring long-term and low-risk benefit from illicit operations do not fit with the structural requirements of transnational organized crime (Zhang 2012). Both smuggling and trafficking markets are fluid and multifaceted due to the extensive movement involved in illicit goods and services. The markets of transnational crime are fragmented, risky, and uncertain because the clientele are scattered over different regions, and the crime is exposed to law enforcement agencies of different nations. Therefore, transnational organized crimes are best operated by loosely organized ad hoc groups rather than hierarchical organizations like the triads and tongs, because small-sized groups could be more adaptable and responsive to the unstable and hostile environment. The risky smuggling and trafficking environment requires limited vertical hierarchy with high level of division of labor, instead of bulky, hierarchical structure with long reporting line.

Moreover, due to the liberalization of the smuggling and narcotic trafficking market, the illicit market is open to anyone with resources, social capital, and access to business opportunities. Consequently, it is difficult for one particular group to dominate the market and the long-term stable benefit is not guaranteed. Therefore, it may not fit with the organizational goal of triads and tongs. In addition, flexibility in recruitment is important for transnational crime operation, as the clientele is limited and the opportunities are not constantly available. The restricted membership system and identity of triads and tongs reduce flexibility in developing new network and grasping new opportunities, making them difficult to compete with freelance participants who now share the illicit transnational market (Zhang and Chin 2003).

Future Directions

Given the rapid economic development and rising interest of overseas investors, triads are taking a stake in the Chinese market. Mainlandization is the characteristic of triad crime in the new century. A possible analogy of mainlandization is a "vacuum cleaner." Once the hover starts, the current is so strong that everything will be sucked into it. Triads are pulled into mainland China because of the lucrative profit and low risk. Economic prosperity in the mainland provides ample opportunities for the triads to generate profit, whereas the risk is low due to the power monopoly and corruptibility of judicial, municipal and police officials, the absence of the rule of law, a weak civic society and censored mass media, and the existence of *guanxi* and protective umbrella where criminal syndicates can bribe officials in exchange for protection in their activities (Zhang and Chin 2008). Such economic and political climate encourages triads to leave their local territories to embrace the "patriotic triad" claim in the mainland (Lo 2010; Lo and Kwok 2012).

The unknowns ahead, however, are whether the triads can secure their position in the mainland. Does mainlandization take place simply in the form of crime displacement? Can triads transplant their illegal operations from Hong Kong to the mainland? Can Hong Kong triads colonize the underworld of the mainland? Will transplantation and colonization (Varese 2006) elicit resistance from mainland criminal syndicates against Hong Kong triads? On the mainland, the Chinese government has been aware of the potential risk of triad displacement or transplantation to the mainland. In order to control this trend, the government amended its Criminal Law in 2002 and Article 294 stipulates that triad members outside

China trying to recruit members or develop a triad branch in China will be sentenced to 3–10 years of imprisonment. The government has paid close scrutiny to the development of "triad-nature" crime and activities, but how effective the law, procuratorate, and public security organs are in controlling triads in the mainland is a major concern. All of the aforementioned questions need to be further addressed and require more research.

Understanding Cross-National Variation

Steven F. Messner[1] and Gregory M. Zimmerman[2]
[1]Department of Sociology, Arts, and Sciences, University at Albany, State University of New York, Albany, NY, USA
[2]School of Criminology and Criminal Justice, Northeastern University, Boston, MA, USA

Overview

Cross-national inquiry can make several distinctive contributions to the understanding of criminal violence. One, it permits an assessment of variability in levels and patterns of violent crime. In his classic discussion of the "normality of crime," Durkheim (1964:66) argued that crime is "closely connected with the conditions of all social life," leading him to conclude that a society without crime is inconceivable. The same may very well hold true for violent crime in contemporary nations. Coercive action has intrinsic utility for obtaining compliance from others, and thus a certain degree of violence may be an inevitable feature of complex forms of social organization. Nevertheless, cross-national research elucidates the range of possibilities for minimizing levels of criminal violence.

Two, cross-national inquiry is indispensable for establishing the generality of theories of violence and the need for any scope conditions (Kohn 1987). As Lilly et al. (1989:11) observe, "social context plays a critical role in nourishing certain ways of theorizing about crime." The substantive content of theories of criminal violence, therefore, reflects to a large degree what "makes sense" to criminologists given the specific environments with which they are familiar. Therefore, the causal processes depicted in criminological theories may in fact be limited in scope to a restricted set of sociocultural situations. The application of theories of violence beyond the confines of a single nation provides an opportunity to distinguish between causal processes that are truly general and those that vary by the larger national context.

Three, cross-national inquiry permits an assessment of the role of macrosocial factors in the explanation of criminal violence. Criminological research, especially in the United States, is most commonly conducted at the individual level of analysis. This kind of research is directed towards answering the question: "what is it about individuals that explains their behavior" (Short 1985:53). While such inquiry is without question valuable in criminology, it is also

This essay incorporates and extends material published in Messner (2003) with the permission of the publisher.

G. Bruinsma, D. Weisburd (eds.), *Encyclopedia of Criminology and Criminal Justice*,

important to consider how basic features of social organization such as demographic structures, institutional arrangements, and broad cultural orientations help explain violent crime. These kinds of variables are by their very nature properties of large-scale aggregates rather than of individual persons. Moreover, to discover the causal significance of such macrolevel properties, it is necessary to observe variation in violence across aggregate units.

The present essay is restricted to research dealing with nation-states. As Ember and Ember (1995) explained, two general types of comparative research can be distinguished: cross-national and cross-cultural. Cross-national research compares politically organized entities, whereas cross-cultural research is directed towards "societies" in the larger anthropological sense, that is, populations that occupy contiguous territories and share a common language not normally understood by outsiders. In addition, this essay focuses primarily on research that is analytical rather than descriptive and that employs quantitative rather than qualitative techniques. For example, comparative research on genocide, which has adopted primarily qualitative techniques (Straus 2006), is not discussed. The bulk of research on cross-national variation in criminal violence is oriented to testing theoretically derived hypotheses. In recent years, quantitative, theory-testing studies almost always employ multivariate statistics.

Theory

Cross-national research on criminal violence has been informed by a variety of theoretical perspectives. Specific arguments are often complex and multifaceted, which makes it difficult to summarize the theoretical approaches concisely. Nevertheless, previous reviews of the literature have offered typologies of theories that delineate core themes and that overlap to a considerable degree (Neuman and Berger 1988; LaFree 1999; Neapolitan 1997). Building upon these earlier reviews, the various theoretical perspectives can be organized into two general categories reflecting the underlying strategy for theorizing.

One strategy can be labeled macro-sociological theorizing. Theories of this type begin with arguments about properties of large-scale social systems and their interrelationships. These system-level properties are then related to criminal violence (and crime more generally) by means of intervening mechanisms suggested by conventional theories of crime. An alternative strategy begins with theoretical explanations developed to account for crime within nations, at the individual-, group-, or neighborhood-level. The specified causal processes are then linked with national characteristics, and the explanations of crime are essentially extrapolated to apply to national crime rates. For convenience, this approach can be referred to as "extrapolative" theorizing about cross-national variation in violent crime.

Macro-Sociological Theories

One of the most influential macro-sociological theories in cross-national research on crime is modernization theory, which draws liberally on the Durkheimian tradition. Although several prominent proponents of this approach can be identified in the literature (see Eisner 1995, for a review), Louise Shelley (1981) is usually credited with developing the most thorough formulation of the thesis. Modernization theory posits an evolutionary model under which social structures are fundamentally altered, and levels and patterns of criminal activity change, as nations modernize.

The precise nature of the consequences of modernization for crime varies depending on the stage of national development and the offense under consideration. At early stages of urban and industrial growth, traditional social structures are undermined in the growing cities. The concomitant social disorganization, anomie, and weak social control promote increases in property crimes. At the same time the newly arriving migrants from the countryside bring with them traditions of violence associated with rural life, which leads to increases in violent crime. At later stages of development, patterns of crime change. Property crimes continue to rise, becoming the most prominent type of criminal activity. In contrast, the growth in criminal violence subsides as rural migrants become adjusted to urban life. Increasingly, when criminal violence occurs, it does so in the context of the commission of property crimes. In sum, modernization theory posits that changes in levels of criminal violence (and the preponderance of criminal violence relative to property crimes) can be understood with reference to macrosocial processes accompanying societal development.

A second influential argument relevant to the effects of large-scale social change and criminal violence draws upon Elias' (1978) thesis of the civilizing process. According to this view, societal development entails important changes at both the micro- and macrolevel (Eisner 1995; Heiland and Shelley 1991). At the microlevel, personality structures are transformed. Customs and manners are refined, the "threshold of repugnance" against acts of violence is lowered, and action is increasingly guided by internalized self-control. At the macrolevel, the institutionalization of capitalist economies renders interpersonal violence largely dysfunctional because such violence undermines the mutual trust upon which markets are based. In addition, the modern nation-state begins to monopolize power, thereby creating a relatively stable framework for social interaction (Neapolitan 1997:71). The clear implication of the civilization thesis is that levels of criminal violence should decrease as nations become more "civilized."

A third macro-sociological approach to the explanation of cross-national variation in violent crime is dependency/world systems theory (Barak 2001). This perspective is concerned primarily with crime in lesser developed nations. Different variants of the theory have been proposed, but the core claim is that criminogenic conditions within less developed nations arise from the subordinate and dependent position of these nations within the larger world economy. Economic dependency, reflected in conditions such as transnational corporate penetration and trade imbalances, promotes distorted economic and political development. Extreme poverty, inequality, and political oppression characterize subjugated nations. In turn, high levels of criminal violence can be understood as a response to the "frustration and misdirected anger created by deprivation and demoralizing living conditions" (Neapolitan 1997:76). In sum, the distinctive claim associated with dependency theory is that the national conditions that serve as the proximate causes of violent crime must be understood within the context of an inherently exploitive international division of labor.

Finally, recent scholarship has directed attention to processes of capitalist globalization and the emergence of postmodern societies. A common theme in much of this literature is that the expansion of markets and the accompanying triumph of capitalism have unleashed a host of criminogenic forces. These include the spread of rampant individualism (Currie 1991), anomic cultural orientations (Messner and Rosenfeld 2000), the decline of social reforms that previously mitigated the more deleterious consequences of capitalist society (Teeple 1995), and an expansion in the opportunities for organized criminal activities at a transnational level, activities which are often accompanied by violence (Castells 1997).

Extrapolative Theoretical Arguments

Much of the cross-national research on violence does not involve the kind of macro-sociological theorizing just described. Instead, researchers often begin with premises about processes described in conventional criminological theories, and then national characteristics are identified that are suggestive of the operation of these processes. In practice, virtually all of the major sociological theories of crime have been applied in the cross-national literature on criminal violence. This has resulted in a diverse array of hypotheses encompassing a wide range of independent variables. In her research on homicide rates across 18 advanced nations, Gartner (1990) proposed a useful framework for organizing the hypothesized determinants of national crime rates. She observed that explanations of violent crime emphasize some combination of motivations, controls, and/or opportunities for victimization. Applying the extrapolative model of theorizing, national characteristics can be expected to affect levels of criminal violence to the extent that they raise motivations, lower controls, and/or increase opportunities (Gartner 1990:94).

Gartner (1990) proposed that such national characteristics can be grouped into four general types: the material context, the integrative context, the demographic context, and the cultural context. The material context refers to conditions that entail economic deprivation and stress. Variables commonly used to represent the material context include levels of poverty and income inequality and the extensiveness of governmental efforts to alleviate economic stress through welfare policies. The integrative context refers to the strength and depth of social ties that serve to control violent behavior. Common indicators of the integrative context include measures of family structure and racial/ethnic heterogeneity. The demographic context refers to features of population structure. Age distributions, population size and growth, and the sex ratio are major components of the demographic context. The last context – the cultural context – has received the least amount of attention in the research literature because of the difficulty of measuring "culture." In a few studies, researchers have called attention to the potentially important role of general value orientations (Karstedt 1999; Messner 1982; Smith and Kwong Wong 1989), religious values (Groves et al. 1985), and values supportive of legitimate violence (Gartner 1990).

Empirical Evidence

Cross-national research on crime was very limited prior to (around) 1970, but studies have accumulated steadily since that time. The vast bulk of the contemporary work deals with homicide. Researchers generally agree that the comparability of definitions and the quality of official data are greater for homicide than for other offenses. Most of the quantitative studies of homicide share a basic analytic design. The effects on homicide rates of theoretically strategic national characteristics are assessed in multiple regression equations.

Comprehensive reviews of cross-national empirical research on homicide are available in the literature (Neuman and Berger 1988; LaFree and Kick 1986; LaFree 1999; Messner 2003; Neapolitan 1997). Rather than detailing the results of all studies represented in these previous analyses, the following discussion focuses on general patterns and substantive conclusions.

The Material/Economic Context

Most cross-national studies of homicide include some measure of economic development. Common indicators are Gross National (or Domestic) Product per capita, the prevalence of modern media or communications (telephones, radios, newspapers), energy consumption, the sectoral distribution of employment (e.g., agricultural vs. industrial), and composite indexes of such indicators. The results reported in the research are not entirely consistent, but the general picture is one of null or weak negative effects on homicide rates for measures of economic development.

Numerous studies have also focused on the effects of a related concept: economic deprivation. In these analyses, researchers typically distinguish between "absolute deprivation" and "relative deprivation." Indicators of absolute deprivation sometimes include the same measures as those used to represent economic development (e.g., GNP/capita). Infant mortality and unemployment rates have also been examined as indicators of absolute deprivation. Indicators of absolute economic deprivation generally fail to exhibit consistent associations with national homicide rates in multivariate models, with the exception of measures of infant mortality (Pridemore 2011).

There is considerable support, however, for the hypothesis that homicide rates vary with the degree of "relative deprivation" as reflected in levels of income inequality. Reviews of cross-national studies relating measures of income inequality and poverty to homicide (e.g., LaFree 1999; Messner 2003) show that, with few exceptions (e.g., Neumayer 2003; Pridemore 2008, 2011), income inequality exhibits significant, positive effects on homicide rates. This relationship is observed across different measures of income inequality (e.g., the Gini coefficient, quintile shares) and different homicide data sources (e.g., Interpol's *International Crime Statistics*; the World Health Organization's *World Health Statistics*; the United Nation's *World Crime Surveys*). The presence of the positive effect is so pervasive that scholars have called "the scale of income differences between rich and poor… the most well-established environmental determinant of levels of violence" (Wilkinson 2004:1).

Most of these studies are based on cross-sectional assessments of the effect of income inequality on homicide, but a few longitudinal analyses have appeared in the literature. Sophisticated statistical procedures have been applied, such as fixed-effects pooled time series techniques (e.g., Jacobs and Richardson 2008; see also Messner et al. 2010). The evidence generally indicates that the widely observed cross-sectional relationship between income inequality and homicide rates is replicated in longitudinal analyses in multivariate analyses with statistical controls for other relevant predictors.

Research has also investigated the possibility that the relationship between income inequality and violent crime depends on other socioeconomic features of nation-states. Pratt and Godsey (2003) discovered an interaction effect between income inequality and social support: as social support increases, the positive effect of income inequality decreases. In addition, Savolainen (2000:1021) found a negative interaction effect between economic inequality and the strength of the welfare state: "nations that protect their citizens from the vicissitudes of market forces appear to be immune to the homicidal effects of economic inequality."

In a similar vein, a few studies have also examined the direct effects of governmental efforts to provide a safety net via the provision of various social security and welfare benefits. Although the evidence is sparse, the general pattern of findings is consistent. More generous and expansive social welfare policies are associated with lower homicide rates. These effects have been observed for child homicides as well as total homicides and in both cross-sectional and longitudinal analyses (Fiala and LaFree 1988; Gartner 1990; Messner and Rosenfeld 1997).

The Demographic Context

Most multivariate studies of cross-national variation in homicide rates include measures of population structure and distribution. Researchers drawing on modernization theory commonly examine the effects of urbanism/urbanization, often measured as the relative size of the population residing in urban areas. The results of these studies are mixed. The bulk of studies report nonsignificant relationships in multivariate models, although several analyses find modest but significant negative relationships.

For the most part, other demographic factors have not emerged as robust predictors. Population size and density typically exhibit weak or null effects. Similarly, measures of age structure (e.g., the proportion of the population in "high-risk" age brackets) and sex ratio are generally non-related to homicide rates. These results are surprising (even with the potential lack of variation in age structure and sex ratio across aggregate units) given the strong associations between criminal violence and age and sex at the individual level. The one demographic factor that has emerged as a significant predictor with a fair degree of regularity is population growth. Several studies report that rapid population growth is associated with high homicide rates (see Messner 2003).

There is also scant but suggestive evidence that demographic factors may interact with other national characteristics to affect homicide rates. One study (Krahn et al. 1986) reported an interaction effect between population density and income inequality. The positive impact of income inequality on homicide rates is higher in the more densely populated nations. Another study (Pampel and Gartner 1995) found that demographic structure interacts with the degree of "collectivism" in society. Increases in the relative size of the young population tend to elevate homicide rates under conditions of weak collectivism.

The Integrative and Cultural Contexts

As noted above, various criminological theories emphasize the importance of social integration and cultural values in the explanation of levels of criminal violence. One common way of operationalizing social integration is with measures of racial/ethnic, linguistic, and/or religious heterogeneity. Such heterogeneity is generally interpreted as a potential source of value conflict and as an impediment to social cohesion. While some studies have found the expected positive effects of indicators of heterogeneity on homicide rates, null effects have often been observed in the literature. The general consensus is that conventional indicators of heterogeneity are at best only weakly related to homicide rates. Similar to some of the results noted above for demographic variables, however, there is some evidence to suggest that heterogeneity may interact with economic inequality to affect homicide rates. Specifically, economic disadvantage that is rooted in group characteristics has been related to high homicide rates.

A few cross-national studies have examined the relationship between divorce rates and homicide. Divorce is often viewed as both a consequence and a cause of weak integration. Once again, the evidence is mixed, with some studies reporting appreciable positive effects and others reporting null effects.

With respect to the potential impact of the cultural context, the research is quite limited. A few studies have reported positive associations between battle deaths and homicide rates and between the use of capital punishment and homicide rates (Archer and Gartner 1984; Gartner 1990; Landau and Pfeffermann 1988). These findings are consistent with the claim that cultural support for the legitimate use of violence is likely to "spill over" and increase the use of illegitimate forms of violence. Similarly, a limited body of evidence relates gun availability to lethal violence (Killias 1992; Walker 1999). Although gun availability is sometimes interpreted as an "opportunity" factor, it has also been interpreted as an indicator of cultural values conducive to violence.

Researchers have also considered the impact of individualistic values on levels of violence. Competing theoretical arguments have been offered about whether individualism is likely to promote or inhibit criminal violence (Currie 1991; Karstedt 1999). The difficulties associated with the measurement of values preclude definitive conclusions. Nevertheless, there is scant but suggestive evidence pointing to the importance of values of "moral individualism." This value orientation emphasizes a universalistic respect for human rights and independence from strong collective ties (especially kinship and ethnic-group ties). In one of the few efforts to use direct measures of value orientations in cross-national research on criminal violence, Karstedt (1999) reported that a measure of individualism exhibits significant negative effects on homicide rates in multivariate models.

Nonlethal Criminal Violence and "Unofficial" Data Sources

As noted earlier, the majority of quantitative cross-national research on criminal violence has examined homicide rates. Indeed, some have argued that cross-national research should be restricted to homicide because differences in legal definitions and official recording practices render the official data for nonlethal offenses suspect (Neapolitan 1997:38). An important methodological development over the past decades has been the application of survey techniques to overcome limitations associated with official data on nonlethal forms of criminal violence. The most prominent and ambitious of these efforts have been multinational self-report studies of delinquent behavior among youths (Junger-Tas et al. 1994; Gatti et al. 2011) and victimization surveys (van Dijk et al. 2008).

Another advance in this area is the use of multilevel analysis to simultaneously examine individual, structural, and cross-level interaction effects on homicide across nations. For example, Stein (2011) found significant direct effects of individual-level and structural-level measures of opportunity on violent victimization in a multilevel analysis of 45 western industrialized and nonindustrialized countries (see also Stein 2010).

Furthermore, victimization surveys have been used to study the cross-national covariates of intimate partner violence against women. The theoretical and empirical evidence suggests that three factors may decrease national rates of intimate partner violence against women: the empowerment of women through socioeconomic equality, a cultural context (i.e., religion, institutions) that cultivates independence among females, and national globalization (see Ellsberg and Heise 2005; García-Moreno et al. 2005; Johnson et al. 2008; Kaya and Cook 2010).

Given the myriad of methodological difficulties associated with cross-national research on criminal violence, it is not surprising that the literature yields a somewhat cloudy picture. A few generalizations, however, appear warranted. From a purely descriptive standpoint, the evidence demonstrates remarkable cross-national variation in levels of criminal violence, especially in the case of lethal violence. Homicide is a major social problem and a significant cause of mortality in some nations, whereas it is a very rare event in others. Clearly, highly variable levels of violence are compatible with complex forms of social organization.

With respect to the more prominent macrosociological theories reviewed above, the failure to observe appreciable negative effects of standard indicators of economic development on national levels of lethal violence runs counter to simple versions of modernization theory. In particular, the evidence raises questions about the interconnectedness of different dimensions of modernization and about the utility of strict evolutionary models. The consequences of economic development for levels of criminal violence evidently depend to a considerable degree on the larger historical and cultural context of a nation (Shelley 1986). The finding of weak effects of developmental measures in the cross-national literature also suggests that the theory of a civilizing process offers a better explanation of changes in criminal violence associated with the transformation of agrarian, rural communities into industrial and postindustrial nation-states than it does of variation in violence across such nation-states. Considering dependency theories, the finding of positive effects of income inequality on homicide rates is consistent with an underlying premise of the theory. However, the distinctive prediction of this approach is that deprivation within a nation reflects a dependent position in the international division of labor and that this deprivation statistically interprets the effect of dependency on crime. Few quantitative studies actually consider these claims.

Despite ambiguities about the validity of dependency theory, the research does offer clear evidence indicating the importance of the material context. Not only does income inequality emerge as a significant predictor of cross-national variation in homicides rates but indicators of governmental efforts to protect the citizenry from economic hardship also yield reasonably consistent effects. In contrast, standard demographic factors are less important than might be expected in accounting for cross-national variation in criminal violence. This suggests that simply generalizing from individual-level evidence on violence (e.g., age and gender patterns) to the national level through a simple aggregation process is potentially misleading. Evidently, "contextual" effects can modify in an important ways the purely "compositional" effects associated with relatively large numbers of persons with various demographic statuses. Finally, as noted above, only limited evidence is available concerning the role of social integration and culture. However, when indicators of the integrative and cultural context are statistically significant, they are usually in accord with the predictions of criminological theory (Gartner 1990).

Future Directions

The cross-national research on criminal violence has without question advanced markedly over the course of recent decades. Researchers have become increasingly sensitive to issues of data quality, advanced techniques of causal modeling have been applied in multivariate analyses, and efforts to systematize the literature through comprehensive reviews have appeared. Nevertheless, most scholars in the field concede that knowledge about the reasons for cross-national variation in criminal violence is still at a relatively primitive stage.

The compilation of accurate, reliable, and comparable data on criminal violence continues to be a vexing problem. The efforts of the United Nations to standardize data collection and to enhance participation in its crime survey are encouraging. Nevertheless, the collection of international crime statistics presupposes well-developed criminal justice systems at the national level. Some nations simply lack the reporting infrastructure to provide the data requested by multinational organizations.

Victimization and self-report surveys are largely independent of and circumvent official governmental agencies. Yet these surveys are often expensive to conduct, particularly when samples are nationally representative. Thus, to a considerable extent, advancement in cross-national research on criminal violence will continue to be dependent on progress in the development of national criminal justice systems.

There is also a dilemma surrounding priorities for data collection. Researchers desire highly detailed information from large samples of nations. Yet the two objectives of detail and sample size are in some respects incompatible. Given the limited data-collection infrastructures in many nations (noted above), research on large samples will undoubtedly be limited to broad categories of offenses, such as aggregated rates of selected forms of criminal violence.

Cross-national research on criminal violence is also hindered by limitations in the measurement of strategic independent variables. Most studies employ a fairly standard set of predictors regardless of the theoretical objectives of the research. As Neapolitan (1997:88–89) observed, this has led to troublesome ambiguities in the literature. Diverse concepts are often operationalized by the same measure, and the same measure may be interpreted as reflecting different concepts. This practice is understandable – researchers tend to select measures of national characteristics that are readily available in accessible publications, such as those of multinational organizations. The priorities of these organizations and participating governments, however, do not necessarily coincide with those in the scholarly community. In particular, measures of cultural orientations are not well represented in standard data sources. A key challenge for researchers is to initiate efforts to expand the scope of nationwide data collection to encompass indicators of variables relevant to criminological theories beyond the economic and demographic data that have traditionally been compiled under governmental auspices.

Another important methodological challenge for cross-national researchers is to design, implement, and assess interventions. While a body of literature based on correlational designs has accumulated steadily, comparable efforts to conduct field experiments and intervention assessments have yet to emerge on a significant scale (Weiner and Ruback 1995:180–181; see also Eisner et al. 2012). Such research has particular significance for the development of social policies to deal with the problem of violence.

There is also a pressing need for theoretical development in the field. For the most part, researchers have drawn upon existing criminological theories to identify potentially important independent variables, but the nature of the relationships between these variables and levels of violence has not been stated with much precision. For example, with few exceptions, researchers implicitly assume simple additive, linear relationships (see Gartner 1995), or "impose" nonlinearities for methodological reasons. Theoretical rationales for nonlinear relationships warrant greater theoretical attention. Similarly, as noted, several studies have detected interaction effects of various national characteristics on levels of violence. These effects are typically observed in exploratory analyses and are "under theorized." An important task for the future is to incorporate interactions more systematically into theorizing about criminal violence.

More generally, researchers should devote greater efforts to explain the mechanisms that link independent variables and national rates of violence. At best, researchers provide a theoretical rationale for anticipating an association between some national characteristics and rates of criminal violence, but alternative interpretations for the same predictions are usually possible. The precise nature of the hypothetical processes needs to be specified so that distinctive implications of different theoretical arguments can be derived.

A final task worthy of concerted attention in the future is the incorporation of diffusion processes into theories of cross-national violence. There has been a growing interest in spatial analyses of violent crime in the "within-nation" literature over recent years, and sophisticated spatial econometric techniques have been developed to identify diffusion or contagion processes in multivariate models. Moreover, evidence indicates pronounced differences in levels of violence across major regions of the world, which is consistent with diffusion processes. Further theorizing about the possible diffusion of violence is particularly important given the growing recognition that issues of crime and criminal justice increasingly transcend national borders.

Understanding Homicide and Aggravated Assault

Richard Rosenfeld
University of Missouri-St. Louis, St. Louis,
MO, USA

Overview

This entry considers the cultural meanings, empirical patterns, theoretical explanations, and social responses connected with homicide and aggravated assault. The paper addresses:

- Homicide and aggravated assault trends in the United States over the past several decades
- Cross-national comparisons of homicide and assault
- Characteristics of victims, perpetrators, and incidents
- The relationship between victims and perpetrators
- Theories of violence
- Policies to reduce violent crime

The main empirical patterns in homicide and serious assault are easily summarized, less easily explained. Rates of homicide and aggravated assault have exhibited substantial volatility in the United States, rising to peak levels by the early 1990s and then falling over the next decade to 30-year lows. Cross-national comparisons reveal strikingly higher rates of homicide, but not assault, in the United States than other developed nations. In all nations where they have been recorded, rates of homicide and serious assault are higher among men and the young than women and older persons. In the United States, the prevalence of homicide and serious assault is greater among African-Americans and Hispanics than non-Hispanic whites. In all groups, firearm use greatly increases the risk that a violent encounter results in the victim's death. Large fractions of victims are acquainted with the perpetrator in homicide and aggravated assault, sometimes intimately. Women are more likely than men to be killed or injured in attacks by an intimate partner. Rates of intimate partner violence have fallen in recent years, but the decrease differs by sex and lethality. Greater reductions in assault victimization have occurred among women than men, and homicide victimization has decreased more among men than women.

Although homicide and serious assault have declined in the United States, the reasons why remain something of a mystery. Mass imprisonment is one contributor to the crime decline, but its other social consequences are troubling, and even its crime-reduction benefits may dissipate over time. The same sense of political purpose, widespread mobilization, and forceful leadership that ushered in the era of mass imprisonment will be required to bring about needed reforms under the banner of "prisoner reentry," the reintegration of released prisoners into the social and political mainstream. A surprising degree of political support for prisoner reentry currently exists, but that is likely to last only until violent crime rates begin to rise again.

Introduction

Homicide and aggravated assault are forms of violent crime. A “crime” is a violation of criminal law, but what is “violence”? That turns out to be a difficult question. Should the definition of violence be limited to acts causing physical harm? What about threats of harm? Can mere words or symbols constitute violence? Is defacing religious property or burning a cross on someone’s lawn a violent act?

Social scientists do not agree on a single or unified definition of violence. Psychologists generally prefer broad definitions that include behaviors producing emotional harm. The Committee on Family Violence of the National Institute of Mental Health, for example, offers a definition that not only includes acts threatening or inflicting physical harm but those resulting in “restraint of normal activities or freedom, and denial of access to resources” (quoted in Crowell and Burgess 1996, p. 10). By this definition, prisons and poverty could be considered forms of violence.

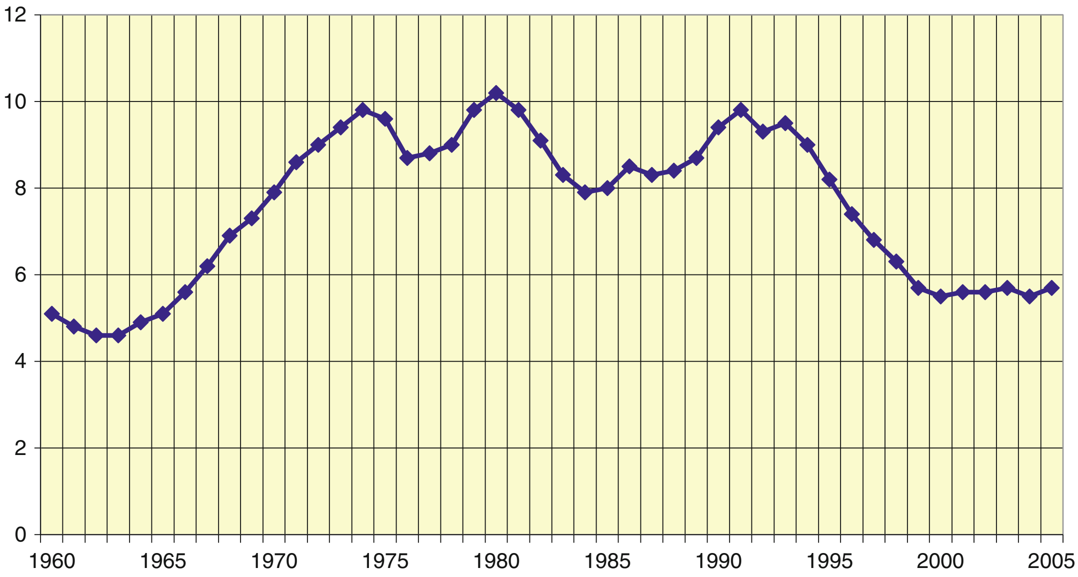
Criminologists tend to favor narrower definitions of violence focusing on physical harm or threats. Many, but not all, criminologists accept the definition provided by an influential National Research Council study of violence as “behaviors by individuals that intentionally threaten, attempt, or inflict physical harm on others” (Reiss and Roth 1993, p. 2). This definition includes a diverse assortment of behaviors, including homicide, assault, rape, torture, capital punishment, and boxing. But it excludes many acts that are encompassed by other, equally reasonable, definitions. How one chooses to define violence, as we shall see, prefigures the types of behavior that are counted as violence, the levels of violence observed across place and time, the theories that “make sense” of violent behavior, and the social response to violence.

Regardless of the definition, not all violence is criminal violence. Violence is made a crime through the *criminalization process*, which entails the selective application of the criminal law to violent acts. Criminal law, and law itself, are not universal. They have not always existed, and they do not impose uniform standards or sanctions on behavior, across societies or in the same society over time. It is a criminological truism that acts legally prohibited at one time or place may not be at others. A common example is prohibition of the manufacture, sale, and distribution of alcohol in the United States during the 1920s. But this maxim applies to violent behavior and not just so-called victimless crimes. Until late in the twentieth century in most US states, for example, a man could not be criminally charged with raping his wife; now all states have laws against marital rape (see Russell 1990).

Patterns of Criminal Homicide and Assault

The foregoing discussion implies that how one chooses to define violence and the cultural meanings attached to particular instances of violent behavior will affect how violence is measured, the levels of violence observed across places at any given time, and trends in violence over time. What is true for violent behavior generally is also true for homicide and aggravated assault. Homicide is the willful killing of one human being by another. Some homicides are lawful, such as those committed in warfare or as legal punishment for crime, and some are criminal. Aggravated assault is an attack by one or more persons on another with the purpose of inflicting serious bodily injury, including threats and attempts, or an assault committed with a dangerous weapon – an “aggravating” condition (Federal Bureau of Investigation 2006). As with homicide, the behavior itself does not distinguish a criminal from noncriminal assault. The sport of boxing is a legally regulated form of assault.

In the United States, three sources of data can be used to track levels and trends in criminal



Understanding Homicide and Aggravated Assault, Fig. 1 Homicides per 100,000 population in the United States, 1960–2005. Source: Uniform Crime Reports

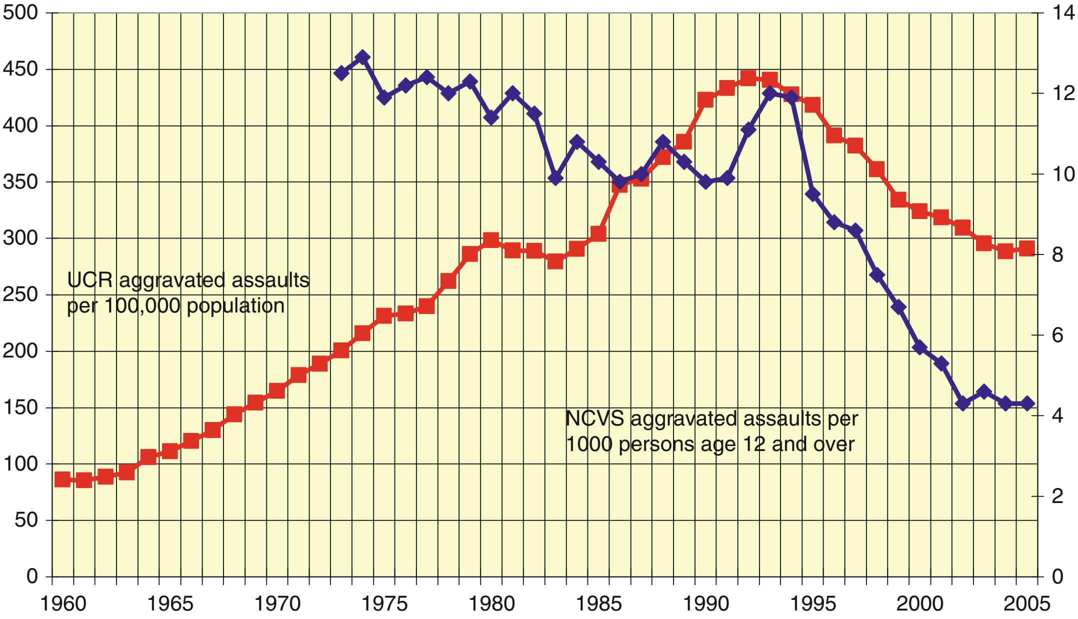
homicide and assault: the FBI's Uniform Crime Reports (UCR), the Bureau of Justice Statistics' National Crime Victimization Survey (NCVS), and the National Center for Injury Prevention and Control's (NCIPC) mortality and intentional injury data series. The UCR data are based on offenses reported to and recorded by police departments. The NCVS data are from representative surveys of the population age 12 and over. The NCIPC data are from hospital and death records. The three data sources complement one another in several ways. For example, the NCVS picks up crimes that are not reported to the police, and the UCR and NCIPC count homicides, which are not included in victim surveys. The NCIPC mortality series includes the nearly 3,000 homicides resulting from the 2001 terrorist attacks, whereas the FBI omitted these victims from its 2001 homicide statistics. Finally, the three series categorize rapes and other sexual assaults separately from other assaults.

Recent Trends in the United States

Criminal homicide and aggravated assault rates have exhibited marked fluctuation over the past several decades in the United States. UCR homicide rates between 1960 and 2005 are displayed in Fig. 1. Homicide rates were relatively stationary at 4–5 homicides per 100,000 population during the 1950s and early 1960s and then rose substantially over the next several years, peaking at just over 10 per 100,000 in 1980. They cycled between 8 and 10 per 100,000 until the early 1990s when they began a nearly decadelong drop, what one analyst has called the “Great American Crime Decline” (Zimring 2007). By 2000, US homicide rates had returned to levels not seen since the mid-1960s.

Aggravated assaults are measured in both the UCR and the NCVS, using virtually identical definitions. But the two series show very different patterns of change since 1973, the first year of the NCVS (see Fig. 2). Although both UCR and NCVS aggravated assault rates have fallen since the mid-1990s, the UCR series rose almost continuously before then, while the NCVS series decreased from 1973 until the early 1990s, increased for a few years, and then began to fall again.

Some of the divergence between the two series could reflect a growing willingness by victims to report crimes to the police. All of the increase



Understanding Homicide and Aggravated Assault, Fig. 2 UCR and NCVS aggravated assault rates. Source: Uniform Crime Reports, National Crime Victimization Survey. Note: NCVS rates prior to 1993 adjusted to reflect 1992 NCVS redesign

in reporting to the police, however, occurred well after the NCVS and UCR aggravated assault trends began to converge in the 1990s and, therefore, cannot explain the divergent trends of the earlier years (see Catalano 2006a).

The contrasting trends prior to the 1990s more likely reflect better police recording of crimes with the advent of computerized records and 911 emergency call systems, and police “upgrading” of many assaults as aggravated that in the past had been considered less serious crimes. The latter interpretation is supported by evidence showing much stronger correspondence between the UCR and NCVS time trends for assaults committed with firearms than those without a firearm. The police are unlikely to record firearm incidents as simple assaults, whereas they have much greater discretion in classifying incidents without firearms or very serious injury. Beginning in the 1970s, the women’s movement and domestic violence advocates began to press police and prosecutors to treat assaults more seriously, especially those with female victims, and those pressures contributed to the increase in aggravated assaults reflected in the UCR data series. Because the NCVS is based on standardized screening questions to determine criminal victimization and lacks the police recording “filter” of the UCR, the NCVS aggravated assault series is much less likely to be affected by such changes (see Rosenfeld 2007).

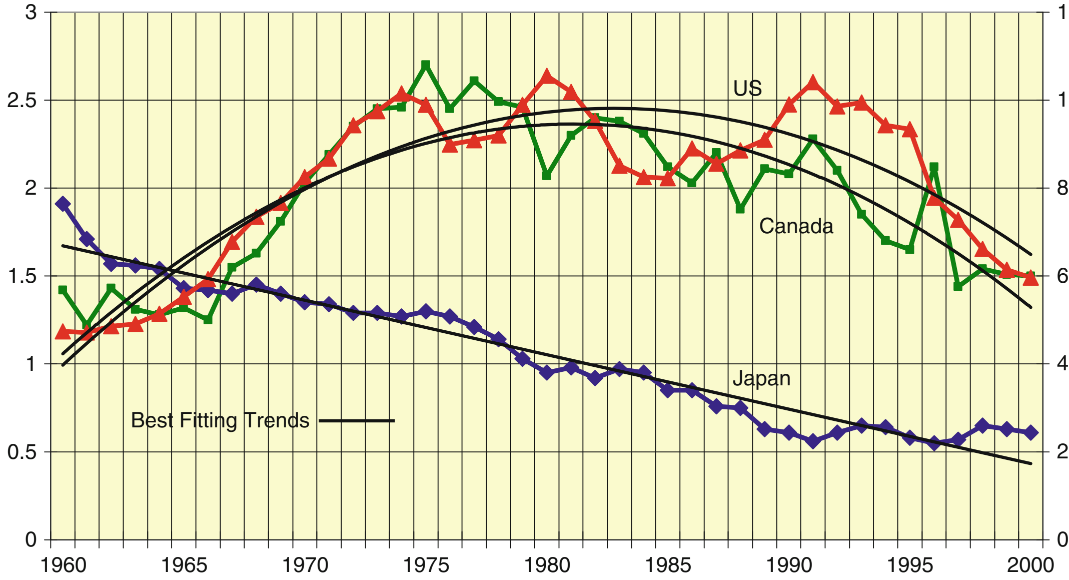
Changes in police recording of assaults provide an excellent illustration of how the cultural meanings of violence are redefined by social movements and affect the definition and measurement of violent crime. Assaults that the police, reflecting commonly held views, once had classified as misdemeanor offenses, or may not have recorded as crimes at all, were upgraded in seriousness with the increasing social status of victims. The rights and prerogatives of crime victims have grown during the past 30 years, with victims of so-called domestic violence leading the way. Mandatory and pro-arrest policies have reversed the legal protection once granted to violence occurring in the home. But, as we shall see, the effects of such policies on the incidence of domestic violence are more difficult to discern.

Cross-National Comparisons

Comparative assessments of changes in homicide or other crime rates over time are important because they can reveal limitations in explanations of crime trends that are restricted to a single nation, as is true of several leading explanations of the recent violent crime decline in the United States (Zimring 2007). Like those in the United States, the homicide rates of many developed nations rose during the 1970s and 1980s and have fallen since then, but there are plenty of exceptions. As an illustration, Figure 3 displays the homicide rates for Japan, Canada, and the United States between 1960 and 2000. Japan's homicide rate dropped steadily over the 40-year period. By contrast, the Canadian trend mirrors the increases and declines in the United States, as shown by the best-fitting curves superimposed on the two nations' homicide time series. Explanations of recent US crime trends that emphasize the importance of prison expansion and urban crack markets leave open the question of why Canada should have experienced much the same trends, without comparable changes in imprisonment or drug markets (Zimring 2007).

Explanations of cross-national differences in homicide also must contend with the substantial difference in homicide *levels* between the United States and other developed nations, regardless of the time period. Even after dropping by 40 % during the 1990s, the US homicide rate greatly exceeds those of other developed nations. Figure 4 displays the homicide rates of 14 highly industrialized, democratic nations in 2000. With six homicides per 100,000 population, the United States is the clear outlier in the group. The US homicide rate is three times those of Australia and Canada, its nearest competitors, and over six times the average rate of the remaining 11 nations.

Some analysts attribute the large difference in homicide rates between the United States and other developed nations to the widespread availability of firearms in the United States (Zimring and Hawkins 1997). Others point to the fact that the rate of homicides committed without guns is also greater in the United States than other



Understanding Homicide and Aggravated Assault, Fig. 3 Homicides per 100,000 population in Japan, Canada, and the United States, 1960–2000. Source: World Health Organization, compiled by Gary LaFree

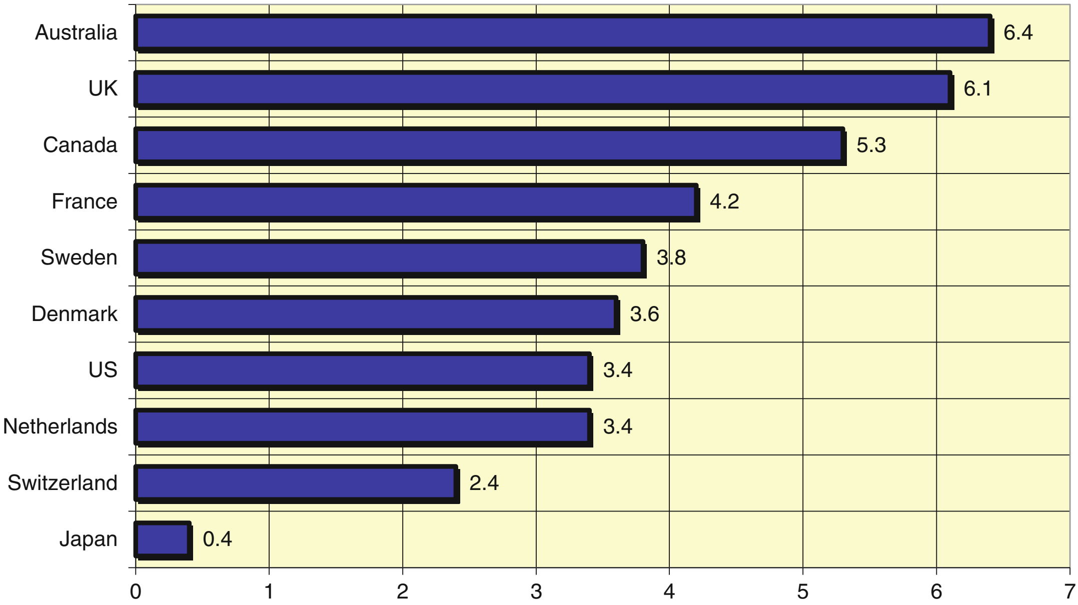
developed nations and call attention to a history of racial oppression, economic inequality, and lack of protection from market forces, in addition to the availability of guns, as reasons for the exceptionally high levels of criminal violence in the United States (Beeghley 2003; Messner and Rosenfeld 2007).

But are rates of "criminal violence" greater in the United States than other developed nations, or is American exceptionalism limited to homicide, as Zimring and Hawkins (1997) maintain? The prevalence of nonlethal assault does not appear to be greater in the United States than other developed countries. Figure 5 displays the percentage of respondents to the International Crime Survey (ICS) in 10 nations who reported that they were victims of one or more assaults in 1999. The United States is far from the top of the list, ranking just below Denmark and Sweden and well below Australia and the United Kingdom. This finding favors causal accounts able to explain why the United States dominates international comparisons of homicide but not other forms of criminal violence.

Characteristics of Victims and Firearm Use

Nearly everywhere they have been assessed, rates of aggravated assault and homicide are higher among males and the young than females and older persons. In the United States, serious interpersonal violence is also more common among blacks and Hispanics than non-Hispanic whites. Table 1 presents 3-year average rates of aggravated assault and homicide in the USA by sex, race, ethnicity (Hispanic and Non-Hispanic), and age. The data represent rates of victimization; offending rates exhibit the same demographic patterns, except that offenders tend to be a few years younger than their victims.

Looking first at rates of aggravated assault, we see that they are 78 % greater among males and 58 % greater among blacks than females and whites, respectively. Aggravated assault is somewhat more common among Hispanics than non-Hispanics, but this difference is smaller than the sex and race differences. Age-specific rates of aggravated assault exhibit a distinctive,



Understanding Homicide and Aggravated Assault, Fig. 5 Percentage of respondents reporting assault victimization, 1999. Source: International Crime Victimization Survey

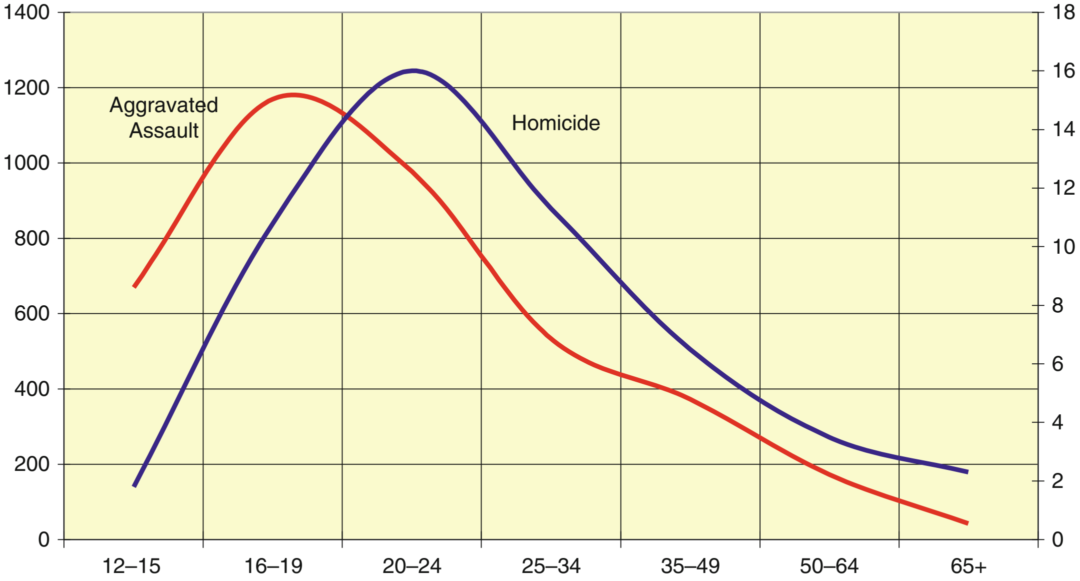
curvilinear pattern, rising from early to late adolescence and falling steadily thereafter. With a victimization rate only one-tenth of the average rate of 440 per 100,000, persons over the age of 65 are particularly unlikely to be victims of serious assault. This "age-crime curve" characterizes many common criminal offenses.

Firearms are used in about one-quarter of aggravated assaults victims report to the NCVS. Recall that use of a dangerous weapon is one of the "aggravating" conditions that distinguish aggravated from simple assaults. The other condition is serious bodily injury. It turns out that aggravated assaults involving firearms are much less likely to produce injury than those committed with other weapons or none at all. But, if the presence of a firearm reduces the chance of nonfatal injury, it increases the chance that the victim will be killed, thereby converting an aggravated assault into a homicide (Kleck and McElrath 1991).

The homicide rate for persons 12 and older in the United States is 6.8 per 100,000, meaning that the average American over the age of 11 has a one-in-14,706 chance of becoming a homicide victim. The sex, race, ethnic, and age patterns in homicide are roughly similar to those in aggravated assault, although the group differences are larger. Males are about four times more likely than females to be the victim of a homicide. The homicide rate among blacks is more than six times that among whites, and the risk of homicide is about 60 % higher among Hispanics than others. Like aggravated assaults, homicide rates rise during adolescence, but peak a few years later in the early 20s before falling through the remainder of the life course, as shown in Fig. 6. Finally, in contrast to aggravated assault, about two-thirds of homicides are committed with a firearm, so that the firearm homicide rate in the United States is more than twice that of homicides committed without firearms.

The third column in Table 1 presents the "lethality ratio," or the number of aggravated assault victims for every homicide victim, by characteristics of the victim and whether or not the victim was attacked or threatened by an offender with a firearm.

The lethality ratio is a rough approximation of the degree to which death results from the serious violence a group experiences. A full accounting



Understanding Homicide and Aggravated Assault, Fig. 6 Age-specific aggravated assault and homicide victimizations per 100,000 population, 2002–2004. Source: National Crime Victimization Survey, National Center for Injury Prevention and Control

of the lethal outcomes of violent crime would have to include other "precipitating" offenses, such as robbery and rape, in addition to aggravated assault, but the group differences shown in the table would not be altered substantially.

For the population over the age of 11, the average ratio is 65 aggravated assaults for every homicide. Some groups – teenagers, whites, and women – have ratios that are much higher than average, meaning that the serious violence they experience is less likely to result in death than is true for groups with lower-than-average ratios, such as blacks and, interestingly, senior citizens. Persons age 65 and over have a lethality ratio of 19 aggravated assaults for each homicide, the lowest ratio shown. It is tempting to attribute this result to the frailty of older persons, which would transform more of their serious assaults into homicides, but their comparatively low homicide rate of 2.3 per 100,000 suggests that is not the full story. Rather, older persons are much less likely to experience interpersonal violence, serious or not, than other age groups. Even their level of simple assault (assaults without a dangerous weapon or serious injury) is far lower than that of younger persons. But when they are attacked, they are more likely to be killed.

The group with the largest lethality ratio is near the other end of the age spectrum. Adolescents between 12 and 15 years old experience 372 aggravated assaults for each homicide. Teenagers, who are said to have replaced fists and knives with guns when they fight, remain far less likely to die in violent encounters than their parents or grandparents.

Finally, attacks involving firearms produce far more deaths per incident than those committed with a knife or club or no weapon. There is no question that firearms are lethal weapons, and many analysts argue that decreases in the availability of firearms would result in fewer homicides. But critics of this view maintain that strict controls on firearm availability would deprive victims of needed protection and even increase violent crime rates, if offenders assume their victims are unarmed. A comprehensive assessment by the National Research Council finds fault with the methods and data used in studies of the "more guns, less crime" hypothesis, regardless of their results (Wellford et al. 2004). The relationship between firearms and violence

[c]Hispanics may be of any race

remains a contentious research and public issue in the United States, which is not surprising in a nation with persisting traditions of popular justice and self-protection, high homicide rates, and the largest private arsenal in the world.

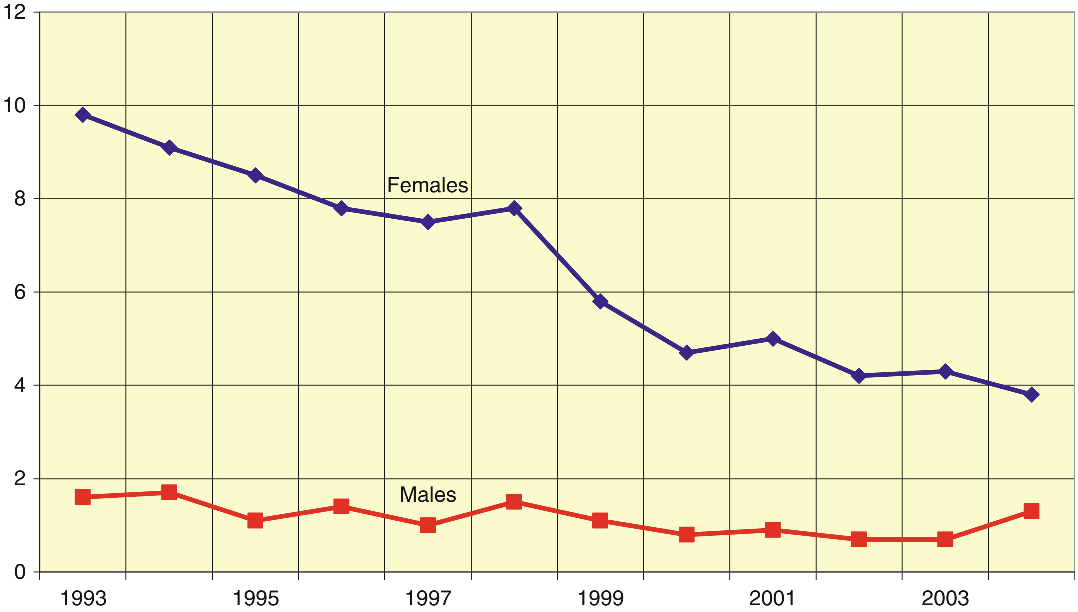
Victim-Offender Relationship

Victims of homicide and serious assault are often acquainted with the offender, sometimes intimately. According to the NCVS, about 47 % of aggravated assault victims in 2004 knew their attacker. It is more difficult to determine the proportion of homicide victims who knew their killer, both because the victim is unable to say and because an offender is arrested in only about 6-in-10 homicides committed in the United States (Federal Bureau of Investigation 2006). The FBI's Supplementary Homicide Reports (SHR), a detailed compilation of homicide incidents, victims, and known offenders, show that 43 % of homicide victims in 2004 were acquainted with the offender, 13 % were strangers, and the victim-offender relationship could not be determined in the remaining 44 % of cases. Women and younger victims are more likely to know their attackers than men and older victims. The same patterns emerge in violence among family members and other intimates. About 16 % of aggravated assault victims and 12 % of homicide victims in 2004 were attacked by a family member, including spouses or ex-spouses. So-called intimate partner violence has received widespread attention by researchers, victims' advocates, and policymakers in the United States. It is worth taking a closer look at patterns in intimate violence.

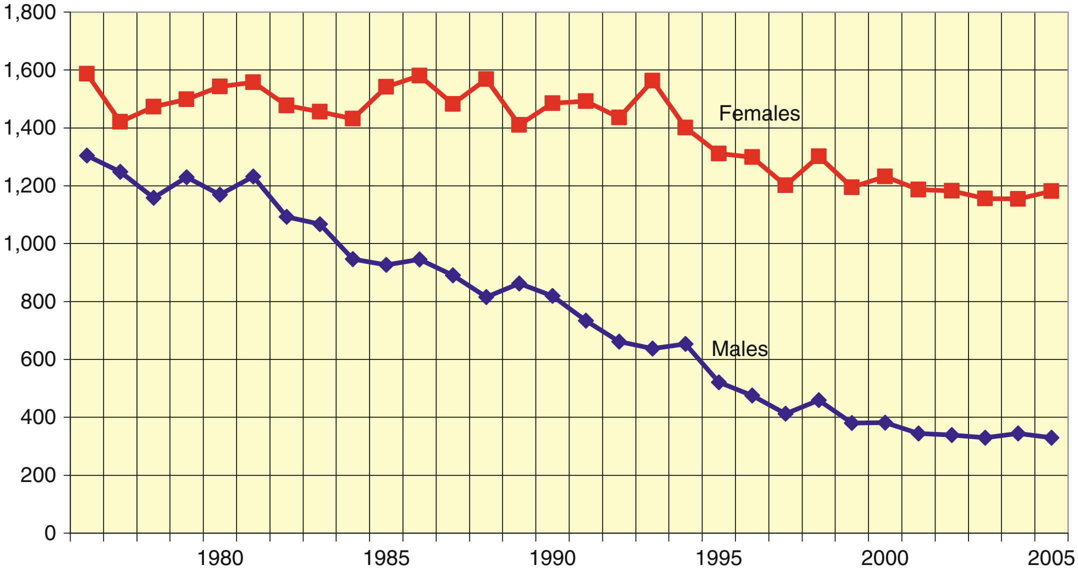
Intimate Partner Violence

Two facts stand out in patterns of intimate partner violence: (1) Women are more likely than men to be victims of serious intimate partner violence. (2) Levels of intimate partner violence have declined markedly over time. Both of these patterns are revealed in Figs. 7 and 8, which show US trends in nonfatal and fatal intimate partner violence, respectively, by sex of the victim.

Both figures show higher levels of victimization among female than male intimate partners and decreases in victimization over time, but the rate of decline differs for men and women by type of victimization. Continuous data from the NCVS on nonfatal intimate partner violence are available only since 1993. They show a greater decline in the nonfatal victimization of women than men. By contrast, the drop in male victims of intimate homicide over the past 30 years is steeper than the drop in female victims, which only began in the early 1990s. These contrasting declines are, at first glance, puzzling.



Understanding Homicide and Aggravated Assault, Fig. 7 Victims of nonfatal intimate partner violence per 1,000 population by sex of victim, 1993–2004. Source: Catalano (2006b)



Understanding Homicide and Aggravated Assault, Fig. 8 Intimate partner homicides by sex of victim, 1976–2005. Source: Catalano (2006b)

What accounts for the sex differences in nonfatal and fatal victimization trends?

The conditions responsible for reducing violent crime generally during the 1990s – including a booming economy, more police, and a dramatic expansion in imprisonment – might be expected to have reduced violence against women (Levitt 2004; Rosenfeld 2004). But that makes the sharper drop in male than female intimate homicide victimization all the more puzzling. A key to the puzzle lies in the differing circumstances of male and female intimate partner homicide.

When women kill their male partners, the homicide is much more likely to be "victim precipitated" than when men kill their female partners (Rosenfeld 1997; Wolfgang 1975 [1958]). A homicide is victim precipitated when the victim initiates the violent conflict that ends in his or her death. The person who starts a fight is not always the one left standing when it ends. When women kill their male partners, they typically do so in response to an attack or threat. The same is not true of men who kill their intimate partners (Rosenfeld 1997). Women are more apt than men to kill as a last resort, when all else fails, to stop the violence directed at them, sometimes over a long period of time. Women, then, should be more willing than men to take advantage of nonviolent alternatives to homicide that effectively reduce their exposure to their partner's violence.

Dugan et al. (1999) used that reasoning to explain what otherwise is a very curious result in their study of the impact of hotlines, shelters, legal advocacy, and other domestic violence services and resources on trends in intimate partner killings: intimate killings of men, not women, dropped more rapidly in cities where such resources were more prevalent. It is a fair bet that the domestic violence prevention advocates who demanded more services and greater legal protection for battered and abused women and their children did not intend that their struggle would result in saving batterers' lives. But if we view domestic violence resources as providing nonviolent alternatives to killing a violent partner, it is not surprising in light of the sex difference in the circumstances of intimate partner homicide that they would have a greater impact on the rate at which women kill their male partners than the rate at which men kill their female partners.

In a second study, Dugan et al. (1999) found that the homicide reductions associated with domestic violence services and legal reforms were uneven across racial groups and by marital status: the availability of domestic violence resources produced greater reductions among whites and married couples than among blacks and unmarried intimate partners. These results are consistent with evaluations of so-called mandatory and pro-arrest policies for domestic violence, which have found stronger deterrence effects of arrest on subsequent violence for married and employed men than for the unmarried and unemployed (Sherman 1992). Domestic violence policy interventions explain only part of the drop in intimate partner homicide; rising divorce rates also contributed to the decline as more women exited relationships with violent or abusive partners (Dugan et al. 1999). In fact, an important rationale for liberalizing divorce laws in Europe during the nineteenth and twentieth centuries was to reduce the number of domestic homicides (Gillis 1996). The institution of divorce was the first and arguably remains the most effective program to prevent domestic violence.

Theories of Homicide and Assault

Homicide and assault are studied from a variety of theoretical perspectives, and no single theory commands consensus among students of interpersonal violence, even when the focus is limited to criminological perspectives. It is useful to categorize theories of violence according to their level of analysis and whether they apply to all forms of violence, legal as well as criminal, or are restricted to nonnormative or criminal violence. Microlevel theories direct attention to characteristics of individuals or their immediate social context (e.g., family and peer influences) to explain individual differences in violent behavior. Macrolevel theories explain the variation in rates of violence across groups, populations, and societies. Both micro and macro criminological theories of violence are limited primarily to explaining socially disapproved violence, although two perspectives, Felson's (2004) interactionist theory and Black's (1998) theory of social control, encompass normative violence as well.

While conceptually and analytically distinct, specific micro and macro perspectives share underlying assumptions about the individual and social processes implicated in crime. The three major microlevel perspectives in criminology – social learning theory, social control theory, and strain theory – share behavioral assumptions with three of the major macrolevel perspectives on crime – cultural deviance theory, social disorganization theory, and anomie theory, respectively (Messner and Rosenfeld 2007). Social learning theory posits that criminal behavior is learned under the same social conditions that shape learning of all kinds. Its macrolevel counterpart, so-called cultural deviance perspectives, explains variations in violent crime across groups and communities on the basis of cultural or subcultural values, beliefs, and norms that promote or tolerate violent conduct. Social control theory explains criminal behavior as resulting from weakened or absent social bonds that, when strong, discourage crime and delinquency. Its macrolevel analogue, social disorganization theory, specifies the social conditions that weaken social bonds, including economic deprivation, residential instability, and population heterogeneity. Finally, strain theories posit that criminal behavior is a function of failure to attain desired goals, aversive stimuli, and negative emotions. At the macrolevel, anomie theories hold that high levels of crime characterize communities and societies in which cultural goals extol the virtues of economic success for everyone, access to the legitimate means to attain cultural goals are unequally distributed in the population, and the social controls and supports of basic institutions are weakened.

The three pairs of criminological theories make very different assumptions about how criminality is facilitated by personal and social characteristics. Cultural-learning theories propose that criminal propensities are generated in interaction with others whose values and beliefs conflict with prevailing legal standards. In sharp contrast, social control theories view criminal behavior as needing no special explanation; what must be explained is not why some people steal or behave violently, but why the rest of us do not. People conform to law, control theorists argue, because not doing so is costly. To the degree nonconformity threatens valued social relationships and investments in rewarding legitimate activities, people will conform. In addition, time and energy devoted to legitimate pursuits limit the time and energy available for criminal activity. Contemporary strain and anomie theories incorporate elements of social learning and control theories but also specify the personal and social processes that weaken social controls and encourage the adoption of deviant or criminal attitudes and beliefs (Messner and Rosenfeld 2007).

As mentioned, none of these perspectives holds a commanding position among criminologists. Researchers tend to mix and match arguments from multiple perspectives, often oblivious to the contrasting assumptions they make about how and why persons violate legal standards (Kornhauser 1978). In recent years, rival theories have emerged that seek to transcend the limitations of established theories or recast them around new insights. Routine activity theory (Felson 2002) downplays the significance the older perspectives attach to criminal motivations and emphasizes the opportunities to commit crime that emerge when offenders, however motivated, come into contact with victims in situations that facilitate theft or attack (e.g., an unguarded cash register, a lone individual on a darkened or empty street). Self-control theory (Gottfredson and Hirschi 1990) transcends social control theories by locating the source of deviant behavior in early childhood socialization. Poor parenting produces persons incapable of forming deep attachments to others or controlling their impulses and who will commit crimes whenever opportunity permits. Life course theories also emphasize the importance of early childhood in facilitating or retarding delinquent and criminal behavior in adolescence and adulthood but reject self-control theory's deterministic assumption that faulty socialization spells trouble throughout the life course (Laub and Sampson 2003; Sampson and Laub 1993). Age-graded "turning points," such as marriage, military service, or a good job can promote conformity and discourage criminality.

None of these established or emerging criminological perspectives applies specifically to criminal violence; they are intended to explain criminal behavior generally: violent offending, property offending, and public order offending, such as possessing illegal drugs. At the same time, the explanatory scope of all of them, unsurprisingly, is restricted to *criminal* violence. That is a significant limitation. None of the criminological theories can explain why some forms of violent conduct are socially condemned while others are not. Implicitly or by design, all take the prevailing legal order as given and therefore are fundamentally culture bound.

Not all theories of violence are so restricted in their application. Black's (1998) theory of social control views violence as one among several means of conflict management. Whether disputants engage in violent "self-help" rather than avoidance, toleration, mediation, arbitration, or other ways of managing conflict depends on how closely they are related to one another, the degree of economic inequality or cultural difference between them and relevant third parties, and their integration into broader collectivities. Black's theory is intended to explain dispute-related violence of all kinds, at all times, everywhere.

Felson's (2004) interactionist theory explains both dispute-related and predatory violence. Whereas persons engage in dispute-related (sometimes termed "moralistic") violence in response to a perceived wrong, predatory violence is committed without real or imagined provocation by the victim. When a parent spanks a child for misbehaving, she is engaging in moralistic violence. When a robber demands his victim's money at gunpoint, he is engaging in predatory violence. Rejecting the traditional duality of "expressive" versus "instrumental" violence, Felson argues that all violence is intended to achieve some goal, whether to exact compliance, achieve justice, or secure a desired social identity. His theory applies to both criminal and noncriminal violence, in any and all societies and historical periods.

Many forms of violence are roundly condemned and, in principle, can be explained with reference to the various problems and pathologies highlighted in traditional criminological perspectives. But the commonalities underlying normative and nonnormative violence are obscured by such a restrictive focus on the problematic origins and manifestations of violence. Science craves generality (Black 1995). All else equal, theories of violence capable of explaining the executioner's behavior, and not merely that of the condemned, are better.

Violence Reduction and Mass Incarceration

Homicide and aggravated assault rates in the United States have declined markedly over the past two decades. Homicide fell by 43 % between 1991 and 2005. UCR aggravated assault rates dropped by 33 % over the same period. As measured in the NCVS, aggravated assault rates fell by 57 %. Declines of this magnitude in death and serious injury must be counted as good news. But valued effects are not always brought about by equally appealing causes. That is the case with the relationship between recent crime reductions and mass imprisonment in the United States.

Over a quarter of a century ago, the United States embarked on an unparalleled program of prison expansion. For most of the twentieth century, US imprisonment rates were on par with those prevailing in Europe and the rest of the developed world. Since the mid-1970s, the US imprisonment rate has risen fivefold. No other nation incarcerates its citizens at the now customary levels in the United States.

The rise of mass incarceration in the United States resulted from deliberate policy choices and was not the unavoidable outcome of increasing crime rates. One state after another, with strong inducements and pressures from the federal government, instituted mandatory-minimum sentences, sentence enhancements, and truth-in-sentencing provisions to insure that more convicted felons would be sent to prison and would serve longer sentences (Messner and Rosenfeld 2007, pp. 115–118). Drug offenders were a prime target of the sentencing reforms. Presumably African-Americans were not, but changes in drug laws and other get-tough policies, whether intended or not, have disproportionately affected the life chances of African-Americans (Tonry 1996). Fully 10 % of African-American men between the ages of 25 and 29 resided in a state or federal prison in 2002, compared to 2 % of Hispanic men and 1 % of white men of the same age (Messner and Rosenfeld 2007, p. 5). It is fair to assume that few policymakers intended or foresaw a quintupling of the prison population as a consequence of the mandatory-minimum sentencing and truth-in-sentencing laws passed over the last 30 years, but once the dramatic escalation in incarceration – and its racially disparate effects – became evident, if policymakers were inclined to limit future imprisonment growth, presumably they would have done so by now (Tonry 1996).

Although debate remains about the size and even the direction of the effect, accumulating research evidence shows that the massive expansion in imprisonment has reduced crime rates in the United States (Levitt 1996, 2002, 2004; Marvell and Moody 1994; but see DeFina and Arvanites 2002, Tonry 2004). It would be astounding if mass imprisonment at the level used in the United States had no impact on crime rates. But the effects are complex. They are likely to differ by age, with the strongest crime-reduction effects among offenders in their early 30s, who have the longest residual criminal careers, and the weakest effects among juveniles, who are at low risk for incarceration in state and federal prisons. And recent research has shown that the crime-reduction effects of incarceration diminish with increases in the scale of imprisonment (Liedka et al. 2006).

Mass imprisonment is a stopgap and costly crime-control policy. Most persons released from prison are rearrested for new crimes and half return to prison within 3 years (Langan and Levin 2002). The costs of the huge correctional complex are borne primarily by state and local governments, and they have risen at roughly double the rate of state and local outlays for education, health care, and policing over the past 30 years (Hughes 2006). Each additional dollar spent on prisons, jails, and community corrections is money that states and local areas cannot devote to other pressing needs, including improvements in education and early childhood interventions that hold some promise for reducing *criminality* and not just containing crime rates by incapacitating offenders (Greenwood et al. 1998).

Add to the economic costs of mass imprisonment the political and social costs in the form of a growing disenfranchised population of ex-prisoners, further destabilization of the communities hardest hit by the continuous “churning” of young men moving in and out of prison, the high recidivism rates of ex-prisoners, and the racially disparate impact of prison expansion – and policy alternatives that promise to limit *both* crime rates and prison expansion begin to have growing appeal to policymakers at all levels of government, regardless of political affiliation. A “prisoner reentry” movement has attracted the attention of the federal government and state legislatures across the country. Advocates of prisoner reentry point to the limited employment, housing, health, and social services available to persons returning home from prison and the spotty and inconsistent supervision of many ex-prisoners in the community as primary reasons for their high recidivism rates (see Petersilia 2003; Travis 2005). To protect the communities to which they are released and staunch the flow of offenders back to prison, reentry advocates call for sharply lower parole caseloads and enhanced supportive services for ex-prisoners and their families.

Whether current reentry programs reduce recidivism rates remains uncertain, but if they are found to be effective and are widely implemented, they could well limit the overall growth in imprisonment, for the simple reason that most persons entering prison in recent years have been there at least once before (Blumstein and Beck 2005). The essential challenge to prisoner reentry programs is finding the right mix of incentives, supports, and controls that will reduce the chances that persons who have already been in and out of prison, and then are reincarcerated, will not return to prison yet again when they are released.

Effective crime-control policy requires more than addressing the needs of released prisoners. The best policy is multifaceted and also should include promising approaches to the prevention and policing of violent crime and in-prison rehabilitation programs of proven effectiveness. There is no shortage of such initiatives (http://www.crimesolutions.gov/about_ojp.aspx), but combining them in a coherent policy set and providing the resources necessary to bring them to scale poses enormous political challenges.

One is tempted to say the challenge is insurmountable, but recent history indicates it is not. The United States showed the world it is possible to effect startling changes in crime-control policy when the necessary sense of urgency and political will are mobilized for action. In a nation renowned for its political decentralization and fragmentation, a coherent and self-reinforcing policy of mass imprisonment took hold almost instantaneously across the 50 states with the federal government, no matter which party was in power, leading the way. Limiting the costs of mass imprisonment and instituting effective alternatives are no less possible. The challenge is to mobilize the necessary political resources and instruments before crime rates begin to rise again.

Understanding Victimization Frequency

Andromachi Tseloni
School of Social Sciences, Nottingham Trent University, Nottingham, UK

Synonyms

Victimization incidence; Victimization rate

Overview

In the past two decades, the central place of repeat and multiple crime incidents against the same victims in boosting crime rates, predicting vulnerability to victimization and, with that knowledge, assisting crime prevention, has been recognized. This entry overviews the accumulated evidence on measuring and predicting victimization frequency and hints at possible crime prevention implications. It concludes with a list for future improvements in measuring and thus understanding repeat victimization.

Context

The field of criminology has traditionally focused on the offenders, the origins of offending behavior, and how to contain or ultimately eliminate it. The Chicago School of the inter-world war period broke away from that tradition by examining the societal (demographic, social, and economic) conditions that were associated with crime concentration. In doing so, researchers, such as Shaw and McKay (1942), introduced context to the study of crime and examined the conditions that enabled offending propensities to be formed and acted out. Since then, considerable research has been conducted in this vein and valuable lessons have been learned while Chicago still yields some groundbreaking analyses of the contextual behavioral parameters of crime concentration (Sampson 2006)!

The development of criminology via the study of offending in relation to area crime concentration has been encouraged and facilitated by the type of information that has been available to researchers and practitioners alike. Police records and data from other criminal justice agencies have existed roughly since the formation of these institutions (readers are invited to explore the rich archive held by the Galleries of Justice located in the old Sheriff of Nottingham mansion, court, prison, and "serious" offenders' execution site of the writer's home city should they visit it). Recorded crime data however hold only basic, if any, information on the victims of crime, such as name, sex, and age. As police alongside other state/public institutions' accountability came into question, it became clear that recorded crime gives a partial picture of how much crime is committed. Population-based criminal victimization surveys were thus launched in the 1970s as a means to estimate the "dark" figure of crime and implicitly or explicitly evaluate the quality and efficiency of the police service. Victims of crime, who at that time were conveniently distinguished from offenders, came, therefore, to the forefront of criminological enquiry to offer information about the criminal incidents they have experienced, the circumstances of their occurrence, and any consequences to those involved.

The National Crime Survey was launched in 1973 in the USA as a tool to "measure" crime in society. After two decades, it was revamped as the National Crime Victims Survey (NCVS) with improved information about victim and crime situational characteristics. In 1981, the British Crime Survey (BCS) was launched in the UK to offer data to supplement that on recorded crime (with regular sweeps in England and Wales) and provide appropriate measurements for testing victimization theory and crime-related national policy initiatives. National crime surveys have also been introduced in Canada, Australia/New Zealand, and a number of European countries. In 1989, the first regular comparative survey was launched, the International Victimization Survey, which followed the same sampling design and administered the same questionnaire cross-nationally until recently (2005). Since 2000, it has been known as the International Criminal Victimization Survey (ICVS). For many countries and some parts of the world, the ICVS is the only crime survey data held. The above are the main data sources upon which this entry draws. For a history of the development of victimization surveys, please, see the entry by Jan van Dijk and Pat Mayhew herein.

The pioneering victimization research that originated from the forerunner to the NCVS and resulted in the well-known lifestyle theory examined the association between the likelihood of experiencing crime and each socioeconomic attribute at hand (Hindelang et al. 1978). For instance, whether victims belonged disproportionally to specific population subgroups was assessed in an effort to identify "victim profiles" in a similar manner to that by which offender characteristics had been and continue to be drawn. The victimization theories of lifestyle and routine activities are well documented in the literature and textbooks (Felson 2002). The developments in statistical modeling research of the last two decades have shown that lifestyle and routine activity effects alone do not predict victimization and that context, that is, the social disorganization parameters put forward by Shaw and McKay (1942), is equally important (for instance, Kennedy and Forde 1990; Osborn and Tseloni 1998). Finally, the appearance in the new millennium of studies based on hierarchical modeling established that individual characteristics and lifestyles are not only additional factors to but also conditioned by context (Rountree et al. 1994; Tseloni 2000) as well as victimization history (Tseloni and Pease 2004). Therefore, a micro- and macro-level victimization theory seems to be emerging that recognizes the context-specific importance of socioeconomic attributes, routine activities, and previous crime experiences. This work will not revisit the original theories but dwell on the established evidence that the world, victimization *not* excepted, is a multi-dimensional place.

The Pervasiveness of Victimization: Definitional Issues

This part focuses on the different ways in which victimization and victims can be defined. This is central in understanding, predicting, and thus preventing criminal victimization.

The likelihood of becoming victim of crime, also known as victimization risk or prevalence, gives the probability that a crime target experiences at least one crime incident during a specific period. The population of eligible crime targets varies according to the crime type in question. For instance, personal crimes may affect any individual in a society, property crimes are against households, or car theft refers to the number of car-owning households. The specific period that offers a snapshot of crime problems in a society depends on the sampling design and the nature of the employed survey. It can be, for instance, the quarter, the calendar year (January to December), the financial year (April to March), or a lifetime.

Victimization risk has been widely used and still appears as the main variable of interest in empirical research. However, it confounds a wide spectrum of victim experiences, from unlucky chance encounters to dangerous daily lives. Therefore, examining the all-encompassing probability of being victimized one or more times does not tell much about the mechanisms of criminal victimization and, therefore, how to prevent it. Indeed, each victim type from the typology set out below represents quite different crime experiences affecting the perceived seriousness of that experience (for identical crime types) and requires different prioritization as for a minority of victims, the "continuity" of crime experiences affects their mental health and/or diminishes their quality of life:

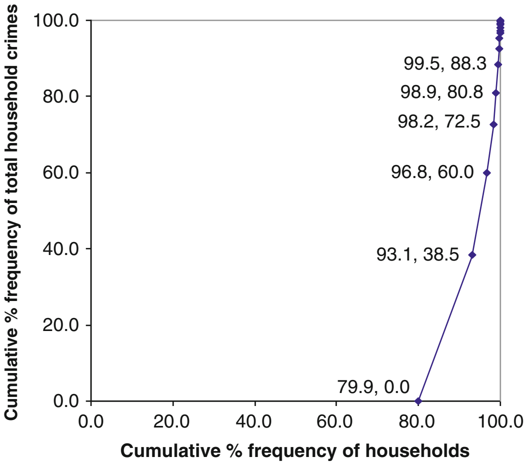
- Single victimization refers to one incident during the reference period.
- Multiple victimization refers to two or more different crime types in the same period.
- Repeat victimization exists when victims have experienced the same crime type more than once.
- Series victimization is defined as a large (what constitutes a large enough count is still unresolved between crime survey methodologists) recurrent number of very similar crime incidents that occur under similar circumstances and possibly by the same perpetrators. Finally,
- Composite victimization has recently been suggested to characterize incidents during which more than one crime type occurred, but according to survey methodology practice, they are classified under the most serious one (Tseloni et al. 2010).

Therefore examining the crime count, namely, the entire distribution of incidents including zero crimes, that is, non-victims, offers an alternative way to examine victimization. Such an approach does not mask some of the aforementioned distinctions. In particular, the crime count clearly distinguishes single and repeats, while series, depending on the study's research design, may be included in the upper truncation point of the distribution (Osborn and Tseloni 1998). This is not perfect but much preferred than lumping all victims together in a "one or more" truncation of self-reported victimization. In addition, when aggregate crime categories are investigated, such as personal or property crime, victimization by two or more crimes may include both multiples and repeats. The variable that summarizes the mean number of crimes per individual or household rather than the victim/non-victim dichotomy is the so-called victimization incidence.

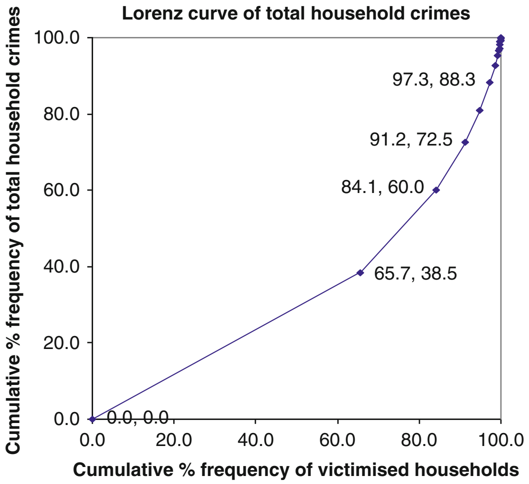
The question of whether repeat, multiple, or series victims differ significantly from single victims has not been thoroughly addressed at the time of writing. The only study that tested whether repeat victims have different attributes or live in different contexts than single victims suggested that the former have simply higher crime exposure but no dissimilar risk factors than the latter (Osborn et al. 1996). In the absence of evidence suggesting otherwise, therefore, the full count of crime incidents should be examined (Tseloni et al. 2002).

Rarity and Concentration of Victimization

Crime is a relatively rare event. But for some people, it is not as rare as it would be



Understanding Victimization Frequency, Fig. 1 Lorenz curve for total household crimes over population (Adapted from Tseloni and Pease 2005)



Understanding Victimization Frequency, Fig. 2 Lorenz curve for total household crimes over victims (Adapted from Tseloni and Pease 2005)

if victimization was a matter of chance. Counterintuitively perhaps, high crime areas have a lower proportion of victims than predicted if crime was random. The difference between victimization rate and crime rate is made up by more crimes per victim, that is, repeat victimization (Trickett et al. 1992). In particular, for more than five crimes for every hundred people, the number of victims is overestimated if we assume that crimes are random events and crime concentration, that is, the number of crimes per victim, is underestimated (Osborn and Tseloni 1998).

Figure 1 shows the Lorenz curve of the distribution of property crimes in England and Wales according to the 2000 British Crime Survey (BCS). The Lorenz curve is traditionally employed in public economics to describe how a society's wealth is distributed across the population, and it is related to the Gini coefficient of income inequality. The closer the Lorenz curve is to the low right-hand corner of its square outline, the higher the inequality. In the extreme, one person holds all wealth or in this case experiences all crime.

Figure 1 shows that 80 % of households have not experienced any crime over the 1-year risk period used in the BCS. This is good news for the majority, but bad news for the minority. Tracking the Lorenz curve upward, it is seen that the 6.9 % of the most victimized households experience 61.5 % of crime in the sample. Further, the 3.2 % of such households experience 40 % of property crimes, and so on and so forth, until nearly 12 % of crimes affect the 0.5 % most heavily victimized households. This indicates that the crimes reported by the 20 % victimized households are allocated unequally. Figure 2 demonstrates this more clearly.

For instance, the least victimized 65.7 % of victims experienced 38.5 % of crimes (see Fig. 2). By contrast, the most victimized 2.7 % of victims experienced 11.7 % of crimes. Therefore, crime is affecting both the population and victims unequally. Assuming therefore an appropriate statistical model for highly skewed counts, the chances of two crimes (or any other given number) can be predicted (Osborn and Tseloni 1998).

As mentioned, a large portion of empirical victimization research looks at risk rather than the number of crimes per person. It thereby ignores repeat victimization which is an important component of high crime rates. This seems to be confirmed further by the significant reductions of repeat rather than single victimization rates (Thorpe 2007) during the last 15 or 20 years of considerable crime falls.

Measuring Repeat Victimization and Crime Concentration

Repeat victimization did not feature in a consistent manner in criminological research prior to the work by Ken Pease and colleagues in the 1990s (Forrester et al. 1990). With the exception of few still inspiring studies, such as Reiss (1980), a number of issues with regard to counting and analyzing crime incidents hindered the allocation of crimes over victims. For instance, the discontinuous nature of police statistics, which, as mentioned in the beginning, is offender- or at best location-centered, does not allow a straightforward victim-based aggregation. In addition, the infrequency of crimes overall, that is, in the general population (see Fig. 1), which becomes even more skewed when individual crime categories are analyzed, such as larceny or theft from the person, has led quantitative population-based victimization research to focus on the proportion of victims. Therefore, new ways to look into crime experiences were introduced (Farrell and Pease 1993).

Repeat victimization can be measured in a number of ways depending on the objectives of the analysis. The following fictional crime distribution of Table 1 demonstrates how. It assumes that 100 people were surveyed and a minimum of 0 and a maximum of 4 crimes were reported, the latter thankfully by just one respondent. The majority of hypothetical respondents (52) had no crime experience which gives a victimization risk of 48 %. But 18 respondents were repeat victims; therefore, the percentage of repeat victimization is 100 × 18/48, that is, 37.5 %. The total number of crimes is 75 which gives crime incidence of 75 % or 0.75 crimes per respondent. But crime concentration is 75/48, that is, 1.56 crimes per victim. Crime concentration should be distinguished from crime incidence which refers to the mean number of crimes in the entire population not just victims. Finally, 45 crimes are the result of repeat victimization; therefore, the percentage of repeat crimes is 100 × 45/75 which gives 60 %.

Ideally, therefore, examining the entire (skewed) distribution of crimes via compound Poisson statistical models that are appropriate for counts, such as the distribution given by the first two columns of Table 1, addresses both the binary victim/non-victim outcome that was the focus of early research and repeat victimization.

Understanding Victimization Frequency, Table 1 Fictional crime distribution

Number of crimes	Frequency	Total number of crimes
0	52	0
1	30	30
2	10	20
3	7	21
4	1	4
Total number of respondents	100	75
Total number of victims	48	

Table 2 shows the extent of repeat victimization for each crime type based on the 2000 BCS. "Concentration" measures the mean number of crimes per victim. The second column of "% Repeat crimes" shows the percentage of total crimes that affected the same victims. The last column, "% Repeat victims," measures the percentage of victims who suffered at least two incidents by the respective crime type. For instance, threats and assaults are the most recurring individual crime types. Sixty-four percent of threats were against victims already threatened. Thirty-six percent of threat victims were threatened twice or more within a year. Evidently aggregate categories, such as total household or personal crime, have more repetition because a number of different offense-type counts and the boundaries between multiple and repeats are unclear.

Table 2 suggests that all crime types tend to be suffered disproportionately by the same targets. This is not limited to England and Wales. It is well established that repeats exist across crime types and cross-nationally with roughly similar victim characteristics (Farrell and Bouloukos 2000).

Why Is Crime Concentrated?

Having established that repeat victimization and crime concentration exist, the question calls for

Understanding Victimization Frequency, Table 2 The extent of repeat victimization based on the 2000 British Crime Survey for England and Wales (Source: Tseloni and Pease 2005)

Crime type	Concentration	% repeat crimes	% repeat victims
Total household crime	1.71	61.5	34.3
Burglary	1.32	37.9	17.9
Theft from dwelling	1.46	50.0	26.9
Total personal crime	1.55	53.4	27.8
Assault	1.68	61.2	34.7
Theft and robbery	1.29	31.2	11.0
Threat	1.75	63.7	36.4
Total vehicle crime	1.51	53.7	30.1
Theft from vehicle	1.35	42.7	22.5
Theft of vehicle	1.13	19.1	9.7

an answer. Why are individuals or households likely to experience more than one crime, especially when there are so many more non-victims in the population? Three explanations, which were conveniently borrowed from the literature on statistical analyses of accidents, have been suggested (Tseloni 1995). They are given below:

- Population heterogeneity (apparent contagion) – The simple fact that people are and behave differently and encounter dissimilar situations because they live and spend time in diverse places and/or settings. According to this explanation, all individuals have constant but unequal victimization risks. In the next section, the profile of individuals and settings which are vulnerable to crime and crime repetition is outlined.
- Event dependence (true contagion) – The chances of a second, third, and so on and so forth crime depend upon the outcome of the previous one. All individuals have the same initial risks, but these change after each victimization event. For instance, during his/her first attempt, an offender acquires more knowledge about the target. It is only natural that this new experience will inform and increase the chances of subsequent victimization of the same target.
- Spells – It is the time periods during which an unusually large number of crimes occur. For instance, burglars may operate in an area for a period of time and then move elsewhere perhaps being locked up or reformed. At the time of writing this, there is a spell of gold-related burglaries due to its increased price, for instance.

Traditional victimization theory and the majority of academic empirical research focus on the first explanation. Indeed, population heterogeneity has guided the prediction of the victim/non-victim dichotomy (please see the considerable work by Professors Lauritsen, Miethe, McDowall, and colleagues). The frequency of crime experience and victimization history is however ignored with few exceptions (for instance, Lauritsen and Davis-Quinet 1995), and as mentioned, it may not be a priority in terms of crime prevention as it is repeat crimes that contribute to high crime rates (Pease 1998). The second explanation, event dependence, has guided crime prevention by the Home Office in England and Wales since the 1990s and elsewhere (Pease 1998). The third explanation, spells, has hardly been explored to date (Bowers and Johnson 2005).

Predicting Victimization Frequency

In an oversimplified statement, which, as such, is open to legitimate criticism, victimization frequency depends on "who you are, where you live, and past crime experiences." To be more precise, it can be predicted from the following:

- Individual risk and protective factors and their interactions
- The conditioning of the risk and protective factors according to context and
- The conditioning of the risk and protective factors according to victimization history

The various combinations of the above elements, given reliable victimization survey data and good statistical model fit, can tell how many times crime is expected to occur. The relative importance of each individual and contextual attribute as well as victimization history depends on the specific crime type examined. It has long been established that the mechanisms of victimization are better captured when focusing on narrower crime categories rather than aggregate crime types (Kennedy and Forde 1990). After modeling burglary incidence in England and Wales for almost two decades, the current author can safely say that, although the major risk and protective factors remain unchanged over time, their relative importance may change. Therefore, crime prevention practitioners and other readers should take the order of the independent effects given herein with a pinch of salt.

Independent Effects and Their Interactions

This section overviews the strongest (in terms of size of statistically significant effect) risk and protective factors associated with crime-specific victimization frequency. Perhaps not surprisingly, these effects are consistent both across periods and cross-nationally (Osborn and Tseloni 1998; Tseloni 2000; 2006). The following bullet points give the eight most important crime-specific factors. Eight is an arbitrary cutoff point (the full lists of risk and protective factors are available in the original studies). These are risk factors (indicated via R) which increase the mean number of crimes or protective (indicated via P) that reduce them. More than one attribute within the same bullet point implies that the effect sizes are effectively identical although the signs may be opposite, that is, presenting an (R) and a (P) along the same line.

The crime types overviewed here are total household and total personal crime (contrary to the writer's own wisdom given in the previous section), burglary, household theft, and criminal damage.

The frequency of household crime can be predicted from the following:

- 3+ Cars (R)
- Lone parent (R)/prior assault (R)
- Inner city (R)/prior burglary (R)
- Social renting (R)
- Number of cars per household in the area (P)/terraced or town house (R)
- Percentage of 5–15 years old in the area (R)/area population density (R)/urban (R)
- Prior car theft (R)
- Over £30,000 household income (R)

The well-established opposite effect of individual and contextual affluence on victimization is demonstrated here. Area affluence, which is indicated by the average number of cars per household, is a protective factor against household crimes, while household affluence, given by the number of cars in the household and high income (Over £30,000), is a clear risk factor (Tseloni et al. 2002). Therefore, it seems that from a policy perspective, the relative well-off households in poor areas require more household crime protection than their neighbors which may contradict intuitive justice sentiments. In this vein, the relatively modest households living in affluent areas may consider themselves safe from being targeted.

The second fundamental lesson to be retained is that victimization history, even by a different crime type, as in the prior assault effect on aggregate household mean crimes above, is of high importance. Therefore, event dependence effects via the use of panel data, such as the NCVS, or questionnaire items about crime experiences that happened prior to cross-sectional surveys' reference period are equally worth capturing as socioeconomic and contextual attributes (population heterogeneity).

Household crimes are disaggregated into burglary, household theft, and criminal damage – motor-vehicle crime is ignored here as it can happen away from the victims' residence. The following set of bullet points shows the main factors associated with each crime type.

The frequency of burglary including attempts can be predicted from the following:

- 3+ Cars (R)/lone parent (R)
- Social renting (R)/prior burglary (R)
- Prior assault (R)
- Number of cars per household in the area (P)
- Prior car theft (R)/flat 2nd floor or above (P)
- 1–2 years in the area (R)

- Inner city (R)
- Percentage of 5–15 years old in the area (R)

The best predictor for frequent burglaries is three or more cars in the household; the second and the third most important risk factors are again related to event dependence: been burgled and assaulted in the past (prior to the study period). To demonstrate the earlier point about crime definition- and period-specific effects, in analyses based on more recent BCS data, car ownership loses its top place in the set of associated factors to inner city/urban residence. In addition, when isolating burglary with entry from attempted burglary, a different order of the same set of risk factors appears (Tseloni 2011).

The frequency of household thefts can be predicted from the following:

- 3+ Cars (R)/lone parent (R)
- Prior assault (R)
- Social renting (R)
- Ethnic minority (P)
- Prior burglary (R)
- Terraced (R)
- Prior car theft (R)
- Nonmanual household reference person, henceforth HRP (R)

The following are most associated with the frequency of criminal damage:

- 3+ Cars (R)
- Prior assault (R)
- Percentage of 5–15 years old in the area (R)
- 1 or 2 cars (R)
- Terraced (R)
- Social renting (R)
- Number of cars per household in the area (P)/3 + adults in the household (P)
- Percentage of Indian-subcontinent household representative person (politically correct term for "head of household") in the area (P)

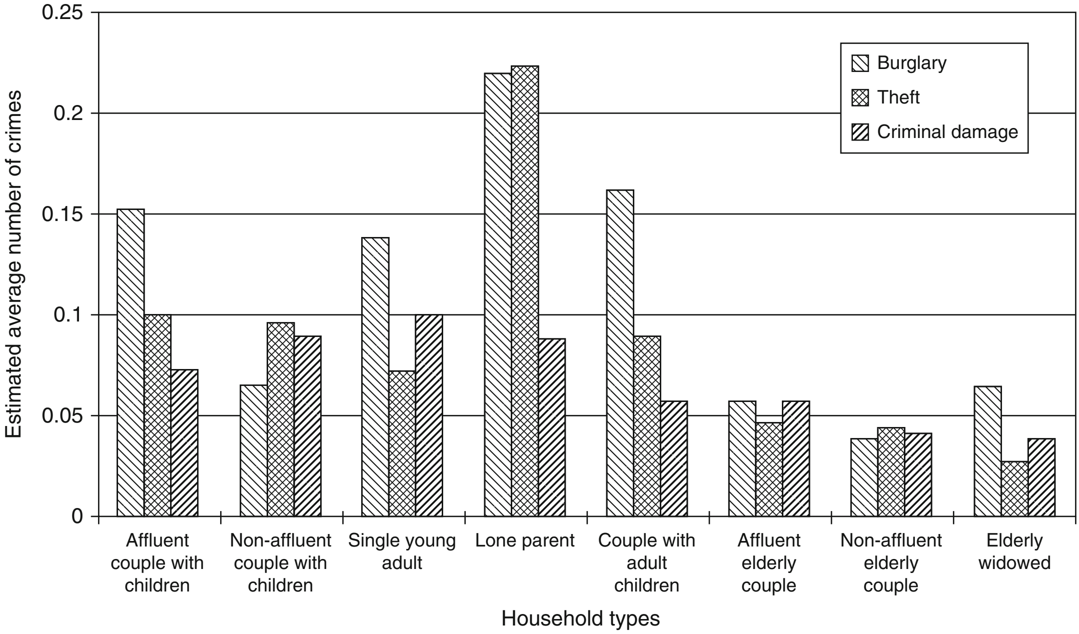
As seen, for instance, the availability of young people in an area is the third most important factor for criminal damage but does not feature in the top eight factors for household theft and makes it last for burglary.

The risk and protective factors of personal crime are the following:

- Divorced (R)
- Single (R)
- Ethnic minority (P)
- 3+ Adults in the household (R)
- Social renting (R)/inner city (P)
- Private renting (R)/children (R)/flat (R)
- Area population density (R)
- Terraced (R)/over £30,000 household income (P)

Three things should be noted here. First, the ninth most important risk factor, which did not make it to the list, is area deprivation. Second, individuals' affluence, ethnic minority, and living in inner city are protective factors for personal crimes. Third, gender is not within the eight (or nine) most associated factors. All three do not only appear in incidence analyses but replicate victimization risk results. Indeed, some studies have not evidenced any significant difference in personal victimization between men and women (Rountree et al. 1994), especially within households of high vulnerability (Tseloni 2000). If anything, females have higher chances of experiencing personal theft than males (Miethe and Meier 1990). Ethnic minorities are significantly less victimized by personal crimes than Whites overall (Tseloni 2000; Lauritsen 2001) and, in particular, when spending at least a night out per week, in full-time employment or study (Miethe et al. 1987) and within ethnically heterogenous communities (Rountree et al. 1994). More research is under way at the time of writing this both in the USA and the UK, but the traditional lifestyle theory propositions that males and/or ethnic minority individuals are more exposed and therefore victimized than others (Hindelang et al. 1978) seem to be counterindicated by results of contextualized individual effects.

The frequency of victimization increases if households or individuals possess multiple risk factors. It diminishes if they possess risk alongside protective factors. In addition, some combinations of attributes reinforce victimization over and above the simple sum of the respective individual effects. For instance, in general, men are more frequently "threatened" than women. But divorced women experience triple the number of threats as divorced men (Tseloni 1995). Similarly, widowed people, who are in general the



Understanding Victimization Frequency, Fig. 3 Estimated mean rates of property crimes for fictitious households in an average area of England and Wales based on the 1992 BCS (Source: Tseloni et al. 2002)

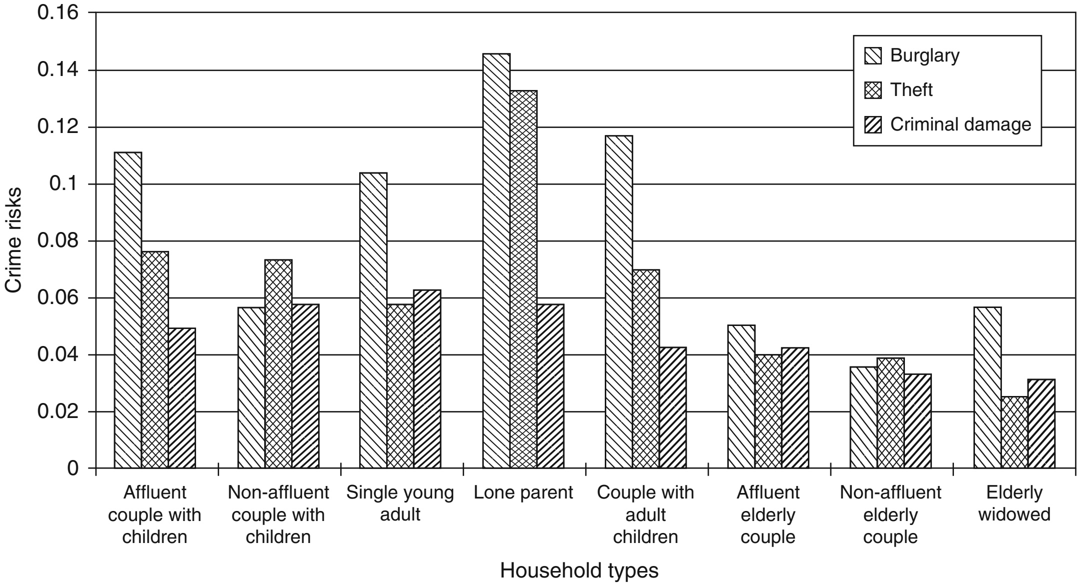
least victimized by personal crime marital status group, become disproportionally vulnerable in densely populated areas (Tseloni 2010). Therefore, context is as important as individual characteristics and lifestyle. The following section illustrates this point and the one after next explores it in more detail.

So What? How Practitioners Might Make Use of Predicted Population Heterogeneity

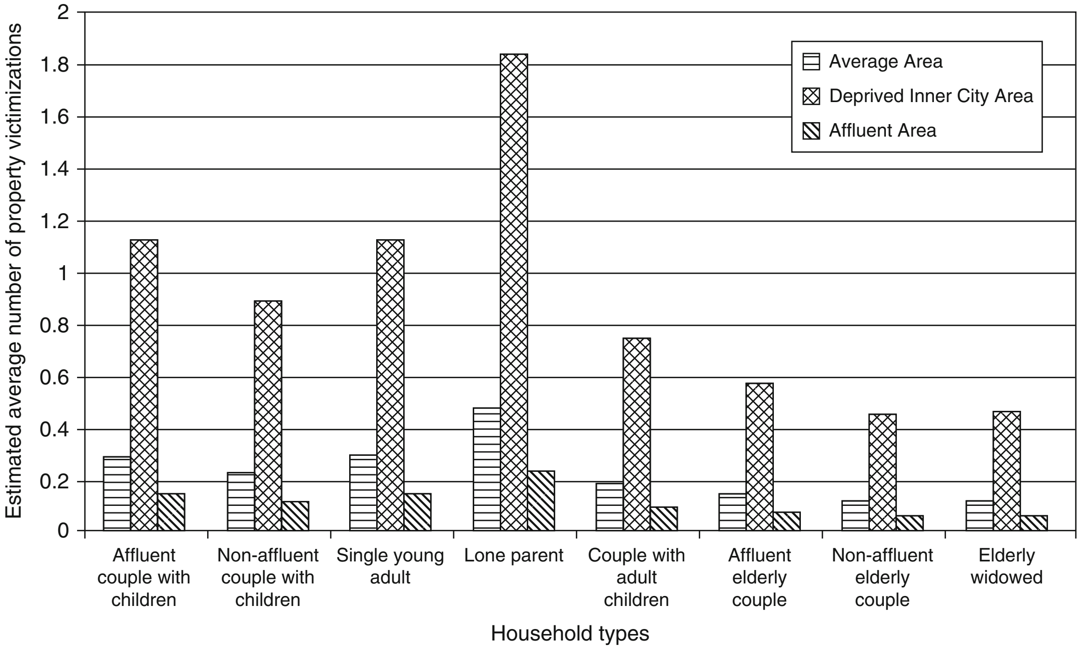
Figure 3 shows how estimated crime rates from empirical statistical models can provide information about the relative vulnerability of different households. Having this knowledge, group-specific crime prevention can be developed. For instance, a nonaffluent family experiences considerably more thefts than burglaries. Therefore, if this result is replicated, this group would benefit more from awareness about the risks of offering access into their house than from technological target hardening via burglary prevention devices. By contrast, a couple with adult children which probably possesses more valuables and gadgets would benefit from target hardening.

Figure 4 offers the same information as Fig. 3 but for risk rather than average victimization frequency. It is evident that notable differences exist between predicted risk and incidence. For instance, lone parents are at greater risk of burglary than theft but the mean number of respective events is similar. Single adults experience more incidents of criminal damage than theft but similar risks. This demonstrates that a different story might be told when risk and incidence are examined. By the same token, if interest centered upon victims of three or more repeats, a different order of specific-crime-type frequency per household composition might have appeared. Therefore, modeling (and predicting) the entire distribution of crimes offers flexibility in the choice of a cutoff point for analysis and intervention.

Figure 5 shows how the predicted household crime incidence over household types is influenced by area of residence. Even low vulnerability groups, such as a nonaffluent elderly couple, may experience more crimes in deprived inner city areas than the most vulnerable population subgroup, lone parents, in affluent areas.



Understanding Victimization Frequency, Fig. 4 Estimated risks in property crime categories for hypothetical households in an average area (Source: Tseloni et al. 2002)



Understanding Victimization Frequency, Fig. 5 Estimated mean rates of aggregate property crime victimization for hypothetical households across selected areas of England and Wales (Source: Tseloni et al. 2002)

Therefore, context has a direct effect on victimization frequency. The next section discusses how it may also interact with and condition the individual and routine activity effects.

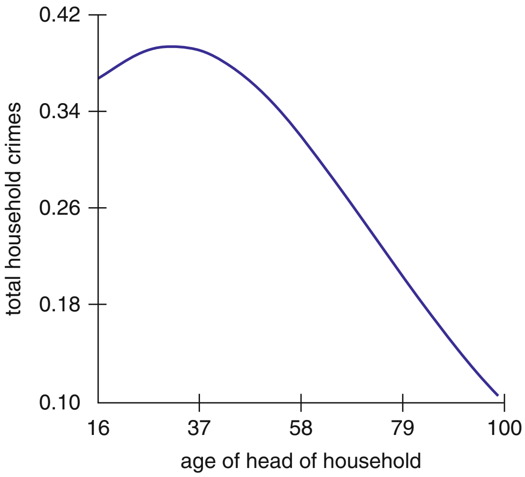
Conditioning of Individual Factors According to Context and Victimization History

The interaction between individual and contextual characteristics, the so-called cross-cluster effect (Rountree et al. 1994; Tseloni 2006), addresses the following question: Why is person A more vulnerable than person B in a given situation but not always?

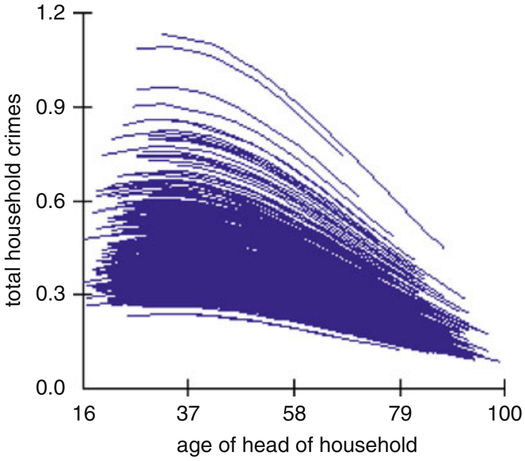
There are two types of cross-cluster interactions: explained, such as the area deprivation interaction with widowhood mentioned in the earlier subsection "Independent Effects and Their Interactions," and unexplained or random. In the latter case, the importance of a risk or protective factor alters by context. It may jump up or down few places in the series of bullet point lists given earlier (subsection "Independent Effects and Their Interactions") from one area to another. To illustrate this, please, consider the classic negative age effect on victimization. Figure 6 shows the average effect for England and Wales in 1999.

Age is indicated as the horizontal axis of Fig. 6. Household crimes (indicated in the vertical axis) increase for HRPs between the ages of 16 (the lower bound of the BCS sample at the time) and about 34 years old and then drop sharply as HRPs grow older. This curve however portrays the average of a wide range of age effects, such as seen in Fig. 7. Households with young HRPs experience about six times more household crimes in the "worse" area than in the best area. As they grow older, the number of household crimes they may experience converges regardless of where they live. As a result, ageing reduces victimization incidence more sharply in the "worst" area compared to the "good" ones.

Another example is the lone parent risk factor: In "good" areas, lone parents are expected to experience roughly the same low number of household crimes as others, but in the "worst" area, they may experience roughly ten household crimes per year (Tseloni and Pease 2010). Similar conditioning of individual effects and lifestyle has been evidenced in victimization risk analyses especially, as mentioned in subsection "Independent Effects and Their Interactions," with regard to ethnicity (Lauritsen 2001; Rountree et al. 1994).



Understanding Victimization Frequency, Fig. 6 Total property crimes over age of household reference persons (Source: Tseloni and Pease 2010)



Understanding Victimization Frequency, Fig. 7 Total property crimes over age of "household reference person" for households clustered within English and Welsh areas (Source: Tseloni and Pease 2010)

The last issue in predicting crime concentration is to examine whether the effect of victimization history on current crime experiences depends on sociodemographic characteristics and lifestyle of individuals. To some extent, and especially during adjacent periods, when victims' attributes and routine activities remain the same, event dependence is an indication of unmeasured population heterogeneity, namely, of subtle differences between people or households. The effects of recent victimization history in the short run are exacerbated by outgoing lifestyle and vary widely according to area of residence (Tseloni and Pease 2004).

Future Agenda

This essay discussed the acquisition of knowledge during the last two decades or so on victimization frequency and its prediction. In particular, crime risk and concentration can be examined simultaneously via crime count models and predicted from individual and contextual factors, victimization history, their interactions, and contextual conditioning.

That prediction will most definitely improve if population crime surveys:

- Incorporate a longitudinal element with data on the same households (rather than addresses as currently in the NCVS) that span longer than the 1-year reference period.
- Collect detailed information about each incident that occurred per victim.
- Locate as precisely as possible incidents on a timeline.

Given that crime concentration is predictable, it can also be prevented.

Overview

A growing international literature has been attentive to the collateral consequences of net-widening imprisonment policies, observing that the social costs of steadily rising prison admissions in an era of rapidly declining crime rates might very well outweigh the crime-control benefits. The potential irony of mass imprisonment is that, to the extent it has unintended adverse effects on life outcomes that are correlated with criminal offending, large-scale growth in the incarceration rate may actually exacerbate the crime problem over the long run by stigmatizing an ever larger class of individuals.

One unintended collateral consequence faced by ex-inmates might be felt acutely in the institution of marriage. Specifically, a prison record might erode one's prospects for family formation by delaying or permanently disrupting the transition to marriage. Imprisonment might also disrupt intact marriages by increasing the risk of divorce. In light of compelling research demonstrating an inverse relationship between marriage and criminal behavior, such difficulties could inadvertently sustain an individual's criminal career. Marriage has a prominent place in criminological theory and research as one institution that has the potential to genuinely foster desistance from a criminal career. Mass imprisonment policies in the United States and elsewhere, therefore, pose a potential threat of increased crime if they impede the ability of ex-prisoners to reintegrate into society by stigmatizing them and limiting their chances in the marriage market.

A second unintended collateral consequence of imprisonment that is central in criminological literature pertains the effects of incarceration on physical and mental health. Criminological literature suggests that former inmates are relatively more vulnerable for mental disorders (e.g., depression and suicide) and chronic and infectious diseases such as HIV, tuberculosis, and hepatitis. Moreover, there can be expected to be an ultimate collateral health outcome of incarceration, that is, premature death. Scholars and policymakers are relatively uninformed about the causal effects of incarceration on premature death after release from prison. However, several studies revealed relatively high mortality within prisons and during life after prison.

A third unintended collateral consequence of imprisonment pertains the effects of parental imprisonment on their children's behavior and well-being. There is increasing concern that imprisonment may have far-reaching undesirable consequences for families of prisoners and the wider community. However, these implications are understudied.

This entry provides an overview of the theoretical background and the empirical earlier studies on three unintended collateral consequences of imprisonment: (a) marriage and divorce, (b) mortality, and (c) criminal behavior of children of (ex-)prisoners.

Unintended Effects of Imprisonment I: Marriage and Divorce

Theoretical Background

A number of plausible theoretical explanations can be marshaled to interpret the inverse correlation between incarceration and marriage among unmarried offenders or the positive correlation between incarceration and divorce among married offenders (see for a review Apel et al. 2010). Four possibilities are discussed below, although it is cautioned that the review is not intended to be exhaustive.

First, one mechanism by which incarceration would conceivably erode marriage prospects is through the stigma of imprisonment and the "signal" that such a label transmits to potential spouses. From the perspective of signaling theory and its sociological counterpart – labeling theory – a prison record conveys (however, imperfectly) information about a person that entails more than just his or her future risk of criminal behavior. For example, it might communicate something about one's prospects for success in the labor market, about one's ability to provide for a family, about the company that one chooses to keep, about a potential spouse's risk of becoming a victim of domestic violence, and so on. In other words, a label of "ex-inmate" provides important information that is used by prospective spouses to assess the labeled individual's reputation, integrity, and future prospects – criminal and non-criminal alike. If potential spouses are responsive to cues about one's "marriage potential," it is conceivable that a prison record conveys, quite simply, that one is not marriage material. Incarceration would thus lead to exclusion from the pool of eligible marriage partners because one is viewed as a less viable and attractive partner.

Second, stigmatization might operate in a second, related way by constraining the social networks of ex-inmates and thereby limiting the opportunity to meet potential dating or marriage partners. While crime-prone individuals might run in social circles and frequent geographic locations dominated by like-minded others (through a process of self-selection or social homophily), incarceration and the formal labeling process might exacerbate this tendency through a process of subculture formation among similarly stigmatized individuals. To the extent that policies of mass imprisonment create a society of outcasts through processes of social exclusion, incarceration might result in growing isolation from conventional peer contexts and growing integration into criminal peer networks. This "criminal embeddedness," or social embeddedness in crime, would provide fewer opportunities than before to meet marriageable partners.

Third, for married offenders, incarceration imposes a period of time-out from the marriage. Because incarceration often removes offenders from their communities of residence, married inmates are physically isolated from their spouses and families, which can lead to disruption in the quality of existing marital ties (Lopoo and Western 2005). The stress of separation could lead to withdrawal and dissolution as alternative sources of emotional support are sought by the "surviving" spouse. Additionally, the loss of economic support by the imprisoned individual might motivate a spouse to separate or divorce in the interest of finding a new partner who can help stabilize the financial situation in the household, particularly if children are present (see Phillips et al. 2006).

Fourth, an entirely different view on the incarceration–marriage relationship flows from the possibility that individuals sort themselves into certain institutional settings on the basis of a differential tendency to consider the long-term consequences of their actions, what Gottfredson and Hirschi refer to as self-control. Because individuals with low self-control seek immediate gratification of their desires with minimal effort or long-term planning, they are less likely to be married or, if married, will tend to have difficulty maintaining a stable union: "People who lack self-control tend to dislike settings that require discipline, supervision, or other constraints on their behavior" (Gottfredson and Hirschi 1990, p. 157). Additionally, individuals with low self-control are theorized to be self-centered, insensitive, and nonverbal, qualities that would also likely interfere with union formation and stability. Simply put, non-marriage, an unstable marriage, and crime are all manifestations of the versatility of individuals with low self-control.

Earlier Research

Four datasets provide the only quantitative evidence pertaining to the effect of imprisonment on the likelihood of marriage. For example, data from the Glueck delinquents support the notion that juvenile incarceration disrupts marital unions in adulthood. Sampson and Laub (1993) found that men sentenced to a reformatory as juveniles were more likely to be divorced in young adulthood (ages 17–25) and middle adulthood (ages 25–32). In their model of the propensity to marry (in order to estimate the effect of marriage on crime), Sampson et al. (2006) found that the length of juvenile incarceration was inversely correlated with the probability of marriage throughout adulthood and into the seventh decade of life. Thus, early imprisonment appears to erode a man's long-term marriage prospects. Evidence from the Glueck men also suggests that incarceration impedes marriage formation in adulthood, both contemporaneously and in the short term. For example, Sampson et al. (2006) found that the length of incarceration in the previous year (as well as cumulative incarceration length) was inversely correlated with the probability of being married in the current year.

A pair of studies utilized the Fragile Families and Child Well-Being Study (FFCWS) to estimate the effect of incarceration on family formation among a high-risk sample of parents of newborn children. Western and McLanahan (2000) found that the cumulative incarceration status of the father (at the first follow-up) was strongly related to whether or not the family was intact, that is, whether the father resided with the child's mother in either a cohabiting or marital situation. Specifically, an incarceration history (as reported by the father) reduced the odds of living together by 49 % (odds ratio = 0.51). Using the same dataset, Western et al. (2004) reported that the father's incarceration history (as reported by either the father or mother) was inversely associated with the likelihood of cohabitation and marriage relative to nonresidence (see also Western 2006).

Several recent studies using the National Longitudinal Survey of Youth 1979 (NLSY79) have investigated the relationship between incarceration and marriage. Western (2006) observed that 40 % of males with a prison record remained unmarried until age 40 compared to just over 10 % of never-incarcerated males. Lopoo and Western (2005) reported that male offenders were significantly and substantially less likely to get married during periods in which they were interviewed in an institution. In their discrete-time event history model of first marriage using the 1979–2000 interviews, they estimated that the odds of the transition to marriage were 78 % lower (odds ratio = 0.22) for incarcerated individuals compared to their non-incarcerated counterparts. Similar results were reported from the 1983 to 2000 interviews by Huebner (2005); for race-specific analyses, see Huebner 2007) in a fixed-effects model of marriage, in which she estimated that the odds of being married were 39 % lower for currently incarcerated individuals (odds ratio = 0.61). One notable exception was the study by Raphael (2007) using the 1979–1996 interviews, who found that current incarceration had no impact on the probability of never being married once individual effects were controlled.

With respect to the long-term (versus contemporaneous) relationship between incarceration and marriage in the NLSY79, Huebner (2005, 2007) reported that a history of incarceration as an adult – from the 1983 survey onward, when all respondents were at least 18 years of age – was inversely associated with the probability of marriage but that youthful incarceration (prior to the 1983 interview) was not correlated with marriage. Raphael (2007) noted that having ever been incarcerated prior to the current interview was associated with about a 14-point increase in the probability of having never been married. Lopoo and Western (2005), on the other hand, observed no such effect of having ever been incarcerated on transitions to marriage and divorce. The preponderance of evidence from the NLSY79 suggests, therefore, that incarceration is inversely correlated with marriage, although when measured contemporaneously, this is conceivably an incapacitation effect of prison on marriage likelihood. The findings about the long-term or accumulative effect of incarceration on marital transitions are more equivocal.

Research on the likelihood of divorce is rarer still, but the results are quite consistent. Lopoo and Western (2005) and Western (2006) found that a transition to divorce was significantly more likely to occur contemporaneous with periods of incarceration in the NLSY79. In particular, there was an astonishing twofold increase in the odds of divorce among individuals who were incarcerated relative to their non-incarcerated peers (odds ratio = 2.99). In the FFCWS, Western (2006) similarly found that incarceration significantly increased the risk of separation for men in marital or cohabitational unions, and in fact it was among the strongest predictors in his model (odds ratio = 2.23). Thus, incarceration appears to have a major disruptive effect on preexisting unions.

Finally, Apel et al. (2010) use a long-term study of a conviction cohort in the Netherlands to ascertain the effect that first-time imprisonment has on the likelihood of marriage and divorce. The analysis uses data from the Criminal Career and Life-Course Study (CCLS), a large-scale longitudinal study. The results suggest that the effect of imprisonment on the likelihood of marriage (among unmarried offenders) is largely a selection artifact, although there is very weak evidence for a short-lived impact that does not persist past the first year post-release. This is interpreted as a residual incapacitation effect. On the other hand, the results strongly suggest that the experience of incarceration leads to a substantially higher divorce risk among offenders who are married when they enter prison.

Unintended Effects of Imprisonment II: Mortality

Theoretical Background

Although some criminological theories have suggested that offenders are more likely than non-offenders to suffer early morbidity and mortality, knowledge on the exact nature of the relationship between incarceration and mortality remains scarce. A number of criminological and health theories were reviewed to learn more about the possible effects of imprisonment on mortality. A literature review shows that, based on different theories, at least four conflicting hypotheses can be formulated about the expected effects of imprisonment on mortality (see Dirkzwager et al. 2012).

First, it is possible that imprisonment has no effect on mortality at all. In that case, differences in mortality rates between ex-prisoners and others result from the fact that other common factors influence both imprisonment and mortality. For instance, individual factors such as low intelligence and high impulsivity can cause criminal behavior, as well as poor health and mortality. In their general theory of crime, Gottfredson and Hirschi (1990) emphasize the importance of the causal agent of low self-control in explaining crime. Compared with their high self-control counterparts, individuals with low self-control are more likely to engage in all sorts of criminal, reckless, and risk-taking behavior throughout their life course. Empirical studies have provided evidence for this theory and showed that personality factors such as high impulsivity, low self-control, and a high need for sensation seeking were related to criminal behavior as well as to an irregular and unhealthy lifestyle with excessive drinking, drug use, risky sexual behavior, and risk-taking in traffic.

Another factor that may influence both criminal behavior (including imprisonment) and mortality is socioeconomic status. It is well established that individuals of low socioeconomic status are overrepresented in prison populations. Throughout history, socioeconomic status (even without delinquency) has been related to health, with persons higher in the social hierarchy having a better health than those lower in the hierarchy. Additionally, research consistently demonstrated a relationship between low socioeconomic status and mortality risk from all causes, as well as specific causes of death.

Second, it can be hypothesized that imprisonment has a direct positive effect on health and consequently decreases the risk of premature mortality. It is, for instance, possible that imprisonment decreases mortality risk by improving prisoners' health. Life in prison can have some healthy elements. For instance, in some countries, prisoners receive three meals a day, have a right to exercise, have free access to medical and mental health care that must meet the same quality requirements as health care outside prison, and have fewer possibilities to use drug and alcohol while imprisoned. Such health-improving elements of imprisonment may be particularly beneficial for individuals who were already living in problematic circumstances before imprisonment, including poverty, addictions, and homelessness.

Imprisonment can also be hypothesized to change prisoners' skills, knowledge, and values. Some theories such as learning theories, and economic and social control theories, argue that investment in human capital (i.e., an individual's skill level, knowledge, and experiences) will increase a person's (market) value, will increasingly embed a person into conventional society, and will increase the costs associated with further criminal behavior. This idea is consistent with the rehabilitation goal of imprisonment. By offering training (such as education, job training, and social skill training), prisoners are expected to acquire new skills that may increase the possibilities of a conventional life and decrease the chance of future criminal behavior. Thus, when the rehabilitation of prisoners is successful, former prisoners are equipped with more constructive skills that may enhance a healthier lifestyle with a decreased risk of mortality.

Third, it is possible that imprisonment has a direct negative effect on health and consequently increases mortality risk. A prison experience can be seen as a major stressful event in prisoners' lives, which may negatively affect their mental and physical health, and thereby increase their risk of mortality. Stress theories argue that major life events and exposure to prolonged stress require major behavioral adaptation. Exposure to (chronic) stress will result in an increased awareness of the body and a burdening of certain physiological and bodily systems (e.g., cardiovascular, immune, and hormone systems). On the long term, if an individual is unable to successfully adapt to stress, this can predispose an individual to disease. Major life events have been related to a number of negative health outcomes, such as psychiatric problems, morbidity, and mortality.

Moreover, in some countries, the conditions of confinement are harsh, including a lack of food and medical services, poor quality of care, limited possibilities for self-care, aggressive incidents, and overcrowding. Such conditions can negatively affect prisoners' health on the long term and may increase the risk of premature death after release from prison. Furthermore, relatively high rates of chronic and infectious diseases are observed within prison facilities. Therefore, prisoners may be disproportionately exposed to such diseases that can negatively affect their further health and increase their risk of premature death. Finally, it has been argued that prisons can be "schools of crimes" and breeding grounds for further crime. In line with this belief, a prison experience will increase the chances of future criminal and risky behavior and associated risks of experiencing violent encounters in life.

Fourth, imprisonment may have an indirect negative effect on health and therefore increase the risk of premature death. Research has shown that imprisonment can be a turning point, changing the lives of those involved in a negative way. Imprisonment can, for instance, result in long-lasting problems on the labor market, a loss of income, and homelessness. Additionally, incarceration removes the prisoners from their spouses, families, friends, and neighbors. As a consequence, former prisoners can experience difficulties in family formation and dissolution and a decrease in social networks and social capital. Former prisoners often have to deal with stigmatizing reactions that may also negatively affect the degree of social support. All these factors, that is, a low socioeconomic status, unmarried civil state, and decreased social support, are associated with increased mortality risks in themselves.

In sum, criminological and health theories do not provide clear and unequivocal answers but confront us with alternative hypotheses about the way imprisonment can result in either higher or lower risks of premature mortality.

Earlier Research

The limited knowledge on the effects of incarceration on premature death is, to a large extent, due to limitations in the research design of the existing studies. Determining an effect of incarceration on mortality is difficult because a selective group of offenders will enter prison. A review of the literature (see Dirkzwager et al. (2012) for more information) shows that to date only 24 studies worldwide have compared postprison mortality rates of ex-prisoners with the mortality rates of some kind of comparison group. The studies investigated mortality rates among former inmates in different parts of the world, such as the United States, the United Kingdom, Australia, and Europe. There was a substantial difference in the length of the postprison follow-up periods.

In most of these studies (i.e., 22 of the 24 studies), the mortality rates of former prisoners were compared with rates in the general population (age and gender adjusted). This is problematic, however, because there are well-known preexisting differences between prisoners and the general population (e.g., in criminal history, educational level, ethnicity, social class, mental health). Therefore, such studies may be seriously biased in their estimates of the effects of incarceration on mortality (i.e., probably overestimating prison effects). Subsequently, such studies are problematic in drawing causal conclusions regarding the effects of imprisonment on postprison mortality.

However, even the two studies (Fleming et al. 1992; Sattar 2001, 2003) using more appropriate control groups (i.e., offenders receiving noncustodial sentences instead of the general population) did not take selection effects adequately into account. Obviously, the assignment of offenders to custodial or noncustodial sentences is not random. Judges will be more likely to imprison offenders who have committed serious crimes, who have more prior convictions, and who have a high risk of recidivism. The idea that more serious and frequent offenders encounter more difficulties in their lives, including health and mortality problems, is well established.

As mentioned, to identify studies on the effects of imprisonment on postprison mortality, Dirkzwager et al. (2012) performed an extensive literature search. Based on this search, they identified 24 studies that examined mortality rates among former prisoners, relative to a comparison group. Of the 24 studies, 22 compared mortality rates of former prisoners with rates in the general population, adjusted for age and gender (sometimes also adjusted for race). The results consistently show that compared with gender- and age-adjusted persons from the general population, former inmates were more likely to die from both natural and unnatural causes of death. Former inmates appear particularly at risk of dying during the first few weeks after release from prison. Mortality during the first weeks following release of prison was particularly associated with death by drug overdose. This suggests that, soon after their release, addicted prisoners used drugs again and died due to overdose (perhaps by accident, having not used drugs during imprisonment). Other prevalent causes of unnatural deaths among former prisoners were accidents, suicide, and homicide. Leading causes of natural deaths among former prisoners were cardiovascular diseases, cancer, liver diseases, and infections.

Comparing mortality rates of former prisoners with gender- and age-adjusted persons from the general population can be informative. However, this method can provide only limited information regarding the relationship between imprisonment and the increased risk of premature death. The group of former prisoners and the general population differ on more characteristics than age and gender alone. Prison populations are, for instance, overrepresented by ethnic minorities, people from lower social classes, and people with poor mental and physical health (Sattar 2001); such preexisting differences can also cause differences in mortality rates.

A more adequate approach is to compare former prisoners with a more similar control group, such as offenders who were sentenced to a noncustodial sentence. Only three studies have investigated mortality rates among former prisoners and offenders receiving noncustodial sentences. First, in England and Wales, Sattar (2001, 2003) compared the nature and risk of death of prisoners, with offenders serving community sentences, former prisoners being supervised in the community, and the general population. Standardized mortality rates showed that, compared with the general population, community offenders and former prisoners were both more likely to die. Mortality rates of former prisoners were either somewhat lower (in 1996) or similar (in 1997) to mortality rates of offenders serving community sentences (Sattar 2003). Although these overall mortality rates may seem similar, the study also showed that ex-prisoners were more likely to die within the first weeks after release from prison. These results suggest that the phase immediately after release is particularly risky for ex-prisoners in terms of accidents or incidents with drugs, alcohol, or suicide (Sattar 2003).

Second, in Australia, Fleming et al. (1992) investigated people who died while they were serving a noncustodial correction order during the years 1987 and 1988. The sample consisted of offenders on parole (i.e., ex-prisoners) and offenders serving other community correction orders, such as probation and community service orders. The mortality rate of ex-prisoners was 15.1 per 1,000 orders compared with 10 per 1,000 orders for offenders on probation and 2.2 per 1,000 orders for offenders serving community service orders. The results of their study suggest that former prisoners serving parole orders are at increased risk of premature death compared with people serving other forms of noncustodial sentences. It should be noted, however, that the group of parolees in their study was older than those serving other types of custodial orders, and age is also associated with mortality risks.

Third, in the Netherlands, Dirkzwager et al. (2012) examined the effects of first-time imprisonment on postprison mortality. Data are used from a longitudinal study examining criminal behavior and mortality over a 25-year period in a representative group of 2,297 Dutch offenders who had their criminal case adjudicated in 1977. Of these offenders, 597 were imprisoned for the first time in their lives in 1977. The remaining 1,700 offenders got a noncustodial sentence. Ex-prisoners' mortality rates and causes of death are compared with those in the general population and those in a matched control group of non-imprisoned offenders. Propensity score matching is used to minimize selection bias. Odds ratios with 95 % confidence intervals are used to examine whether mortality among the ex-prisoners differs significantly from the general population or from the non-imprisoned controls. About 18 % of the imprisoned offenders died over the 25-year follow-up period. Compared with the general population (age and gender adjusted), ex-prisoners are three times as likely to die during the 25-year follow-up (odds ratio [OR] = 3.21). Compared with a more appropriate control group of non-imprisoned offenders (matched on age, gender, and propensity score), ex-prisoners are no longer significantly more likely to die (OR = 1.40). In line with the available research, the Dutch results demonstrate significantly elevated mortality rates among former prisoners when compared with age- and gender-adjusted individuals from the general Dutch population. In the present study, ex-prisoners were three times more likely to die during the 25-year follow-up period than persons from the general population. The difference in mortality rates between former prisoners and non-imprisoned offenders of similar age and gender was substantially smaller and even became nonsignificant when former prisoners were compared with non-imprisoned offenders who were similar regarding age, gender, and propensity score. The results of the present study emphasize the importance of constructing appropriate comparison groups when examining the effects of imprisonment on postprison mortality.

Unintended Effects of Imprisonment III: Criminal Behavior of Children of Prisoners

Theoretical Background

Reviews by Murray and Farrington (2008a) and Van de Rakt et al. (2012) distinguish four theories that explain how paternal imprisonment might cause an increase in child criminal behavior. First, trauma theories suggest that the parent–child separation caused by the imprisonment might be harmful for children (for a full discussion of this perspective, see Murray and Murray 2010). Attachment theory and social bonding theory both acknowledge the importance of children's attachment to their parents. The separation caused by imprisonment usually is unexpected, and opportunities for contact are often very restricted during their imprisonment. Following trauma theories, disrupted attachment to the parent following parental imprisonment might cause an increase in children's delinquent behavior. Parental imprisonment might have stronger effects on children if it is experienced early in childhood, because parent–child bonding in early childhood is particularly important for child development, and separation can be more disruptive when young children have fewer cognitive skills to process the event. Longer separations might predict worse outcomes for children.

Second, modeling and social learning theories suggest that parental imprisonment might cause an increase in child criminal behavior because children become more aware of parental criminality and imitate their parents' behavior. Differential association theory (Sutherland et al. 1992) proposes that criminal behavior is learned in the same way as normal (accepted) behavior is learned. Thus, learning of criminal behavior primarily takes place in intimate personal groups, such as the family. Not only are the techniques to commit crime learned, but motives, values, and attitudes toward crime are also learned. Association with criminal parents might be especially influential in determining children's criminal behavior. Parental imprisonment could make children more aware of their parent's criminality and encourage the idea that committing crimes is normal and desirable. Such learning and imitation processes might be especially strong after early childhood, during adolescence, when children are more aware of the meaning of their parents behavior and imprisonment. At the same time, removal of a highly antisocial parent from the household, because of imprisonment, might mitigate these learning processes and, in some cases, actually reduce the probability that children develop criminal behavior.

Third, strain theories suggest that the loss of economic and social capital due to parental imprisonment causes children to commit more crimes. Parents cannot contribute to family income while in prison, and telephone calls and prison visits can add considerably to family expenses. In the long term, imprisonment might lead to unemployment and fewer labor market opportunities for ex-prisoners. Also, children are more likely to have unstable care arrangements when one of their parents is in prison. Therefore, the quality of parental care and supervision may be reduced by parental imprisonment. Because of reduced income, social capital, and supervision, children with imprisoned parents may have fewer chances in school and in the labor market. This may increase their risk for delinquency compared to children of non-imprisoned parents.

Finally, labeling theories suggest that parental imprisonment might cause children to experience stigma, bullying, and teasing, which increases their criminal behavior. Children might become more reluctant to go to school and to socialize with other children. As a result, children with imprisoned parents might perform worse at school and in the labor market than their peers. There might also be official bias against children of prisoners, making them more likely than other children to be monitored by the police and to be convicted. Labeling mechanisms will be most likely to influence children when parental imprisonment endures for a long period of time and when it is experienced in adolescence. When children are somewhat older, they understand the meaning of parental imprisonment better. In these settings, stigmatization and bullying will be more powerful.

Earlier Research

A critical problem for research is to separate out the effects of parental imprisonment on children from the influence of other childhood risk factors. Large-scale longitudinal studies show that children of prisoners are much more likely than their peers to be exposed to other risk factors, such as low IQ, high daring, poor school attainment, poor parenting practices, parental criminality, and low family socioeconomic status. It is particularly important to disentangle the effects of parental imprisonment from the effects of parental criminality, because prisoners tend to be highly criminal, and there is strong evidence that crime runs in families.

To accurately estimate the long-term risks for children after parental imprisonment and the effects on children's criminal careers, studies need to use representative samples, suitable control groups, and long-term follow-ups. Five main studies have done this to date (for an extensive review of prior research, see Murray and Farrington 2008a; Van de Rakt et al. 2012).

In the first study, Huebner and Gustafson (2007) compared rates of adult offending behavior between 31 children whose mothers had been imprisoned and 1,666 children whose mothers had not been imprisoned in the National Longitudinal Survey of Youth (NLSY). The NLSY is a prospective longitudinal survey of males and females in the United States, who were aged 14–22 in 1979. Of children with imprisoned mothers, 26 % were convicted as an adult, compared with 10 % of controls. Controlling for background variables (including child, maternal, paternal, family, and peer risk factors), maternal imprisonment still significantly predicted adult convictions. These results are consistent with the idea that maternal imprisonment has a causal effect on children.

In the second study, Murray and Farrington (2005) investigated the effects of parental imprisonment on children in the Cambridge Study in Delinquent Development (CSDD). The CSDD is a prospective longitudinal study of 411 boys, born in 1953 and living in a working-class area of South London. Outcomes were compared between 23 boys who were separated because of parental imprisonment (between birth and age 10) and four control groups: (1) boys with no history of parental imprisonment or parent–child separation (up to age 10), (2) boys separated because of hospitalization or death, (3) boys separated for other reasons, and (4) boys whose parents were imprisoned only before the boy's birth. Parental imprisonment during childhood was a strong predictor of antisocial-delinquent behavior through the life course. For example, of boys separated because of parental imprisonment, 65 % were convicted themselves between ages 19 and 32, compared with 21 % of boys with no history of parental imprisonment or separation. Effects of parental imprisonment remained even after controlling for other childhood risk factors in the study (including parental criminality), suggesting that parental imprisonment might have a causal effect on children. Parental imprisonment also strongly predicted boys' mental health problems, educational failure, drug use, and unemployment in the CSDD.

In the third study, Murray et al. (2007) compared rates of adult offending behavior of 283 children whose parents were imprisoned (from the children's births until they were age 19) and 14,589 children without imprisoned parents in Project Metropolitan. Project Metropolitan is a prospective longitudinal survey of children born in 1953 and living in Stockholm, Sweden (Janson 2000). Parental imprisonment was strongly predictive of offspring criminal behavior between ages 19 and 30. Of prisoners' children, 25 % offended as adults, compared with 12 % of controls. However, when account was taken of background criminality of parents (using regression analyses and comparing children exposed to parental imprisonment in childhood with children whose parents were imprisoned only before the child's birth), there were no additional effects of parental imprisonment on children. This suggested that parental imprisonment did not cause offspring offending in Sweden.

In the fourth study, Kinner et al. (2007) compared 137 children whose mothers' partners had ever been imprisoned with 2,262 children whose mothers' partners had not been imprisoned in the Mater University Study of Pregnancy. This is a prospective longitudinal survey of 8,458 women who were pregnant in Australia in 1981 and their children. At age 14 years, children whose mothers' partners had been imprisoned were significantly more likely to have externalizing problems than their peers. However, after controlling for other parental and family risk factors, there was no effect of the imprisonment on child externalizing problems suggesting that the original association was spurious.

In the fifth study, Van de Rakt et al. (2012) investigated the effects of fathers' imprisonment on criminal convictions of their children (aged 18–30). Unique official data of the Criminal Career and Life-Course Study (CCLS) are used on a nationally representative sample of Dutch men convicted in 1977. Growth curve analysis is used to establish the influence of paternal imprisonment on the development of criminal careers of children. Special attention is paid to the timing and the duration of the imprisonment. The authors demonstrate an association between fathers' imprisonment and child convictions, especially when fathers are imprisoned when the child is between 0 and 12 years old. When fathers' criminal history is controlled for, the influence of paternal imprisonment becomes much weaker, although it remains significant. The dose–response relationship between the length of the father's imprisonment and children's convictions disappears after controlling for other variables. In the Netherlands, effects of paternal imprisonment on children are very weak and similar to the effects found in another study in Sweden.

In summary, five longitudinal studies show that parental imprisonment is strongly associated with child antisocial and criminal behavior. However, the evidence on causal effects is mixed: two studies suggest that there are causal effects, and three studies suggest that the relationship is weak or even spurious. It is possible that these differences are accounted for by differences in the social and penal contexts where the studies took place.

National Crime Survey; NCVS

Overview

The importance of the National Crime Victimization Survey (NCVS) and its predecessor the National Crime Survey (NCS) to the study of crime and development of crime statistics cannot be emphasized enough. For over 40 years, the NCS-NCVS has been one of only two ongoing national measures of crime in the United States that provide annual level and change estimates. The NCS-NCVS not only has played a groundbreaking role in shaping US crime statistics, but also international ones. This entry discusses the rich history of the NCS-NCVS with a focus on its methodological development. This entry also describes the survey's trends and key findings over time and the continued influence of the NCS-NCVS on crime measurement.

Introduction

The importance of the National Crime Victimization Survey (NCVS) and its predecessor the National Crime Survey (NCS) on the study of crime and development of crime statistics cannot be emphasized enough. The NCS-NCVS is one of only two ongoing national measures of crime in the United States that provide annual level and change estimates. In addition, the NCS-NCVS played a groundbreaking role in shaping US crime statistics. Before the NCS, no national crime statistics had been based on self-reported survey data from the general public. The other national source is from the Uniform Crime Reporting Program (UCR), which measures crime using official police records. To provide an understanding of the NCS-NCVS, this entry examines the history and development of the survey with a focus on its methodology. This entry then reviews key findings that have been obtained from the survey as well as a discussion of its effect on the study of crime and measurement of victimization.

History of the NCS-NCVS

In 1965, President Lyndon Johnson appointed two Presidential Commissions with charges that included examining the causes and characteristics of rising crime in urban areas in the United States and recommending policies and programs to reduce this apparent growing crime problem (Cantor and Lynch 2000). The Commissions immediately confronted the problem of a significant lack of information from which to accomplish their charges. The Commission strongly criticized the quality of US crime data at the time and described the situation as one where "the United States is today, in the era of the high speed computer, trying to keep track of crime and criminals with a system that was no less than adequate in the days of the horse and buggy" (President's Commission on Law Enforcement and Administration of Justice 1967, p. 123).

At the time the Commissions were instituted, the only source of national crime data available was from the Uniform Crime Reporting Program (UCR). The Federal Bureau of Investigation collected UCR data from state and local law enforcement agencies. UCR data had four fundamental limitations for studying crime and for the Commissions' purposes. First, as an accounting of crimes known to police, UCR data by design could not identify the nature and extent of offenses that victims did not report. A second limitation was that UCR data were several steps removed from the crime incident and likely reflected law enforcement activity and agency priorities rather than criminal behavior and trends in crime. Sellin (1931) identified this problem shortly after the UCR was implemented. Third, police data could be subject to manipulation and misrepresentation through the classification and counting rules needed to establish uniformity in the UCR data (Beattie 1941). While this problem did not appear to be widespread, well-publicized cases highlighted this concern and brought all UCR data under question (Seidman and Couzens 1974). Finally, UCR data at the time were aggregate counts of crime and as such failed to provide details about the criminal incidents. Without any incident-level details, these data could not identify important information about criminal events nor the victims and offenders involved (Dodge and Turner 1981).

The Commissions reached the conclusion that the United States needed a national survey of crime victimization (President's Commission on Law Enforcement and Administration of Justice 1967). The genesis for using victim surveys to measure crime originated from the UCR data limitations as well as an environment receptive to a self-reported survey-based data collection. This new attitude toward survey research arose due to a convergence of factors that included increased attention on crime as a social problem and overall advances in the field of survey methodology (see Cantor and Lynch 2000, for a discussion). Victimization surveys offered an alternative source of crime data that provided greater incident details than the existing aggregate-based UCR as well as a system independent from, and not influenced by, police practices and policies.

Victimization surveys in theory addressed the data limitation identified by the Commissions. The unknown issue was whether victimization surveys would work in practice, both in terms of the cooperation of respondents in reporting victimization experiences, the reliability and validity of their responses, and the ability to produce annual crime estimates. No other country had relied on self-reported survey data to produce national crime estimates (Hough et al. 2007; UNODC 2010). To test this method, the Presidential Commissions supported three sets of pilot victimization surveys: one household-based sample in Washington, DC; one group of city based household samples; and one national household sample. All of these pilots produced two important findings: confirmation that victim surveys could provide reliable crime estimates and identification that a significant amount of crime that occurred was never reported to the police (Biderman 1967; Cantor and Lynch 2000). These pilot surveys also assisted in identifying methodological issues such as ways to facilitate recall, temporal placement, and collecting crimes against the household (Cantor and Lynch 2000).

Given these findings, the Commission recommended a routine collection of national victimization data on an ongoing basis as well as the infrastructure to collect this data in the form of a national criminal justice statistics center. In 1968, the Law Enforcement Assistance Administration (LEAA) was created within the US Department of Justice and charged with implementing a national victimization survey. The LEAA was the predecessor to today's Bureau of Justice Statistics (BJS), which now oversees the crime survey as well as a full portfolio of other criminal justice statistics. The Bureau of the Census was selected to design and implement the survey on LEAA's behalf.

Based on recommendations from the Commissions and findings from methodological studies, the NCS was created and first implemented in 1972. Originally the NCS was a system of four interrelated victimization surveys: one national household sample (the Crime Panel), a city-level household sample (the Central Cities Survey), and two Commercial Victimization Surveys (one at the national level and one at the city level). The Commercial Victimization Surveys initially included a sample of 2,000 commercial establishments in 26 large cities, and a sample of 15,000 businesses across the nation. The Central Cities Survey included sample from 26 large cities, and the Crime Panel was a national probability sample of 72,000 households. Almost immediately, budgetary and methodological issues beleaguered this design and prompted the removal of three of the surveys. After 1976, only the Crime Panel remained and is what is referred as the NCS. This entry uses NCS to refer to the Crime Panel's national sample of households.

The original goals for the NCS concerned providing an indicator of the crime problem independent from police data and the UCR and an ongoing measure of victimization risk (Rennison and Rand 2007). The NCS also served other purposes that included shifting the focus of the criminal justice system to the victim and away from the offender and providing a measure to assess changes in police reporting (Rennison and Rand 2007). As a result of this close tie to monitoring the UCR and police activities, the crimes covered by the NCS were closely linked with the UCR crimes. The NCS crimes included rape, robbery, aggravated and simple assault, personal larceny (pickpocketing and purse snatching), burglary, motor vehicle theft, and property theft.

Methodological Development of the NCS-NCVS

Original NCS Methodology

The NCS originally was based on a sample of approximately 72,000 housing units and group quarters in the United States. Given this sampling frame, individuals who served as crewmembers of merchant vessels, military personnel housed in military barracks, and institutionalized persons (including but not limited to prisoners) were excluded from the survey. This sample of households was developed based on a rotating, stratified, multistage cluster panel design to take advantage of efficiency and cost-saving qualities of this approach as well as to comport with the Census field staff assignments for its Current Population Survey (Hubble 1995; Lehnen and Reiss 1978).

Each NCS household remained in-sample for three and a half years and was interviewed at 6 month intervals. Sampled households entry into the survey was staggered with an introduction of new panels of households being rotated in and out of the overall sample during each month. The rotation was designed such that one-sixth of the sample was interviewed for the first time, one-sixth for the second time, one-sixth for the third time, and so forth, each month (Lehnen and Reiss 1978). As a result, the overall sample changed on a monthly basis. Because the NCS was a survey of households, individuals or families were not followed if they moved. Thus the composition of households could change due to events such as relocation, marriage, divorce, incarceration, children aging into the sample, or death. In the most extreme case, entire families moved out of housing units and were replaced by new families during the 3 and a half year interview period.

At each 6 month interview period (or enumeration), all persons age 14 or older residing in the household were interviewed either in person or over the phone using a paper and pencil interviewing mode. Household residents ages 12 and 13 were included in the NCS but only were interviewed by proxy. Each household had a single respondent designated as the household respondent. This individual not only answered questions regarding any personal victimization experienced in the 6 month retrospective period, but also questions regarding victimizations against the household, which included burglary, motor vehicle theft and other theft. The household respondent was required to be a household member at least 18 years old who was deemed likely to give accurate answers regarding the household questions. This person was always the first person interviewed in the household during each enumeration. Household respondents could vary within each household across enumerations. All other respondents were questioned regarding their own personal victimization experiences.

The NCS utilized three primary survey instruments: the Control Card, the Basic Screen Questionnaire, and the Crime Incident Report. The Control Card served as the administrative record to gather basic information about the sampled unit including a roster of all persons residing in the household, a record of visits, telephone calls, interviews, and non-interview reasons. The household respondent provided the names, ages, genders, marital statuses, education levels, and relationships of all persons in the household. This information was updated at each interview and included a brief description of all victimizations previously reported by all members of the household. With this information, the Control Card served as a quick reference during later interviews to minimize double-counting of victimizations already reported to the survey during a previous interview.

The NCS collected its victimization data using an innovative two-step process to promote recall. The first step concerned screening for any victimization. Here the Basic Screen Questionnaire ascertained whether any crimes had been committed against the household or individual household members during the previous 6 months. The structure of the NCS screener that was implemented departed from the pilot tests that recommended a short cue approach to facilitate recall (Cantor and Lynch 2000). One reason for this departure was to facilitate matching reported victimization incidents with UCR defined crimes. While the legal jargon of the UCR was not used in the screener, the questions did have a direct correspondence with UCR crimes. For example, screening questions related to assault victimizations asked: "Did anyone beat you up, attack you or hit you with something, such as a rock or bottle?" and "Were you knifed, shot at, or attacked with some other weapon by anyone at all?" If a respondent reported a victimization incident, a separate set of questions would gather details of the event for later determination as to whether a crime (and what type of crime) occurred.

The Crime Incident Report (CIR) collected detailed information about the reported victimizations identified during the screening stage. These details included incident characteristics such as the time, date, and place of the crime; information about the offender including any relationship to the victim; consequences to the victim including injury and loss of or damage to property; and whether the incident was reported to police. The detailed information collected on the CIR was used to determine whether the incident reported was within the scope of the NCS and to classify the type of crime. The NCS used an algorithm based on responses to several questions to classify the crime type.

Counting crimes for the NCS's annual estimation purposes required addressing additional issues in the case of respondents who experienced more than one crime in a particular incident (such as a rape and a robbery) or multiple incidents during the 6 month recall period. For respondents who experienced more than one crime during an incident, the NCS created a hierarchy of crime, where only the most serious crime would be counted. The NCS hierarchy from most to least serious was as follows: rape, robbery, aggravated assault, simple assault, personal larceny (purse snatching and pickpocketing), burglary, motor vehicle theft, and property theft. In the example where a victim was robbed and raped in a single incident, only the rape would be counted for annual estimation purposes. It is important to keep in mind this hierarchy is only for BJS's annual estimation purposes. Public use NCS-NCVS files allow researchers to discern all crimes that occur within a victimization incident (see, e.g., Addington and Rennison 2008).

A second difficulty in crime counting concerns measuring victims who experience on-going or repeated violence. To address the difficulties that these respondents had in remembering needed details of each incident and to minimize the burden of completing a large number of CIRs, the NCS utilized a special protocol for such "series victimizations" Series victimizations referred to three or more victimizations, similar in nature, in which a respondent unable to remember the details in the previous 6 month reference period. In these instances, details of only the most recent incident in the series were recorded in the CIR along with the number of times the person was victimized.

Changes to the NCS Methodology Over Time

The NCS underwent a significant redesign effort (see Cantor and Lynch 2000, for an in-depth discussion). The redesign efforts began almost as soon as the survey went into the field (Cantor and Lynch 2000). The NCS was a significant event for both those interested in survey methodology as well as social statistics. One area of criticism came from academics who challenged the significant financial expenditure on a data system that provided limited analysis options and few variables that could be used for theory testing (Cantor and Lynch 2000). Critiques also came from the law enforcement community who questioned this new survey crime data collection method based on victim self-reports and the associated criticisms of police-based crime data (Cantor and Lynch 2000). At one point, the NCS had attracted enough criticism that the US Department of Justice considered discontinuing the survey until it could be redesigned (Lynch 1990). While the survey was never suspended, it was the subject of a re-evaluation by National Academy of Sciences and a 5 year program of research, instrument development, and redesign planning (Lynch 1990).

This redesign effort focused on developing a better screening instrument to promote respondent recall of victimization incidents and revising the incident report to collect additional details about the victimization event (Cantor and Lynch 2000). Other redesign work concerned research devoted to recall periods, respondent fatigue and other methodological issues (Cantor and Lynch 2000). Research and development of these efforts began in the 1980s and the fully redesigned survey was introduced into the field in 1992.

Before full implementation of the redesigned NCS, certain changes were implemented that addressed methodological issues as well as minimized the cost of the survey. These so-called "near term" changes were limited to those that were not likely to affect the NCS's estimates of annual crime rates for trend purposes also referred to as non-rate affecting. Examples of these changes concerned reducing proxy interviews, changes to the CIR, changes to telephone interviewing, and a name change. In 1986, the survey reduced the number of proxy interviews by directly interviewing persons age 12 or older (vs. 14 or older as it had been originally), and additional questions concerning incident details were added to the CIR. In 1987, centralized computer-assisted telephone interviewing (CATI) started being phased in alongside continued paper and pencil mode (both in-person and over the telephone). Over the years, the number of in-person interviews was reduced to the point where only the first interview is conducted in person. All other interviews are conducted over the telephone unless this mode is not acceptable to the respondent or not feasible due to circumstances such as a household moving into sample. Finally in 1991 prior to the launch of the fully redesigned NCS, the survey changed its name to the National Crime Victimization Survey (NCVS). For the remainder of this entry, the acronyms "NCS" refers to the pre-redesign survey, "NCVS" refers to the post-redesign survey, and "NCS-NCVS" refers to both surveys.

The completely redesigned NCVS went into the field in 1992. The redesigned survey kept the same three instrument format (control card, screener and incident report). Otherwise the survey had been completely overhauled, most noticeably in terms of the screener. The post-redesign screener included a series of short cues to prompt recall. In the NCS, each screener question corresponded to a particular crime, such as assault. In the NCVS, screener questions instead focused on aspects of the victimization such as where it occurred, what the respondent was doing at the time, and who committed the offense. The premise was to facilitate recall and to use various memory triggers to do so. An example of the screening question that focuses on who the offender is the following: "People often don't think of incidents committed by someone they know. (Other than any incidents already mentioned,) did you have something stolen from you OR were you attacked or threatened by – (a) Someone at work or school – (b) A neighbor or friend – (c) A relative or family member – (d) Any other person you've met or known?"

The redesigned screening process also added identification of new crimes (vandalism and sexual assault) and specific prompts were added to better collect data on certain crimes that had been included in the NCS (rape and domestic violence). Rape and domestic violence were more clearly screened by including questions related to sexually based offenses and offenses committed by people known to the respondent. In addition, the redesigned NCVS took advantage of the use of supplements or additional sets of questions beyond the Control Card, Screener and CIR. These supplements were used to collect information on additional crimes beyond those included for annual crime estimation purposes. Supplement topics included workplace violence, school crime, stalking, and identity theft. Other changes that occurred with the redesign concerned repeated (or series) crimes were counted and certain methodological changes (Rennison and Rand 2007).

The 1992 redesign was implemented over an 18-month period using a split-sample design data in which half the sample was collected using the old NCS methodology, and half was collected using the redesigned NCVS methodology. Analyses indicated that the redesigned survey provided a better measure of crime and as expected that the redesign had a greater effect on certain crime types than others. In particular, the redesigned survey and its use of short cues in the screener uncovered more rape and domestic violence and the redesigned survey collected a higher percentage of crime that was not reported to the police than the NCS.

The NCVS has experienced additional changes since its redesign. Until recently, many of these changes centered on efforts to reduce costs as the NCVS has been flat funded for most of its existence since the redesign. The most significant of these changes has been the dramatic cut in sample size (Rennison and Rand 2007). Concurrent with the flat funding and sample cuts, external pressures demanded that the NCVS do more in terms of data collection and speed in releasing data. Questions were added concerning hate crimes, crimes against the disabled, computer crimes and identity theft. The NCVS was also under pressure to produce its annual estimates more quickly (Rennison and Rand 2007).

The deep cuts to the NCVS program generated an unsustainable situation and a request by BJS for the National Academies' Committee on National Statistics (CNSTAT) for a panel to review the NCVS and "consider alternative options for conducting the [NCVS]" (National Research Council 2008, p. 23). The CNSTAT Panel's review found the NCVS was in need of more resources and restoration. Specifically "[a]s currently configured and funded, the NCVS is not achieving and cannot achieve BJS's legislatively mandated goal to 'collect and analyze data that will serve as a continuous and comparable national social indication of the prevalence, incidence, rates, extent, distribution, and attributes of crime . . .'" (National Research Council 2008, p. 78). The CNSTAT Panel offered many recommendations to restore and modernize the NCVS as well as an overall call to encourage appropriate funding of the survey. In response to this report, BJS began conducting a redesign effort to address the recommendations. These efforts have included restoring the sample size to increase precision and reliability, as well as efforts to generate sub-national victimization estimates (BJS, n.d.).

Limitations of the Victimization Survey Methodology

Victimization surveys provide a perspective of crime independent from official police statistics. While this approach offers valuable information for understanding victimization, these surveys in general and with the NCS-NCVS in particular are not without limitations. These limitations can be categorized as ones based on the sampling frame, sampling error, and non-sampling error (see Maltz 1998 for a detailed discussion of these issues).

Certain limitations arise due to the selection of the population to be included in the survey sample. For the NCS-NCVS, this methodological decision does exclude certain crime victims due to selections based on age and residential requirements as well as it being a non-commercial survey. Currently one must be age 12 or older to be eligible for the NCS-NCVS. In addition, only households in the United States are sampled for purposes of the NCS-NCVS. Therefore homeless persons, those living in military barracks, incarcerated individuals, persons visiting from out of the country and other institutionalized persons are excluded from the survey. The NCS-NCVS only covers non-commercial crimes since businesses are not included in the population sampled. As such, while a household burglary is counted, a burglary of a business is not.

Like all surveys, the NCS-NCVS are subject to sampling error. Depending upon the crime and population of victims considered, this error can be large (Maltz 1998; Rand and Rennison 2002).

The NCS-NCVS is also subject to nonsampling errors including those related to inaccurate respondent recall. Respondents may forget criminal events, or be in error about characteristics of a recalled event including when it happened, who was involved and what transpired. In some instances victims may refuse to share details of criminal events especially if the offender is a relative or intimate partner.

Key Findings from NCS-NCVS Data Over the Years

The NCS-NCVS is a rich resource of information on crime trends and incident details. In terms of long-term trends, NCS-NCVS data show that non-fatal violence most recently peaked in the early 1990s, and has since decreased dramatically to rates unseen for decades (Bastian 1995; Ringel 1997; Truman 2011). In addition to identifying overall long-term trends, the NCS-NCVS data are uniquely suited to provide incident level details over time for US crime rates. When these details are examined, similar trends are observed across different types of victims, offenders and crimes (Bastian 1995; Ringel 1997; Truman 2011).

One unique aspect of the NCS-NCVS in comparison to the UCR is the collection of data regarding patterns of reporting victimizations to police. The pre-NCS pilots highlighted the large proportion of crimes that were not reported to police and prompted Biderman and Reiss's groundbreaking 1967 article that identified this "dark figure of crime." The underreporting of crime continues to this day. The NCVS data indicate that a higher percentage of violent crimes come to the attention of police than property crimes (50 % vs. 40 %) (Catalano and Rand 2007; Rand 2009, 2008; Truman 2011; Truman and Rand 2010). Within violent crime, the percentage of victimizations reported to the police varies. For example approximately 57 % of robberies and 55 % of aggravated assaults are reported to police (Hart and Rennison 2003). Historically, rape and sexual assault is the violent crime least likely to come to the attention of the police as only about one-third are reported (Hart and Rennison 2003). Finally, less than half (about 44 %) of simple assault tend to be reported to the police (Hart and Rennison 2003). In contrast, while motor vehicle thefts are the least common type of property crime, it is the individual crime most consistently reported to the police (Catalano and Rand 2007; Hart and Rennison 2003; Rand 2009, 2008; Truman 2011; Truman and Rand 2010).

Data from the NCS and NCVS also provide the basis for current understandings about victimization, particularly the relationship between victimization and particular individual characteristics. With the exception of rape and sexual assault, males are more likely to be victimized than females (Catalano and Rand 2007; Rand 2009, 2008; Truman 2011; Truman and Rand 2010). Those with less education, a lower income, and who are younger are at a higher risk for all forms of victimization than the well-educated, those with higher incomes and older individuals (Catalano and Rand 2007; Rand 2009, 2008; Truman 2011; Truman and Rand 2010). Most non-fatal violence is not committed with a weapon, but when it is, a firearm is most often used; and similarly most victims are not injured as a result of non-fatal violence that is reported to the NCS-NCVS (Rand 2009, 2008; Rennison 1999; Truman 2011; Truman and Rand 2010). The NCS-NCVS also put victimization into context and challenged popular beliefs. Stranger violence against females is less common than is violence by a known offender (Rand 2009, 2008; Rennison 1999; Truman 2011; Truman and Rand 2010). The bulk of non-fatal violence is intra-racial and occurs close to the victim's home (Truman and Rand 2010; Rand 2009, 2008).

In addition to the core NCS-NCVS questions, the NCS-NCVS supplements have allowed unique insights with regard to particular types of victimization including information on characteristics of workplace violence, types of identity theft, and trends in school violence. The workplace violence supplement shows that law enforcement officers, security guards and bartenders as those who experience the highest rates of workplace violence (Harrell 2011). Data from the NCVS's identity theft supplement shows that from 2005 to 2010 credit card theft was the most common type of identity theft occurring in a household (Langton and Planty 2010). With regard to school violence, regular fielding of the NCVS's School Crime

Supplement shows that school violence has been declining at a steady rate since 1992 (Robers et al. 2012).

Effect of NCS-NCVS on Crime Data Collection

The NCS-NCVS have been influential on the measurement of crime and collection of crime statistics. One of the most immediate effects of the NCS was not on a survey data collection, but on the UCR and its use of police records to collect crime data. The incident details provided by the NCS highlighted the limitations with the UCR's aggregate-level system. With the available details from the NCS, researchers and policymakers began to demand the production of police data that provided incident-level information needed to explain the crime problem (Poggio et al. 1985). This situation prompted the creation of the National Incident-Based Reporting System (NIBRS) as a new method for collecting UCR data. In addition to expanding the number of crimes reported to the UCR, NIBRS captures incident-level characteristics not included in the summary reporting system.

Given the groundbreaking nature of the NCS-NCVS as demonstrating the feasibility of survey data as a resource for generating national crime statistics, the NCS-NCVS also have influenced the development of omnibus crime data collections abroad. In particular, the methodological experiences gained from the NCS-NCVS informed victimization surveys in other countries. For example, both the idea and the model for the British Crime Survey came from the NCS (Hough et al. 2007). Since the NCS began in 1972, the number of crime surveys has flourished. According to one inventory sponsored by the United Nations Economic Commission for Europe and the United Nations Office on Drugs and Crime, there were approximately 62 country-wide victimization surveys as of 2006. Approximately two-thirds of these surveys were purely victimization surveys (e.g., Scottish Crime Survey, British Crime Survey, Northern Ireland), while the remainder were victimization components of more general surveys (e.g., Australia and Canada). The NCS also influenced cross-national studies of crime. Since 1989, the International Crime Victimization Survey (ICVS) has provided for a comparative approach to understanding crime and victimization without the limitations associated with official records by gathering victimization data for several types of crime from participating nations. Since its inception, 78 countries have participated in the ICVS at least once, and more than 300,000 people have been interviewed.

Conclusion

The NCS-NCVS fundamentally changed how crime is measured and shaped how crime data are collected. The history of the survey highlights the wealth of research that has been devoted to the initial development of the NCS and its redesigned successor. The surveys have shaped knowledge about crime and the experience of victims as well as provided important insights regarding trends in crime over time and details about particular aspects of victimization. The future of the NCVS is one of continued evolution both in response to new knowledge about crime and a continued demand for more detailed data. Current recommendations for the NCVS focus on considering including data collection on emerging crime types such as identity theft as well as expanding the use of supplements to collect detailed information on a rotating basis (NRC 2008). The NCVS must balance these demands for expansion and change with ongoing concerns particularly its historic primary goal of generating annual level and change crime estimates.

US Responses to Terrorists

Brent L. Smith[1], Christopher Shields[2] and Kelly R. Damphousse[3]

Overview

America's response to terrorism has changed dramatically over the past 30 years. Changes have included everything from the way in which terrorism is portrayed politically to the manner in which terrorists are investigated, prosecuted, and punished. Modifications to governmental interventions also have affected the manner in which terrorists plan and conduct terrorist activities as well as the manner in which they defend themselves in court. Although it would be difficult to address all of these changes in a single paper, the purpose of this current entry is to provide an overview of the most significant events that evoked changes in the manner in which terrorists are portrayed, pursued, and prosecuted as well as the way in which terrorists and their defenders have responded to federal prosecutorial efforts. The specific ways in which federal agencies respond to terrorism, however, are rooted in much larger political and social issues.

American Terrorism and Governmental Response in Historical Context

For whatever reason, the United States has avoided the concept of "political crime" and "political criminality." Some have contended that this is due to ideological considerations – that America has tried to portray itself as a nation characterized by consensus and, as a result, America is simply immune to violent political conflict (Ingraham and Tokoro 1969; Turk 1982). For many years, terrorism and political crime were associated almost exclusively with the extreme left and Marxist revolutionaries. The Cold War, communism, Fidel Castro's support of revolutionaries in the United States, and the civil rights and student antiwar movements of the 1960s and 1970s shaped America's views on those who sought political change through violence and terrorism. Terrorists came to be described as exclusively young, Marxist, urban, educated revolutionaries who were bent on destroying capitalism (Russell and Miller 1977; Smith and Morgan 1994). The potential threat posed by these revolutionaries was not lost on the FBI. Efforts to suppress the activities of the Black Panthers and other leftist groups through the FBI's now infamous counterintelligence program (COINTELPRO) of the late 1960s and early 1970s are well documented (Poveda 1990).

Abuses within these programs and the impact of Watergate in the mid-1970s severely tarnished the public's image of the FBI. Confidence in the agency was shaken, and Congress and the American people demanded change. In the wake of the post-Watergate investigation, two significant events occurred that helped shape the definition of American terrorism and how the federal government responds to it. First, in April 1976, new FBI investigative guidelines were implemented under the guidance of then Attorney General Edward Levi. The guidelines identified the standards by which internal security investigations could be initiated and the length of time they could last (Hearings 1978). As evidence of this change, the number of domestic security investigations dropped from more than 20,000 in 1973 to less than 200 in 1976 (Elliff 1979). Second, in August 1976, the FBI dismantled its domestic intelligence units, moving investigations of domestic terrorism from its Intelligence Division to the General Investigative Division (Kelley and Davis 1987; Poveda 1990). This move limited the types of investigative techniques that could be used in terrorism cases to the standards used for traditional crimes.

The impact of these changes was two-fold. First, it reaffirmed that terrorism in the United States was to be viewed as "conventional crime" and that terrorists were to be treated as such. Second, it marked the end of an era in FBI history in which the agency focused on domestic intelligence gathering. The next generation of FBI agents generally was trained to avoid data collection on American citizens. The FBI adopted a much more "reactive" stance, investigating terrorist groups only when a "criminal predicate" could be established. The more proactive "intelligence gathering" days of the pre-Watergate and COINTELPRO era were replaced with a desire to restore the FBI image and characterized by a reluctance to invade the "personal privacy" of domestic extremist groups. Domestic terrorist groups that survived the FBI's COINTELPRO operated almost with impunity during the late

1970s and early 1980s. During this time, the number of terrorism incidents in the United States reached its zenith according to the FBI's annual reports on *Terrorism in the United States*. (It should be noted that the title of the FBI's annual reports has changed over the years. Initially, they were called *FBI Analysis of Terrorist Incidents in the United States*. In 1984, the title was changed to *FBI Analysis of Terrorist Incidents and Terrorist Related Activities in the United States*. The 1986 report reverted to the pre-1984 title. In 1987, the FBI adopted the title *Terrorism in the United States* followed by the year of the report.) Leftist terror continued unabated, Puerto Rican separatists targeted both the island and the US mainland, and far-right terrorism emerged partly as a response to gains made by African Americans as part of the civil rights movement. But like Watergate and COINTELPRO, which triggered the changes described above, new events would swing the pendulum to the other direction.

The Impact of President Reagan on Counterterrorism Policy

With the election of Ronald Reagan in 1980, a substantially different trend in federal response to terrorism began to emerge. A staunch conservative President Reagan saw leftist and Puerto Rican separatist groups as significant threats to American security. The FBI, however, was reluctant to reengage in domestic intelligence. Congressional criticism of the FBI subsequently mounted. A seminal event would trigger renewed FBI vigilance. In October 1981 in Nyack, New York, an armored truck was robbed in an incident that left two police officers dead. The robbery involved members of the long-forgotten Weather Underground and Black Liberation Army, which had also been providing assistance to the Puerto Rican separatist group, the Armed Forces of National Liberation (FALN). Later that year, members of another holdover leftist group from the mid-1970s, the United Freedom Front, killed a New Jersey state trooper. The leftist threat suddenly appeared to be quite real.

These and other events resulted in revision of the Levi guidelines for FBI investigations. The new guidelines, issued by Attorney General William French Smith in 1983, set the standard for FBI investigations of domestic terrorism groups for the next 20 years. Although minor modifications were made by subsequent attorney generals, the theme and spirit of the "Smith Guidelines" remained intact until modifications after the September 11 attacks in 2001. After the Smith guidelines were issued in the spring of 1983, the FBI implemented a series of counterterrorism initiatives, including the creation of counterterrorism task forces around the country to combat specific regional and local threats. The success of these efforts was remarkable. Leftist groups like the Weather Underground and its radical East Coast offshoot, the May 19th Communist Organization, the United Freedom Front, and the Puerto Rican groups, the Macheteros and the FALN, were decimated by arrest, indictment, and convictions in federal courts. The extreme right met a similar fate. Leading members of the Order, the Sheriff's Posse Comitatus, the White Patriot Party, and the Aryan Nations, among others, were indicted and convicted in a series of dramatic trials in the mid to late 1980s.

The Smith Guidelines were quite explicit – terrorism investigations were to be "concerned with the investigation of *entire enterprises, rather than individual participants* [emphasis added]." Furthermore, terrorism investigations could not be opened unless "circumstances indicate that *two or more persons* [emphasis added] are engaged in an enterprise for the purpose of furthering political or social goals... that involve force or violence and a violation of the criminal laws of the United States" (Office of the Attorney General 1983). Although the Smith Guidelines provided an opportunity for the FBI to reestablish itself in collecting domestic intelligence, the new policy was clearly intended to prevent a return to the abuses of the past. Furthermore, the FBI continued to self-impose restrictions on when terrorism investigations could be opened. Although the new guidelines did not mandate the necessity of a "criminal predicate," the term came to be the standard descriptor used by agents when discussing the threshold for opening a terrorism enterprise investigation.

For domestic terrorists, the Smith Guidelines had a significant impact in four major ways. First, a "focus on groups rather than individuals" would later lead terrorist groups in the USA to implement "leaderless resistance" or lone wolf strategies in an effort to avoid terrorism investigations. Second, the guidelines made it clear that dismantling a terrorist organization, primarily by decimating its leadership, was more important than convicting the actual perpetrators of specific terrorist incidents. This approach had a significant impact on negotiated pleas as a result of plea offers to cadre members in exchange for governmental cooperation against key leaders. Third, the FBI continued its "reactive" policy begun under Levi, as evidenced by a reluctance to get involved in domestic intelligence gathering. The number of active terrorism investigations generally ranged from 8 to 12 in any given year (although the actual number and names of groups investigated is classified) from 1983 to the end of the century. Finally, the FBI and Department of Justice continued to maintain the position that terrorists should be perceived, portrayed, tried, and punished as "conventional" criminals (Smith and Damphousse 1996).

Complicating this scenario was a new emphasis on international terrorism under Reagan's administration. As a result of the bombing of the US Marine Corps barracks in Beirut in 1983 and the bombing of the LaBelle Disco in Germany, which targeted American service members, Reagan pushed for greater authority and jurisdiction in dealing with terrorism overseas. With passage of the Comprehensive Crime Control Act of 1984 and the Omnibus Diplomatic Security and Antiterrorism Act of 1986, the federal courts now assumed jurisdiction over terrorists who committed acts of terrorism against US citizens or property overseas. These persons were typically investigated under a different set of FBI investigative guidelines – the *Attorney General Guidelines for FBI Foreign Intelligence Collection and Foreign Counterintelligence Investigations* (FBI 1998). While classified, it is clear that investigations involving international terrorists provided greater latitude to investigators than investigations under the domestic guidelines. Essentially, a "dual system" was emerging in which domestic terrorists were portrayed as "common criminals," while international terrorists were much more likely to be portrayed and described as "terrorists" (Smith 1994). This line of reasoning emerged in the 1990s and was in place when international threats to the US homeland began to become a reality.

America Awakens to the Threat of Terrorism

Despite having a long history of domestic terrorism, prior to the 1990s, most Americans viewed terrorism as something that happened in Europe and the Middle East. We typically viewed ourselves as immune from the leftist-anarchist terror associated with the Red Brigades, Black September, and the Baader-Meinhof Gang. The first World Trade Center bombing in 1993 and the Murrah Federal Building bombing in 1995 awakened the American public to the catastrophic damage that terrorists can inflict on a nation. Although the latter event precipitated significant focus on the extreme right and the so-called militia movement in the late 1990s, the first WTC attack was a seminal event for federal officials. Although Islamic extremists had targeted Americans overseas since the Iranian Revolution in 1979, the US mainland had remained relatively secure. That perception changed for federal officials in 1993. Subsequent plots uncovered over the years that followed relating to the bombing of New York City landmarks further emphasized that the threat of international terrorism on American soil was no longer merely a "threat."

Congress responded by passing the Antiterrorism and Effective Death Penalty Act of 1996. One of the most notable provisions of the Act involved the designation of "foreign terrorist organizations" (FTOs) and penalties for providing material support to any group on this official list. For scholars studying those indicted for terrorism-related activities in the United

States, the law created a new, and fairly large, group of persons indicted in federal courts. Over the next decade (1996–2006), over 325 persons would be indicted for providing material support to foreign terrorist groups. Emphasis on identifying these perpetrators blurred the previously rather simple distinctions between "domestic" and "international" terrorism. In the past, almost all domestic terrorists had been American citizens, while the overwhelming majority of international terrorists had been noncitizens. By the turn of the century, identifying who was being investigated under which set of Attorney General's (AG) Guidelines was becoming "muddied." After the attacks of September 11, 2001, it became even more difficult to distinguish.

Prior to 9/11, most domestic terrorists were portrayed in court as common criminals. In most cases, every effort was made to avoid raising the specter of a "political trial." Common practices used by both defense and prosecutors included filing motions "in limine" to avoid mention of the word "terrorist," the name of the terrorist group, or the ideology to which the group adhered; avoiding seditious conspiracy charges; and using "presumed" or "strict liability" counts that did not require mention of the terrorists' intent in order to obtain a conviction. Prosecutors had learned over the past 20 years that discussion of "motive" in terrorism trials could be extremely hazardous to conviction rates.

In contrast, international terrorists were usually portrayed quite differently. In many cases, their trials were explicitly politicized, and the defendants were frequently called "terrorists," "revolutionaries," and other terms that evoked a threat to national security. The successful conviction of the first WTC bombers and their associates in 1995 represented the first successful prosecution of terrorists on seditious conspiracy charges in over a decade.

Policy Changes After September 11

After September 11, the strategies used to combat terrorism in the United States underwent dramatic change. In broad terms, American antiterrorism policy is now focused on terrorist organizations, affiliated networks, and state sponsors in an effort to identify potential terrorist threats and *proactively prevent* future attacks. In a seminal statement released after September 11, Attorney General John Ashcroft explained that the policy of the United States Government changed from prosecuting terror-related crimes that had already occurred to thwarting attacks before they could happen (Ashcroft 2002).

Prior to this time, the FBI had remained primarily a "reactive" agency – in which "preventive" intelligence gathering played second fiddle to the more conservative standard associated with a "criminal predicate." After September 11, 2001, Congressional and public complaints regarding why the FBI did not have an intelligence apparatus in place to prevent such an attack were commonplace, and the nation moved quickly to encourage intelligence gathering and intelligence sharing.

With these new proactive goals in mind, the US Congress and Executive Branch agencies changed a number of policies to provide new tools for combating terrorism. The creation of fusion centers, the National Counterterrorism Center, and passage of new, less restrictive investigative guidelines by Attorney General Ashcroft reflected this paradigm shift. Some policies expanded legal authority to engage international terrorism that occurs away from American soil (Perl 2003). Other policies expanded legal authority to intercept, investigate, and prosecute domestic terrorists.

The research presented here focuses on changes in domestic policies that affected the prosecution of terrorists. For example, the Antiterrorism and Effective Death Penalty Act was revisited, and the USA PATRIOT Act of 2001 (Patriot Act) was created to extend and strengthen US antiterrorism policy. In addition, the Executive Branch changed Department of Justice policy on how the FBI and US attorneys would handle the investigation and prosecution of terror suspects, namely, through the aforementioned Ashcroft guidelines.

Pre-9/11 AG investigative guidelines (Smith) had required FBI field offices to refer potential terrorism investigations involving two or more persons to the director or assistant director of the FBI; they, and only they, could authorize a "terrorism enterprise" investigation. Once the director authorized such an investigation, he had to report that fact to the Office of Intelligence Policy and Review. The prior guidelines also required the director or another top official to monitor the progress of the investigation at 180 day intervals. Section (B)(4)(a) of the Ashcroft Guidelines loosened those standards by allowing agents in the field to authorize a terrorism investigation for a period of up to 1 year (unlike the Smith Guidelines, the Ashcroft Guidelines allowed the Special Agent in Charge to renew the investigation without additional authorization from FBI HQ). While a field office was required, within 1 year, to report to FBI HQ any terrorism investigations it initiated and provide reports, permission to open an investigation was no longer necessary. The research that follows examines how these changes impacted government interventions in, and outcomes of, federal terrorism cases.

Terrorism on Trial

Defendants investigated as suspected terrorists under the Attorney Generals' Guidelines and later charged with crimes in federal court have been the focus of empirical research for more than 20 years, in part, because they behave differently than similarly situated federal defendants and they have been processed differently by the federal criminal justice system. Each phase, from investigation strategies and charging decisions, to prosecution and defense strategies and their relationship to negotiated pleas and trial outcomes, to conviction rates and sentencing outcomes, deserves separate treatment.

Investigating and Indicting Suspected Terrorists

In the early 1980s, the government's response focused on infiltrating terrorist cells, either by undercover government agents or by turning rank and file members of suspected terrorist organizations into confidential informants, and gathering evidence of planned operations and attacks for the purpose of charging group leaders with conspiracy crimes centered on those plans. The impetus on indicting leaders and putting them behind bars was driven by the policy goal of tearing the organizations apart from the top down. By targeting group leaders, the government hoped to disrupt the groups and help assuage the threat of their radical agendas.

US Responses to Terrorists, Table 1 Proportion of cases with confidential informant

Era	Proportion	N	Std. deviation
Pre-9/11	0.59	133	0.493
Post-9/11	0.14	86	0.349

$t(102.2) = 7.430$, $p < 0.001$ 20 system missing pre-9/11, 40 system missing post-9/11

US Responses to Terrorists, Table 2 Proportion of cases with undercover agents

Era	Proportion	N	Std. deviation
Pre-9/11	0.29	130	0.457
Post-9/11	0.03	86	0.185

$t(185.9) = 4.96$, $p < 0.001$ 23 system missing pre-9/11, 40 system missing post-9/11

This policy was time-consuming, requiring time to infiltrate and build relationships with group members, but prior to September 11, the FBI and other federal agencies had successfully infiltrated groups to the extent that 29 % of all cases filed in federal court involved an undercover agent (see Table 1). Federal agencies were even more successful in convincing group members to turn states evidence. Prior to September 11, prosecutors were using evidence provided by confidential informants in 59 % of all federal terrorism cases (see Table 2).

The post-September 11 policy shift ushered in new strategies directing federal investigators and prosecutors to arrest and prosecute suspected terrorists more proactively. In an effort to disrupt potential threats, the policy goal of infiltrating groups and building conspiracy cases gave way to prosecuting suspected terrorists for any crime as soon as there was sufficient evidence to do so. This shift had a profound and predictable impact on the type of investigations the government conducted, as well as the proportion of cases involving successful infiltration. As Tables 1 and 2 suggest, after September 11, the government made use of confidential informants in just 14 % of cases filed against suspected terrorists and undercover agents in only 3 % of those cases. It should be noted that Smith et al. (2011) found no significant drop in the amount or quality of evidence provided by confidential informants after September 11, though the average number of confidential informants per case did decrease.

Fewer informants and undercover agents to provide evidence resulted in prosecutors moving forward with a smaller proportion of cases in the post-September 11 era that were based on evidence of complex conspiracies. In turn, prosecutors relied on a greater variety of statutes to convict suspected terrorists (Shields 2008; see also, Chesney 2007; and Bradley-Engen et al. 2011). Indeed, the number of cases involving planned acts of terrorism dropped substantially after September 11. Shields (2008) and Jackson (2011) determined that the proportion of cases linked to planned or completed terrorism events declined from 84.2 % to 29.9 % after the policy change.

Not only did the government shift the types of cases it pursued, it pursued more of them. From 1980 to 2001, the government prosecuted approximately 500 individuals after they were referred by the FBI following a domestic security/terrorism investigation. According to Smith et al. (2011) and Shields (2008), over 500 individuals were similarly referred and prosecuted in the first 4 years following September 11, 2001, and that number increased to nearly 1,000 by the end of 2009 (see also, Greenberg 2011). In addition, the average number of defendants per case decreased after September 11, dropping from ten to four defendants, and the average number of counts per indictment decreased from 13.8 to 7.9 (Shields 2008; Smith et al. 2011). The average severity of charges filed against terrorist defendants also decreased (see, Shields 2008; Jackson 2011; and Smith et al. 2011). Post-September 11 policy changes also impacted the prosecutorial and defense strategies used once suspected terrorists were indicted.

Prosecuting and Defending Suspected Terrorists

Among the more intriguing aspects of prosecutions involving suspected terrorists are the strategies used by prosecutors to convict them and the strategies used by defense attorneys to counter federal prosecutors. Smith (1994) observed that in some cases federal prosecutors explicitly politicize the ideological beliefs and political motives of a suspected terrorist defendant. Prosecutors using this strategy frequently seek conspiracy charges that openly tie the predicate criminal act to the defendant's group affiliation or ideological beliefs. This, in turn, is typically done in concert with labeling the defendant as a member of an extremist group or the follower of an extremist ideology in charging documents, motions, and in open court.

Federal prosecutors used this strategy in the majority (64 %) of the cases they pursued before September 11 (Shields 2008; Smith et al. 2011). Prosecutors also employed a second, subtler strategy that implied a link between the defendant and terrorism. Prosecutors using this strategy seek counts charging defendants with any number of crimes, but unlike the previous strategy, prosecutors make no attempt to link the defendant's alleged crimes to terrorism in the indictment. Rather, prosecutors drop "hints" during open court implying the defendant belonged to an extremist group or held extremist views. Shields (2008) reported the use of these hints at all phases of the criminal prosecution, from bail determinations to sentencing hearings. Prior to September 11, prosecutors used this strategy about 25 % of the time.

The third strategy, the conventional approach, involved treating suspected terrorist defendants as traditional offenders, and in doing so, prosecutors avoid any reference to the defendant's group affiliation or belief system. Smith (1994) observed cases where federal prosecutors filed motions in limine to prevent defendants from using their trials as a soapbox to draw attention to their cause. While the conventional strategy was only used in one out of ten cases before September 11, prosecutors relied on it in half of all cases afterward (see Table 3). There has been

US Responses to Terrorists, Table 3 Crosstab prosecution strategy before and after 9/11

	Conventional criminality	Implicit politicality	Explicit politicality	Total

	22.5 %	32.8 %	44.6 %	100.0 %
Post 9/11	29	20	159	208
	13.9 %	9.6 %	76.4 %	100.0 %
Total	134	173	367	674
	19.9 %	25.7 %	54.5 %	100.0 %

$X^2 = 62.258$, df $= 2$, $p < 0.0001$, 109 system missing

a marked and corresponding decrease in the use of both politicized strategies (explicit 33.9 %; implicit 15.9 %) after September 11.

Shields (2008) and Smith et al. (2011) have suggested that the increased use of conventional prosecution strategies may be a result of the aforementioned proactive policy to prosecute suspected terrorists earlier leading to a decrease in the number of confidential informants and the evidence they would provide. Whether that is the case, defense attorneys have responded by using more traditional defense strategies and, as will be discussed below, defendants are pleading guilty at a higher rate.

In response to politicized prosecution strategies, defense attorneys developed a number of strategies calculated to counter prosecutors. Defense attorneys who presented evidence that their clients were the focus of political persecution because of their beliefs dropped from 22.5 % before September 11 to 13.9 % afterward (see Table 4). Similarly, defense attorneys who tried to disassociate their clients from a terrorist group or ideology decreased from 32.8 % to 9.6 % after September 11. Probably due to prosecutors increased reliance on conventional prosecution strategies, defense attorneys turned to conventional defense methods in greater numbers, from 44.6 % to 76.4 %, after September 11.

Case Outcomes in Terrorism Trials

Differences in the investigation and indictment of suspected terrorists, as well as the strategies used to prosecute and defend them, resulted in significant differences in case outcomes. While the conviction rates for indicted defendants increased slightly from 77.1 % in the pre-September 11 era to 78.1 % in the post-September 11 era, the means by which those defendants were convicted differed dramatically (see Table 5).

The biggest change occurred in the proportion of defendants who entered guilty pleas versus those who went to trial between the eras. While less than one-half (43.2 %) of defendants indicted prior to September 11 pleaded guilty, more than two-thirds (66.5 %) did so after September 11. Mistrials and dismissals increased after September 11 from 14.7 % to 20.0 %, and jury convictions decreased from 33.9 % to 11.5 %.

It is possible that the "early prosecution" mandate demanded by Attorney General Ashcroft impeded the government's ability to infiltrate extremists groups with agents, and likewise, it may have limited the amount of time government agents had to develop relationships with potential informants who were associated with group members. In preliminary studies, Shields (2008), Jackson (2011), and Smith et al. (2011) do suggest a significant shift in the way the government pursued and prosecuted terrorists after September 11.

The policy shift may have been responsible for limiting the amount of evidence available to prosecutors. Shields (2008) suggested that less evidence probably caused a shift in the type of cases prosecutors pursued and the type of prosecution strategies they employed resulting in an increase in negotiated pleas. It is also possible that these lower levels of evidence might be the cause of the noted increase in the number of case

US Responses to Terrorists, Table 5 Disposition of defendants before and after 9/11

dismissals. Significant changes in sentencing occurred as well.

Sentence Outcomes for Convicted Terrorists

While conviction rates increased after September and, ostensibly, defendants were charged with slightly less severe lead offenses, Smith et al. (2011) noted an average drop of 138 months in average prison sentences after September 11, from 203 to 65 months. While the gap narrowed to 120 months when immigration and financial fraud cases were excluded from the post-September 11 cases, there remained a rather dramatic and statistically significant difference between the eras. These findings are not unique (see also, *Terrorism Trial Report Card*, Center for Law and Security 2010).

It is important to note that it is somewhat inappropriate to simply use "sentence in months" as an indicator of changes in sentence length over the past 30 years due to changes in federal sentencing procedures. Changes in federal sentencing policies render direct comparisons tenuous at best. One goal of the federal sentencing guidelines was to reduce disparity among "similarly situated" defendants. Smith (1994) and Smith and Damphousse (1996) addressed this issue and found that individuals involved in terrorism cases received sentences that were, on average, about three and one-half times longer than others convicted of the same lead offenses. A later examination of post-sentencing guidelines in terrorism cases found that this disparity had dropped considerably but that it remained significant (Smith and Damphousse 1998).

The magnitude of the reduction in sentencing disparity in the post-September 11 era suggests that a number of other factors may be at work. First, there was a small but significant decrease in count severity in lead offenses in post-September 11 cases. This likely had a small but significant impact on the average sentence length. Second, one would expect shorter prison sentences for defendants who plead guilty as compared to those who are convicted at trial. As noted above, prosecutors and defendants agreed to plead guilty in two-thirds of all cases filed after September 11, an increase of 23 % from before September 11. Third, Jackson (2011) determined that prosecutors were more likely to accept guilty pleas on fewer counts within an indictment in the post-September 11 era, reducing the opportunity for consecutive sentences. Jackson found the percentage of unconvicted counts per indictment before September 11 was roughly 37 % while the percentage of unconvicted counts per indictment after September 11 was about 82 %. In essence, a chain of events is probably responsible for the decline in sentence length. As the FBI has moved to a "proactive" rather than "reactive" stance regarding terrorism after September 11, they have begun to intervene earlier in investigations. This frequently means evidentiary strength is not as great in these cases (Jackson 2011), which results in greater willingness among prosecutors to negotiate a plea agreement.

Use of Social Media in Policing

Sean P. Varano and Ryan Sarasin
School of Justice Studies, Roger Williams University, Bristol, RI, USA

Overview

Social media has in many ways altered the landscape of communication and information sharing in recent years. Nearly 750 million people across the globe are estimated to have accessed *Facebook* by August 2011, or nearly one-tenth of the world's population (Facebook 2012). Its impact has been felt across the social landscape, from basic interpersonal communications to shaping the short-term and long-term socio-political future of some countries. It has been argued, for example, that it played a central role in the toppling of tyrannical governments during the "Arab Spring" of 2011 (Howard and Hussain 2011). With the breadth and depth of this impact in mind, law enforcement agencies have begun to adopt social media strategies in an effort to expand the scope of their communication strategies. It is estimated that by September 2011, approximately 88 % of law enforcement agencies across the United States had adopted some form of social media strategy (International Association of Chiefs of Police 2011). The purpose of this entry is to provide an overview of the use of social media in law enforcement. After providing a definition and brief history of social media, the authors provide a conceptual framework for understanding the role of social media, like other mechanisms for communication and information sharing, within a policing environment. The entry then provides an overview of the benefits and potential liabilities associated with the integration of social media into organization communication strategies. Finally, the entry offers a set of policy recommendations that can assist police organizations considering implementing social media strategies.

Background

The City of Los Angeles was rocked by a series of fires that occurred between December 29, 2011 and January 2, 2012 when more than 50 separate instances of arson indiscriminately occurred. By December 31, it was clear that there was a serial arsonist on the loose wreaking havoc in the greater Los Angeles area. While motor vehicles were the primary targets, several fires quickly spread to nearby buildings, which only intensified the mounting problems. The damage was extensive in many situations as evidenced by one small cluster of fires in the West Hollywood area that caused more than $350,000 worth of damage to vehicles and property (CNN 2012).

Fire officials scrambled across the widely dispersed city in an effort to get a handle on the expanding threat. But with multiple fires erupting within short periods of time, the public safety capacity of Los Angeles was pushed to its limits. Public safety officials quickly turned to social media as an outlet to both collect quickly emerging information from the public about a rash of fires, but also to communicate back to the public about the evolving situation, particularly when a suspect was eventually identified. Almost immediately it was recognized that social media played a critical role in a quick resolution to this public safety crisis. It greatly enhanced the ability of public safety officials to disseminate information to the public and media alike quickly, but also because it provided a capacity to access segments of the community that might otherwise not frequent more conventional news outlets. In the end, a suspect was identified and apprehended by January 2, 2012. The police and traditional media have universally recognized the value of social media in helping to bring this situation to a timely end.

The 2011–2012 New Year's fires represent an important milestone for the Los Angeles Police Department; the fires represented one of the first times that social media has been used by the LAPD in an effort to facilitate bi-directional communication with the public about an emerging public safety threat. This example shows the promise that social media presents to public safety officials trying to do more with less. Yet, while the potential advantages to implementing a robust social media capacity are apparent to many, some police departments across the United States have been reluctant to accept this new form of communication. While the reasons for this reluctance might be many, it is clear that at least some of this apprehension is due to basic lack of familiarity and expertise.

Social media is a complex concept that generally refers to a broad range of non-traditional forms of electronic communication. It is not completely clear what exactly the term "social

media" encompasses. Social media ranges widely in form and purpose. According to Kaplan and Haenlein (2010), social media is "a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of User Generated Content" (p. 61).

As of 2010, forms of social media included blogs and microblogs, discussion forums, media sharing websites, social networks, social news, social bookmarking, and Wikis (see Table 1). Although these forms of social media differ, a common feature that differentiates them from the conventional web and traditional media is that they are consumers of content. Compared to traditional media (TV, radio, movies, and newspapers), in which only a small number of people decide which information should be produced and how it is distributed, a user of social media can be both a consumer and a producer. With millions of users active on the various social media sites, everyone can be a media outlet. Thus, social media allows for the production of timely news and leads to volumes of user-generated content.

Kaplan and Haenlein (2010) take on a slightly different approach when defining social media by developing a more robust classification scheme. According to the authors, there are six different types of social media. The first type of social media is collaborative projects, which allow for the joint and simultaneous creation of content by end-users (e.g. Wikipedia). The second type of social media is blogs and micro-blogs, which are particular websites that normally display date-stamped entries in reverse chronological order (e.g. Twitter). Third, content communities refer to the sharing of media content between users (e.g. YouTube). The fourth type is social networking sites, which allow users to connect by creating profiles, enabling friends to have access to those profiles, and sending emails and instant messages between each other (e.g. Facebook). The fifth type is virtual game worlds, which refers to platforms that portray a three dimensional environment whereby users can create and appear in the form of personalized avatars and interact with each other (e.g. World of Warcraft). Finally, virtual social worlds are similar to virtual game worlds, except there are no rules restricting the range of possible interactions, such as the Second Life application (Kaplan and Haenlein 2010). These technologies allow users to simply create content on the Internet and share it with others. Thus, social media is the infrastructure that enables users to become publishers of content that is interesting to them and others.

Social media allows for the production of timely news and information. For example, during the London terrorist attack in 2005, some witnesses blogged about their experience in order to provide first-hand reports of the incident. Similarly, witnesses provided updates on Twitter during the bloody clash that resulted from the Iranian presidential election in 2009. In the event of an emergency or disaster, people have demonstrated to turn to social media platforms. This has prompted the city of Arcadia, California to introduce social media to their Emergency Operations Center (LeVeque 2011). In addition, social media enables collaborative writing to create high-quality bodies of work that was not previously possible. For example, over the last decade, Wikipedia has grown into one of the largest reference web sites, with more than 85,000 active contributors working on more than 14,000,000 articles and attracting more than 65 million visitors monthly. Furthermore, one of social media's unique characteristics is in its user interaction. The participation of users on social media websites is what makes them successful, advancing eight social media sites to the top 20 websites in the United States (Tang and Liu 2010).

Evolution of Social Media

Because the term social media is not exactly clear, examining the history also varies from different sources. However, several articles agree that an early social media service was launched in 1997. According to Boyd and Ellison (2007), the first recognizable social network site, Sixdegrees.com, was launched in 1997, which allowed users to create profiles, list their friends, and, starting in 1998, view the "friends" list. In 1999, Pyra Labs' Blogger was introduced, an early blog-publishing service that allows blogs with time-stamped entries (Paquet 2002). Another social media website created in 1999 included LiveJournal, a virtual community in which users can keep a blog. The next series of social networking sites began in 2001 when Ryze.com was created to allow people to leverage their business networks (Boyd and Ellison 2007).

According to Boyd and Ellison (2007), three key social networking sites that shaped the business, cultural, and research landscape included Friendster (2002), Myspace (2003), and Facebook (2004). Friendster was created in order to help friends-of-friends meet, unlike meeting strangers on dating websites. However, due to a substantial increase in users, the site encountered technical difficulties, leading to a reduction in the number of users. Social networking sites really hit the mainstream from 2003 onward. Most sites used a profile-centric form, similar to Frendster. Myspace was created in 2003 in order to compete with other social networking sites like Friendster and Xanga. Myspace differentiated itself from other social media sites because it allowed users to personalize their pages. A significant number of teenagers began joining Myspace in 2004, and eventually evolved into three distinct populations: musicians/artists, teenagers, and the post-college urban social crowd. Facebook was originally designed to support distinct college networks only. Although it started as a Harvard only site, it eventually expanded to include other colleges, high school students, professionals inside corporate networks, and, ultimately, everyone. The latest key social media site that has substantially increased in popularity over the last few years is Twitter. Twitter, which began in 2006, is a microblogging site, limiting posts to 140 characters or less. This restriction allows real-time posts, also known as "tweets," to be made using short message service (SMS) technology, which is the basis for text messaging on cell phones and other mobile devices. Although these social media sites have been created and evolved to seek broad audiences, several sites also target business people, such as LinkedIn, Visible Path, and Xing. A recent study argues that LinkedIn is a fantastic tool for law enforcement professionals (Stevens 2011). Table 1 illustrates the evolution of major social networking sites. Because the history of social media encompasses a huge phenomenon, this list is unavoidably incomplete.

Explosion of Social Media Use

In recent years, there has also been a considerable expansion in the levels of use of social media. According to Kaplan and Haenlein (2010), 75 % of Internet users used "social media" in the second quarter of 2008 by becoming members of social networks, reading blogs, or writing reviews on shopping websites, compared to 56 % in 2007. This growth is not only attributable to teenagers, but also populations well beyond their forties and fifties. According to Chou et al. (2009), participation in social networking sites more than quadrupled from 2005 to 2009. Boyd and Ellison (2007) claim that although there is not any exact data regarding how many people use social media websites, marketing research suggests that these sites are growing exponentially worldwide. As a result, many corporations now invest time and money into creating, purchasing, and promoting social networking sites. Boyd and Ellison (2007) also argue that the rise of social networking sites suggest a shift in the organization of online communities. Social networking sites are now mainly organized around people, not interests, and are structured around personal networks. Therefore, social media is an extremely active and evolving domain that now accounts for a significant proportion of Internet traffic.

A recent poll by the Pew Research Center indicates that approximately 66 % of online adults use social media, with the vast majority reporting the use social media to "stay connected" to family and friends (Smith 2011). Although the extent of connectivity via social media sites varies across countries, data indicate that approximately 30 % of adults in most industrialized countries use social media to some degree (Pew Research Center 2011). Facebook, one of the leading social media companies, has experienced an exponential increase in the number of registered users in recent years. The number of registered "active" users, for example, increased from 12 million in December 2006, to 100 million in August 2008, to 500 million in July 2010, and finally to over 750 million "active" users by August 2011 (Facebook 2012). This figure, which represents nearly 10 % of the *world's* population, is nearly impossible to grasp. The magnitude and speed of this growth defies comprehension and has placed its founder, Mark Zuckerburg, as one of the wealthiest people in the world. . .at age 27 (Forbes 2012). The use of social media has affected the social landscape in many ways, and has added terms such as "friending," "defriending," and "tweets" into the daily lexicon of many.

The Legacy of Technology in Policing: Setting the Stage for Social Media

It should come as no surprise that social media has developed into an issue that police departments across the world have sought to understand and harness. Policing is in many ways a technology driven profession that has historically been quick to adopt burgeoning forms of technology, particularly as it relates to communication and information sharing. The motorized vehicle, radio communication systems, and computer systems have been integrated into policing in highly visible and instrumental ways. The tendency toward the adoption of technology is functional and symbolic as well as practical and ceremonial. From the outside, it appears that police have enjoyed and exploited major technological advancements of the modern era (Brady 1997). As Varano et al. (2007, p. 263) argued, "technology [in policing] holds the symbolic potential for providing a degree of respect as it implies access to resources, commitment to innovation, organizational leadership, and a degree of sophistication." That many police organizations have adopted social media as a way of communicating to the public, then, should be of little surprise.

Social media represents one of the next biggest waves of technological advancement in law enforcement. Like other governmental sector agencies, many police departments around the world have been quick to adopt the use of social media to communicate with the public. A recent survey by the International Association of Chiefs of Police (2011) found that 88 % of 800 surveyed agencies reported some use of social media, with Facebook, Twitter, and YouTube among the most common (p. 4). These strategies, in many ways, lie at heart of more innovative policing strategies such as community-policing or problem-oriented policing, both of which hold police-citizen communication/interaction as a core philosophy. The most common reasons cited by police for the adoption of social media include community outreach, information dissemination, emergency/disaster notification, and investigations (International Association of Chiefs of Police 2011, p. 9). Not only do social media provide a greater opportunity for bi-directional communication with the public in general, it is even more so for the younger generation. Young people across the socioeconomic divide use social media to stay connected with family and friends, as a primary source of information about the world around them, and even as a primary source of emotional support (Ellison et al. 2007; Greenhow and Robelia 2009). There is a growing sense that while exploitation of social media might be optional today, it will not remain so for very long as these new forms of communication expand in their dominance of the social landscape and discourse.

Factors Underlying the Adoption of Social Media Practices

From a conceptual point of view, the trend toward adoption and expansion of social media in policing is part of a larger trend centered on greater communication with the public. Community policing, a policing model that stresses community engagement and proactive problem-solving, has pushed police departments and communities alike to reorient themselves in ways that view one another more as allies and less as adversaries. Community policing represents an important paradigm shift that moves police out of the role of the crime fighting professional who is solely responsible for establishing organizational priorities. Instead, the community is viewed as an active participant in organizational processes. The community has a role in defining organizational priorities, but just as important, the police are held accountable to the public they police. Community policy sees the community as the *customer* whose needs are worthy of consideration. This is part of a lager "customer service" trend in the public sector.

Another important dimension of community policing has been the notion of *police accountability* to the public. That is, community policing is based on the premise that the community not only has a direct role in helping to shape organizational priorities, but that the police have a responsibility for sharing information with the public. It is important to remember that information sharing is *not* something that comes natural in policing environments. Information is generally something to be tightly controlled and it is disseminated on a "need to know" basis. Police are traditionally not in the habit of sharing information about individual cases or overall trends with the public. This, however, is not unique to the relationship between the police and the public. Most police departments are reluctant to share information with other police departments and even other units (e.g., vice, narcotics, or gang units) within the same police department. It is also not uncommon for officers in the same unit within the same department to be reluctant to share information with each other. The need to tightly control the internal and external flow of information is viewed as so important that many departments employ a "Public Information Officer" to specifically handle requests for information. Thus, information sharing is something that is neither natural nor routine in a policing environment.

From a conceptual point of view, information sharing can be viewed not only as a service to the public, but also as image control whereby police agencies have adopted deliberative strategies intended to create positive public presences. Driven both by the desire to share information and to craft an image of a progressive department, many agencies have some sort of presence on the World Wide Web. Social media then is likely part of this larger trend toward information sharing and community outreach.

While there is little doubt that the movement toward community policing partially explains the expansion of social media, it is not the exclusive factor. The movement toward a "virtual presence" on the web, including the adoption of social media, has also been influenced by resource constraints that have plagued policing and other public sector agencies, particularly in the past two decades. In policing, calls for service (e.g., 911 calls) are one of the primary sources of workload. Large call volumes to emergency 911 centers and shrinking personnel resources due to layoffs have put pressure on police departments to develop innovative ways to reduce workload, but to do so in a way that compromises neither public safety nor community relations. Police departments across the United States have experimented with alterative reporting strategies that have moved non-emergency calls out of the 911 system. The goal of these efforts is to free up officer patrol time by limiting their involvement in non-emergency events that do not need a police response. Moreover, the intent is to also enhance customer satisfaction by creating a reporting strategy that is more convenient. At the end of the day, alternative reporting systems are premised on leveraging existing resources in a way that maximizes return and enhances customer service.

Communities experimented with a variety of non-emergency reporting strategies including 311 systems and phone-based police reports. What few evaluations are published indicate that, by and large, alternative systems can be effective alternatives to the traditional 911 system (Mazerolle et al. 2003). The explosion of the internet, however, created a new and relatively inexpensive crime reporting strategy – online crime reporting. By the 1990s police departments across the United States were experimenting with the use of online crime reporting technologies as a means for permitting the reporting of crimes in a way most convenient to the victims. Since many departments were already developing an online presence as part of the community outreach efforts identified above, this seemed to be a natural extension of these efforts. While the actual prevalence of online reporting is unclear, the Executive Director of the COPS Office, Bernard Melekian, has referred to it as the "wave of the future" (Cisneros 2009).

It has been the movement toward community engagement and the impact of financial constraints requiring police to do more with less, phenomenon that occurred almost simultaneously, that set the stage for the adoption of social media. The ever-expanding capacity of internet, the diffusion of computer technology across most segments of society, and rapid expansion of evolution of social media all occurred within a short 10–15 year period. The quickly evolving technical infrastructure provided the means for police, like other public and private sector agencies, to develop a virtual presence and cautiously explore the dynamics of information sharing.

The Use of Social Media in Policing

As social media continues to expand in its dominance of the social landscape, organizations in any profession that dismiss social media will find themselves lagging behind. Utilizing social media has several benefits and can be extremely invaluable in a contemporary policing environment. To keep up with the quickly evolving landscape, many police departments have experimented with different strategies. There remains, however, wide variation in the extent to which social media has been adopted within the policing community. Below is an overview of how social media has been integrated into policing.

Recruitment

Police recruitment in the twenty-first century can be especially challenging. Agencies are faced with staffing challenges associated with budget-related attrition, retiring wave associated with the baby-boom generation, and certain "generational trends" that move qualified candidates to other professions (Wilson and Castaneda 2011). In order to be competitive employers, law enforcement agencies need to be resourceful in their approach for recruiting applicants and seek new tools to accomplish this task. Social media offers law enforcement this new set of tools with an ability to attract, engage, and inform potential applicants.

There are several advantages of using social media platforms for recruitment volume. With the vast number of users who utilize social media sites on a daily basis, it presents a great opportunity to connect with both passive and active job seekers. Also, unlike commercials and paid investments, social media sites are inexpensive. For example, there is no cost to create an account, but personal time is necessary to maintain and update content on the sites. In addition, social media allows agencies to answer any recruitment questions applicants might have on a personal level and in a publicly accessible fashion (International Association of Chiefs of Police 2011).

Law enforcement agencies such as the Houston Police Department (Texas) and the Vancouver Police Department (British Columbia) currently use social media platforms including blogs, social networks, and multimedia-sharing sites to give potential applicants a unique and distinct view of the police profession. In 2008, a Houston Police Department senior officer launched a successful blog in order to provide insight and offer a resource to jobseekers, applicants, and new recruits. The blog consists of stories, information, videos, and pictures, with daily weekday posts. The recruitment blog substantially expanded, starting with approximately 15 hits per day to now over 1,500 site views daily. The Houston Police officer argues that it offers the ability to share insight with potential applicants that they cannot get anywhere else (International Association of Chiefs of Police n.d.-b). The Kentucky State Police has also turned to various social media platforms to attract new recruits. The agency has launched recruiting videos on its YouTube Channel, while already having presence on Facebook, Twitter, Flickr, and Blogger.com (Gazaway 2011).

Social media tools such as the methods used by the Houston Police Department and Kentucky State Police have offered law enforcement agencies the ability to connect with the general public and answer any questions about a future career in law enforcement. Blogs have given agencies a method to communicate more regularly and more personally than a conventional department website offers. For example, some topics discussed include a day in the life of a new recruit, advice or comments from the police chief, and miscellaneous blog posts from other department personnel. Law enforcement agencies have used Facebook to communicate with both potential and current applicants. Facebook posts allow applicants to have specific conversations that can be viewed by other applicants. In addition, departments have created a personal YouTube channel in order to post recruitment and other career-related videos.

Investigations

Social media is transforming the way in which law enforcement agencies conduct investigations and should be embraced by the department as a whole. Law enforcement agencies use social media for investigative purposes when seeking evidence or information about missing or wanted persons, gang participation, as well as Internet crimes such as cyberstalking or cyberbullying. For example, in Franklin, Indiana, police work with prosecutors and use social network sites as evidence in cases ranging from underage drinking to child custody cases. Information found online helps supplement other evidence already gathered by the police (National Law Enforcement Policy Center 2010). In one case, police and prosecutors convicted an individual of operating a vehicle under the influence of a controlled substance. The individual had smoked marijuana on the day he crashed his vehicle and killed another individual inside. On his Facebook page, the individual referenced his marijuana use and also posted photos of a bong (Michalos 2010). This example illustrates what many law enforcement agencies are doing throughout the country in which police and prosecutors are using information found on social media sites to gather and enhance the evidence against an individual (National Law Enforcement Policy Center 2010).

The Utica, New York Police Department (UPD) has been using Facebook since 2010 and began using Twitter and YouTube in 2011. During a period of 4 months, UPD made 11 arrests directly from information posted on the UPD social media sites, including a bank robbery and numerous grand larcenies. In some cases, people have turned themselves in, possibly out of fear or embarrassment. In other cases, people who recognize the pictures and videos contact the police department with information. The Department believes that social media empowers the community to get involved in the crime fighting process (International Association of Chiefs of Police, n.d.-a). This leads to enhanced relationships with community members.

Community Outreach and Citizen Engagement

Law enforcement agencies have begun to use social media tools to enhance community policing initiatives. Police departments throughout the country, for example, are posting crime prevention tips through various social media platforms, providing opportunities to report crime online, posting crime maps and other data, and disseminating alert information to the community (National Law Enforcement Policy Center 2010). Agencies throughout the country are also using social media platforms to reach out to their community members in order to foster better relationships and connections. For example, Baltimore Police Department uses social media sites such as Facebook, Twitter, and Nixle to enhance their relationship with the community and increase knowledge and safety throughout the city. The Baltimore Police Department uses social media sites as "an extension of the local news media because the media can't cover everything that happens and involves the department" (National Law Enforcement Policy Center 2010, p. 2). The Richmond (Virginia) Police Department (RPD) also uses social media sites to strengthen community relations. RPD posts information on their sites such as its "officer of the month" (Wagley 2011). The Colorado Springs Police Department (CSPD) uses social media sites and includes several features on its pages including: From the Chief, Quote of the Week, and Officer of the Month. The department argues that there is real value in sharing information with the public and illustrating how the different processes and procedures work within the police department. CSPD has received positive feedback from the community (International Association of Chiefs of Police n.d.).

In terms of citizen engagement, the Boca Raton (Florida) Police Department has clearly structured and defined goals regarding social media outreach. The department's social media and communications strategies prioritize effectively engaging the community. Thus, instead of simply disseminating information to the public, the department's social networking sites allow for two-way communication, which allow for heightened levels of transparency. The two-way communication also offers a mechanism for the police department to gather information from community members (Alexander 2011).

Background Investigations

Social media has also been used to screen potential police officers during the application phase. Much to the consternation of some, several law enforcement agencies request that applicants sign waivers that allow investigators to have access to their various social media sites in the search of disqualifying information. Some agencies even require candidates to provide private passwords, Internet pseudonyms, text messages, and email logs as part of the expanding cybervetting process for law enforcement jobs (Rose et al. 2010). According to a report on law enforcement social media use, more than a third of 728 law enforcement agencies check applicants' social media sites during background checks. A potential recruit in Malden, Massachusetts was disqualified after background investigators found evidence of a past threat of suicide. Another potential candidate in Middletown, New Jersey was disqualified for posting racy photographs of himself with scantily clad women (Johnson 2010). Although it is important for law enforcement agencies to use cybervetting procedures during the background investigation process for potential applicants, they must be diligent to keep in mind privacy concerns to ensure fair and just hiring practices (National Law Enforcement Policy Center 2010)

The use of social media for background investigations is so common that many potential recruits are aggressively warned to delete any social media accounts they have maintained sooner than later. The prevailing theory is that departments who fail to properly screen/monitor potential and current employees are open to negative media attention. Nearly one-third of 800 agencies responding to the IACP survey indicated their agency had experienced negative media attention from social media use by on-duty or off-duty employees (International Association of Chiefs of Police 2011, p. 11).

Global Social Media Impact

The use of social media is not limited to the United States. According to the International Telecommunication Union (2012), there are now over one billion users of social media worldwide. Police agencies in various countries have began to embrace the benefits of using social media. The Metropolitan Police of London, for example, have turned to Flickr in an effort to identify individuals involved in serious crimes. After the 2011 riots on London streets, local police posted a set of photos on Flickr showing people they believed to be involved in the riot. Police were asking the public to identify any individuals from the photographs captured from CCTV surveillance cameras in areas where stores were looted. On the Flickr page, police posted that their intent was to "bring to justice those who have committed violent and criminal acts" (Wortham 2011).

German police will soon use a social media platform to assist in criminal investigations. Police in the German state of Lower Saxony are preparing to use their networks of Facebook "friends" to find missing persons and find suspected criminals. The decision to use social media comes from their successful implementation of a pilot program in the capital of Lower Saxony. This pilot program helped solve six criminal investigations and two missing persons cases. Photographs of suspects were posted on Facebook asking for public assistance. Two cases were solved just hours after the information was uploaded to the site (Baghdjian 2012).

Police agencies across the globe are also using social media platforms for community outreach and citizen engagement. The Toronto Police Service (Canada) is highly regarded as one of the most forward-thinking law enforcement agency users of social media platforms, especially for community engagement. Service members can continually be seen tweeting and posting to Facebook and YouTube (Stevens 2011). Several police agencies in Australia have also begun to utilize the community outreach strategy. For example, the South Australian Police (SAPOL) has embraced multiple social media platforms in hopes of better connecting with communities at a local level. SAPOL launched Facebook and Twitter accounts as well as a YouTube Channel, in an effort to increase community support. SAPOL also shares information on such things as travel hazards and CCTV images of wanted offenders (Fedorowytsch 2012). In addition, the New South Wales Police Force's eyewatch program brings community members and police together to communicate and solve problems using Facebook. The Facebook page includes crime prevention messages, alerts, updates, and other important community information. Since this social media platform has been implemented, there has been a 20 % increase in the information flow to the crime stoppers tip line (Maxwell 2012).

Police Facebook sites are also popular in New Zealand. One local police department's Facebook page had more than 5,000 views within 3 months of implementation and is responsible for solving several burglaries. The police agency uses the Facebook page for leads, while the public uses it for information. A community constable in the police agency argues that it's about bringing policing into the twenty-first century, using new tools available to get messages across to the community (Hueber 2012).

Opportunities and Challenges

There is little doubt that social media presents tremendous opportunities for the policing community. In a time of an unprecedented tightening of resources and ever-increasing demands on the policing community, organizations continue to struggle with the realities of doing more with less. In fact, the concept of "doing more with less" seems to be the prevailing mantra of most organizations today, and like other complex organizations, police are not immune from these demands. In a time of tough economic times that project to remain constant for the near future, police departments around the globe are strained with making the tough choices between what they *can actually do* in lieu of budgetary constraints. The opportunities are real and tangible.

In many ways, social media and related technologies offer to help law enforcement agencies grasp the realities those more contemporary philosophies of policing have to offer. Policing paradigms like community policing and problem-oriented policing have promised a new era in police community relations. These paradigms have stressed the centrality of the community to the policing function, the need to share information with the public, the value of connecting with the community on *their* terms, and a need to do these things within the natural constraints of available resources. While laudable, these goals are often hampered by a larger policing culture that does not necessarily support or recognize the value of community involvement in what can otherwise be considered “police business.”

Social media, however, offers the opportunity to facilitate these goals in important and unique ways, especially as it relates to information sharing. It affords the ability to fundamentally change the ground rules of police-community relationships in ways that increase transparency. “To truly develop a police culture that can exchange data, information, and intelligence” (National Law Enforcement Policy Center 2010, p. 5). Social media provides a relatively inexpensive fix for a broad array of information exchanges. It provides an opportunity for rich information exchange that is done on the terms of the public, but which is also not too taxing on either the police or the community. It offers the opportunity for meaningful information exchange and “dialogue.” It expands the “reach” of police departments into segments of the community they may otherwise have difficulty accessing. It is also remarkably efficient in doing so in a way that minimizes actual resource investment.

Yet social media offers more than just information sharing. It offers bi-directional communication that may actually increase *public safety*. The Los Angeles fires during the 2011–2012 New Year season are a noteworthy case in point. As described earlier in this entry, this situation represented a rapidly expanding threat that pressed the limits of the public safety apparatus. The sheer magnitude of the unfolding events made it nearly impossible for serious investigations to be initiated during this early period. Police and fire officials quickly began to take notice that social media sites such as *Facebook* and *Twitter* were inundated with “chatter” about fires. Users were quickly “reporting” new fires, sometimes before 911 was even notified. Videos and pictures of freshly set blazes were appearing on these sites on a near instantaneous basis. *Facebook* and *Twitter* sites such as “Arson Watch L.A.” were used quickly and became venues for individuals interested in following the situation with the arsons to track the latest news, and have the most up-to-date information on what was occurring. By December 31st, public safety officials had begun to fully exploit this technology to both gather information about events, but also to communicate the most current information such as descriptions of suspects, particularly to segments of the community who might otherwise not frequent more conventional media outlets. Social media would eventually emerge as one of the primary ways Los Angeles police were able to communicate directly with the residents of affected neighborhoods. During similar situations in the past, police would have to organize last-minute community meetings in an effort to disseminate information to residents. As one police official noted, “By the time we’d be done with that, we’d be behind the curve, at best, 24 h.” Now, he argued, “we can turn out information in minutes” (Stevens and Winton 2012). By January 2nd, police had identified and apprehended a suspect after aggressively disseminating footage from a surveillance video depicting a person of interest leaving the scene of a crime. Social media played a vital role in helping police and fire officials manage a dynamic public safety threat.

The advantages of a favorable orientation toward social media are obvious, but less obvious are the potential complications presented by social media. Police organizations are inherently risk-adverse institutions intent on communicating to both internal and external constituencies a sense of professionalism. It is an occupation rife with potential complications associated with violations of standard operating procedures. The potential costs associated with scandal are a perennial management concern, and the first hint of scandal often brings a search for internal “suspects” on whom the blame can be laid. The action and inaction of police organizations can often be viewed through this “risk-averse” lens.

It should come as no surprise that many police departments around the country have been trepid about integrating social media into their broader community outreach initiatives. Numerous police departments, for example, have been faced with the very real challenges associated with the discovery of unsavory behavior on the part of sworn employees prominently displayed on social media sites. Examples of problematic behavior have included provocative pictures, apparent participation in illegal behavior, unsavory text-based comments, or other behavior that is considered unbecoming of an officer. One BBC News (2011) news story reported that 150 police officers in the UK were recently disciplined for inappropriate use of *Facebook*, at least 1 of which was fired. Infractions included harassing former paramours and the posting of racist comments. In one example, officers were disciplined after bragging of beating up members of the public during recent protests.

Concerns about the misuse of social media are evidenced by the extensive attention given to the "legal aspects" of social media use in IACP's document titled *Social Media, Concepts and Issues Paper* (National Law Enforcement Policy Center 2010). This document, for example, devotes nearly two-thirds of the entire document to potential legal issues. Concerns raised include important issues such as first amendment rights of employees, the inappropriate dissemination of sensitive information via social media, and the impacts of personal use of social media on the employability of current and future employees. Agencies, IACP warn, have a *duty* to educate and inform their employees, both civilian and sworn, about departmental "proper use" policies.

Recommendations for Moving Forward

The very notion that nearly 10 % of the world's population were active users of Facebook in just a few short years since the product was first developed signifies an unimaginable trajectory of growth. Social media is here to stay and its dominance as a mode of communication is growing by the day. It seems reasonable to assume that new and emerging forms of social media will be the dominant form of social interaction in the near future. With that in mind, police organizations are encouraged to exploit the advantages that social media has to offer, but to do so in a way that mitigates the potential negative tradeoffs. The following are a list of recommendations leaders should consider when planning for the adoption of social media:

1. *Clearly define your purposes*: Agency leaders are encouraged to fully explore their rationale for the adoption of social media practices. Social media is not an all or nothing strategy. It is a set of technologies that evolve over time to fit the changing needs of the department. Different forms of social media have particular advantages/disadvantages and primary forms of social media should be driven by a clear understanding of its purpose. A chaotic approach that is neither focused nor strategic has the potential to not only be ineffective but actually be counterproductive if it communicates a sense of unprofessionalism. Agencies are encouraged to start small but smart.
2. *Commit*: Regardless of the purposes social media plays in a police organization, commit to doing it well. Like static websites that rarely are updated with current content, the success of any social media strategy depends heavily on the extent to which agencies commit to making it part of operational strategies. The most successful social media strategies are those which help create a cultural of interaction and information sharing. Purposeful and consistent utilization of social media technology will help institutionalize its larger role in public safety.
3. *Appreciate the expectations social media creates on the part of the public*: Police departments often justify their forays into social media based on the value of transparency and open communication. Such statements along with the accompanying technology may also create an *expectation* of transparency and open communication on the part of the public. Before an agency fully commits to the use of social media, agency leaders need to fully appreciate how such an effort may also create expectations for more information sharing. Organizational representatives need to create reasonable expectations about the circumstances of information sharing.
4. *Devotion of necessary resources*: Agencies are encouraged to devote a reasonable set of resources to social media strategies in terms of

both money and personnel. While social media is attractive to many agencies because it is seemingly inexpensive, this does not suggest there are no costs. Like any attempts at communication, social media strategies need to be viewed as an important component of community outreach and interaction.

Overview

This encyclopedia entry surveys victim rights at sentencing in adversarial justice systems and explores the continuing debate surrounding victims' claim to have a voice in the sentencing of "their" offender. Although victims claim input at various stages of the criminal process – from bail to parole – the sentencing process is of most significance to victims. At the same time, victim input at sentencing generates the most opposition among scholars and practitioners, making the topic of continuing significance to criminal justice professionals as well as victims and their advocates. The essay reviews the arguments for and against victim input at sentencing and the empirical research which has explored the effects of victim-related reforms in the area of sentencing.

Introduction

Within the adversarial model of justice, a criminal trial is construed as a conflict between two theoretically equal adversaries – the state and the defendant – played out before an impartial adjudicator – the judge. According to this model, the victim is a passive participant who may be called to testify and respond to questions in direct and cross-examination, if necessary. In jurisdictions which employ an adversarial legal system, the crime victim serves as the principal witness for the prosecution and, having served this function, has no further role to play in criminal proceedings.

Over the past three decades, the role of the victim has been transformed from passive witness to active participant, with rights for input into proceedings. While still lacking full "standing" as a party to the proceedings, victims in adversarial systems such as those in USA, Canada, England, or Australia are consulted, informed, and provided input into proceedings more than ever before. To some, this evolution represents a threat to core values of the adversarial model. Victims' rights advocates, on the other hand, view the new privileges and powers of the victim as evidence of progress toward the goal of full participation in the criminal process.

Currently, most countries with adversarial justice systems provide victims with the right to receive information about the status of the case in which they are involved (in the USA, referred to as victim notification laws), the right to apply for and receive financial and psychological assistance, and input rights throughout the criminal process (such as in bail, sentencing, and parole hearings). Although most of these rights and

benefits have been generally accepted, the right to provide input into sentencing decisions has proved controversial and continues to be the subject of heated debate. Controversies revolve around the extent and forms of victim input and its impact on the principles and outcomes of criminal justice proceedings. Underlying this debate is the continuous struggle for the "ownership of the conflict": many prosecutors and other court workgroup members still consider victims as outsiders, or at best symbolic participants, while victims and their advocates, particularly in serious crimes, view themselves as interested parties and thus demand input into court proceedings (Englebrecht 2011). Some victims' advocates have even proposed providing crime victims with "Parallel Justice" – a system that mirrors in its scope and importance the rights accorded to offenders (see Herman 2011). These debates have also emerged at the international level, where the international community pursues justice in special courts established to address mass victimization involved in crimes against humanity, genocide, and war crimes (Zappala 2010).

In the USA, victims' input rights have also assumed a constitutional dimension. The *Victims' Right Amendment* is a proposed constitutional amendment that would establish various participatory rights for crime victims nationwide, with remedies in cases of noncompliance. These rights include the right to speak during the course of legal proceedings, including pretrial release, plea bargains, sentencing, and parole. To date, despite campaigns for its passage and joint resolutions presented in congress, the proposed Victims' Rights Amendment has failed to gain the necessary number of states in support. The principal argument against its passage has been that victim participation and input can be accomplished by enforcing existing laws found in state constitutional amendments or statutes (Beloof et al. 2010).

The Emergence of Victim Input Rights

The role of victims in a criminal prosecution has changed drastically over the centuries in common law countries – from a system in which victims were expected to deal with their offenders directly, through a system in which the monarch assumed the duty of imposing punishment, to the present system in which the state prosecutes a defendant on behalf of the surrogate victim who is relegated to a role of (at best) lead witness. For most victims, even their role as witness never materializes. Because of the high case attrition in the criminal process, most cases do not result in arrest, much less prosecution. Even when charges are laid, many are subsequently stayed or withdrawn by the prosecutor acting in the public interest or because there is no reasonable prospect of a conviction. Further, in the overwhelming majority of cases, the offender enters a guilty plea, often following negotiations with the prosecutor. The victim's principal role in most cases is as a backup – a threat waiting in the wings if plea bargaining breaks down. If the defendant pleads guilty, there is no need for a trial, and the victim has no opportunity to testify. Unlike continental legal systems, which provide victims with party rights, the adversarial system accords victims no formal standing in the prosecution of their offenders and no input rights in the disposition of "their" offender.

The demand by crime victims to have a voice in the criminal justice system has been recognized by many national committees established to study victims in the criminal justice process. The President's Task Force on Victims of Crime (1982) was a particularly important undertaking which explored victims' experiences and revealed the extent of their secondary victimization as a result of their treatment by the criminal justice system. The international community has also recognized the need to integrate victims into the criminal justice process in the 1985 United Nations Seventh Congress on the Prevention of Crime and Treatment of the Offender, which adopted a declaration that required that victims be allowed to present their views and concerns at appropriate stages of the criminal justice process (UN Declaration of Basic Principles of Justice for Victims of Crime and Abuse of Power).

Following these demands and pressures to integrate victims in proceedings, many countries with adversarial legal systems initiated legal reforms that aimed at providing victims with input rights. In the United States, following the recommendation of the President's Task Force on Victims of Crime (1982) that the Sixth Amendment be amended to guarantee victims a right to be present and to be heard at all critical stages of a judicial proceeding, most states adopted laws that address victims' right to be present in proceedings by excluding victims from sequestration requirements or otherwise accommodating their wish to participate. Many states have enacted victims' bills of rights which vary in their scope from mandating that criminal justice officials show respect toward victims, to establishing a victim's right to be present and heard, to allowing victims to sit at the prosecutor's table during trial. In several states, victims' rights legislation is by specific statute. A substantial number of states have adopted constitutional amendments to give victims' rights greater permanence and visibility.

Victim Impact Statements in Major Adversarial Legal systems

In the USA, the states and the federal government allow for victim participation in sentencing hearings. The mechanism for providing victim input in the USA and many other countries is the *victim impact statement* (VIS) or *victim personal statement* as it is known in England and Wales. The VIS is commonly administered by either victim assistance team within the prosecutor office or probation departments within the court. Using the VIS victims can provide details on the physical, psychological, social, and economic harm they and their significant others have suffered as a result of the crime. In some states victims may make specific sentence recommendations in their victim impact statements. Elsewhere, in other common law jurisdictions such as England and Wales and Canada and New Zealand, victims are instructed not to make sentence recommendations. In these countries the purpose of the statement is to allow the victim to describe the harm created by the crime and not to influence the court in any particular direction with respect to the sentence that should be imposed.

The victim impact statement can be presented in writing and by video and some states allow for victim allocution, according to which victims can also present their VIS orally during sentencing. States also provide for victim input in plea bargaining and at parole hearings. For example, crime victims in Arizona have the right to be consulted with respect to any potential plea agreement. Furthermore, prosecutors are required to demonstrate that they have complied with victims' rights legislation. While some victims are hesitant or unwilling to partake in the arrest and prosecution of their violators (e.g., battered women who fear retaliation, are economically or emotionally dependent on their abusers, or are concerned with issues of privacy (e.g., Dichter et al. 2011)), most crime victims, particularly of serious offenses, welcome the opportunity to provide input into sentencing. The suffering endured by parties other than the direct victim, whether it consists of physical, psychological, or financial lasting impact, is known as "ancillary harm" (Roberts and Manikis 2010), and there is growing evidence that courts recognize such harm in sentencing (Cassell and Erez 2011). Most American jurisdiction do not provide for cross-examination of victims about their VIS.

It should be noted, however, that when input rights are provided, most US jurisdictions construe them as courtesies to be extended or withheld at the discretion of the police or prosecutor, without guaranteed remedies for nonenforcement (Tobolowsky et al. 2010), although the trend is to recognize the importance of providing legally enforceable rights with remedies, particularly at the federal level (*Crime Victims' Rights Act, 2004*), and a few states (e.g., Arizona) provide victims with remedies when their rights for input are breached (Beloof et al. 2010).

Other countries with adversarial legal systems have also adopted victims' right for input into sentencing, although not to the degree found in the United States. Australian states provide victims with input rights that are comparable to the rights accorded American victims. The purpose of the VIS in Australia is assisting the court in determining an appropriate sentence. VIS can be made by the primary victim in all of the Australian jurisdictions, and there are also provisions allowing for others to make VISs on behalf of themselves or, in certain circumstances, on behalf of the primary victim. Some jurisdictions, such as South Australia, allow a VIS to include recommendations as to the quantum of sentence, while others, such as Western Australia, expressly disallow the inclusion of sentencing recommendations. In all Australian jurisdictions, it is possible for a victim to orally present their VIS to the court. In Canada, victims have a statutory right to submit a victim impact statement at sentencing and to deliver the statement orally if they so desire. In addition, there is an obligation on courts to inquire of the prosecutor whether the victim has been apprised of her right to submit a statement. If no VIS is present, the prosecutor or the victim may ask for a remand of the case in order for the victim to be able to submit a statement. These provisions go further toward meeting the needs of crime victims than those found in many other countries.

A number of countries have adopted "Victims' Charters," which create expectations that the system will conform to certain standards without actually conferring legal rights upon crime victims. For example, in 2001, England and Wales implemented a victim impact scheme, known as the victim personal statement (VPS). This is a statement expressing the physical, emotional, and financial consequences of the incident. The policy was supposed to be a unique policy, crafted with the US practices as the backdrop and was intended to differ from them in several ways: obtaining the victim's statement early in the process (during the police report, with a right to update it when necessary), presenting this information as a written statement (as opposed to an oral statement), and notably, specifying that victims were not to comment on what sentencing options they prefer for the accused. Finally, the importance of victim participatory rights is apparent from Article 68 of the Rome Statute of the International Criminal Court (ICC) which recognizes the security interests and participatory rights of victims and witnesses and allows victims to provide input into sentencing decisions.

Debates Surrounding Victim Impact Statements at Sentencing

Arguments for Victim Input

Advocates of victims' rights to participate in the criminal justice process have advanced various moral, penological, and practical arguments in support of victim input into sentencing. The right for input recognizes victims' wishes to be treated as a party to the proceeding and with dignity. It reminds judges, juries, and prosecutors that behind the "state," there is an individual with an interest in how the case is resolved. Some argue that sentencing outcomes will be more proportionate if victims provide accurate information about the impact of the crime (Cassell 2009). Without hearing from the crime victim, a judge bases his or her sentence on the description of the crime provided by the prosecution – an indirect account of the crime. By deposing a victim impact statement, the victim provides the court with a more comprehensive picture of the consequences of the crime. Victim input may also promote psychological healing by helping victims who express their harm to recover from the emotional trauma associated with their victimization and court experiences. Finally, there may also be benefits in terms of the offender. Hearing from the crime victim may sensitize the offender to the consequences of his actions in a way that is not possible if the victim does not provide input. This sensitization in turn may promote the offender's rehabilitation and strengthen his intention to refrain from further offending.

Arguments Against Victim Input

The objections to victim input into sentencing range from assumptions that vengeful justice will result to predictions that the system will grind to a halt as a result of the additional time needed to process cases if victims provide input (Erez 1994). Critics argue that a victim's input into sentencing is "irrelevant to any legitimate sentencing factor, lacks probative value in a system of public prosecution, and is likely to be highly prejudicial" (Hellerstein 1989, p. 429). Permission to deliver a VIS in person – exercising victim allocution right – has been regarded as particularly objectionable, as an oral delivery in a very serious crime may be emotionally moving for the judge or jury; this may increase sentence severity or sentencing disparity (Bandes 2009). Critics argued that similar cases might end up being disposed of differently depending on whether a VIS is available and the persuasiveness of the victim. Legal professionals and scholars also argued that victim input violates the fundamental principles of the adversarial legal system, which, as previously noted, do not recognize the victim as a party to proceedings. Including victims would transform the trial between the state and the defendant into a tripartite court proceeding (state – victim – offender). Such practices, it was argued, belong only in continental legal systems with adhesive prosecution or *partie civile* procedures, or to restorative justice schemes, but not in adversarial legal systems (see Ashworth 2002).

Research on Victim Input into Sentencing

Research provides answers to some of the issues raised in the debate about victim input into sentencing (see Roberts (2009) for a review of research findings). Findings from this research sustain the following conclusions: (a) levels of victim input vary across jurisdictions and are influenced by personal reasons as well as by jurisdictions' communal and organizational contexts; (b) victim input does not generally delay the criminal justice system by increasing the time taken to arrive at an adjudication; (c) victim input does not necessarily result in harsher punishment of offenders because courts are able to use victim impact statements appropriately; (d) victim input has the potential to increase victim satisfaction with the judicial system, although victim exposure through participation to the working of the criminal justice may also lead to disappointment; and (e) the implementation of victim input laws is still problematic, and many victims do not exercise their rights or benefit from these reforms.

Levels of VIS Submission

Research has revealed various impediments to the implementation of VIS programs (the term "VIS" is used as generic to describe VIS or VPS or other forms of victim input into sentencing). Many victim-related reforms such as the VIS in practice never reach victims. Victims are sometimes unaware of their rights to provide input, elect not to exercise them, or are confused about the nature and purpose of VIS. When VIS laws were first introduced, victims either did not know what VIS is or claimed that they did not fill out such statements when, in fact, they had done so. Being questioned by a seemingly endless array of people may have caused victims confusion about the purpose of particular interviews. More recently, as jurisdictions have improved their notification schemes and increased outreach and attention to victims' welfare, victims have become more of aware of their rights (Erez et al. 2011b).

One observation applicable to victim impact schemes in all common law jurisdictions is that only a minority of all victims submit a VIS. In England and Wales, a national survey of crime victims found that less than half of all victims interviewed recalled having been informed of the opportunity to submit a statement. Of those who had been informed, only approximately half actually submitted a statement (Roberts and Manikis 2011). Similarly, judges in surveys conducted in Canada reported seeing a VIS on average in 11 % of cases proceeding for sentencing (Roberts 2009).

The decision to submit a VIS is largely determined by personal considerations, but communal and social factors also play a role. Contextual factors such as the availability of victim resources, the outcomes victims receive, the procedures used to determine those outcomes, the manner in which victims were treated, and the information available to victims have all been shown to influence levels of participation (Haynes 2011). The social context in which the victimization occurred and was processed likewise affected participation. Higher levels of victim participation have been documented in urban areas, where anonymity often helps victims to avoid the discomfort or embarrassment associated with involvement with police and the courts (Haynes 2011).

Reasons for Submitting a Victim Statement at Sentencing

The reasons why victim choose to submit VIS or VPS vary across victimization types and jurisdictions. In the survey of crime victims in South Australia, Erez et al. (1994) report that the main reason that victims cited for providing a VIS was to ensure that justice was done (cited by more than two thirds of the respondents), with other reasons ranging from a wish to convey the harm to the offender, to considering the harm in sentencing. Research in other counties has found that victims are more likely to want the court to understand the effect of crime than to influence the sentence imposed. Other reasons cited by victims for submitting a statement include communicating the impact of the crime to the offender and in order to discharge a civic duty. Some studies have found that VIS also provides a platform for victims to convey their concerns, feelings, or views about the crime to the community at large or to authorities who were negligent in protecting victims or preventing the victimization (Cassell and Erez 2011). In some instances victims also wished to correct misconceptions the media created about them or the reasons for their victimization. Lastly, victims commonly do not consider their input, sentencing outcomes, or even capital penalty imposed on an offender as leading to “closure” (Bandes 2009) but rather describe participation in justice as allowing three interrelated benefits: empowerment, validation, and “moving on” (Erez et al. 2011). Clearly, there are many reasons why victims participate or submit an impact statement.

The Effect of Victim Input on Criminal Justice Administration

Researchers have evaluated the effects of victim input at sentencing in many ways, through the analysis of criminal justice statistics as well as surveys of criminal justice professionals such as prosecutors and judges. Research in jurisdictions that allow victim participation indicates that including victims in the criminal justice process does not cause delays or additional expense and that very few court officials believe that victim input creates or exacerbates problems or slows down the proceedings (Hillenbrand and Smith 1989). Court officials (prosecutors, defense attorneys) even in very busy jurisdictions generally view victim input positively.

Perceptions of the Judiciary

The views of judges are particularly relevant to the debate, as they are best placed to know whether victim impact statements contain relevant or extraneous information. One of the criticisms of victim impact statements is that they add little or nothing to the court record and may actually detract from the process by introducing irrelevant assertions about the offender. Surveys of the judiciary demonstrate that most judges see a benefit in receiving crime impact information directly from the victim by means of a victim impact statement. Although much of the information in VIS should already be reflected in evidence adduced at trial or prosecutorial submissions at sentencing, at times VIS may provide additional information useful to the judge who is determining sentence.

One high-profile example of judges’ appreciation of the VIS can be found in the case of Bernard Madoff who ran a “Ponzi” fraud scheme involving the lost of many billions of dollars, devastating the lives of large numbers of victims. In his sentencing remarks, the judge referred to the content of many VIS and listed what they revealed as one of the factors in his decision for a commensurate sentence (Cassell and Erez 2011). Surveys of judges in Canada and Australia found that most judges acknowledge that VIS contains information that is relevant to the purposes of sentencing (Erez and Rogers 1999; Roberts 2009). In short, the most important constituency at this stage of the criminal process – sentencing judges – perceives considerable utility in VIS. This is particularly true for crimes in which the impact on the victim was disproportionate or unusual or involved a large number of victims, violence, sex offenses, or crimes in which property was stolen, damaged, or misappropriated by deception.

Accuracy and Meaning of VIS

Although defense lawyers occasionally express concern that victim statements are inaccurate or express victim vindictiveness, research indicates that, in fact, victim statements seldom include inflammatory or prejudicial material (Roberts 2009). If this occurs, the prosecution can edit the statement to prevent the offending phrases from coming to the attention of the court. Another unfounded criticism of the VIS is that victims often exaggerate the level of harm that they sustained. This appears to happen only rarely, and when it does, judges and prosecutors report that these exaggerations involve financial matters, not emotional or mental suffering (Erez and Rogers 1999). In general, victims express feelings that others who have not been in their shoes or have prior experience with listening to victims may not consider valid or believable (Erez and Rogers 1999). Judges have also rejected the claim that the VIS serves as a platform for victims' vindictiveness or that similar statements by multiple victims suggest "mob vengeance" (Cassell and Erez 2011).

The Impact of Victim Input on Sentencing Practices

A major criticism of VIS is that its submission, and particularly its content, will tip the scales against the defendant, resulting in harsher sentencing patterns. Research largely refutes assumptions that victim input results in harsher sentences for defendants. Studies suggest that sentences are determined predominantly on the basis of legal considerations such as the seriousness of the offense and the offender's criminal record. As a practical matter, VIS will have limited relevance in the US federal system or in jurisdictions that employ a determinate sentencing scheme. Judges and prosecutors in one study (Erez and Rogers 1999) reported that VIS results in harsher sentences in some cases (e.g., when the intended harm was particularly serious or the crime was especially heinous) and in less severe sentences in other cases (e.g., when no harm occurred or when the harm was much less than would be expected). This may in part explain why aggregate studies (e.g., Erez and Tontodonato 1990) do not find any effect of victims' participation on sentencing trends. With respect to other jurisdictions such as Canada and England and Wales, the trends seem consistent; sentencing patterns did not get harsher after the introduction of victim impact schemes (Roberts 2009).

The Effect of VIS Submission on Victims' Welfare and Satisfaction with Justice

Findings on the effect of providing input into sentencing or participation in proceedings are inconsistent with respect to the issue of victim welfare, distress, and satisfaction with justice. At best, research has shown modest impact for certain types of victims or victimization. The evidence, however, may simply reflect a problematic implementation of the law, variations of the impact on different type of victims, or the use of different research methods and measures to study the impact. One study found that filing VIS usually results in increased satisfaction with the outcome (Erez and Tontodonato 1992), and studies of domestic violence victims (Cattaneo and Goodman 2010) have found that victim participation generally increases victims' satisfaction. Studies that examined victims in general, even with random assignment to various treatments, have found that VIS had no effect on victims' satisfaction with the criminal justice process or its outcome (Davis and Smith 1994).

Similarly, studies of the VIS programs in Canada and in Australia have revealed that victims who submit an impact statement are not necessarily more satisfied with the outcome or with the criminal justice system. The Australian study found that lack of impact of the input scheme may be related to the problematic implementation of the law; many victims did not realize that the purpose of the interview they had was to gather input that would be provided to the judge. In some cases, filing VIS heightens victims' expectations that they will influence the outcome. When that does not happen, victims may be less satisfied than those who do not submit a statement. In contrast, a comparative study of victims in the continental criminal justice systems (which allow victims a party status and significant input into the proceedings) suggests that victims who participated as subsidiary prosecutors or acted as private prosecutors were more satisfied than victims who did not participate (Erez and Bienkowska 1993). These differences suggest that in jurisdictions in which victims have more input into proceedings, levels of satisfaction are higher.

The most compelling evidence to support the position that victims see a benefit in submitting a statement comes from responses to the question "Would you submit a statement again if you were victimized?" This question has been posed to crime victims in several countries including the USA, Canada, and the United Kingdom, and the result is consistent: most victims state that they would submit a statement in the event of future victimization (see Roberts and Manikis 2011).

Research has identified three major factors that increase victims' overall satisfaction with the justice system and reduce their trauma. They include (a) procedural justice concerns such as whether the victim had the opportunity to be heard and whether he or she was treated with respect and informed of key developments in their cases (see Wemmers 1996), (b) the final decision of the court (e.g., whether the victims received financial compensation), and (c) whether there was an admission of guilt or request for forgiveness from the perpetrator. These variables were found to be more predictive of victim satisfaction than the severity of punishment imposed. This research suggests that victims' interests or concerns relative to proceedings are not simply to generate a severe sentence but pertain to the court addressing a broad range of issues that are within its purview, issues that a well-implemented VIS program can facilitate. Recent research has confirmed that victim overall participation in justice is influenced not only by the outcomes victims received but also the procedures used to determine those outcomes, the manner in which victims were treated, and the information available to victims about their rights and benefits in the cases they were involved (Haynes 2011).

Finally, research with victims of violent crime in several countries has revealed that victims appreciate judicial recognition of the harm they sustained. Judicial acknowledgment may be expressed in a direct statement if the victim is present in court at sentencing, or it may be articulated in the reasons for sentence (see Cassell and Erez 2011). Judges appear aware of the importance of this validation of the harm: a survey of the judiciary found that most reported acknowledging victim harm directly by addressing the victim in court or indirectly by citing victim impact in their reasons for sentencing (Roberts 2009).

To summarize, the substantial research record on victim impact statements demonstrates that when input schemes are properly administered, most victims benefit from the experience. Unfortunately, VIS regimes around the world are only partially successful in reaching all crime victims. One consequence of this is that only a minority of all victims benefit from participating in the sentencing process.

Conclusion

Victim input into sentencing is now recognized as an important component of criminal justice proceedings in adversarial legal systems around the world. Reports from practitioners indicate that few administrative problems, serious defense challenges, longer trials, or higher incarceration rates result from victim input into sentencing. However, because victim input challenges traditions and established patterns within the criminal courts, the implementation of this right still encounters resistance. Legislative reforms typically lack remedies for noncompliance. Victims' input at times depends on such fortuitous factors as whether a victim encounters criminal justice personnel who support victims' rights and inform him or her what they are or the levels of resources that a jurisdiction allocates to victims (see Haynes 2011). At present then, the victim input schemes at sentencing which employ victim impact statements as the vehicle for victim input have achieved partial success. Although only a minority of victims depose impact statements, most who do report the experience as being a positive one. Moreover, the benefits to victims do not seem to disadvantage offenders. As noted, there is a compelling argument that hearing the victim describe the impact of the crime may be beneficial to offenders.

The road to incorporating a victim voice in adversarial proceedings has not been smooth (see U.S. Department of Justice 1998) nor has it overcome all the barriers to implementation. Yet victim input into sentencing is no longer questioned and is considered an integral part of sentencing in both adversarial and continental legal systems.

Victim-Focused Prevention of Child Sexual Abuse

Yi-Ning Chiu and Benoit Leclerc
School of Criminology and Criminal Justice,
Griffith University, Brisbane, QLD, Australia

Overview

Reppucci and Haugaard (1989) have argued that before designing prevention programs to prevent sexual victimizations, we should first know what actually happens in sexual offenses. In other words, prevention should be based on empirical studies focusing on a detailed analysis of the actual offense not anecdotal accounts. To our knowledge, a very limited number of studies have been completed on victim resistance and its impact on the offender-victim interchange and related outcomes in child sexual abuse. A clearer understanding of the patterns in offender-victim interchanges may assist in informing and improving prevention programs. This entry begins with an overview of child sexual abuse, leading to current knowledge regarding offender-victim interchange and victim resistance. Second, it reviews victim-focused prevention programs and its effectiveness in reducing the number of sexual abuse incidents. Lastly, it makes a number of recommendations as to potential future directions.

Fundamentals

Child Sexual Abuse: An Overview

In child sexual abuse (CSA), the victim is most often in a trusting relationship with the offender with whom they share an emotional attachment. Approximately 95 % of CSA are committed by offenders already known to the victim, with 47 % who were related to or lived with the victim (Smallbone and Wortley 2000). Most incidents of sexual abuse occur in a familial or acquaintance relationship where the offender has established a previous nonsexual relationship with the child, often in authority and care-taking roles (Smallbone and Wortley 2000). The "grooming process" in CSA can be subtle, involving a graduation of giving attention, touching, and sexual talk to more explicit sexual behaviors, but is rarely associated with overt force and violence (e.g., Leclerc et al. 2011a; Smallbone and Wortley 2000). Offenders often target children who appear to have low confidence and self-esteem, who are more vulnerable to emotional exploitation (Elliott et al. 1995). CSA is a highly underreported form of crime, where studies have found as little as 3 % of incidents were reported to the police (Finkelhor and Dziuba-Leatherman 1994). Explanations such as reluctance to see the offender face serious police investigations, fear of stigmatization and retribution, and fear of blame or disbelief from non-offending adults have been speculated (Finkelhor and Ormrod 2001).

The Victim in Focus: Offender-Victim Interchange

Differences have been found in CSA regarding female and male children. Offender sexual behaviors such as touching and fondling are predominant for girls, whereas masturbatory, oral, and anal abuse is more likely for boys (Ketring and Feinaur 1999). Girls are more likely to be abused by familial offenders (in particular, by a stepfather), whereas boys are more likely to be abused by nonfamilial offenders (by a family friend) and also experience threats and force in conjunction with the abuse (Gold et al. 1998). These differences are indicative that offender methods and crime-commission processes vary for boys and girls. Due to the complex nature of offender-victim relationships, the offender-victim interaction is of particular importance in understanding the processes and outcomes in CSA.

Although recent reconceptualization of CSA from a criminological standpoint saw progress toward victim incorporation in crime analyses, only a few studies have examined offender-victim interaction in CSA with a deeper focus. An example is taking into account victim characteristics (e.g., Leclerc et al. 2009) and including the temporal order of events (e.g., Leclerc et al. 2011a). To date, research has suggested that the degree of intrusiveness of offenders' sexual behaviors in CSA is contingent on the victim performing sexual behaviors on the offender, which is in turn dependent on the offender's *modus operandi* (*MO*) or strategies used to gain the victim's cooperation (Leclerc and Tremblay 2007). Furthermore, in examining what factors might lead to a more intrusive sexual outcome, Leclerc et al. (2009) found that modus operandi as well as victim characteristics of gender and age had an important effect on crime event outcomes. Their findings suggest that offenders who get their victim to perform sexual behaviors on them (or victim participation) need to first secure the victim's trust through manipulation (including seduction, money and gifts, playing with the victim, and intoxicating the victim with alcohol or drugs). In fact offenders who used manipulation strategies were nearly six times more likely to make their victim perform sexual behaviors on them in sexual episodes; however, they were also less likely to perform penetration for female victims. In their study, Leclerc et al. (2009) suggested that offenders who used manipulation were more likely to perceive their victims as partners and therefore stopped short of performing penetration when met with resistance. Manipulation was found to decrease the risk of penetration for female victims, but not male victims, and it was assumed that female victims are more reluctant to experience intrusive sexual behaviors than male victims. This interpretation was supported by another pattern found in the study – an interaction effect was discovered between victim characteristics and sexual outcomes. Offenders were more likely to make the victim perform sexual behaviors on them in sexual activity as the victim became older when abusing a male victim. The opposite effect was apparent for female victims; older female victims were less likely to perform sexual behaviors in sexual episodes but were at greater risk of experiencing penetration.

A broader way to examine CSA is by mapping the complete sequence and events of the crime, such as through the use of crime scripts. Crime scripts evolved as an extension of the event model in rational choice perspective, where Cornish extended the analysis of offender decision-making from target selection to the whole process of the crime. A crime script (Cornish 1994) is a step-by-step account of the procedures and decisions used by offenders during crime commission. It breaks the crime down into steps or scenes, which enables potential for situational prevention at each step of the crime, and acts as a framework for breaking down the crime-commission process. The first empirical CSA crime script was developed by Leclerc et al. (2011a), which drew on the script model provided by Cornish (1994). It outlined the sequence of behaviors in CSA through a comprehensive framework. This script involved several stages including (1) entry to setting, setting where victim is first encountered; (2) instrumental initiation, gaining trust strategies; (3) continuation, proceeding to crime location strategies; (4) location selection, location for sexual contact; (5) instrumental actualization, isolation; (6) completion, gaining cooperation strategies; (7) outcomes, amount of time spent in sexual activity, victim participation, and offender sexual behaviors; and (8) post-condition, avoiding disclosure strategies. By breaking down the sequence of actions into a script, it allowed the authors to devise potential situational intervention strategies at different stages of the script, such as parent training sessions on modus operandi and context of abuse and information sessions for teachers on how to detect intrafamilial abuse and limit long-term and repetitive access to children. Offender-victim interaction was incorporated in the script by examining crime event outcomes; however, in this study victim resistance was not accounted for.

Victim Resistance

Victim resistance has been examined in a range of crimes. It has been argued that the interaction between victims and offenders largely determines the severity and level of injury during the crime (Block 1981). Studies that incorporated violence-resistance sequence analysis found that related injuries were attributed to the offender's physical attack rather than the subsequent result of victim resistance (Ullman and Knight 1991, 1992). This indicates that apparent inconsistencies in research may be explained by factoring in sequential relations of offender attack, victim resistance strategies, and assault outcomes. Although it is unclear whether victim resistance decreases the likelihood of injury, results generally indicate that victim resistance is successful and at worst inconsequential for different types of crime including robbery, burglary, sexual offenses against women, assault, and personal larceny (Tark and Kleck 2004).

However, there exists a discrepancy in CSA. The issue of victim resistance is more complicated in CSA, as victims represent a vulnerable group with less ability to physically resist against an adult offender. Finkelhor et al. (1995a, b) examined the efficacy of child's resistance and determined that children who resisted were more likely to suffer injuries and did not experience lower levels of victimization. A few earlier studies in victim resistance asked the offenders regarding what self-protection strategies children should use to avoid abuse (e.g., Elliott et al. 1995). Suggestions made included saying "no" to offenders, telling someone about the abuse, trying to get away, and learning about the proper touching of private parts. In more recent research, the efficacy of resistance strategies in CSA was analyzed based on empirical evidence in crime events. Of the different forms of resistance, it was discovered that the most successful resistance strategies included saying "no" and being assertive and the less effective resistance strategies included trying to get away, fighting back, and yelling for help (Leclerc et al. 2011b). In Leclerc et al.'s (2011b) sample of 94 adult offenders, a total of 74.3 % of offenders reported that their victim was able to avoid sexual contact at some point by telling them they do not want to participate in such activities, and 56.4 % by saying "no." Fighting back (11.8 %) and yelling for help (4 %) were the least successful strategies to avoid sexual contact.

Leclerc, Wortley, and Smallbone's (2010) work supported this finding and added another dimension into their analysis by examining the circumstances where children were more likely to successfully resist abuse. Factors such as pre-offense situation, offender modus operandi, and victim characteristics were examined in association with victim resistance in CSA. In relation to victim characteristics, it was found that younger girls were more likely to employ non-forceful verbal resistance than older girls and also use a greater number of strategies. Additionally, the older the child, the less likely they were to use non-forceful verbal resistance. As younger girls were more likely to use self-protection strategies, they were able to prevent episodes of abuse than older girls. This is in line with Asdigian and Finkelhor's (1995) study, which found that younger victims were more likely to use passive forms of resistance and a greater number of resistance strategies; however, older children were more likely to use active forms of resistance during the assault. Leclerc et al. (2010) found that victim resistance was also affected by offender modus operandi. Examination of offender modus operandi and victim resistance at a multivariate level showed that only violence was significantly linked to victim resistance. Offender violence was related to all forms of resistance, where the use of violence increased the chance of victim resistance by nearly five times when compared to strategies without violence (e.g., desensitization, gifts/privileges). Assuming that violence preceded resistance, it was interpreted that victims had no other way to avoid abuse but to resist in this context.

Victim-Focused Prevention Programs

Crime prevention of CSA can take many forms, including situational crime prevention, developmental crime prevention, community approaches, and criminal justice interventions. Current approaches to CSA prevention are dominated by formal interventions that take effect only after the crime has been committed, such as investigations, selective incapacitation, and offender rehabilitation (Smallbone et al. 2008). Against this backdrop, child protection programs have emerged as a non-criminal-justice response and alternative prevention to CSA incidents. Victim-focused prevention largely revolves around personal safety programs that seek to equip children with self-protective skills, including recognizing and avoiding sexually abusive situations. CSA prevention programs operate on several levels. The overall aim is to prevent potential occurrences and reoccurrences of child maltreatment, as well as reduce the likelihood of intergenerational transmission, where victims of CSA become perpetrators of the next generation. A composite approach to prevention programs was developed from the public health model of disease prevention, based on the level of severity: child maltreatment programs are commonly categorized as primary, secondary, or tertiary interventions (Tomison and Poole 2000). An example table of program classifications is adapted from Holzer, Bromfield, Richardson, and Higgins (2006), as seen in Table 1.

Victim-Focused Prevention of Child Sexual Abuse, Table 1 Types of child maltreatment prevention programs (Holzer et al. 2006)

Focus	Intervention level		
	Primary	*Secondary*	*Tertiary*
Child	Personal safety programs	Assertiveness training for “at risk” children	Therapeutic programs for abused children
Parents/ family	Home visiting programs	Parent education programs	Child protection service referrals
Community	General media awareness campaigns	Targeted media campaigns in “at risk” communities	Intensive community interventions

Primary interventions are strategies aimed toward targeting communities and building public resources. This includes personal safety programs taught in schools for children and parent education such as home visiting programs designed to increase knowledge of child development, assist in parenting skills, and normalize the challenges and difficulties faced in parenting. Secondary interventions target families with higher risk of child abuse, involving interventions such as home visitation, parent education, and skills training. This involves early screening to detect children who are potentially at risk due to the presence of one or more risk factors for child maltreatment, in order to prioritize early intervention. Tertiary interventions involve families in which child abuse has already occurred and is therefore seen as a reactive approach. Interventions such as statutory child protection and child welfare services seek to prevent the reoccurrence of abuse and mitigate the negative impacts of trauma and maltreatment. In summary, prevention programs differ in their focus, whether it is pre-intervention or post-intervention, or vary in their target audience. Education can be specified for parents, for children, for the family as a unit, for the community, or for the offender/potential offenders. Greater emphasis has been placed on primary and secondary interventions following reports indicating greater difficulties in treating abusive parents at the tertiary level, as such abuse may have become a fixed pattern in parent-child interactions (Geeraert et al. 2004).

Victim-Focused Prevention of Child Sexual Abuse, Table 2 Core concepts in the curricula of school-based prevention programs (adapted from MacIntyre and Carr 2000)

Core concept	Description
1. *Body ownership*	The child's body belongs to herself/himself and has a right to control access to her or his body
2. *Touch*	There is a distinction between "good" touch and "bad" touch, where a good touch can be permitted and bad or confusing touches should be refused
3. *Saying "no"*	The child has the right and should practice the skill of saying "no"
4. *Escape*	The child should be aware of the importance of escaping potential offenders and practice the skills necessary for escape
5. *Secrecy*	The child should be able to talk about any touch he or she is asked to keep secret
6. *Intuition*	The child should trust his or her feelings when a situation does not feel right
7. *Support systems*	The child should identify adults that he or she can turn to for help in case of disclosure and seek help from another adult if the first does not listen or believe the disclosure
8. *Blame*	The child is not to blame if he or she is abused or victimized

Recognition of the importance of proactive strategies has increased among government bodies, community alliances, and nongovernment organizations. Victim-focused safety programs adopted across schools are included in this category.

MacIntyre and Carr (2000) summarized the core concepts generally taught in school-based prevention programs, including body ownership, touch, saying "no," escape, secrecy, intuition, support systems, and blame (see Table 2). Body ownership and saying "no" try to teach the child that they have a right to refuse other people access to his or her body. This also teaches children to be assertive and that the child's body belongs to himself/herself. Touch and intuition methods rely on the child's ability to detect what feels confusing or wrong, including the concepts of "good touch, bad touch." Escape includes teaching methods and skills to escape potential offenders. Secrecy and support systems encourage disclosure from the child by assuring children they can talk about anything (even what they were told to keep a secret) and identify a trusted network of adults to whom they can do so. Programs also try to reduce victim blame by assuring children that they are not responsible and are not to blame if he or she is abused.

Are Self-Protection Programs Effective in Reducing Child Sexual Abuse Incidents?

Since its early development, programs such as the Protective Behaviors (PB) program from the 1970s have been subject to several criticisms. For example, early programs were criticized for not incorporating children's developmental and learning needs in the concepts of the program (Finkelhor and Strapko 1992). Also, it was pointed out that the child's ability to clearly recognize and safely respond to unsafe feelings was ineffective, as adults are generally viewed as protectors (Briggs 1991). This is particularly relevant in CSA where 95 % of incidents are perpetrated by adults with prior established relationships with the victim (Smallbone and Wortley 2000). For young children, the attachment toward the offender combined with lack of sexual knowledge means the abuse might not be recognized by the child. This limits the effectiveness of understanding what constitutes as a "bad touch" and increases the risk of victim shame and self-blame.

Outcomes of child safety programs are generally determined by evaluations during a follow-up period. There are three main types of evaluations (Richardson and Tomison 2004): *process evaluations* examine how a program has been implemented or practiced; *impact evaluations* investigate whether a program has achieved its operational goals, such as increased knowledge, skill gain, or increased disclosure. Finally, *outcome evaluations* determine whether the program has resulted in reductions of subsequent incidence of CSA. The latter has rarely been examined by studies, and to date only one study by Gibson and Leitenberg (2000) reported positive results: a survey of 825 female undergraduates revealed that 8 % of students experienced subsequent child sexual victimization after attending protection programs, compared to 14 % of students who had not participated in a program. This result is a contrast to Finkelhor et al.'s (1995a, b) study, which examined the efficacy of self-protection in several types of victimization, including assaults by peers, family members, gangs, kidnappings, and sexual offenses. First, Finkelhor et al. (1995a) completed telephone interviews with a nationally representative sample of 2,000 children who participated in school-based prevention programs. Children who took part in prevention programs were more likely to use self-protection strategies, to disclose abuse when it does occur, and to perceive themselves as having been more effective in avoiding or minimizing the harm of sexual victimization and were less prone to self-blame. It was also found, however, that children involved even in the most comprehensive personal safety programs were more likely to suffer injuries in coping with sexual assaults. According to the authors, this finding was perhaps related to children's more aggressive resistance. In a follow-up study, Finkelhor et al. (1995b) then recontacted previous participants for a second interview, with the average delay being 15 months. Children involved even in the most comprehensive personal safety programs did not experience lower levels of completed victimizations.

However, in actual CSA situations using recent offender self-report data, some strategies were found to be successful in avoiding sexual abuse, such as saying "no" (Leclerc et al. 2010). Although the sample used in the study was limited to children who were ultimately abused at some point, the research indicates that some forms of resistance may be effective in avoiding episodes of sexual contact in real-life situations. In summary, while there is general evidence supporting process and impact evaluations of child safety programs (MacIntyre and Carr 2000), evidence regarding outcome evaluations is lacking and inconsistent. Whether programs are successful in reducing the incidence of subsequent sexual victimization is still unclear (Smallbone et al. 2008).

Where to from Here?

A better understanding of offender-victim interchanges has the potential to contribute to child sexual abuse prevention and inform prevention programs. Below is a list of general recommendations to guide future studies.

Sequence of Behaviors (Offender-Victim/ Offender-Outcome)

Although it has been demonstrated that offender-victim interchanges can impact the outcome, the time sequence of behaviors has not been incorporated. For example, offender response to victim reaction and associated outcomes has yet to be studied. This sequence of behaviors can be valuable in understanding why some resistance strategies are more effective than others. An excellent example of this kind of study is Luckenbill's (1977) work in criminal homicide. In the examination of 70 cases, he found that victims did not play a passive role in the event. Murder was found to be the outcome of a dynamic interchange between the offender, victim, and bystanders. The actions of the actors were shaped in part by each other. Alternatively in sexual offending, when incorporating sequence analysis to sexual offenses against women, it was found that victim injury generally did not precede offender attack (Ullman and Knight 1991, 1992). Therefore, victim resistance is often adopted in response to offender violence. By factoring in sequential relations of offender attack, victim resistance, and assault outcomes, it was further discovered that resistance rarely precedes injury, where 85 % of women studied responded with physical force only in reaction to the offender's initiated violence (Ullman and Knight 1992), and that most forms of resistance are not significantly associated with higher rates of subsequent victim injury (Kleck and Sayles 1990). Similarly, by incorporating sequence analysis to CSA, it will provide a better framework to understand the offense process and interpret the associated outcomes.

Scripts Based on Victims

Although Leclerc et al. (2011a) developed an empirical script model in CSA, the sequence of events can be examined in greater detail using scripts or script tracks. For situational purposes, it is important to be crime-specific. Other offense characteristics such as victim characteristics, victim resistance, encounter settings, or offense location could be incorporated. Studies have already shown the victim gender and age have an impact on the crime (e.g., Leclerc et al. 2009, 2010). For example, what is the crime script for sexual offenses against younger boys compared to older boys? What is the crime script for sexual offenses in public places compared to private locations? Are there differences in offender modus operandi or victim reaction? By operating at a higher level of specificity, crime scripts may offer further insight into prevention strategies. This is valuable for prevention programs. If programs can be tailored to the victim's unique needs and circumstances, based on higher likelihood of the situations they may encounter, more effective and informed advice can be given. This is congruent with Asdigian and Finkelhor's (1995) recommendation, which does not encourage a one-size-fits-all approach to CSA prevention.

What Works, What Does Not, and What Is Promising?

Further impacts and links regarding offense characteristics and victim resistance can be investigated in greater detail and with larger sample sizes. Other factors such as duration of the abuse, escalation pattern, victim gender, guardianship, offender-victim relationship, and settings can be explored. In particular, analyzing the crime process for girls and boys has potential to inform self-protection programs. Examining the efficacy of victim resistance in child sexual abuse empirically is also important. Although some studies have found evidence that some self-protection strategies may be more effective than others [i.e., saying "no" and saying they do not want to participate (Leclerc et al. 2011b)], whether these strategies work for boys and girls of different ages and whether the effectiveness varies in different contexts can be explored. This evidence gives practitioners clearer indications of what works and what does not and what has the potential to be developed. An example to draw from may be in the area of sexual offenses against women, as victim resistance in this area has been more thoroughly explored in comparison. For instance, several types of victim response have been central to women's rape avoidance studies, including forceful physical resistance, non-forceful physical resistance, forceful verbal resistance, and non-forceful verbal resistance. Forceful physical resistance has been consistently related to successful rape avoidance and found to be directly related to less severe sexual abuse without increase of physical injury (Ullman and Knight 1991). The method of resistance also affected the outcome, where forceful fighting and screaming was related to decreased severity of sexual abuse. Non-forceful verbal resistance such as pleading, begging, and reasoning, however, were related to greater severity of sexual abuse (Ullman and Knight 1991). Better understanding of victim resistance strategies in CSA, its efficacy and associated outcomes, and the contexts in which it occurs has important implications for prevention programs.

Conclusion

In conclusion, despite existing knowledge in the field, there are still many avenues to be investigated in CSA. Currently the effectiveness of child protection programs in reducing subsequent victimization has not yet been validated. The design of early victim-focused prevention programs was subject to various criticisms. Some concepts adopted in programs, such as "bad touch" or "unsafe feelings," are ineffective for children (Briggs 1991) and based on common assumptions rather than empirical research. This is in part due to a lack of understanding of the processes that occurs in child sex offenses. Existing literature in CSA indicates that victim characteristics (such as gender and age) and offender modus operandi are important elements that can influence abuse outcomes in terms of severity and level of injury (Leclerc et al. 2009). These factors also impact victim resistance (Leclerc et al. 2010). However, there is still much to be explored and understood regarding the child sexual abuse crime event. The complexity of CSA means that without a more detailed context it can be hard to determine the complete behavioral sequences and interactions in the crime. This is an important area to investigate, as the understanding of what happens during an offense is essential in driving the design of prevention programs (Reppucci and Haugaard 1989; Smallbone et al. 2008). Building further knowledge of patterns in offender-victim interchange may help to interpret crime event outcomes and identify intervention strategies for prevention programs. The recommendations mentioned above provide a guideline for future research to inform practitioners; the pursuit of such knowledge can improve practical intervention and programs aimed at reducing the risk of child sexual abuse.

Overview

Since the development of the criminal victimization survey in the late 1960s, appreciation of the impact of crime has risen up national and international criminal justice agendas. Its more recent refinement as a tool, alongside the input of feminist work, has contributed to a rising awareness of the gendered nature of that impact. This is especially the case in respect of sexual violence. However, as awareness of this impact has increased so has awareness of the shortcomings of criminal justice systems to appreciate and respond appropriately to this kind of criminal victimization. In this chapter some of the tensions that exist between what is known about the gendered nature of sexual violence and what is done about it will be considered. By way of conclusion areas for further work and investigation will be suggested.

What Does Gender Mean?

It is beyond doubt that gender as a word is now increasingly used not only in everyday language and but also routinely in policies and practices. The word gender is frequently used in monitoring and other questionnaires in which people are routinely asked: what gender are you? However, in asking this question, those same documents follow this up by providing the respondent with the option of the choice of being either male or female: categories that denote sex. These practices illustrate, more profoundly than in any other way, both the embrace of gender as a word and the deep confusion between sex and gender that this embrace exemplifies. In many ways gender has become the word that has, in a rather unthinking way, replaced sex. In a chapter of this kind then it is important to appreciate what this author takes, not only the words sex and gender to mean, but also what they refer to as concepts.

Put simply, sex is a biological given. A person is either male or female. Whilst there might be some confusion about the nature of this biological given for a small percentage of people, being male or being female is a *biologically* ascribed attribute. Gender refers to the *socially* achieved qualities of being male or female, that is, being a man or a woman. More specifically the concept of gender alludes to socially constructed understandings of masculinity and femininity. So, whilst everyone is biologically either male or female, sociologically, being male or being female does not necessarily equate with being masculine or being feminine. These latter attributes refer to the social expectations associated with biological characteristics and they are expectations that may vary over time, space, and place. Moreover, it is important to remember that the term "gender," by implication, refers to both men and women.

Why should being clear on the distinction to be made between these terms matter for understandings of gender, victimization and the criminal justice system? In part the answer to this question is important because of the observations already made concerning the substitution of the word sex for gender. The mere substitution of one word for another in policy and practice might at first glance suggest that, the questions that gendered understandings of the world pose, have been addressed. However, such an understanding would be superficial, since gendered approaches demand changes at the level of conceptual understanding as well as practices so informed, rather than merely a change in words.

One way of making sense of how the conflation between sex and gender has come about is to situate this within the broader policy drive for gender mainstreaming. In particular, it is through the conduit of gender mainstreaming that sexual violence has become a part of the policy agenda on a global scale, from the United Nations to the European Community, to national governments. Moreover it is this drive that sets a framework for policy development for their respective member states and/or organizations. Indeed Fraser (2009) posits that as a result of these activities, gender equality is now part of the social mainstream but has yet to be realized in practice. Whilst Fraser (2009) is addressing a wide range of equality issues (unequal pay and so on), the gap between theory and practice that she comments on is a very pertinent one for the criminal justice system. It is this gap between theory and practice, that forces a consideration of the implications for making sense of the ambivalent relationship between what is *known* about the relationship between gender and victimization and what it is that is *done* in the light of this knowledge.

By implication the question of gender challenges not only intellectual understandings of victimization but also what is to be done on the basis of those understandings. In addressing this challenge this chapter will do three things. First it will briefly reflect upon the domain assumptions associated with the concept of victim and victimology: the theoretical context. Second, it will map these concepts against the domain assumptions of the criminal justice system in which one particular kind of victimization that poses considerable challenges to that system will be considered, men and women who present themselves as victims of rape: the policy context. Finally it will reflect upon the extent to which the experiences of the rape complainant are matched by the criminal justice response: the gap between theory and policy.

The Theoretical Context: What Does the Term 'Victim' Mean?

When the word "victim" is gendered, as in French for example, being la victime, it is feminine. The links between this word and being feminine implies that the passivity and powerlessness associated with being a victim are also feminine qualities. This link is problematic for those working within the feminist movement who prefer to use the term "survivor" to try to capture women's resistance to victimization. At the same time the tensions between being a victim or being a survivor are also problematic for others interested in criminal victimization since this either/or distinction fails to capture the *processes* of victimization. In other words it is possible that an individual at different points in time in relation to different events could be an active victim, as passive victim, an active survivor, a passive survivor, or at a point on a whole range of experiences in between. The label "victim," a consequence, seems quite sterile when considered in this way.

There is, however, another problem associated with the word "victim" that is derived from appreciating the process whereby an individual becomes identified as a victim. This is connected with Christie's (1986) concept of the "ideal victim." In other words, there are certain assumptions attached to the label "victim" that mean not everyone actually acquires the label of victim. For Christie the "ideal victim" is the Little Red Riding Hood fairy story victim; a young, innocent female out doing good deeds, who is attacked by an unknown stranger. Indeed this "ideal victim" fits all the common sense stereotypes of the "legitimate" victim of rape, as will become clear in the example to be developed in this chapter. It can result in some people being "deserving" victims, that is acquire the label of victim very readily and easily, and others as "undeserving" victims and may never acquire the label of victim at all. This distinction between deserving and undeserving victims and how it impacts upon experiences of the criminal justice process is one of the issues that we shall be concerned with. This distinction suggests a hierarchy of victimization experiences with some people more likely to be recognized and embrace the label of victim. Such a hierarchy alludes to a third problem intrinsically associated with the term victim: it is also a highly gendered. As shall be seen men and women find themselves in potentially quite different places in this hierarchy even though they may have experienced the same kind of criminal victimization. It will be informative, then, to reflect upon how this concept has become gendered and what kind of impact this gendering has. But first, a few words on the interconnected domain assumptions of victimology.

The origins of victimology are located in the work of Von Hentig and Mendelsohn, amongst others. Like many other like-minded intellectuals of the late 1940s and the 1950s they were perplexed by the events that had happened in Germany during that time. That perplexity led Von Hentig and Mendelsohn to think about the dynamics of victimization, though being lawyers how they understood those dynamics was very much at the level of the individual and very much informed by their legal training. Both of them were concerned to develop ways of thinking about the victim that would enable the victim to be differentiated from the non-victim. In other words both were clearly suggesting that there is a normal person who, when the victim is measured against them, the victim falls short. Each developed victim typologies. Von Hentig's typology worked with a notion of "victim proneness." He argued that there were some people, by virtue of their socio-economic characteristics who were much more likely to be victims (in this case of crime) than other people. These he identified as being women, children, the elderly, the mentally subnormal etc. If this categorization is thought about from a gendered perspective it suggests that Von Hentig thought the normal person against whom the victim was to be measured was the white, heterosexual male. Von Hentig's work has been very influential in the development of victimological thinking and is perhaps most keenly identified in the concept of "lifestyle" that has informed much criminal victimization survey work.

Mendelsohn adopted a more legalistic framework in developing his typology. His underlying concept was the notion of "victim culpability." Using this concept he developed a sixfold typology from the victim who could be shown to be completely innocent, to the victim who started as a perpetrator and during the course of an incident ends as the victim. Arguably his typology is guided by what might be considered a reasonable or rational way of making sense of any particular incident given the nature of the law. Again gendered thinking suggests that his understanding of reasonable equates with that which the white, heterosexual male would consider reasonable. This is especially demonstrated in the later work that was generated from Mendelsohn's ideas, in which victim culpability became translated into "victim precipitation." The furore that greeted the publication of Amir's (1971) work, whose analysis of police data on recorded rapes that suggested 19 % of these were "victim precipitated" stands as a case in point. That furore, driven by the feminist movement, railed against the way in which this work perpetuated myths about rape. However, as shall be demonstrated, such concepts, and the myths that they serve, still have considerable cultural and professional resonance despite their questionable acceptability intellectually.

From these beginnings the concepts of lifestyle and victim precipitation have formed the core of much traditional victimological work and illustrates the influence of positivism on victimology. This kind of victimology reflects an emphasis on measuring differences, seeing those differences as being somehow abnormal, and looking for explanations of those differences that lie outside of individual choice. In all of this, the development of the concept of lifestyle has been of central importance in perpetuating certain assumptions about criminal victimization and how to measure it so we shall consider its relevance to the discussion here in a little more detail.

The concept of lifestyle was developed initially and related to criminal victimization by Hindelang et al. (1978). This book presents a way of thinking about personal victimization in which lifestyle refers to "routine daily activities, both vocational activities (work, school, keeping house etc.) and leisure activities" (ibid: 241) and in which individuals are constrained by role expectations and structural characteristics that are reflections of their demographic positions (class, age, sex, ethnicity etc.). The authors argue that there is a direct link between an individual's routine daily activity and their exposure to high-risk victimization situations from which personal victimization occurs. It is important to note the implicit acceptance of the view that the chances of personal victimization vary in relation to the amount of time spent in public places. This assumption does two things simultaneously. First it reflects a very male view of what constitutes a problematic arena for people: the public. As a result it hides the world of the private (all that goes on "behind closed doors") as being an arena in which personal victimization might occur. In other words this assumption hides the world of women, children, and some men. Second, in focusing on what goes on in public it implicitly accepts the view that this is the context in which legitimate criminal victimization might occur. Thus the victim out doing good deeds who is attacked in public by a stranger stands as an "ideal victim" (Christie 1986) provided that the victim was out doing good deeds and did nothing to "invite" the attack.

Centering lifestyle reflects an interesting twist in the domain assumptions of victimology. No longer is the white, male exempt from victim status, as in the work of Von Hentig and Mendelsohn. The concept of lifestyle centers the importance of public space and places men in the foreground of potential victimhood with women and children in the background, in the world of the private. However, despite the potential of this assumptional twist, the early criminal victimization work that emanated from this development did little to build on its potential for problematizing men and masculinity. Indeed, it was not until the early 1990s, arguably as a consequence of the input of radical feminism, that the conundrums that this work generated (for example, the empirical finding that whilst men were most at risk from criminal victimization they expressed the least concern about it) were subjected to closer (gendered) scrutiny.

What feminist work did was, not only to offer a different conceptual apparatus, informed by the concept of patriarchy, with which to understand women's lives in general, it applied that apparatus to the crimes that affected women's lives. Those crime that occurred in private, behind closed doors; mainly rape and "domestic" violence. From this viewpoint the key variable in understanding women's experiences including their experiences of criminal victimization is, therefore, men's power over women. Put simply radical feminism clearly focuses attention on all those criminal victimizations that go on in private between people who are for the most part known to each other. This included rape, sexual assault, and domestic violence. The seminal work of Russell (1990) marked a key turning point in placing these acts on the criminological and victimological agenda, aided by the conceptual development of a ‘continuum of sexual violence’ introduced by Kelly (1988). This work rendered men, and their relationship with masculinity, as centrally problematic to understandings of the nature of women’s victimization. In so doing it made men as victims of such violence invisible (see also Graham 2006). Conceptually this in itself was problematic since it did not resonate with the relatively small volume of work that suggested men too could be victims of such violence and that it occurred in the community as well as in prison.

In one intervention on this invisibility, Goodey (1997) used the phrase “big boys don’t cry” to help explain how it was that young men struggled with being victimized. Put simply it contradicted their understanding of themselves as men. The epidemiological work of Coxell et al. (1999) on non-consensual sex between men, the pioneering work of Lees (1999) on male victims’ experiences of the criminal justice system, the in-depth interviewing work with male victim of rape reported by Allen (2002), all add both quantitative and qualitative depth to our understandings of men’s differential experiences of violence, victimization, and their responses to it. More recently further detail has been added to this picture in appreciating how blame works for male and female victims of rape (Davies et al. 2006), the continued efficacy of the stranger rape stereotype as mediated by gender (Anderson 2007), the comparative role of shame in reporting behaviors (Weiss 2010), and the persistent inability of the law to recognize the gendered nature of the act of rape i.e. that it includes men as victims (Graham 2006). The work referenced here affords just a snapshot of the ongoing intellectual engagement with rape as both a male dominated act and a male experienced process of victimization.

To summarize, whilst much victimological work leaves the impression that victims are not likely to be male, this is clearly empirically not the case. Much male violence is committed against other men, and in recent years there has been an increasing awareness that much of that male violence against other men is also sexual violence. So quite clearly men can be victims even if they have been relatively hidden from the victimological gaze. The empirical fact of their (sexual) victimization, however, has not only been relatively invisible in conceptual understandings of victimization, but also in criminal justice responses to such victimization. The next section considers the extent to which, despite this intellectual context, gendered understandings have permeated or failed to permeate policy responses to sexual victimization of both men and women.

The Policy Context: Implementation Failure?

Charting the nature and extent of sexual violence and developing appropriate policy responses to this problem is fraught with difficulties. Nevertheless is it the case that much effort over the last 20 years has been focused on improving the response of all the criminal justice agencies to the rape victim across many different jurisdictions. These improvements have ranged from the development of specialized police units designed to respond to rape complainants, to the establishment of specialized investigative procedures, specialist health responses, to changes in the law. In addition legislation designed to curtail the use of questioning about the past sexual history or character of complainants has been introduced both in the UK, Australia, New Zealand, and United States of America. Nevertheless the conviction rate for rape cases in England and Wales remains low at 5.6 %, a finding replicated across Europe and elsewhere (Daly and Bouhours 2009). Her Majesty’s Crown Prosecution Service Inspectorate Thematic Report published in 2007 attempted to offer some understanding of why the conviction rate remains so low in England and Wales despite the evidence that the reporting of complaints of rape has increased. Its findings reveal that, of 573 recorded complaints of rape (and it must be noted that all these cases involved female complainants), in 491 (85.7 %) of the cases the suspect and the victim knew each other, in 102 of these cases (20.8 %) and the victim withdrew the charges, leaving 398 cases. Of these the suspect was charged in 160 cases, the main reason for not charging was insufficient evidence (229 cases). Of 160 cases in which the suspect was charged, 75 case files were examined further that revealed that out of these 75 cases there were 39 convictions, 20 as a result of a guilty plea, 19 on the basis of a jury decision.

This snapshot of what happens to cases in England and Wales is illustrative of problems experienced across a range of jurisdictions. It points to not only the problem of attrition but also the points at which cases of rape pose problems for the criminal justice system. This data points to at least three of these critical moments; the point at which the incident is reported (this involves the police); the point at which a case for charging a suspect is being made (this involves the Crown Prosecution Service), and the point of conviction (this involves the court and the jury). Indeed the Stern Review (2010: 8), of how rape is handled in the UK, concluded that despite these problems the:

> . . .policies are the right ones and we have only a few changes to recommend. In some areas the policies are applied consistently and with commitment by all involved. The policies are not the problem. The failures are in the implementation.

Is this analysis correct? The following summary of the Warboys case (Brown and Walklate 2011: 2–3), provides some insight into why this analysis might not be the appropriate one.

Warboys was the driver of a London black cab. He was first identified as a suspect in cases of sexual assault reported to the police in July 2007 but it was not until February 2008 that he was charged with a large number of such offences dating back to October 2006. He was found guilty and sentenced in April 2009. Some 80 victims contacted the police after Warboys' arrest, many of whom had not previously reported their assault to the police. The Independent Police Complaints Commission's (IPPC) enquiry into this case noted that not only there were failures to comply with Standard Operating Procedures for the investigation of rape but also systemic failures to identify and link offences. The IPCC concluded that there had been a poor initial investigative response, a failure to trust victims, failures in front line supervision, lack of cross checking systems to link similar offences, and they found that the detective sergeant missed crucial investigative opportunities. Such a catalogue of failings is not peculiar to the UK. Jordan (2008) documents a similar set of failings during the investigation of a case in New Zealand that revealed majors flaws within policing practices and the wider criminal justice system.

As has already been suggested, embedded here are patterns of a bigger picture relating to sexual violence, like for example, under reporting, attrition of cases as they drop out at key stages of the criminal justice process, disbelieving of complaints, and giving men's explanations for what happened greater credence. For example, in England and Wales the British Crime Survey reveals that a significant number of victims still tell no one about their assaults with only 11 % making a report to the police (Povey et al. 2009). Indeed in Brown et al. (2010a), two-fifths (40 %) told no one about their experience and while men and women were equally likely to tell someone, who they told varied somewhat. Of those who did tell, the most common confidantes were friends, relatives or neighbors (44 %). The way in which women's (and men's) experiences of rape and sexual assault are silenced, within and outwith the criminal justice system, is subjected to critical analysis by Jordan (2011). This is an analysis that needs to be considered against criminal victimization survey data. For example, Povey et al. (2009) also report that nearly 1 in 4 women (23.3 %) and 1 in 33 men (3 %) men had experienced some form of sexual assault (including attempts) since the age of 16. For rape (including attempts) the prevalence was nearly 1 in 20 women (4.6 %) and 1 in 200 men (0.5 %) since the age of 16. Taken together, findings like these speak volumes as to the nature and extent of such violence and the wider (lack of) recognition of it.

As the thematic report referenced above indicates much work remains to be done in supporting complainants of rape through the criminal justice process. However this need for support needs to be put into a wider context as Jordan's (2011) analysis suggests. Complaints of sexual assault face challenges in being heard and responded to in a wider cultural context. For example, an Amnesty International sponsored poll (ICM 2005) revealed that 26 % of those asked thought that a woman was partially or totally responsible for being raped if she was wearing sexy or revealing clothing, and more than one in five held the same view of a woman who had had many sexual partners, with 30 % "blaming the woman" if she was drunk. These findings echo those of Brown et al. (2010b) and highlight the kinds of attitudes that are exploited in the criminal court during the course of a trial.

Women's experiences of the rape trial arguably are still governed by the need to be beyond reproach or blame in every respect especially in the witness box. The process of cross-examination in the witness box is, more often than not, designed to render a woman's evidence less than believable on the grounds of her womanhood rather than the quality of her evidence. It is well established that trials involving sexual offences requires counsel to test the credibility of complainants. This, of course, is a strategy not confined to sexual offence trials though it is argued that the impact of such questioning is qualitatively more traumatic in these cases than in those involving other kinds of offences. Moreover, Burman (2009: 394) reports that, despite legislative changes made in Scotland intended to improve women's experiences of the witness box:

> The 2002 Act has clearly not gone in the direction intended; it has resulted in neither a decrease in the use of sexual history and character evidence overall, nor a tighter focus on the type of questioning that is allowed. Rather, it has resulted in the introduction of much more sexual history and character evidence than under the 1995 Act. The proportion of trials with applications to introduce prohibited evidence have increased markedly, questioning on sexual history and character is now sought by both the prosecution and the defence, the numbers of multiple applications have doubled and the "belt and braces" approach adopted by the defence means that the questioning or evidence sought in written applications is now far more detailed and extensive than that sought in verbal applications made during the trial under the 1995 Act.

Whilst less well documented, the finding reviewed above can also be translated to men's experiences of the criminal justice process as victims of sexual assault. Rumney (2008: 4) reports that "While some men do report a positive response, some police officers and other criminal justice professionals appear to attach to gay men or those they perceive as gay highly questionable assumptions regarding credibility, trauma and truthfulness." Of course, assumptions in respect of homosexuality, and indeed, experiences of homophobia have the potential to permeate men's experiences of reporting sexual assault despite the empirical data pointing to the fact that the majority of sexual assaults are committed by heterosexual men on other men both within and outwith the context of prison. As Lees (1997: 106) has commented:

> One of the most damaging insults to be thrown at a man is to call him a woman, a bitch or a cunt. The act of coercive buggery can be seen as a means of taking away manhood, of emasculating other men and thereby enhancing one's own power.

Experiences at court, then, can not only challenge a woman's testimony based on her qualities of womanhood, they can also challenge a man's based on his qualities of manhood. In each case these qualities are measured against normal forms of femininity and normal forms of masculinity. These are forms that are permeated with assumptions around what constitutes normal heterosexuality. Thus, in facing questioning at court, the issue of penetration, various legislative interventions in different jurisdictions notwithstanding, still remains crucial to a rape trial: who did what to whom with what implement. The focus on the penis characterizes that which Smart (1989) has called the celebration of phallocentrism. A celebration that tells us much that is implicit in the law with respect to gender and why the rape trial proceeds in the way that it does.

The celebration of the penis privileges a male centered view of both female and male sexuality. Women do not know what they want; they have to be persuaded. So a woman whose dress or behavior challenges this assumption is problematic. Men cannot be blamed for acting on deep-seated sexual needs: in the face of temptation these are uncontrollable. As a result the few who are convicted must be the psychologically deranged "other men" in whose name, men as a group, dare not speak. Moreover it is this manhood that proves equally problematic for the male complainant of rape. As Allen's (2002) typology of men's reactions to having been the victim of rape, clearly indicates the necessity of understanding these through the lens of what it is to be a man. Thus presumptions surrounding appropriate manhood (masculinity) render the male complainant of rape hugely problematic for the criminal justice system in general and the criminal trial in particular, given the implicit celebration of (heterosexual) phallocentrism commented on above. Naffine (1997: 119) suggests:

> It is not only women who suffer from the culture of the strong man, though it is women who are consistently dispossessed by it..... There are a range of other masculinities which are simultaneously implied and then cast out. They are by implication, rendered unnatural and undesirable. Thus are the men who depart from the masculine ideal rendered silent.

Thus sexual assault and rape are framed by deep-seated understandings of who the law is for and what can be achieved in the recourse to law. This frame inexorably regresses to very conservative understandings about who can do what to whom with what kind of implement. Such conservatism inherently buys into ideal typical notions of victimhood that are differently informed for women and for men, but in each case can result in a silencing of their respective voices. The question remains: is this resistance to gendered understandings of sexual violence, implementation failure, as many policy and practitioners would claim, or reflection of a deeper problem?

Current Issues and Controversies: Implementation Failure or Conceptual Failure?

The foregoing discussion offers an overview of the extent to which addressing sexual violence, rape in particular, has been responded to as a social problem. This overview clearly implies that whilst there has been a good deal of policy activity directed towards addressing sexual violence against women, there has been less attention paid to the problem of sexual violence against men. Moreover, despite the desire to improve policy and professional responses to women as complainants of sexual violence, whilst much is promised, much also remains to be delivered, leaving responses to men as complainants arguably further in the shade. This overview also implies a deeply held believe that the criminal justice systems could "do better"; that is, could implement agreed policies much more effectively. A good deal of the debate around how a better response might be achieved has focused on the question of attrition and, what attrition actually means, which is neither simple nor straightforward. Yet it is also important to note that criminal justice system policies and practices does not act within a vacuum. As the foregoing discussion has also intimated, there are inherently conservative images embedded in the law around sexuality and difference and there are similarly conservative views articulated in public opinion around the factors that contribute to sexual violence. Moreover such views are held about men and women as victims and perpetrators (Anderson 2007). In the face of such conservative forces, implementation failure seems not only a likely outcome but also, arguably, an unfair charge.

Mooney (2007: 269) comments that the values whereby men's violence to women is sustained in the face of public imperatives otherwise "exist throughout the width and breadth of popular culture." For example, consider the vicarious pleasure gained by some young males in witnessing violence on a "good night out" (Winlow and Hall 2006). Thus violence becomes part of everyday life; as is the case of a woman living with violence who judges that the risk of poverty and homelessness are worse than the violence she knows she will be subjected to. This is the ordinary violence of everyday life. In fading out the voices of those who know this, as Jordan (2011) suggests, the ordinariness of violence is rendered absent. So too is the ordinariness of the (sexual) violence that men commit against each other both within and outwith the prison. So to answer, Mooney (2007) it is with the ordinary nature violence in which it can be both public anathema and a private common place all at the same time. It is within these tensions that the problems of the "implementation gap" are to be found.

Conclusions and Future Research

In a recent commentary on her own conceptual intervention on sexual violence Kelly (2011: xxiii) suggests that "neither recognition nor redistribution provide an adequate framework for understanding the persistence of gender inequality, VAW [violence against women] and the intersections involved" and that the apparent policy failures that have ensued from over 20 years of campaigning, "need new theoretical framings, which place the continuum of violence at the core of gender inequality." In other words, what we have witnessed, and what has been articulated in this chapter, is not implementation failure, but conceptual failure. This does not necessarily mean that current policies should be dropped but does mean that greater recognition that gender refers to men and women is required. By implication, more work is needed in considering sexual violence from a gendered perspective. Work that does not assume what might be known about women's experiences also translates to men's, but considers how a gendered understanding might transform their respective experiences of the criminal justice system as both women and men as victims, offenders and professionals working within the criminal justice system.

Overview

A major theme expressed in many of the chapters of this volume is the dissatisfaction that crime victims have long felt concerning the policies and practices of the traditional criminal justice system. After centuries of neglectful and, all too often, abusive treatment in criminal courts, crime victims in countries throughout the world within recent decades have demanded fundamental reforms to address their needs and concerns. What many victims' advocates envisioned was a criminal justice system not simply fixated on the goals of assessing blame and punishing offenders, but one which offered crime victims the opportunity to meaningfully participate, to have their voices heard, and to repair the emotional and material harm they have suffered.

With the emergence of the restorative justice movement in the 1980s, it appeared that crime victims had gained an important ally in their quest for reform. Restorative justice, after all, was seeking many of the reforms crime victims had sought: greater involvement in the criminal justice process, compensation for losses and a path to healing the emotional wounds of crime. One could scarcely have imagined a more natural alliance of interests, and yet, despite its early promise, the relationship between the victim's advocacy movement and restorative justice has been and continues to be tenuous at best. (Amstutz 2004, p. 85). In the most extensive survey of victims' advocacy groups conducted to date, widespread dissatisfaction was uncovered concerning restorative justice programs in the United States, including concerns about injustice, disrespect, exclusion, lack of empathy, and irrelevance of the programs (Mika et al. 2002). A number of respondents believed that restorative justice was created primarily for the benefit of offenders in search of reducing punishment and avoiding responsibility and that the needs of victims were merely an afterthought. Some respondents reportedly felt they were manipulated into participating by restorative justice "in order to promote and rationalize its agenda" and argued that the characterization of crime as mere interpersonal conflict "trivializes the nature of deep harms and the character of their relationship to the offender" (2004, p. 34). Despite the promises of healing, "little victim relief" was actually attained, and crime victims asked: "What is the compelling proof that it works?" Without proof of the effectiveness of its programs, the report maintained, "there will continue to be resistance to their blanket implementation and reluctance in the victim community to embrace them" (2004, pp. 33–34).

What went wrong? Can this relationship be mended? What are the prospects for future relations as both the victims' movement and the restorative justice movement continue to evolve? In this chapter, these questions will be explored, beginning with a brief historical overview of both the victims' movement and the restorative justice movement, followed by a critical assessment of the benefits to victims claimed by restorative justice advocates, and an analysis of several key policy issues that have impeded the growth and public acceptance of restorative justice. In the final section, we shall consider how a more expansive conception of restorative justice that has emerged in recent years may make restorative justice available to a wider variety of crime victims and become of greater importance in their advocacy for increased public support.

Fundamentals

The Restorative Justice Movement

Restorative justice arose in the 1980s as a radical alternative to a conventional criminal justice system that many had regarded as dysfunctional, morally deficient, and neglectful of the legitimate needs of victims, offenders and communities. Not only was the criminal justice system seen by many critics as ineffectual, unable to stem the epidemic of drug use, and, through its "get tough" tactics, the cause of further alienation and rebellion in the inner cities, the system was increasingly deemed unresponsive to the needs of crime victims and their communities. Social critics from the Left renewed their attacks on the criminal justice system as a means of social control exercised by a repressive state, and proposed decentralized, informal alternative means of resolving conflicts. Prisoners' advocacy organizations that stressed the need to reintegrate, rather than permanently exclude, offenders obtained support from Christian Mennonites who advocated healing, repair and reconciliation in place of retributory justice. The 1980s also saw a rise in interest in community-based problem solving and indigenous justice. During this period, the "just deserts" theory, initially embraced by legislators as a principled solution to the problem of sentencing disparities that resulted from unbridled discretion, came under strenuous attack for being rigid, obsessed with punishment, retrospective, and more concerned with uniformity rather than conflict resolution. (Bazemore and Walgrave 1999, p. 46).

Out of this amalgam of critiques of the existing criminal justice system grew an interest in a new conception of justice based on healing injuries rather than the assignment of blame and punishment for legal transgressions. These "restorative justice" theorists sought an informal, non-punitive alternative to a system in which many victims felt they were treated as little more than a "piece of evidence" and who were "twice victimized, first by the offender and then by an uncaring criminal justice system that doesn't have time for them" (Umbreit et al. 1994, p. 196.)

Because restorative justice arose from a diversity of sources, there has never been an "official version", or even a commonly agreed-upon definition. What has been achieved has been not so much a set of principles as a set of shared values:

- Viewing crime as a source of harm, not simply as a transgression of law, and, consequently, specifying the mission of the criminal justice system as the repair of harm instead of only the determination of guilt and imposition of punishment;
- Providing compensation for the victim and achieving social reintegration of the offender; and

- Involving the victim, the offender, and relevant community members to the fullest extent possible in voluntary dialogue in order to devise restorative solutions.

The Victims Movement

Beginning in obscurity in the 1960s as a scattering of neglected and abused "outsiders" to the criminal justice system, victims' advocacy groups, within a few decades, became a powerful influence on criminal justice policy and practice throughout the world.

Their demands that the voices of crime victims be heard in court, that the full extent of their suffering be acknowledged, and that their expectations of appropriate justice be considered by the courts in sentencing fell upon the receptive ears of law enforcement officials and politicians in the 1970s who seized upon the incipient victims' rights movement as a means to secure the cooperation and political support of crime victims. Crime victims' advocacy achieved a number of significant criminal justice reforms including the establishment of victims' assistance units within prosecution offices that provided court information, protective services, and assistance to victims as well as procedural changes that permitted victims to be heard in court at sentencing and parole hearings. Along with these and other procedural reforms, support for victims' welfare reform also developed. Overturning centuries of legal impediments to obtaining fair compensation for their material losses within the traditional criminal justice system, victims' advocates achieved the remarkable goal of establishing court ordered restitution as a standard component of criminal prosecutions in court systems throughout the world. As the full extent of victims' losses was brought to light both in court and through the news media, it soon became apparent that the prospect of payment for these losses solely through the financial resources of criminal defendants was woefully inadequate. Therefore, advocates of victims' welfare looked to the state for compensation, whether or not the offender could pay restitution, and indeed, whether or not the offender was even brought to justice. Many of these programs, therefore, operated independently of the criminal justice system altogether. Despite these gains, however, there were persistent concerns from victims' advocates that state compensation programs were either flawed or insufficient, and riddled with exceptions, exclusions and limitations. (Dignan 2005, pp. 54–55).

Benefits to Victims Offered by Restorative Justice

While restorative justice advocacy has not been significantly involved in assisting victims groups to obtain increased government support and compensation, it has offered an intriguing new way to fulfill victims' emotional and psychological needs in 100s of innovative programs implemented throughout the world during the last 3 decades.

Restorative justice, indeed, may very well be the first major criminal justice reform that has focused on repairing both the material and psychological harm suffered by crime victims. Besides their physical need for safety and the economic need for restitution of their material losses, crime victims endure emotional and psychological losses as a consequence of the crime. Emotional reactions reported by victims include anger, anxiety, depression, overall physical distress, resentment, and hostility. Psychological harms to victims include a sense of isolation, loss of faith, shock, enmity, loss of control, self-blame, denigration, and fear (Lurigio and Resick 1990, pp. 55–57). Restorative justice advocates have primarily stressed three vehicles for emotional and psychological recovery: apology, receipt of restitution and victim participation.

The central mechanism for emotional and psychological healing cited by virtually all restorative theorists is apology (Strang 2002, pp. 18–23). The demonstration of respect inherent in apology is thought to counteract the message of disrespect that often underlies the feeling of injustice, thus lessening the victim's demands for punishment. Because crime devalues the self-worth and denigrates the status of the victim, proper balance is restored by (1) the offering of an apology by the offender and (2) the communication of condemnation and reproach by society. Through expressive acts, rather than through physical punishment, it is believed that the victim is vindicated and the psychological harm of the crime is repaired.

Additionally, the requirement of restitution is not only a means of material compensation, but also a means of accountability–a symbolic gesture of penance and a corroboration of the sincerity of apology. “Restitution,” it has been contended, “serves both the emotional and practical needs of the victim and the idea of social justice–as opposed to punishment, which instead satisfies the rather archaic requirements of retribution” (Sessar 1999, pp. 287–288). Finally, restorative justice theorists have contended that the disempowerment, loss of control, and sense of isolation experienced by many victims can be ameliorated by greater involvement and more respectful treatment in the criminal justice system itself.

Empirical Testing of Restorative Justice Claims

Overall, the results of victim surveys from dozens of programs throughout the world have been very positive, indicating a high degree of satisfaction on the part of both victims and offenders (Umbreit et al. 2003, pp. 25–28). Victims involved in restorative justice sessions have reported higher levels of satisfaction than their counterparts in the traditional criminal justice system concerning their experience of fairness, receipt of restitution and reduction in fear and anxiety. In his meta-analysis of seven studies screened for statistical comparison, Poulson found significant positive results from victims including their satisfaction with the handling of the case, their opportunity to tell his or her story, their belief that the offender was held accountable, whether apology was offered, and whether the victim was still upset about the crime (Poulson 2003). These studies also indicate that the material and emotional benefits to victims were achieved via a non-punitive restorative alternative while decreasing, or, at least without increasing, the recidivism rate of the offenders who participated.

Not all findings are uniformly positive, however. In her survey of Australian programs, Kathleen Daly found that, contrary to the goal of eliciting empathy and remorse from offenders, most offenders were fixated on negotiating a better sentence and reported that the victim’s story had “little or no effect on them” (Daly 2002, p. 70). Correspondingly, only 27 % of the victims who attended these sessions regarded the offender’s apologies as sincere. Indeed, Maxwell and Morris’ 1997 study found that 25 % of victims who participated in a restorative justice family conference program actually felt worse after attending due to, among other reasons, the perceived insincerity of the offender’s apologies. Even in the limited context of victim satisfaction, researchers have found that victims were the least satisfied of the participants at restorative justice conferences, and that their negative feelings were linked to dissatisfaction with the leniency of the outcome (Maxwell and Morris 1994, p. 119).

Compounding the problem of assessing the success of restorative justice programs are methodological issues including low response rates to questionnaires, problems in identifying and standardizing key variables, the inability of research designs to randomly assign sentencing variables, and difficulties in measuring victims’ emotional and psychological reactions. Studies, for example, that have focused on victim satisfaction have not assessed the victims’ emotional and psychological recovery, and even when attempted, the goal of measuring satisfaction is singularly elusive: “It is virtually impossible to disentangle the multitude of variables which together determine how satisfied people are with any social service” (Johnstone 2011, p. 20).

Moreover, the limitation of restorative justice programs to those victims willing to personally meet with their offenders restricts the scope of the conclusions that can be drawn from the victim satisfaction studies conducted to date. In contrast to the claim that victim participation is, in itself, a source of personal empowerment and a means of repairing the emotional harm of crime, the fact remains that most victims, after being offered the opportunity to engage in dialogue with offenders, have failed or refused to do so. The largely positive results of these surveys, therefore, were very likely obtained from a small, self-selected group of victims who were amenable to the process to begin with and saw a positive benefit in face-to-face encounters with offenders.

Notwithstanding these qualifications and limitations, there is little reason to doubt the largely positive effect of restorative justice practices on the emotional well-being of those crime victims *who choose to participate in restorative justice programs*. What remains highly controversial, however, is the claim that the benefits to the material, psychological and emotional well-being of crime victims achieved though restorative justice programs result from its informal, non-punitive approach to criminal justice in contrast to conventional prosecution of crimes. Unfortunately, empirical researching into this critically important issue has been impeded by an underlying selection bias toward relatively minor offenses that are eligible for diversion away from formal prosecution. These "divertible" cases are necessarily of a different character than those that law enforcement officials refuse to divert. The criteria for diversion typically includes the stipulation that diversion away from prosecution will not jeopardize the safety of the victim or the larger community, nor will it offend community norms of justice. Even if it were possible to randomly assign cases to either restorative justice or conventional prosecution, the most one could conclude would be that, for *cases eligible for diversion*, restorative justice conferencing achieves better outcomes for the victim, the offender and society.

But no such claim could be made about the other, more serious cases, that are not eligible for diversion. As to these serious cases – those that are of greatest concern to victims and to society-the many claimed advantages of restorative justice lack firm empirical support, especially the highly controversial claims regarding the use of punishment and the role of the state in administering criminal justice.

Key Controversies

The Relevance of Punishment to the Emotional Well-Being of Victims

The fact that victims respond positively to apology, greater involvement when desired and receipt of restitution is neither surprising nor controversial. On the other hand, the contention that healing the emotional wounds of crime victims can be better achieved without punishing the person responsible for their suffering is undoubtedly the most controversial claim advanced by restorative justice advocates, and vividly contrasts with the retributory approach to justice held by many, if not most, members of the public, especially for serious crime.

The non-punitive approach of restorative justice has been primarily advanced not on moralistic or religious grounds, but rather on the strength of the claim that it offers victims a better path to healing their emotional wounds than the path offered by retributive justice. The prospect of healing is put forward not merely as an incidental benefit to victims. It is, rather, the primary inducement to their involvement in restorative justice programs and is inextricably linked with the concept of restoration itself. "Restorative justice," it is claimed "is about healing (restoration) rather than hurting. Responding to the hurt of crime with the hurt of punishment is rejected..." (Braithwaite and Strang 2001, p. 1.) If crime is about harm suffered by victims, and if the goal is to repair that harm, merely punishing offenders, restorative justice advocates have claimed, "does not help the injuries caused by crime and simply creates new injury–now both the victim and the offender are injured" (Van Ness and Strong 1997, p. 38). They have asked "How can still more suffering undo the pain of crime?" (Kaptein 2004, p. 83) and have claimed that the "personal needs of those offended are not met by revenge, but by addressing the feelings behind the [victims'] anger" (McCold 2000, p. 361). What all these observations have in common is the claim that, whatever benefits punishment may have in maintaining social order, it is not necessary for the restoration of a victim's well-being and, in fact, may be counterproductive.

Unfortunately, these claims are far from proven by research conducted to date. Despite 2 decades of implementation in programs throughout the world and scores of studies on various aspects of restorative justice programs, no study has shown that the emotional recovery of crime victims can be improved by removing the option of punishment (London 2011, p. 99). Perhaps the best evidence to date for a positive effect of a non-punitive restorative justice approach upon the emotional recovery of crime victims can be found in Strang's study of the Reintegrative Shaming Experiments (RISE) Project in Canberra, Australia (Strang 2002). This study had the methodological advantage of random assignment of cases between conventional court processing and restorative justice conferencing, but the limitation of the research to cases deemed eligible for diversion restricts the scope of its conclusions. Punishment of the offender may indeed have been irrelevant to the emotional well-being of these victims but, then again, in these cases, the need to punish the offender was judged by law-enforcement officials to be so minimal as to warrant diversion from prosecution. Additionally, unless similar procedures are compared- with and without the option of punishment- one cannot discern whether any resulting emotional benefits to victims arose solely from their opportunity for greater involvement, their better treatment by criminal justice staff and, perhaps most saliently, their receipt of an apology, rather than the presence or absence of punishment as an available sanction.

In reviewing the literature, one researcher concluded that most theories concerning the therapeutic effects of punishment on the emotional losses of victims are based on anecdotal evidence and still wait valid empirical testing (Shuman and Smith 2000, p. 103). Indeed, as Parsons and Bergin noted in their 2010 review of the psychological outcomes of restorative justice programs: "there has been no research to date contrasting the mental health impact of restorative justice with that of conventional trials" (Parson and Bergen 2010, p. 186). Remarkably, therefore, the central claim of restorative justice concerning its power to heal the emotional wounds suffered by victims without punishing their victimizers-undoubtedly its most controversial claim as well as its primary attraction to victims- remains unproven by empirical research.

The eligibility of a case to diversion is important to consider when assessing the victims' safety concerns as well. Although restorative justice advocates have cited the greater ability of restorative justice programs to satisfy the victims concerns about his or her safety following the proceedings, it is doubtful whether victims of serious crime would be similarly assured of their safety if their victimizers faced no prospect of punishment for re-offending. Many victims, indeed, would not want "to trade off the protection of the current system for an opportunity to meet with the offender" (Achilles, p. 70). Similarly, even if recidivism rates are unaffected- or lowered- by diverting petty offenses away from prosecution toward non-punitive alternatives, it is unlikely that re-offending by violent criminals would be unaffected or diminished by removing the threat of incarceration. On the contrary, Levrant and her colleagues concluded, "a fundamental weakness of restorative justice is its failure to provide a plausible blueprint for how to control crime" (Levrant et al. p. 22).

Restorative Justice and State Prosecution

A key feature of restorative justice advocacy has been its criticism of the state's control over criminal proceedings. "There is no denying" one author claimed, "the fundamental incompatibility between the state system of doing justice and the principles of restorative justice" (Boyes-Watson 2004, p. 215). By using the state as the offended party in criminal cases, it has been argued, the needs of the actual victims are virtually ignored. Restorative justice has been proposed as an alternative that stands apart from any state-sponsored system of criminal justice, returning the conflict to its rightful owners. Yet justice freed from control by state authorities has thus far failed to engage the support of many victims' advocate for a number of reasons.

First, the rejection of state prosecution in favor of personal conflict resolution would make unavailable to participants the power of the state to compel compliance with the law adequate to ensure their personal safety, and would make unavailable the resources of the state necessary to compensate victims for their losses when the personal resources of the offender are insufficient. Second, personalized justice in the form of victim-offender conferencing is not subject to any standards of procedural fairness, equality of treatment or safeguards against biased or arbitrary decision-making. Unlike criminal justice professionals, participants at these sessions are untrained in the law, are subject to no standards of performance, and are accountable to no reviewing authority. Therefore, in contrast to the advantages claimed for "deprofessionalized justice," there are legitimate concerns that restorative justice conferencing can deliver a higher quality of justice than that available under the conventional system (Ashworth 1993).

Third, even with respect to the purely private concerns of the victim, victim – offender conferencing, offered as a substitute for state prosecutions, may be an inherently inadequate means for victims to satisfy their demand for public vindication. Rather than accusing the offender of a criminal offense against the victim, the goal of the restorative justice mediator is "the creation of a safe or even sacred space to foster dialogue", and for this to happen, the mediator must have an "attitude of unconditional positive regard and connectedness with all parties, while remaining impartial (e.g. not taking sides)" (Umbreit et al. 2003, p. 17). There is no dominant "narrative" imposed on the event as in state prosecutions of a crime, but rather an exchange of viewpoints. The admonition to mutuality thus may burden the victim with the expectation of empathizing with the offender, acknowledging the validity of the offender's needs as well as her own, and providing support for the offender's rehabilitation (Achilles 2004, pp. 69–70). Finally, in those cases in which the crime was made possible by a power imbalance between the parties, the same power in imbalance that gave rise to the crime are likely to persist during the conference. The danger is that the very vulnerability of the victim that was exploited in the crime will also be exploited at the conference, thereby undermining the validity of the victims' moral assessment of the crime and the appropriateness of the sanction he or she seeks. The victim, lacking the support of the state as the complaining party, is now expected to stand up for herself and demand justice.

To sum up, the claims advanced by restorative justice advocates concerning its unique power to heal the emotional wounds of crime and its even more controversial claims rejecting retributory justice in favor of non-punitive personalized dialogue between victim and offender are best substantiated in minor matters that may be safely diverted away from prosecution without impairing the public interest in safety and justice. This limitation to diversionary programs for petty crimes by youthful offenders falls very short of the sweeping claims that restorative justice represents an entirely new paradigm that transforms the way we administer criminal justice. In fact, if restorative justice continues to function merely as a diversionary strategy, it would not be significantly different from other types of diversionary strategies employed by the conventional criminal justice system, including face-to-face conflict resolution, counseling and non-punitive means of holding offenders accountable, and therefore will continue to be of limited assistance to crime victims.

Future Directions

Despite its present isolation as an exotic alternative to conventional criminal justice practice, a more expansive view of restorative justice has emerged in recent years that would make restorative justice applicable to a greater diversity of victims and a wider variety of cases- from the least to the most serious.

In contrast to the early proponents of restorative justice who conceived of it as a radically different alternative to criminal justice, a growing number of restorative justice scholars and advocates have proposed a "maximalist" view of restorative justice which, uncoupled from its former anti-penal and anti-statist positions, "does not require abandoning deterrence, retribution or the adversarial process" (Bibas and Bierschbach 2004, p. 112). Rather than creating an either/or choice between restoration and other essential objectives, the maximalist version of restorative justice would attempt to achieve restorative goals for crime victims without forfeiting the advantages offered by state resources and mechanisms of enforcement. Bazemore and Walgrave's definition of restorative justice stresses its unique goal rather than its opposition to conventional practices: "restorative justice is every action that is primarily oriented towards doing justice by repairing the harm that is caused by crime" (1999, p. 48).

Despite a diversity of maximalist positions, what is shared is an interest in paring down restorative justice to its essential mission - *repairing the harm of crime*–that is capable of application in diverse settings. These applications might include:

- Diversionary programs
  A maximalist version of restorative justice would continue to offer a diversionary option for appropriate cases, but unlike the purist model, using this diversion strategy would not entail rejecting state resources or coercive power. On the contrary, agreements reached by the victim and the offender would be fully enforceable by the state.
- Applications with victim involvement
  For more serious cases that are not eligible for diversion, opportunities may be presented to victims who wish to meet the offender and participate in fashioning a restorative solution, including sentencing recommendations within a range of penalties prescribed by law. The involvement of victims in sentencing recommendations would not be an alternative to judicial sentencing authority, but rather would be an alternative to sentencing recommendations by prosecutors and defense attorneys in the context of plea bargains.
- Applications without victim involvement
  Because the maximalist model of restorative justice is based on the attainment of a new criminal justice goal rather than any particular procedure, it may be applied as a guide to sentencing in a multitude of different settings, including cases in which the parties fail to agree to participate in restorative justice conferencing and in "victimless crimes" and crimes affecting the population in aggregate such as tax evasion and environmental offenses, in which victim-offender encounters are clearly inapplicable.

The advantages of an expanded view of restorative justice which utilizes rather than rejects the coercive power of the state may be seen in many current post – conviction restorative justice programs that take place within prisons. In these programs, victims who wish to meet the offender to express their feelings, obtain answers to their questions and be offered an apology need not renounce their demand and for justice as a precondition for participation since the offender has already been convicted and sentenced. In one such program analyzed by Susan Miller, "the victims . . . felt strongly that the offender needed to be held accountable by the criminal justice system. They did not wish to sidestep that aspect of justice and punishment but rather, the victims wanted the opportunity to meet with the offenders after the conclusion of the criminal justice process . . ." (Miller 2011, p. 12). Miller concluded that this post-conviction format for restorative justice offers victims the opportunity for healing and empowerment beyond those available either through conventional criminal justice or diversionary programs: "Since the process begins after guilt is established and punishment impose, victims. . . perhaps for the first time since the abuse and violence began – felt empowered by the process" (2011, p. 198).

Example of Application: Domestic Violence Cases

An example of how a more expansive approach to restorative justice can serve the needs of a wider variety of victims may be seen in domestic violence cases. Restorative justice, since its inception, has had an uneasy relationship with advocates of victims of domestic violence. The approach of peacemaking, reconciliation, and conflict resolution that is offered as an alternative to prosecution has been seen by feminist critics as a regression to the time when domestic violence was considered a private matter between partners, best dealt with by counseling and cooling-off periods. The idea of reprivatizing domestic violence by the use of restorative justice as an alternative to the state's punitive powers has been viewed as a form of "cheap justice" (Coker 1999, p. 85) that, by diverting these cases from prosecution de-criminalizes violence and devalues the seriousness of the offense. Other feminist advocates, however, have cautioned that insisting upon arrest and prosecution is no panacea for victims of domestic violence, given the low participation rates of victims, low conviction rates of offenders and poor treatment of victims often associated with conventional prosecution. The use of restorative justice in cases of domestic violence, it is therefore argued, is at least an alternative to an adversarial system that still isn't working for victims of intimate violence (Curtis-Fawley and Daly 2005).

But must there be a choice between the "hard option" of criminal prosecution and the "soft option" of restorative justice diversion? A number of feminist advocates have recognized that this dualistic choice is unnecessarily self-limiting. As Barbara Hudson recognized nearly a decade ago, it is not restorative justice conferencing per se, but it is rather the diversionary nature of privatized, non-punitive restorative justice conferencing that renders it inappropriate for cases of gendered violence (Hudson 2002). Curtis-Fawley and Daly have similarly argued that restorative justice programs should include, but should not be limited to nonpunitive diversions. Instead of setting itself apart as a radical alternative to prosecution, they propose that restorative justice should be regarded as a flexible concept, capable of being integrated into the existing criminal justice system (2005, pp. 632–633).

The kind of integration of criminal justice and restorative justice envisioned by these feminist advocates is precisely the goal of a maximal version of restorative justice. Rather than confining itself to diversions from state persecution, the coercive power of the state would be available to enforce agreements designed to safeguard victims' safety and to mandate compliance with the law. Instead of an either/or choice between prosecution or diversion, a maximalist version of restorative justice would accommodate a number of procedural options, both formal and informal, that are deemed appropriate to the individual case, backed up by the coercive power of the state to compel compliance.

Extending Aid to Victim Beyond Criminal Justice Reforms

Finally, an expansive view of restorative justice opens opportunities for engagement in advocacy on behalf of victims for increased public support. Victims' advocates have long noted that victims' needs exceed the capabilities of the conventional criminal justice system. Given the extent of victims' losses including medical, psychological and rehabilitation expenses, property damage and loss of income, few offenders can be expected to fully compensate their victims from their own resources. If the conventional system cannot adequately address the needs of victims, victim advocate Susan Herman argues, restorative justice, despite its "commendable effort to humanize the justice system" (Herman 2004, p. 78) cannot expand upon these capabilities if it is dependent on the personal resources of those who participate in restorative justice programs. Clearly, the "purist" version of restorative justice offers no rationale for increased public spending since, on the basis of its foundational claim that crime is a personal, not a public harm, it limits redress to measures undertaken by the offender individually to repair the damage he or she has caused.

On the other hand, a maximalist version of restorative justice may very well offer a constructive role in such advocacy because it is unencumbered by an anti-state ideology which, in regarding crime as a personal harm, ignores the public dimension of crime. The simplicity of the maximalist approach gives it its flexibility to extend beyond the confines of criminal justice case administration to reach even those victims whose offenders are unknown or unprosecuted. According to this view, if a person is harmed by crime, the work of restorative justice is to repair that harm in any way possible, utilizing both the resources of the state and the resources of the individual offender. An expanded view of restorative justice, therefore, can play a positive role in advocacy for an expanded view of victims' rights.

Limitations

The evolution of restorative justice from a diversionary strategy to the mainstream of criminal justice practice, made possible by acknowledging the public dimension of crime, paradoxically contains within itself an important limitation; for once the public dimension of crime is acknowledged, it is no longer sufficient for restorative justice to be responsive only to the interests of the victim and the offender. Their interests, in fact, may very well conflict with the public interest in safety, justice and equality of treatment (Ashworth 1993).

This is a topic that cannot adequately be pursued within the confines of this chapter. Suffice it to say, however, that, even as restorative justice continues to evolve and continues to outgrow its original conception as a criminal justice diversion and thereby becomes more responsive to the needs of crime victims, those personal needs of victims must, in the end, remain subordinate to the needs of the public. The challenge to future legislation will be to permit victims the widest latitude in pursuing their personal interests without thereby impairing the public good.

Conclusion

Restorative justice began as a vision of a better way to do criminal justice and, in 100s of programs throughout the world, it has proven to be just that. It has helped victims feel more satisfied with the process and more secure in their personal safety. It has increased offenders' compliance with restitution orders without adversely affecting recidivism rates. Yet it has not nearly reached its potential for transforming the conventional criminal justice system because it has failed to articulate a theory or set of policies applicable to the kinds of cases that most concern us: serious crime and adult offenders. Whether or not restorative justice can effectively deal with serious cases and adult offenders represents its primary challenge today because, unless it can do so, it shall remain on the sidelines of criminal justice practice, "doomed to irrelevance and marginality" (Dignan 2002, p. 179).

The growing trend of restorative justice toward a maximalist version of its mission, however, disassociated from its early insistence on an anti-penal and anti- statist ideology, holds the promise of restorative justice becoming a significant influence on criminal justice policy for a full range of cases- both divertible and non-divertible. Assuming this evolution from insularity to universality continues, the long-hoped-for alliance between restorative justice and the victims' movement may finally come to fruition.

Victims and the ICC

Overview

This entry reviews the treatment of victims in the International Criminal Court, including the victims' participation and reparation regime; the establishment of a Trust Fund for Victims, the institution of an office of Public Counsel for Victims, state cooperation procedures, and relevant jurisprudence.

Fundamentals

The treatment of victims in the International Criminal Court (ICC) represents a substantial innovation in the field of victims' redress under international law. It marks a significant departure from traditional interstate approaches to individual claims for breach of an international legal obligation based on classical principles of state responsibility, towards a more comprehensive regime in which individual victims have a right under international law to seek and obtain reparations directly from individuals found responsible for genocide, war crimes, crimes against humanity, or the crime of aggression. Unlike the Nuremberg and Tokyo International Military Tribunals or the International Criminal Tribunals for the Former Yugoslavia (ICTY) and for Rwanda (ICTR), the ICC Statute allows victims ample opportunity to participate in the Court's proceedings and to receive some form of redress directly from the Court by way of judicial award. The ICC legal regime ensures that the right of victims to redress is no longer left exclusively in the hands of domestic authorities.

The ICC Statute's provisions on victims figure centrally within the ICC's general architecture, linking to other relevant provisions, such as those relating to state cooperation as enshrined in Part 9 of the Statute. This approach anchors the victim's rights to redress solidly in the ICC's norms and operation and improves the coherence and comprehensiveness of the victims' participation and reparation regime beyond that of the ICTY or ICTR.

Key Issues

The Rome Statute's victims' regime rests on five main pillars:

1. Participation in the proceedings
2. Establishment of reparation procedures
3. Creation of a Trust Fund
4. Institution of an Office of Public Counsel for Victims
5. State cooperation procedures

Participation in the Proceedings

The ICC allows victims some degree of direct participation in the Court's proceedings, in line with modern victimology theories which recognize the importance of victims' participation in the retributive process as a fundamental component of the healing process, especially where serious human rights violations are involved. In this sense, the ICC helps to crystallize one of the emerging, fundamental normative components of the victims' right to redress, namely, the right to be involved in the justice process, irrespective as to whether this process is to be administered by a judicial body, such as the ICC, or by quasi-judicial bodies such as truth and reconciliation commissions, enquiry commissions, human rights bodies, or similar entities.

Based on these premises, Article 68(3) on "Protection of the victims and witnesses and their participation in the proceedings" provides that:

> Where the personal interests of the victims are affected, the Court shall permit their views and concerns to be presented and considered at stages of the proceedings determined to be appropriate by the Court [. . .]. Such views and concerns may be presented by the legal representatives of the victims where the Court considers it appropriate [. . .].

This provision basically allows victims to be heard at certain stages of the proceedings, from the beginning of an investigation to the sentencing stage, thus conferring upon them a measure of locus standi. In particular, the ICC regime provides victims with the faculties discussed below.

Victims Can Provide Information to the Prosecutor for the Purpose of Initiating an Investigation

The ICC Statute does not provide victims with an independent power to institute proceedings. Unlike the European Court of Human Rights or the Inter-American Court of Human Rights, where individual victims can petition the Court either directly or, in the Inter-American system, through the Commission, the drafters of the Rome Statute decided against conferring individual victims full capacity to petition the Court. As such, victims have only "indirect" access to the Court through the action of the Prosecutor. At the very initial stages of the judicial process, victims are among those who can provide the Prosecutor with information which may trigger the initiation of a proprio motu investigation into a crime falling within the jurisdiction of the Court under Article 15. At this stage, the Prosecutor has an obligation to "analyze the seriousness of the information received," and, in this context, he or she may "seek additional information" and "receive written or oral testimony at the seat of the Court." Should the Prosecutor decide that the information received is not adequate to satisfy the "reasonable basis" requirement to proceed with an investigation, victims are allowed to submit further information on the same situation "in light of new facts or evidence" (Article 15(6)).

The limitation of not having an independent power to initiate proceedings can prevent victims from accessing the Court, should the Prosecutor fail to give proper consideration to the information provided by victims. In practice, the Prosecutor has ample discretion to decide whether or not to initiate an investigation or to proceed to a prosecution upon investigation.

Under Article 53(1)(c), should the Prosecutor have "substantial reasons to believe that an investigation would not serve the interests of justice," he or she may determine that there is no reasonable basis to proceed to an investigation. Similarly, the Prosecutor can decide whether or not to proceed with a prosecution even following an investigation, as provided in Article 53(2)(c). Although this determination must take into account elements such as "the gravity of the crime and the interests of victims" (Article 53), the Prosecutor's ample discretionary powers to decide on whether a particular prosecution should go ahead or not may limit the possibility of victims seeking and obtaining redress through the ICC.

The Rome Statute, however, provides a series of checks and balances to prevent abuse of power on the Prosecutor's part. For example, should the Prosecutor decide not to proceed with an investigation or with a prosecution following an investigation, the Pre-Trial Chamber retains the power to review and confirm the decision, either on its own motion or at the request of the referring party.

Should the Prosecutor decide that there is a "reasonable basis" to proceed with an investigation, he or she must inform the victims or their legal representatives of the decision to proceed, unless the Prosecutor, at his or her discretion, decides that this "would pose a danger to the integrity of the investigation or the life or wellbeing of victims and witnesses" (Rule 50).

Also, in terms of limitations for the victims, one needs to consider that, unlike the Security Council's authority to refer to the Court situations of genocide, war crimes, or crimes against humanity taking place anywhere in the world, even where the country in question is not a party to the Rome Statute, the Prosecutor's capacity to investigate a particular situation out of his or her own motion must comply with the general conditions of territoriality or nationality. In other words, the Prosecutor can only initiate proprio motu investigations into situations that either have occurred in the territory of a State Party to the ICC or that have involved accused who are nationals of a State Party to the ICC.

Victims Can Make Representations to the Pre-Trial Chamber

Full participation of victims at the pre-trial stage is an essential prerequisite both for the preparation of an eventual trial and for the purposes of reparation. Once the Prosecutor has decided to proceed with an investigation of a situation under the jurisdiction of the Court, the matter goes to the Pre-Trial Chamber for a judicial review of the decision. At this stage, victims can make representations to the Pre-Trial Chamber (Article 15(3)), and the Chamber may decide to hold a hearing to collect additional information.

Victims are the only ones who can make representations at the pre-trial stage, since neither States Parties nor individual suspects can challenge the admissibility of the Prosecutor's request for authorization of an investigation. During the pre-trial stage victims can also trigger the power of the Pre-Trial Chamber to take protective measures for the purpose of forfeiture, which is often an essential step in ensuring proper financial coverage of an eventual reparation award.

Also, in case the Prosecutor seeks a ruling on a question of jurisdiction or on the admissibility of a case, victims or their representatives can make representation to the Court to submit their observations (Article 19(3) in combination with Rule 59).

Victims Can Make Opening and Closing Statements and Participate in Hearings

The Chamber has wide discretion to determine ways in which victims can participate in the proceedings. Once victims have filed a written application to "present their views and concerns" (Article 68(1)), it is up to the Chamber to decide whether or not to accept the application and, in case it does, to specify appropriate ways for victims to participate in the proceedings, including through the making of opening and closing statements (Rule 89).

However, the ICC Statute indicates at least one way in which victims may participate in the proceedings, and this is by way of participating in a hearing and posing questions to witnesses, experts, or the accused either in writing or orally, subject to the Chamber's prior approval. In the case of a hearing for reparations, the victims' legal representative must not be subject to any restriction on the questioning of witnesses, experts, or the accused prior to the approval of the Chamber (Rule 91). Yet, both the Statute and the Rules clarify that victims' participation in the proceedings will be allowed only if it is "not prejudicial to or inconsistent with the rights of the accused and a fair and impartial trial" (Article 68(3)) or if it does not hinder the "need for a fair, impartial, and expeditious trial" (Rule 91). It is therefore up to the Chamber to be responsive to the requirements of the Statute on victims' access to the proceedings and to ensure proper ways for victims to participate in the justice process.

Establishment of Reparation Procedures

The ICC's powers in relation to the victims' right to seek and obtain reparation for damages represent a major advance. The Court's capacity to award reparations directly to the victims was among the more controversial issues debated both prior to and during the Rome Diplomatic Conference. Delegations expressed concern that a direct reparation system would be difficult to manage and would not be compatible with the Court's main responsibilities to prosecute and punish the offender. However, delegations finally agreed on a rather innovative formula providing the Court with the power to determine the scope and extent of damages, losses, and injuries suffered by victims once an individual is found guilty of one of the crimes under the jurisdiction of the ICC. According to Article 75:

> The Court shall establish principles relating to reparations to, or in respect of, victims, including restitution, compensation and rehabilitation. On this basis, in its decision the Court may, either upon request or on its own motion in exceptional circumstances, determine the scope and extent of any damage, loss and injury to, or in respect of, victims and will state the principles on which it is acting.

Article 75(1) adopts non-exhaustive language but also lists specific reparation elements such as restitution, compensation, and rehabilitation, thus resolving what had been a lengthy debate over redress terminology.

Although the Court can determine damages, losses, or injuries either upon request or proprio motu, the reparation procedure is designed to be accessible mainly at the request of victims. The Court therefore acts on its own initiative only "in exceptional circumstances." A victim's request for reparation must be made in writing and filed with the Registrar and must contain certain specific information such as the "identity and address of the claimant"; a "description of the injury, loss, or harm"; the location and date of the incident; the identity of the person the victim believes to be responsible for the violation, if possible; a description of the objects for which restitution is claimed; a claim for monetary compensation, rehabilitation, and other forms of remedy; and any other relevant supporting documentation.

In general, the drafters of the Rome Statute conceived the reparation regime and relevant proceedings to function as a widely publicized process. Under Rule 96, the Registrar has an obligation to give publicity "as widely as possible and by all possible means" to the reparation proceedings before the Court "to other victims, interested persons and interested states." To this end, the Registrar may seek the cooperation of relevant States Parties and the assistance of NGOs.

Following the determination of the scope and extent of damages, losses, and injuries suffered by the victims, the Court can expedite payment in one of two ways. It could:

– Make an order directly against the convicted person "specifying appropriate reparations to, or in respect of, victims, including restitution, compensation, and rehabilitation"
– Where appropriate, order that "the award for reparations be made through the Trust Fund" established under Article 79 of the Statute.

The Court has the authority to exercise its full discretion in the choice of the reparation awards. Reparations may be awarded in the form of restitution of property, compensation, or rehabilitation but also in forms other than those specifically listed in the Rome Statute, such as orders for apologies, satisfaction, or guarantees of non-repetition. Although the Rome Statute does not contemplate expressly the possibility of awarding punitive damages in addition to compensatory damages, this option might fall within the Court's discretion. The Court must give consideration "to the extent of the damage caused, in particular the harm caused to the victims and their families" in determining sentence under Article 78. Conversely, wherever appropriate, the Court must also consider efforts by the convicted person to compensate the victims as a mitigating circumstance (Rule 145).

Creation of a Trust Fund

The ICC has the authority to channel a reparation award against a convicted person through the Trust Fund, which is established under Article 79 "by decision of the Assembly of States Parties for the benefit of victims of crimes within the jurisdiction of the Court and of the families of such victims." Broadly speaking, the Fund can be used almost as an intermediary for the transfer of awards, for example, in the case of mass claims. The Statute identifies two sources of income for the Trust Fund as follows:

– Reparation awards against a convicted person ordered by the Court to be made through the Trust Fund (Article 75(2))
– Money or other property collected through fines or forfeiture under Article 77, ordered by the Court to be transferred to the Trust Fund for the benefit of the victims and their families (Article 79(2))

The choice of the language in Articles 75 and 79 reflects the different scope of application of the two provisions with respect to the Trust Fund. Article 75(2) establishes that "the Court may order a reparation award against a convicted person to be made *through* the Trust Fund," which suggests that the Trust Fund is bound to use the proceeds of a specific reparation award exclusively for the benefit of the victims with respect to the particular case before the Court, rather than to use it for other cases or situations. In this regard, the Trust Fund functions more as an intermediary for the transfer of individual awards. Rule 98(2) indicates accordingly that the Court could order an award for reparation against a convicted person to be deposited with the Trust Fund only in cases where, at the time of the order, "it is impossible or impracticable to make individual awards directly to each victim." This particular award will remain separate from other resources of the Trust Fund and will be distributed to each victim "as soon as possible." However, Rule 98(3) also specifies that "where the number of victims and the scope, forms and modalities of reparations makes a collective award more appropriate," the Court may order such award to be made through the Trust Fund. Indeed, collective awards resulting from class actions appear to be the most likely form of reparation to be distributed by the ICC, as compared to narrowly targeted and administratively onerous individual awards.

In contrast, Article 79(2) indicates broadly that the Court can order "the transfer of money or other property collected through fines or forfeiture to the Trust Fund." This suggests that the Trust Fund is not bound by the Statute with respect to the use of money or property collected from fines or forfeiture, as long as the funds are used "for the benefit of victims of crimes within the jurisdiction of the Court, and of the families of such victims" as per Article 79(1). Rule 85(a) defines "victims" as "natural persons who have suffered harm as a result of the commission of any crime within the jurisdiction of the Court," but also:

> Organizations or institutions that have sustained direct harm to any of their property which is dedicated to religion, education, art or science or charitable purposes, and to their historic monuments, hospitals and other places and objects for humanitarian purposes.

Accordingly, the Trust Fund has the power to recognize and approve intergovernmental, international, or national organizations as beneficiaries of reparation awards directed through the Fund. The ICC Statute establishes that the Court and the Victims' Trust Fund have different budgets and financing schemes. Because the Trust Fund is not funded directly from the budget of the Court, voluntary contributions to the Trust Fund take on added importance.

A crucial question for the operation and effectiveness of the Trust Fund is precisely who can be considered to qualify as a victim for the Fund's purposes. On this point, the Statute's only indication is that the Trust Fund is established for "victims of crimes within the jurisdiction of the court" (Article 79(1)). Some have interpreted the provision of Article 79(1) as conferring "victim's status" for the purpose of the Trust Fund exclusively on family members and victims of violations under consideration in ICC proceedings, thus aligning the Trust Fund's scope of application *ratione personae* to that of the Victims and Witnesses Unit originally provided for in the Statute. Others have suggested that the Trust Fund's scope of action should cover also victims of violations who do not fall within the ambit of the Court's proceedings. This latter approach is based on the argument that Article 79 creates the Trust Fund for the benefit of victims of "crimes within the jurisdiction of the Court" in general, without specifically mentioning their participation in the proceedings. Based on this approach, the Trust Fund's resources could be accessed by any victim of crimes falling within the Court's jurisdiction, regardless of the victim's participation in the proceedings, as a witness or in another capacity.

Institution of an Office of Public Counsel for Victims

The Office of Public Counsel for Victims (OPCV) replaces the Victims and Witnesses Unit, originally established under the ICC Statute to function as a permanent statutory organ of the ICC which is financed by regular budget funding. The OPCV is intended to provide "legal research and advice to victims and their legal representatives at all stages of the proceedings," as well as legal representation to victims. Placed under the Registrar for administrative purposes, the Office comprises Counsel, Legal Officers, and Administrative Assistants. It is designed to function completely independently from the Registrar and the organs of the Court, and in this connection, all members of the Office are obliged to follow a "Code of Professional Conduct" for counselors of traumatized or threatened victims.

State Cooperation Procedures

To work effectively for the benefit of victims, the ICC reparation regime requires the full cooperation of States Parties, non-States Parties, and all others concerned. State parties are under the obligation to cooperate fully with the Court in relation to investigations or prosecutions and to ensure that reparation orders are fully enforced. To this end, the Rome Statute embodies a number of provisions aimed at supporting and implementing the victims' participation and reparation regime. Cooperation provisions come under the general umbrella of Articles 86, 87, and 88 in Part 9 of the Rome Statute. Article 86 provides for a general obligation for states to "cooperate fully with the Court in its investigation and prosecution of crimes within the jurisdiction of the Court." Article 87 grants the Court the power to request state cooperation and sets out some basic procedures to seek assistance, including a provision specifically dedicated to the assistance of victims, potential witnesses, and their families. Finally, under Article 88, States Parties have an obligation to ensure that "there are procedures available under their domestic law for all forms of cooperation" specified under Part 9. State cooperation is required from the early stages of the proceedings, particularly where the Pre-Trial Chamber, acting under Article 58, issues a warrant of arrest or a summons to appear before it and consequently decides to take "protective measures" for the purpose of forfeiture, in particular for the ultimate benefit of victims' under Article 57(3)(e). In its preliminary work, the Pre-Trial Chamber can request the cooperation of states under Article 93, which could include the identification, tracing, and freezing of the defendant's assets; the seizure of proceeds, property, and assets and instrumentalities of crimes; and the execution of searches and seizures.

The Court can also request cooperation at subsequent stages in the enforcement of ICC reparation orders. State cooperation is essential, particularly during early phases of investigation, for example, with regard to identification, tracing, and freezing of assets which could later become the object of reparation orders. Prompt State action at the request of the Court could help to prevent the alleged offender from relocating his or her assets to countries willing to shield the suspect from reparation orders.

Significantly, in its first reparations decision in the Lubanga Case, the Court ruled that Part 9 of the Statute did not prevent it from awarding forms of reparation other than those expressly mentioned in the Statute. In particular, the Court could award reparations as follows:

> By establishing or assisting campaigns that are designed to improve the position of victims; by issuing certificates that acknowledge the harm particular individuals experienced; setting up outreach and promotional programmes that inform victims as to the outcome of the trial; and educational campaigns that aim at reducing the stigmatisation and marginalisation of the victims of the present crimes (ICC-01/04-01/06-2904 at para. 239).

Jurisprudence

In the ICC's first substantial decision on the situation in the Democratic Republic of the Congo (*Decision on the applications for participation in the proceedings of VPRS1, 2, 3, 4, 5, and 6*, "Lubanga Case" ICC-01/04-01/06, 17 January 2006), the ICC Judges addressed some of the Statute's ambiguities concerning the definition and role of victims in the proceedings.

In the *Lubanga Case*, six individuals requested to participate as victims at the investigative stage of the proceedings. This prompted the Pre-Trial Chamber to consider "whether the Statute, the Rules of Procedure and Evidence ... and the Regulations of the Court accord victims the right to participate in the proceedings at the stage of investigation of a situation and, if so, what form such participation should take." In its decision, the Court also considered the question of whether the applicants met the criteria for being considered victims within the meaning of Rule 85.

The Prosecutor contended that victims could not participate in the proceedings at the investigative stage because "there are, strictly speaking, no proceedings within the meaning of Article 68 of the Statute during the investigation phase" since "from a terminological point of view, the word 'proceedings' does not encompass the investigation of a situation." The Prosecutor considered victims' participation as "inappropriate" and further argued that, in any case, the applicants had failed to show that their personal interests were affected at the investigation stage.

In response to the Prosecutor's challenge, the Pre-Trial Chamber observed that the Court had a general obligation to "take appropriate measures to protect the safety, physical and psychological well-being, dignity, and privacy of victims and witnesses," including at the investigation stage and that, in fact, there was no "explicit exclusion" of the investigation stage from the scope of application of Article 68(3) on the question of victim's participation. On this basis, the Chamber concluded that Article 68 of the Statute gave victims a general right of access to the Court, including at the stage of investigation of a specific situation." The Court noted that the victims' right of participation at the investigation stage was in fact consistent with the "object and purpose of the victims' participation regime of the ICC" and, more generally, with "the growing emphasis placed on the role of victims by the international body of human rights law and by international humanitarian law." The Chamber went on to say that victims had the right, under the Statute, to express an "independent voice and role" in ICC proceedings and noted that the victims' right to participate in the proceedings was part of a more general right to participate "in the fight against impunity," thus adopting a broad approach. During the course of the Lubanga Trial, 129 victims participated in the Court's proceedings with submissions, requests to introduce evidence, and more directly, by questioning witnesses. Three victims themselves testified as witnesses.

The approach that the Pre-Trial Chamber adopted to victims' participation in the *Lubanga Case* has come under a certain degree of criticism, especially as concerns the distinction between a victim in the context of a "situation" and a victim in the context of a "case." The difference is that, under the ICC Statute, a situation is a set of background circumstances in which crimes may have been committed, and which the Prosecutor is investigating, for example, the Darfur situation or the situation in the Central African Republic. A case, on the other hand, involves allegations, investigation, and prosecution of a particular individual or individuals who have been accused of crimes within the jurisdiction of the Court. In *Lubanga*, the Trial Chamber decided that whoever had a "personal interest" in the investigation of a situation could participate in the investigative phase of the proceedings. Potentially, this opened the door to a very large number of victims, which raises the question as to whether the Court's having to handle perhaps many hundreds or even thousands of people participating at an early investigative stage could hinder or even compromise the Prosecutor's investigative efforts which require a methodical, organized, and systematic approach.

Once the Prosecutor decides to move on from investigating a "situation" to the laying of charges and preparation of a formal indictment, the Court will have to narrow its recognition of individuals as "victims" to only those persons directly relevant to the issue of criminal guilt. Only those individuals with a clear nexus to the crime ("personal interest linked to the charges," to be assessed by the Court) would be in a position to offer testimony relevant to guilt or innocence and, ultimately, to apply for reparations. A risk is that where the Prosecutor fails to make a strong enough case, the Pre-Trial Chamber can decline to authorize the Prosecutor to proceed further, which could then leave out victims related to the particular crimes in question.

The potential shortcomings of this approach for the victims have been partially addressed by the Court's first reparation order of 7 August 2012, issued following the Court's decision to sentence Thomas Lubanga Dyilo to 14 years imprisonment for war crimes and crimes against humanity in the DRC, for having conscripted and used child soldiers in his rebel army. As regards causation, the Court observed that:

> Neither the Statute nor the Rules define the precise requirements of the causal link between the crime and the relevant harm for the purposes of reparations. Moreover, there is no settled view in international law on the approach to be taken to causation. Reparations should not be limited to "direct" harm or the "immediate effects" of the crimes of enlisting and conscripting children under the age of 15 and using them to participate actively in the hostilities, but instead the Court should apply the standard of "proximate cause." (ICC-01/04-01/06-2904 at paras 249–250)

On the same point, the Court also clarified that:

> Reparations may be granted to direct and indirect victims, including the family members of direct victims [. . .]; anyone who attempted to prevent the commission of one or more of the crimes under consideration; and those who suffered personal harm as a result of these offences, regardless of whether they participated in the trial proceedings. (ICC-01/04-01/06-2904 at para 194)

In its order, the Court noted that "reparations can be directed at particular individuals, as well as contributing more broadly to the communities that were affected" and that reparations must:

> Relieve the suffering caused by [the] offences; afford justice to the victims by alleviating the consequences of the wrongful acts; deter future violations; and contribute to the effective reintegration of former child soldiers. Reparations can assist

> in promoting reconciliation between the convicted person, the victims of the crimes and the affected communities. (ICC-01/04-01/06-2904 at para 179)

The Court also opted for a "collective approach" to reparations to ensure that reparation awards reach both victims who have applied for reparations and those who have not been identified, specifying that individual and collective reparations are not mutually exclusive and that they may be awarded concurrently. In terms of implementation, the Court ordered that the processing of claims and the subsequent awards should be channeled through the Trust Fund for Victims. Eighty-five victims have launched applications for reparations, and it is estimated that there are more than 8,000 victims who were directly affected by the crimes prosecuted in the *Lubanga Case*.

Overview

The way the police respond to reported crime is a delicate balancing act. While it is almost universally accepted, and a key component of police culture, that they should prioritize apprehending the offender, complainants and victims often have broader expectations of what services the police should be offering them, and a successful detection and prosecution may not be their priority.

This entry considers police support for crime victims in different countries. However, because variations in the ways in which the police handle victims of different offense types are arguably just as notable, four contrasting offense types are considered: burglary, where the victim is generally considered "deserving" but where detection rates are low; homicide cases, where indirect victims may also be perceived to be suspects; and domestic violence and rape, both examples of where the police have traditionally been criticized for victim blaming.

Police Support for Victims

It is important that the police provide a satisfactory service for victims for a number of reasons. For example, the police are highly dependent upon the public, and especially victims, for bringing crime to their attention and providing leads on the offender. Victims who feel that the police do not provide an appropriate response may fail to report crimes or even take unsanctioned vigilante action. Moreover, despite the emergence of victim assistance programs in many countries, the police service is still the main agency with which victims have contact. As a result, police response to victims may be their most significant post-crime experience (Mawby 2007). Most important though, victims deserve to be treated with courtesy and respect.

However, traditionally, police forces in a range of countries have provided a very poor service for victims, with the result that they have often exacerbated the effects of the crime, promoting secondary victimization rather than support. This is particularly the case in countries where the police system is (or was) organized on paramilitary lines, as in colonial and communist societies and in many parts of continental Europe (see chapter by Mawby). However, cross-national studies, including the international crime victims survey (ICVS), indicate that victims' criticisms of the police are reflected across a broad range of industrial societies, including the USA, England and Wales, and even Japan, and that criticisms cover lack of interpersonal skills, poor response, failure to take the incident seriously, and not keeping the victim informed of further developments, as well as failure to apprehend the offenders or recover stolen property (van Dijk et al. 2008; van Kesteren et al. 2001; Zvekic 1998).

Given the extent of victims' criticisms, it is scarcely surprising that policies have been implemented in a number of countries aimed at improving police services. Approaches adopted by police services in the USA include specialist police training in victim-oriented work (Rosenbaum 1987) and enhanced police support (Skogan and Wycoff 1987). In the European Union, legally binding minimum standards of victim treatment came into force in 2003 (van Dijk et al. 2008). These included the requirement that victims be treated with consideration and respect by the police and kept informed about investigation and prosecution decisions. Additionally, some countries have introduced more specific requirements and services. For example, in the Zaarstrad area of the Netherlands, Winkel (1989) described an initiative that incorporated both specialist training for the police and additional support for victims from the police. Also in the Netherlands, a series of guidelines for police and prosecutors were issued, requiring the police to treat victims sympathetically, provide all the relevant information, and, where necessary, refer them to other agencies, and victims now have a right to cite the guidelines should they subsequently take legal action against the police (Wemmers and Zeilstra 1991). A similar approach has been adopted in England and Wales, with the 1990 and 1996 Victims' Charters spelling out expectations of how the police should respond to victims and the 2005 Code of Practice detailing the police's obligations (Mawby 2007).

The introduction of international and national standards suggests a greater victim orientation of the police in many countries. However, evaluations of different initiatives indicate a resistance to change. A traditional emphasis upon action, excitement, and "real" policework means that the police often accord a lower priority to work with victims. In fact, despite legislative and policy changes, there is considerable evidence that victims' satisfaction with the way the police have responded has fallen. For example, the 2005 ICVS shows a general decline in victim satisfaction, with the most notable fall in England and Wales, the USA, the Netherlands, Canada, and Sweden (van Dijk et al. 2008). National surveys sometimes paint a different picture. In England and Wales, for example, the 2009/2010 British Crime Survey (BCS) reported a rise since 2008 in victims' satisfaction, with 37 % very satisfied and 32 % fairly satisfied with the police in 2010 (Flatley et al. 2010). Nevertheless, the same survey reiterates earlier findings that victims are more critical of the police than are other citizens.

The way the police respond to victims of different types of offense also varies markedly. Local or national priorities, plus different perceptions of the precise impact of different offenses, mean that agency interpretations of need – and, perhaps more importantly, desert – vary. In some countries (such as England and Wales), the needs of burglary victims have been prioritized, although this is changing (Mawby 2001). In others (like the USA), there has been a greater focus on victims of violent and/or sexual crimes (OVC 2001), partly reflecting feminist influence on early initiatives and partly the high homicide and rape rates. A rather different distinction in the types of victim receiving specialist police support is the recent development in tourist areas of programs dedicated to helping tourist victims. While in some countries, such as the Irish Republic and the Netherlands, such services are provided out with police departments, in others, including the USA, South Africa, and India, specialist Tourist Police units exist.

Because of the stark differences between the ways in which the police handle victims of different offense types, the following sections cover four contrasting examples. The first focuses on burglary, where the victim is generally considered "deserving" but where detection rates are low. Then we address police response in homicide cases, where the police often have to balance the need to treat surviving relatives as both indirect victims and suspects. Finally, we consider domestic violence and rape, both examples of where victim blaming has traditionally featured on the agenda.

Police and Burglary Victims

The circumstances of police intervention in cases of domestic burglary are quite distinct. Firstly, in most cases, the police are called in to a "cold" crime, that is, some time after the incident occurred. Secondly, and as a result of this, detection rates are low, in England and Wales currently about 13 %. Thirdly, in most cases, the status of the complainant as an "innocent victim" is not disputed, although in some cases, the police may suspect the complainant of an insurance scam or similar and in others they may blame the victim for not protecting their property adequately.

Despite low detection rates, victims tend to be relatively positive about police handling of their complaint. In the UK, for example, they tend to be more positive than victims of violent crime, where detection rates are higher and less critical of the police than victims of vehicle-related crime (Mawby 2001). However, the most recent ICVS suggests that burglary victims' criticisms were directly related to the specific circumstances of the offense. Thus, 30 % of critical victims complained at the time it took the police to respond, an indication of the fact that the police give low response priority to "cold" crimes, while the low detection rate is reflected in criticisms that the police failed to apprehend the offender (cited in 58 % of cases) nor recover stolen goods (49 %).

Research by Mawby and his colleagues assessed victims' feelings about the way the police dealt with them (see, e.g., Mawby 2001), comparing cities in two Western European countries (England and Germany) with three former Warsaw pact countries (Poland, Hungary, and the former Czechoslovakia). They addressed three general questions vis-a-vis police services: How do the police handle complaints of burglary, how far do burglary victims from East and West Europe share similar perceptions of the police, and to what extent are their assessments of the police influenced by policing traditions, their perceptions of the crime problem, and by the services provided by the police today?

In general, victims from Poland expressed considerably more criticism than did those from the other four countries, including Hungary and Czechoslovakia. Differences were pronounced when those who expressed any dissatisfaction were asked what it was about the police response that they disliked, using a similar pre-coded checklist to that of the ICVS and BCS. Overall victims were most likely to cite lack of feedback, the fact that the crime was undetected, property not being recovered, and criticism that the police did not do enough or were not interested. However, while lack of feedback was one of the most common criticisms in all five countries, in other respects, the emphasis was different. Most notably, whereas in England victims were also most likely to criticize the police because they "did not do enough" or were "not interested," in Eastern Europe in general, and Poland in particular, the most common complaints were that the crime was not detected and that property was not recovered. This parallels Zvekic's (1996) analysis of the second ICVS and may relate to the fact that in these countries, far less victims were insured.

Arguably then, insurance compensation may mean that criticisms of police reactions are more muted than they otherwise would be.

Victims were also asked how sympathetic they felt the police were when dealing with victims of (a) burglaries, (b) disasters like fires and floods, and (c) rape and sexual assault. Although responses varied with each situation, overall respondents from Poland and Hungary were about as likely as those from England to see the police as sympathetic, and it was in Germany, with its militaristic policing tradition, that victims were least likely consider the police sympathetic. Victims also felt that the police would be most sympathetic in the case of a burglary, less so for sex crimes and in disaster situations. This may indicate that victims felt the police had been particularly victim-oriented vis-a-vis their burglary. On the other hand, it may reflect a real difference in police response to the three situations, a conclusion that is in line with the ICVS data discussed above and may reflect perceptions of the "innocent victim."

Victims were then asked whether, over the last few years, "the police have got better or worse at handling the victims of crime." Burglary victims from Poland, Czechoslovakia, and (especially) Hungary were likely to perceive an improvement rather than a deterioration in this respect. Victims from England were least positive, although in many cases, lack of police resources was cited as the main reason for a decline in police service. It is also possible that as specialist victim services have expanded in recent years in countries such as the UK, so the police have abdicated their responsibilities and instead referred victims elsewhere. In this respect, van Dijk, van Kesteren, and Smit (2008) note that levels of satisfaction with police response have dropped most in countries like the USA, Canada, the United Kingdom, Sweden, and the Netherlands where specialized victim assistance agencies have become well established.

International differences in burglary victims' satisfaction with the police are at least partly due to the nature of police organization and priorities and the expectations citizens hold of their police. However, differences between countries are also, at least partly, due to police practices that may be crime specific. For example, in Poland, where victim dissatisfaction levels were considerable, it was routine for the police attending a burglary to remove door locks for "forensic examination," a practice that actually did nothing to improve detection rates but unequivocally added to victims' grievances!

Police and (Indirect) Victims of Homicide

Homicide is a crime judged very much in context, not only in the public perception but also police perceptions, which can have serious repercussions for victims (Monckton-Smith 2010, 2012). For example, in policing terms, a so-called stranger murder will be approached very differently in the amount of resources and expertise it receives to a domestic homicide. Those homicides where the offender is immediately identifiable, and the victim is adult and an intimate partner of the killer, may well be processed by less experienced officers. In such cases, the police priority is not to handle the victims with skill, but to produce a file of evidence for court, which may impact on the victim experience. Also, as noted above, victims will be assessed as more or less deserving, and this can impact on the way they are treated. The primary victims are often perceived as more deserving the more intimate distance there is from the killer (Monckton-Smith 2010, 2012), and this has been mirrored in approaches to victims of domestic abuse where the outcome is not fatal (Dawson 2003). In this sense, the reputation of the primary victim can be attacked, especially in court, which causes further trauma for families who cannot defend their loved one and a more negative perception of their dealings with criminal justice agencies (Casey 2012; Monckton-Smith 2012). There are many aspects to a homicide which will make the relationship between secondary victims and the police more problematic and may lead to dissatisfaction. Despite the comparatively high clear-up rate for homicide (around 80 % in the UK), victim experience of their dealings with criminal justice agencies is significantly negative on the whole.

Because in a homicide the primary victim is dead, police contact will be with surviving relatives and friends (indirect victims) who are suffering from a severe and exaggerated grieving process (King 2004). Research has shown that in cases of homicide, it is the way that these victims are treated by the police that has the most significant impact on their overall level of satisfaction (King 2004; Kilpatrick et al. 1990) and that more careful consideration of the way indirect victims are treated can have a major impact on the extent to which they experience psychological trauma (Kilpatrick et al. 1990, p. 1). It is even suggested that those indirect victims who have no involvement with criminal justice agencies at all actually cope with trauma better (Casey 2011).

An added difficulty is that the families of homicide victims are more likely to have sustained interactions with the police, resulting from quite complex and diverse issues. Due to the seriousness of the crime, investigations and the court process can be protracted; there is much at stake for the accused and a high likelihood of a trial which is stressful for victims. Where offenders plead guilty, victims may have no involvement in the court process which leaves them feeling frustrated (Casey 2011; Kilpatrick et al. 1990). Unsolved cases can be investigated for lengthy periods of time, sometimes years, and then re-investigated if new evidence is discovered or forensic techniques are developed. Even successful convictions may become the subject of an appeal and further extend family interactions with the criminal justice process. Seemingly simple procedures like the release of the body for funeral can also take a long time while the inquest is completed, and the need for a postmortem, or very often, more than one postmortem, is carried out. This in itself has been a subject of criticism from victims who question the need for second postmortems and lengthy inquests (Casey 2011). In the UK, the former Victims Commissioner Louise Casey campaigned to have a process whereby all bodies are released to families within 1 month to try and make the process more efficient and easier for relatives.

In cases where no killer is identified, the process is especially long, and family suffering is even more exaggerated, with their need for justice frustrated by what might be perceived as police failings in the investigation, and anger may be directed at them (King 2004), creating a very complex and sensitive situation. Kutnjak Ivkovic (2008) found that the more contact that individuals have with the police, in general terms, the more dissatisfaction there is. So there is much scope for victims to feel dissatisfied with their treatment by the police in cases of homicide.

It is fair to say that family and friends of victims have been sidelined by the criminal justice process, having few rights and no legal status in the court or police process. Many complain that the offender has more rights than they do and is given a more robust voice in proceedings (Monckton-Smith 2012; Casey 2012; Kilpatrick et al. 1990), and this is often most noticeable in those cases where families have been so frustrated by failings or weaknesses in the police response that they campaign for change.

It is the high-profile enquiries and reinvestigations resulting from homicide cases, which are the clearest demonstration of victim dissatisfaction. There is little research which documents the homicide victim's experiences of the police in a generic sense but an abundance of individual examples. A prime example from the UK is the Macpherson (1999) enquiry into the racist murder of Stephen Lawrence in 1993 where the police treatment of the family was heavily criticized; the Bedfordshire police report into the Cambridgeshire police investigation into the murder of Claire Oldfield-Hampson, again criticized the way the families were dealt with (Cambridgeshire Police 2011). Similarly in Belgium, the police handling of the investigation into the murders committed by Marc Dutroux rocked public faith in the Belgian police and led to a complete restructuring of policing (Robbers 2008). The murders of Ronald Goldman and Nicole Brown Simpson in Los Angeles, USA, allegedly committed by OJ Simpson, brought significant criticism of the police; the murder of journalist Alfredo Villatoro saw Honduran Police Chief General Ricardo Ramirez el Cid removed from position, shortly after the removal of his predecessor, Jose Luis Munoz, for failings by police in the murder investigation of two university students (Fox 2012). There is a reported nose dive in confidence in the Nigerian police partly as a result of their failings in high-profile homicide cases (Adisa 2012). In some jurisdictions, it is corruption that is cited as failing victims; in others, it is arrogance and incompetence of the police. But across the world, it is homicide cases that have the most potential, it seems, to bring criticism to police services and to instigate change.

These high-profile criticisms into police handling of homicide cases have probably led to many of the changes which have sought to improve the victim's experience. The relationship between the police and victims in any jurisdiction will be affected by wider relationships with the state which will also impact on police performance and attitude (Kutnjak Ivkovic 2008). The biggest criticism from victims' families is police attitude, more so than prosecution outcomes and sentencing decisions. The key criticisms are that the defendant was treated better than victims (Casey 2011; Kilpatrick et al. 1990) with many families expressing the view that there was no aspect of the criminal justice response with which they were satisfied.

Varying levels of satisfaction have been found in the respect given to secondary victims, with some citing police responses as supportive, but lack of consideration was also cited as a key problem in other cases (Kilpatrick et al. 1990). Similarly in the UK, in one study, 76 % considered the police fairly or very supportive (Casey 2011), but this was often different where no offender was identified. The biggest issue here and in other cases was the lack of information given to families, and this has been replicated across all studies. King (2004) reports that some of the major complaints from indirect victims include being shown a lack of compassion, being given incomplete information, a lack of accessibility, ignorance of the grieving process by police, and dishonest answers to questions. A Russian study found that in more general terms, victim interactions with police were marred by rudeness of officers and a lack of trust (Kutnjak Ivkovic 2008).

Victims have long complained that they are not listened to, and in the UK, the USA, and Canada, among other countries, there are now Domestic Homicide Reviews/Fatality Reviews which are inclusive of indirect victims, giving them more room for a voice in the process, but these would only occur after an initial investigation. It has been suggested that more categories of homicide could benefit from such a process (Casey 2011). The introduction of Victim Impact Statements again addresses the need for the victim to be heard.

It is clear from the studies across the world that the way victims are treated is key to their satisfaction with the process, and dignity and respect are the main characteristics seen as lacking. It appears to be a recurring theme that sensitive treatment is what is required but also what is lacking.

Police and Victims of Intimate Partner Abuse

Intimate partner abuse (IPA) or, more broadly, domestic abuse and violence is receiving unprecedented attention worldwide in an attempt to reduce its prevalence and respond to victim's needs (Monckton-Smith 2012). It is a problem of global proportions. Despite the emergence of the notion of gender symmetry in domestic abuse which has precipitated much more sympathetic police responses to male victims, it is the case that the predominant victim group is female. They are killed at a far higher rate and receive more sustained, prolonged, and serious abuse than men (Stark 2007; Websdale 1999). It is also difficult in policing terms because even police departments with more liberal attitudes and proactive response policies are not really geared to respond to the most common forms of abuse against women, which may not be characterized by violence, but by what Evan Stark (2007) calls coercive control. However, coercive control is significantly associated with serious and fatal abuse.

There are now at least 45 countries with specific domestic violence legislation (Unifem 2010), but the most intractable problems are universally acknowledged to be in deeply held prejudicial beliefs about male and female gender roles and gendered behavioral characteristics, which can permeate the official response and undermine the spirit and practice of legislation, as well as direct the behavior and practices of individuals and communities (Monckton-Smith 2012, p. 25). It is well documented that victims of IPA have received poor attention from the police in the past with accusations that they were disbelieving, disinterested, and keen to minimize the harm (Stark 2007; Websdale 1999; Dobash and Dobash 2002). However, despite the changes implemented to improve the response to victims, Dobash and Dobash capture the criminal justice and political zeitgeist in claiming there has been great change and no change at all (2002, p. 21).

Underreporting of domestic abuse is a significant issue with many women not wanting police intervention for fear of antagonizing the assailant or as the result of cultural beliefs which construct wife abuse as a private matter (Hoyle and Sanders 2000; So-Kum Tang 2003; Sun et al. 2011). Many victims seem to desire police intervention to end the immediate danger or to calm the assailant down, but no more (Hoyle and Sanders 2000). The purpose of involving police appears to be an attempt to end the ongoing violence, rather than instigate the power of the law to achieve a conviction. Hoyle and Sanders (2000) found that police intervention rarely has this effect, and abuse and violence often continued. If the victim is seeking to remove herself from danger in calling the police, then she will need a particular response which acknowledges this and has the capacity to manage her safety. Such is the institutional frustration with women who either refused to cooperate with arrest and prosecution; that in the UK and USA, pro-arrest or mandatory arrest policies were implemented for domestic violence calls. The follow-up studies had mixed results suggesting that those men in the higher socioeconomic groups were most likely to be deterred from future violence, having more to lose (Schmidt and Sherman 1993). It is also the case, however, that while an immediate arrest may reduce the threat in the very short term, women without adequate resources to use that time window when the abuser is incarcerated will be in danger of repeat violence on his return and in the long term.

Unfortunately, in many cases where women do report IPA, there is a general dissatisfaction with police handling of the incident and the subsequent investigation, if indeed there is one (Stephens and Sinden 2000). Victims across the world complain that police officers are disinterested, hostile, or frustrated with victims for their reluctance to follow complaints through or permanently leave the abuser. It was found in one American study of trainee law enforcement personnel that their attitudes to women and IPA were significantly more censuring of victims than students in social work (Meyer 2011), suggesting that those entering law enforcement are holding discriminatory attitudes prior to any institutional influence. Studies in China show that those police officers who hold traditional attitudes which see women as “wives” and “home builders” rather than equal citizens are far more likely to be disbelieving and disinterested (Sun et al. 2011). Stephens and Sinden (2000) found that there were four key police demeanors noted by domestic abuse victims which caused dissatisfaction: minimizing the situation, disbelieving the victim, “we don’t care,” and “macho cop.” Similar to the findings in the treatment of homicide victims, domestic abuse victims were most satisfied with police contact when they were shown care and respect with listening and believing the most important characteristics (Stephens and Sinden 2000).

Meyer (2011) reports a study in the USA which shows that over 70 % of victims in their sample reported dissatisfaction with the police response, largely characterized by disinterest, but also that taking the report was a waste of time and effort. Research in China also shows that traditional attitudes to female gender roles are implicated in poor police response to IPA and a tendency to blame the victim (So-Kum Tang 2003).

Even though China has specific legislation outlawing IPA, authorities still do not always consider IPA a matter for the police, sometimes refusing to even record the initial complaint (Sun et al. 2011). Respondents in this research reported they would be more likely to seek help from friends and family (Sun et al. 2011). Reports from Sweden show better victim satisfaction with IPA intervention, largely attributed to their social welfare approach to the problem which gives women more access to resources and state support which helps them manage their safety (Sun et al. 2011). A Canadian study found that not all victim groups have benefitted even where there are developments in victim treatment by the police. This study found that Aboriginal women experience violence at disturbingly high rates with their mortality rate from violence being three times higher than for non-Aboriginal women (Dylan et al. 2008). The police response was said to be marked by disrespect, dismissal and professional failure, and the revictimization of women by the system a common feature (Dylan et al. 2008).

Victims of IPA almost universally express similar problems with police responses which inhibit them from reporting and are related to cultural ideas of male and female gender roles which place women in more danger after reporting. There is a prevailing belief in institutional response to IPA that legislation to further conviction should be used and is helpful to the victim, but this fails to take account of victim needs which are largely about safety planning.

Police and Victims of Sexual Assault

Sexual assault is another form of offending which is receiving worldwide attention. As a result of human rights legislation and more inclusive and nondiscriminatory policies, in Europe and Westernized countries, the victimization of men is also receiving far more attention and practical support. Historically, similar to victims of IPA, victims of sexual assault have received poor service from the police, and this has been articulated in the strongest terms by victims and victim's advocates. It was high-profile feminist campaigning that raised awareness of its prevalence and the damage it causes leading to widespread policy changes with regard to the treatment of victims (Monckton-Smith 2012). Sexual assault is a diverse offending category which encompasses a diverse victimology. The most common forms of sexual assault, however, are those perpetrated against women or children by male family members or acquaintances. Similar to IPA, this form of assault was largely hidden within the family. Pedophilia was made visible by feminist campaigning in the 1970s (Kitzinger 2004) and has become more openly reviled as time has moved on, with pedophiles perhaps being the most hated of offender groups. Despite this, child victims are still not always believed, especially where they are close to the offender (Kitzinger 2004). Similarly, rape is widely considered one of the worst of violent offenses, and it is perhaps this construction of the crime, as particularly evil, that protects offenders from conviction. It is difficult, after all, for a seemingly ordinary and plausible man to look like a "rapist" in this construction of the offense and offender (Monckton-Smith 2010).

There is still a belief that a "real rape" occurs in a public place, committed by a stranger to the victim, and involves aggravating violence and use of a weapon, a perception that is described as more akin to an aggravated rape assault (Kelly et al. 2005). This perception, however, is setting the standard for what "rape" is and reflects what Kelly et al. (2005) refer to as the "rape template." This template reflects a very skewed idea of what a rapist or a rape victim looks like and even the victims themselves do not always identify their assault as a rape. The British Crime Survey found, for example, that "less than half of women who experienced an assault that met the legal definition of rape defined it as such themselves" (Kelly et al. 2005, p. 33).

Attrition in cases of rape is still extremely high and has been the subject of sustained research interest (Kelly et al. 2005). In the UK, the Fawcett Society claims that a rape is reported to the police every 34 min, but only 6.5 % will attract a conviction. Vera Baird reports that of those rapes where the alleged offender is charged by the

CPS, 59 % will receive a conviction, suggesting that the problems are at the very start of a victim's involvement with the criminal justice system. This is not a problem peculiar to the UK; it is a worldwide issue. Kelly and Regan (2001) found similar low conviction rates across Europe. For example, of the 468 rapes reported in Finland in 1997, only 46 resulted in a conviction; of the 1,962 reported in Sweden, only 115 achieved a conviction; and of the 424 reported in Norway, only 35 achieved a conviction. In the USA and Australia, similar problems are documented, suggesting a conviction rate of just 12 % (Kelly et al. 2005). South Africa has one of the highest rates of sexual violence against women in the world, but it is estimated that only around 16 % of those reported attracted a conviction (cited in Monckton-Smith 2010, p. 4). The attrition rates are a stark reminder of the problems victims have with the police. As noted, most cases are lost in the very earliest stages, that is, where the victim either makes a decision to approach the police or not, and most are choosing not, and then in the initial investigation and early contact with officers. It has been found, similar to the experiences of indirect victims of homicide, that those women who have no contact with police and the criminal justice system are more less likely to suffer trauma (Sleath and Bull 2012).

The UK is one jurisdiction where it could be said that improvements for rape victims have been made, yet victims still report significant problems with the police response. The case of taxi driver John Worboys, convicted of 19 counts of rape in the UK in 2009, is a recent example of the prejudice victims of sexual assault can suffer from police. An IPCC (Independent Police Complaints Commission) enquiry into this case found police to have given poor service to victims. The accusation, which was supported, was that victims were not believed and some were allegedly openly scorned. These findings show little improvement in police response from the time of the now infamous Thames Valley fly on the wall documentary *Police* (broadcast 18.01.82 BFI 2005) which revealed the institutional prejudice against certain victims of rape. MP Fiona MacTaggart said of the Worboy case:

> I was depressed by the Independent Police Complaints Commission report into Warboys, because it showed that still there persists, even among specialist police officers, insufficient sensitivity to the experience of the victim of rape and an insufficient determination to treat rape as a major violent crime that must be investigated. (Hansard 2010, p. 180)

It has been consistently found that police and prosecutors overestimate the amount of false allegations and that victims are treated with skepticism (Kelly et al. 2005) and that there is a relationship between belief in the rape myths/template and a failure to recognize sexual assault. Some of the rape myths include women lie about rape, only certain types of women get raped, women encourage rape in their manner of dress, rape is sexual, you can recognize a rapist by the way he looks, women fantasize about rape, rape is impulsive and spontaneous, rape is about passion, and a person who has been raped will be hysterical (Monckton-Smith 2010).

A culture of blame is held largely responsible for the poor response to rape victims by the police, and it has been found that even officers who receive specialist training show no decrease in acceptance of rape myths and levels of victim blaming. However, in the USA, it was found that officers experienced in rape investigation were less accepting of rape myths (Sleath and Bull 2012).

Research demonstrates that as rape is so traumatic, a sensitive response by police can be easily appreciated, whereas negative attitudes can have a devastating effect (Sleath and Bull 2012, p. 650). Sleath and Bull (2012) report, in accordance with other studies, that victims of stranger rape are considered less blameworthy than victims who knew their attacker; similarly, victims dressed in revealing clothes or who were intoxicated were assessed as more blameworthy. These kinds of attitudes are correlated with victim dissatisfaction with police responses to the rape; they deter women from reporting and lead to secondary victimization when they do report (Monckton-Smith 2010).

Summary and Discussion

Ideally, police response to crime victims should encompass a service approach alongside a concern to do everything possible to clear up the crime and provide justice for victims. Certainly, as the example of burglary illustrates, victims are concerned about detection and the return of stolen property. But victims also expect the police to respond sympathetically, to treat them as people rather than crime numbers, to provide help or advice where necessary, and to keep them informed of any progress regarding "their" crime. It is against these criteria, in addition to detection rates, that police services for crime victims need to be measured. Moreover, the balance between detection and service is not a zero sum equation. Police who respond appropriately to victims of domestic violence may prevent reoffending. Police who are sympathetic and supportive to all victims of crime may gain better cooperation from victims and consequently elicit evidence to identify a suspect and/or gain a conviction.

In considering police response to crime victims in different parts of the world, it is evident that there are some differences between victims of different types of crime. Of the examples detailed here, burglary victims, while somewhat critical of the police, are generally more positive about the services they receive, suggesting that part of the problem lies in the police being judgmental and stereotyping some victims, or victims of certain offense types, as more or less innocent (in terms of provocation) and more or less deserving (of any support). There are also international differences where traditional police practices in some countries may exacerbate the problems faced by victims, and new initiatives elsewhere may improve, even if only marginally, victims' experiences. An example of the former is police practices during burglary investigations in Poland. An example of the latter is police practices around domestic violence in the UK, which are reputed to be pioneering in understanding and responding to the problems (Choi 2009).

Nevertheless, the depressing finding is that despite policy changes, the police are regularly found wanting in their treatment of victims of crime. The findings that victims who are in contact with the police frequently feel worse affected by the whole crime experience and are often more critical of the police in general than those who do not report their crime are sad indictments of police service. The reasons for this are, perhaps, twofold. In part, police failure to respond appropriately to victims may be a consequence of a police culture where excitement and action are prioritized over support and care. In part, and not unrelated, it might reflect the types of citizen who become police officers and the features that attract them to a police career. While legislation and policy initiatives aimed at improving police procedure are to be welcomed, it is only by changing this police mind-set that the service provided to victims of crime can be significantly improved.

Victims of Corporate Crime

Hazel Croall
School of Business and Society, Glasgow Caledonian University, Glasgow, UK

Introduction

While the much heralded "rediscovery of the victim" in the latter part of the twentieth century exposed the previously hidden victimization associated with violence against women and minority ethnic groups, it did not extend its gaze to the victims of corporate crime (Croall 2007, 2010; Whyte 2007). Yet this form of crime has a huge impact, encompassing for example, the mass deaths, injuries, illnesses and long term health dangers associated with corporate neglect of safety, health and environmental considerations and the enormous financial losses suffered by individual victims, the general public and, very often, the least affluent.

This contribution will explore the factors underlying this neglect including the extent to which corporate crime victimization fails to "fit" the constructions of crime and victimization prevalent in criminology and criminal justice. It will look at issues of research before outlining the potential scope of victimization and providing selected, contemporary, examples. It will outline the relationship between victimization and structural inequalities and at the relatively limited role of criminal justice before considering alternative strategies within and beyond criminal justice.

Constructing Corporate Crime Victimization

The relative invisibility of corporate victims is strongly related to the widely acknowledged ambiguous criminal status of corporate, along with white collar, crime and to the very different nature of victimization. In very general terms, crime and criminal victimization are constructed around *individual* offenders and victims, an immediate *event* involving *intentional direct* physical and economic harm, often, if not always, accompanied by *interpersonal* contact. Corporate offences very often lack individual "bleeding" victims and involve an *impersonal* company with *no intent* to harm specific offenders. There may be no "event," rather a series of offences building up over time (Tombs and Whyte 2010), and, as Sutherland (1949), in his classic work on white collar crime recognized, many, such as consumer crime, have a "rippling effect," causing a small loss to a large number of victims, but yielding large profits. Moreover, many offences are not widely perceived as "crime" or those harmed as "crime victims," raising important issues of what activities to include.

The absence of intent, in legal terms, (*mens rea*), and an individual, guilty offender, gave rise, during the era of public welfare legislation in the nineteenth century, to the development of what is known as regulatory law. In general terms this involves the enforcement, by a vast range of agencies, of regulations covering a very wide range of corporate activities including compliance with financial, health and safety, environmental and consumer legislation. Agencies have the power to criminally prosecute, although such prosecutions are rare and penalties often perceived as lenient (Croall 2004).

This effectively creates a distinction between "real" and "quasi" crimes, which, to critical criminologists, reflects the way in which corporations have been able to influence the criminalization of their harmful acts.

From Sutherland onwards debates have raged over whether criminologists should include these activities, along with other harmful acts not subject to criminal penalties, as "crime." Some critical criminologists, arguing against an acceptance of state definitions of crime suggest using an alternative concept of "harm" (Hillyard and Tombs 2004), while others advocate using the concept of "deviance" rather than crime, which incorporates notions of a reaction by a respected audience and the imposition of sanctions, be they criminal, administrative or less formal forms of censure and reputational damage (Green and Ward 2000). It could be argued therefore that it is reasonable to include, in the category of corporate crime, corporate activities, such as financial fraud, which are unambiguously "real crime," "regulatory" crime as outlined above, activities which are "illegal but not criminal," such as some restrictive trade practices or misleading advertising, and those which are widely recognized as "lawful but awful" (Passas 2005), such as tax avoidance or the continued production of unhealthy food and other consumer products.

Like crime, the construction of criminal victimization is also based on conventional and state definitions of crime, with critical victimology stressing the importance of looking at the "victims we cannot see" (Walklate 2007), including the victims of gendered and racist violence as well as those of corporate crime, state crime and human rights abuses. Green criminologists have argued that "human centered" constructions of victimization neglect harms against non human species and of the planet itself (White 2008), and others challenge an "occidentalism" which downplays the exploitation of groups in developing countries (Hoyle and Zedner 2007). As these activities so often involve corporations they are highly relevant. Following these arguments, this Chapter will adopt a critical inclusive approach.

Research

The nature of corporate victimization also makes it difficult to "count" and directly compare with victimization from conventional crime (Croall 2007; Whyte 2007). Many victims do not regard themselves as "crime" victims and indeed are very often unaware of any harm as they cannot, for example, test for themselves the contents of food, the quality of consumer goods or the degree to which air is polluted. As outlined above, many victims suffer only a very small loss, and others blame themselves for being taken in by fraudsters or other persuasive sales practices. Responsibility for a so called "accident" may only become evident after lengthy investigations, and the long term effect of harmful substances such as asbestos or food additives only slowly recognized, and in some cases, "redefined" as criminal. When victims do choose to report problems to relevant agencies, they are not reported as "crime" but more likely as an "incident" or "complaint." The majority of crime or victimization surveys exclude corporate crime, even where victims would be aware of harm. Researchers aiming to "count" different forms of offences often therefore have to deconstruct a range of different statistical sources, such as the records of enforcement agencies, to estimate the amount which might be attributable to management (Tombs 2000).

Nevertheless, a variety of sources can be useful. Although limited to offences of which victims are aware, there have been academic studies of offences such as consumer frauds (Titus 2001; Shichor et al. 2000), and, in the US, the National White Collar Crime Center carries out a survey every five years on victimization from a range of white collar crimes including mortgage fraud, home and auto repairs, price misrepresentation and losses due to false stockbroker information, the latest in 2010 (National White Collar Crime Center 2010). Other information is found beyond traditional criminological sources. As will be seen below, some surveys, such as, in the UK, the Labor

Force Survey or those carried out by consumer organizations or Government Departments such as the Office of Fair Trading (OFT) are equivalent to victim surveys, although not restricted to "criminal" complaints. A wide range of organizations also carry out surveys on specific issues and investigative journalism provides another invaluable source by exposing aspects of victimization. Much of this is easier, via the Internet, to gather together than hitherto. While relatively unsystematic and difficult to directly compare with "conventional" crime, research tends to confirm the general assumption that victimization from corporate crime is widespread and likely to exceed other equivalent forms of crime. A victim survey which did include questions on health and safety at work, consumer fraud and offences by landlords found higher levels than for other forms of crime (Pearce 1992), and the above mentioned 2010 National Public Survey on White Collar Crime found that 24 % of households and 17 % of individuals reported at least one experience of victimization from the crimes included within the previous year (National White Collar Crime Center 2010). Other examples are outlined below.

Dimensions of Corporate Crime Victimization

While this chapter cannot provide extensive detail about the vast impact of corporate victimization (Croall 2007, 2010; Whyte 2007), the following, albeit selective, examples illustrate some of its main forms and suggest its potential impact.

Corporate Financial Frauds

Corporate financial fraud has a massive impact. It affects millions directly, through loss of investments and savings, the "misselling" of pensions, mortgage endowment policies and other financial products such as payment protection insurance. Indirectly it affects us all, through for example, taxes not paid or higher prices as a result of restrictive trade practices. For example,

- The collapse of the *Enron* corporation as a result of widespread frauds led to thousands of jobs and millions of dollars of retirement savings being lost and its wider impact included higher interest rates; a reduction in capital for investment; associated physical and mental distress and an erosion of trust in major institutions (Friedrichs 2004).
- *Taxation* involves a very fine, and constantly shifting, line between legal tax avoidance and illegal *tax evasion* which, while often seen as "victimless," impacts on state expenditure. While notoriously difficult to "count," it has been estimated that in 2005 tax fraud in the UK, *excluding* income tax fraud, involved losses of nearly £2 billion to businesses; £2.75 billion in charity, consumer, investment and pension frauds and £6.434 billion in frauds on public bodies such as the National Health Service (Levi and Burrows 2008).

To this could be added the massive effects, including job losses, unemployment, insecurity, lower pensions, lower interest rates, loss of savings and recession of the global financial crisis, which, while leading to few prosecutions, has been likened to a "bank robbery," was accompanied by considerable illegality and led to considerable reputational damage being suffered by banks and other financial institutions (McGurrin and Friedrichs 2010). While often seen as primarily economic, corporate fraud also has severe emotional impacts, particularly where loss of financial security or feelings of self blame are involved.

Safety in the Workplace

It has long been recognized that corporate crime "kills," readily illustrated in the numbers of deaths, illnesses and injuries associated with the workplace, so often caused by failures to comply with, often routine, safety regulations. These may involve mass or individual deaths and injuries in one off events, often misleadingly described as "accidents" or the long term impact of working with unsafe substances such as asbestos or chemicals. Thus:

- The mass deaths attributable to neglect of corporate safety regulations include the 500 deaths associated with the faulty design of the Ford Pinto car in the United States; the 26 Canadian miners killed in 1992 in the Westray mine in Nova Scotia; the spate of transport "disasters" in the UK, which included the 192 drowned in the sinking of the ferry *The Herald of Free Enterprise* near Zeebrugge in 1987 and a series of fatal rail crashes (Whyte 2007) and the 167 workers killed in the world's worst off-shore oil disaster on the Piper Alpha Oil rig in Scotland in1988 (Ross and Croall 2010). While these tragedies did not all lead to prosecutions, subsequent inquiries revealed a familiar story of managerial incompetence and disregard of regulations.

- *Individual deaths* in the workplace, across a range of industries and occupations, have been estimated in the UK to far exceed deaths from homicide (Tombs 2010).
- *Occupationally caused diseases* include those associated with asbestos – which, in Britain alone, account for around 4,000 deaths per annum, expected to peak between 2011 and 2015 (Tombs 2010).
- *Injuries from work* affect around 30,000 UK workers and 15,000 members of the public with Labor Force surveys, which can be likened to victim surveys, estimating that as many as 1,000 per 100,000 workers were injured in 2006–2007, a figure exceeding that of "real crime" (Tombs 2010).
- The 2006/2007 Labor Force survey also recorded that 2.2 million respondents suffered from an *illness* which they associated with work.

As well as the direct effect on victims and their families, these offences can have spillover effects on the wider community – especially where they lead to places of employment being closed down.

Crimes Against Consumers

A vast number of consumer goods and services have been associated with fraud, misrepresentation and health and safety issues (Croall 2009). Individual consumers can be poisoned by food, killed or made very ill by pharmaceutical products and be threatened by unsafe products. They can be directly defrauded by or misled by misrepresentations about the quantity, quality or origins of pre packaged goods and misleading advertisements. More indirectly their long term health is threatened by, often untested, chemicals and additives in foods, cosmetic, cleaning and other products, and by the continued production and sale of unhealthy processed foods which yield greater profits than their healthy, unprocessed equivalents (Croall 2012). For example:

- Pharmaceutical products such as the drug Thalidomide and the Dalkon Shield contraceptive caused mass deaths worldwide.
- Unsafe consumer products can be imported from countries with lower safety standards. It has been estimated that unsafe goods, particularly toys and fireworks, entering the UK through one port alone, cause or contribute to 95,000 injuries, 100 fires and 3 deaths per annum (Croall 2010).
- Food poisoning outbreaks, generally associated with lack of attention to hygiene regulations, include outbreaks of E.coli 0157 such as that in Lanarkshire Scotland where 21 pensioners died and in Walkerton, Ontario, which killed 7 (Croall 2010). Many more become ill and other food borne diseases such as campylobacter or salmonella are also linked to poor hygiene – the chocolate firm Cadbury's was prosecuted in 2007 following illnesses to babies and children caused by Salmonella Montevideo (Tombs and Whyte 2010).
- Food adulteration can also kill, seen most recently in the deaths of 6 and illnesses of 300,000 Chinese babies after consuming milk contaminated with melamine (Croall 2012).
- *Consumer fraud* is widespread with frauds in relation to car servicing and repair having been estimated to cost British consumers around £4 billion each year (Croall 2009). A 2008 survey, again equivalent to a victim survey, carried out by Britain's Office of Fair Trading (OFT), of consumer "detriment," which involves instances where customers suffer "partly or wholly as a result of the organization accidentally or deliberately

treating the customer unfairly" estimated its cost to consumers at £6.6 billion annually with around one third reporting at least one problem (Croall 2010). While many losses are small, (only 4 % involved sums of over £1,000), it should be borne in mind that surveys like this can only cover harms of which consumers are aware and perceive to be "unfair." The 2010 National White Collar Crime Center's survey found that 28.1 % of US respondents reported experiences of price misrepresentation, and 22.3 % reported cases of unnecessary repairs to motor vehicles (National White Collar Crime Center 2010). This leaves out a wide range of misleading marketing practices, such as deceptive packaging and misleading descriptions, including, for example descriptions of food as "healthy," which are widespread but not widely perceived as deceptive.

Environmental Crime

Environmental crime also has an enormous impact. Individuals can be killed and made ill by pollution and a host of toxic emissions, which also affect communities through loss of amenities, in some cases threaten the survival of habitats and entire species and endanger the future of the planet (White 2008). Food production can also involve the inhumane treatment of animals as seen in recurrent exposees of the conditions in intensive dairy or chicken farms (Croall 2012). Intellectual property, knowledge and natural and human resources in developing countries can be plundered by international corporations in what is known as bio-piracy (South 2007) and other forms of exploitation which underlines the global impact of victimization. For example:

- The world's worst industrial "accident" took place in the Indian town of Bhopal in 1984, where an explosion of poisonous gas led to a death toll of over 20,000 and at least 200,000 injuries and illnesses.
- In 2005, in the wake of the tsunami, hundreds of barrels containing radioactive waste disposed of by European companies were found on the shores of Somalia, causing infections, skin diseases and as yet un-measurable cancers (White 2008).
- Globally it is estimated that up to 800,000 premature deaths can be attributed to ambient air pollution, and UK Health Department estimates attribute at least 24,000 premature deaths each year to air pollution. In the North West of England air pollution and the Sellafield nuclear power plant have been linked to high levels of cancer (Tombs and Whyte 2010).

These selective examples illustrate several features of corporate victimization, although it is important to recognize its heterogeneity. Despite often being assumed to be "merely" economic, and to have a diffuse and indirect effect, many forms of corporate crime, which can be described as "corporate violence" (Tombs 2010), have an immediate and direct physical impact on victims, some fatal, some causing long term illness or debilitating injuries. Its direct economic effects on individual victims can also be devastating, involving loss of savings, employment and financial security. Like other forms of violent crime, it can have a considerable emotional impact ranging from the need to adjust to life changing losses or, particularly in cases of fraud, feeling that trust has been violated and blaming oneself. Like other groups of crime victims, corporate crime victims can be constructed as "non deserving" or having "asked for it" as in cases where investments have been willingly made, or consumers have chosen to buy cheap but unsafe goods, cosmetics, unhealthy junk food or environmentally damaging products (Croall 2010). This reflects the doctrine of "*caveat emptor*," let the buyer beware, a long accepted principle in consumer law.

While some offences may appear to have relatively trivial effects they may, like minor consumer frauds, occasion irritation and frustration and time taken to complain or seek compensation. In addition, while individual losses may be small, they can have a cumulative effect, which can lead to a loss of trust in business, and all citizens can be repeat and multiple victims – many suffer, for example, from pollution *and* the "misselling" of financial and consumer products, and it is very difficult to avoid harmful chemicals in household products or foods.

Other forms of corporate crime, sometimes regarded as "victimless," have a diffuse and not inconsiderable effect on tertiary victims such as the general public. Tax fraud is the clearest example of this but also significant are the public health costs of pollution and obesity and other problems created by the mass production and marketing of unhealthy junk foods with widely recognized dangers. These are akin to other corporate harms in that, deaths from obesity and diet related problems are "avoidable," with food corporations consistently and fiercely resisting attempts at regulation (Croall 2012). Victimization also has serious global implications. Global corporate crime (Croall 2005a) very often involves corporations taking advantage of "regulatory voids" to locate production in countries with less stringent safety or employment regulations and utilize tax havens. Many forms of forms of production exploit poorly paid, migrant or child labor – to a point where the term "new slavery" is widely used (Lawrence 2008).

Who Are the Victims?

While it has been argued that we are *all* victims of corporate crime, and victims are often described in aggregate terms such as "consumers," workers, or citizens, it is important to ask *which* of these groups are more likely to be at risk from *whic*h forms of corporate crime (Croall 2009). The depiction of one off events as "accidents" masks the greater vulnerability of, for example, workers, to deaths and illnesses caused by inattention to safety regulations and the emphasis on the diffuse nature of victimization masks the greater risks posed to those who have less ability to protect themselves. The following section also illustrates the significance of interrelated inequalities such as gender, race and age.

Global inequalities are well illustrated in examples in which corporations, as outlined above, legally exploit regulatory voids in relation to taxation, employment, safety, product quality or environmental regulations (Croall 2005a). The Bhopal plant would not have complied with regulations in the United States, Thalidomide and the Dalkon Shield were widely sold in the third world after their dangers were known in the West and toxic and e-waste is "dumped" by richer countries in poorer ones, and its impact is most severely felt by the poorest within these countries (White 2008). Major food corporations, most of whom are located in tax havens, extract much needed revenue from developing nations and have also been linked with the "new slavery" associated with poor conditions and low wages in South America (Lawrence 2008).

Within countries many offences prey more particularly on the poor although the affluent, by having more to invest, are more at risk from investment frauds. Low income groups, as well as losing potential benefits through tax evasion, have also been identified by Britain's National Consumer Council, along with those living in a deprived area and those with "skills difficulties," as vulnerable consumers (Croall 2009) and are also said to have less access to healthier food, with some living in so called "food deserts" (Croall 2012). Lower level employees, with some exceptions, are more likely to be seriously and fatally injured at work, with industries relying more heavily on casual and non unionized labor such as the building industry and agriculture having higher amounts of injuries and deaths (Tombs 2010). In the UK, some of the worst cases of chemical pollution have a disproportionate effect on lower class communities (Tombs and Whyte 2010).

A combination of *class and race* have been identified as significant in victimization from environmental crime with, in the US for example, more hazardous chemical plants being located nearer lower class communities and communities of color, black communities being most at risk from health hazards, and chemical accidents occurring more frequently near African-American and low income census tracts (Lynch and Stretesky 2001). Across the globe, migrant workers are particularly vulnerable to exploitation, seen dramatically in, for example, the food industry with "sweatshop" conditions and appalling living conditions being noted in England and Spain as well as in developing countries (Lawrence 2008).

G*ender* is a significant factor although many analyses of corporate crime have been "gender blind" (Snider1996). "Little old ladies" have been seen as archetypal victims of fraud; historically were more vulnerable to investment frauds and their assumed technical and financial incompetence makes them more likely targets of, for example, investment frauds and car sales and service frauds (Croall 2009, 2010). Goods and services marketed specifically for women, often playing on images of femininity, such as cosmetics and household products, contain allergenic and potentially carcinogenic "chemical cocktails," diets, which rarely work, are widely marketed on dubious evidence and botox and silicone breast implants have widely reported dangers (Croall 2009). Men are more at risk from other activities – particularly from workplace fatalities in so called "man's work" (Whyte 2007).

Age inequalities are variously related to victimization. Following the life cycle for example:

- The *very young, babies and children* are particularly vulnerable to offences involving illness such as food poisoning and products containing chemicals such as the Chinese melamine in milk case (Croall 2012), and cheap toys, often manufactured abroad, are amongst the unsafe goods mentioned above. Some food additives, particularly food colorings, have been associated with hyperactivity in children (Lawrence 2008). Globally, child labor is exploited in manufacturing to drive down production costs.
- *Teenagers* constitute a major consumer market making them vulnerable to a host of dubious marketing practices – mobile phone companies have, for example, been widely criticized for misleading indications about phone contracts and fashion goods and clothes, music, and DVD's are subject to faking (Croall 2009). Teenagers also enjoy "risky" and dangerous life styles, rendering them vulnerable to safety offences in, for example, night clubs or adventure centers.
- *Older people* are often seen as particularly vulnerable. Physically, they suffer more from some forms of food poisoning, are more vulnerable to physical and financial abuse in care homes and a variety of, often dangerous or ineffective, pharmaceutical and other products, such as "anti wrinkle cream" which target this market (Croall 2009). Pension frauds play on fears of economic insecurity and dependency in old age. Nonetheless, age is strongly related to class and the vulnerability of the elderly can be overstated – more affluent elderly people may indeed have sufficient knowledge and experience to avoid some obvious frauds (Titus 2001).

These, interrelated, inequalities in victimization reflect wider structural inequalities which form the context for production, marketing and other corporate strategies. Goods and services, for example, are targeted at specific income groups and reflect assumptions about masculinity, femininity, and, often commercially encouraged, consumption patterns. This is seen in, for example, women's greater vulnerability to unsafe household and "beauty" products or children and teenagers' vulnerability to offences involving mobile phones or toys. Children become brand aware at a very early age and parents may be pressured to purchase cheap goods or unhealthy junk foods (Croall 2009). The "race for the bottom" in terms of production costs underlies the exploitation of the least powerful groups whether in Western societies or in developing countries who have little power to resist. While the more affluent are victims, they are protected to some extent by their cultural and social capital which means that they are more aware of the dangers of cheap products, unhealthy food, more able to resist unsafe working conditions or avoid polluting industries being located nearby (Croall 2007).

Issues for Criminal Justice and Beyond

The move of the victim to "centre stage" of criminal justice did not include corporate crime, whose victims do not feature in victim compensation schemes or services to victims in court. This is largely due to the different constructions of crime and victimization outlined above and victims' lack of awareness or failure to report many offences. Many corporate offenders are not part of criminal justice proceedings as so many are subject to the "quasi criminal" proceedings of regulatory law where prosecutions are rare and other harms are not subject to criminal proceedings. Inevitably therefore the criminal justice process plays a limited role. At the same time however, when it is used, the extent to which it meets victims' interests can be questioned and alternatives suggested. Moreover, corporate crime victimization raises issues of social as well as criminal justice, and victims' interests are represented by groups such as those involved in consumer, trade union and environmental issues – for whom criminal law and justice are only one aspect of broader policy concerns.

This is illustrated by the range of groups representing victims' interests. Some perform functions equivalent to victim support groups for conventional crimes, providing emotional and practical support for victims and expert advice about how to deal with inquests, investigations and seeking compensation. Many of these emerged in the wake of major tragedies such as the sinking of the Herald of Free Enterprise, which saw a growth in relevant legal and other expertise. It was seen as important to recognize the need for victims to explain "what happened" and to attribute responsibility (Wells 1993). As well as individual cases, some of these groups, such as the former Centre for Corporate Accountability and Trade Union based organizations also saw victims' interests as being served by campaigning for legal reforms, in particular for changes to the criminal law to remove obstacles to the conviction of companies and individual directors for corporate manslaughter or homicide (Croall 2007; Tombs 2010). Broader based groups such as consumer or environmental groups mount a variety of campaigns which research and expose harms, albeit that they are more concerned with strengthening relevant regulations to prevent offences than with individual cases or discussions of *criminal* law and justice.

Some of these groups have been particularly critical of the scarcity of prosecutions under regulatory law, both for individual cases, where victims may express a desire to see "justice" being done by having those responsible publicly tried and punished, and the deterrent value of a prosecution could prevent further victimization. Against this, it can be argued that compliance strategies, based on persuading and negotiating with organizations, are more "cost effective" and preventative (Croall 2004).

Sentences are also widely perceived as too lenient and as not reflecting elements of victimization such as the harm done. The main sentence for many corporate offences is monetary, reflecting the absence of a guilty individual to imprison or rehabilitate (Croall 2005b). Fines are often constrained by their potential spillover effects of higher prices and potential job losses and the impact on the wider community should the company have to close. Regulatory law, in the absence of intent to harm a specific victim, tends to focus on the breach or neglect of regulations rather than on the "harm done" and, even where deaths have occurred, which are an aggravating factor, sentences can be low. In one Scottish case, known as Stockline, where a gas explosion, subsequently attributed to persistent maintenance failures, killed 9, the two companies concerned were fined £200,000, publicly criticized as amounting to a "mere" £44,000 per life (*Edinburgh Evening News*, 2007). The fine was limited by the need to keep the company in business (Ross and Croall 2010). Higher fines are envisaged under the 2007 UK Corporate Manslaughter and Corporate Homicide Act, which covers death and serious injury and which recognizes the need for heavier sentences where serious harm has been done, but prosecutions under this Act are likely to be rare.

While larger fines may express greater disapproval and go some way to meeting victims' concerns, they do little directly for victims and there have been recurrent arguments that reparative and restorative principles can be appropriate for corporate offenders particularly in view of a corporation's ability to pay and the expertise which it may have at its disposal (Braithwaite and Geis 1982; Croall 2005a). More use could be made of individual compensation orders and where offences impact on communities or the general public, Community Sentences could require offending corporations to "pay back" through, for example, the provision of leisure amenities. Other suggestions include requiring companies to fund research into disaster prevention or other relevant issues (Croall 2005b). Restorative justice has the potential to work particularly well with companies, and Braithwaite (1995) reports a case in which senior executives of an insurance company, convicted for selling deceptive policies to Aboriginal communities, were required to visit the communities and negotiate settlements. Provisions for these kinds of options have been made in parts of Australia for consumer and environmental offences (Law Reform Commission, New South Wales 2003). In the UK, orders containing restorative elements and payments to victims were recommended by the McRory (2006) review, adopted in the Regulatory Enforcement and Sanctions Act of 2008, although initially only as administrative penalties as a desire to avoid criminal prosecution was clearly stated (Ross and Croall 2010). To date however there has been little research on the use and impact of these options although it can be argued that they have a considerable potential.

The role of criminal justice is however inevitably limited, and some forms of private justice also have serious shortcomings. While individual victims can pursue private redress, many, as seen above, are unaware of any harm or of their right to seek compensation and, as so many victims are amongst the least affluent, many do not have sufficient resources to pursue cases against corporations who can utilize their superior resources to dispute liability. This means that victims' interests in preventing future victimization may best be met outside the formal arenas of justice, in the many wider campaigns around social and public policies. These include for example, the role played by Trade Union, environmental or consumer groups in highlighting and conducting research which exposes corporate harms and campaigns for fuller and more comprehensible information to assist consumers, such as those advocated by the UK consumer's organization *Which*? While worthwhile, these are also inevitably limited particularly in view of the structural aspects of victimization which limit the extent to which different groups, however well informed, are able to exercise choices to, for example, not work in unsafe factories, or avoid purchasing cheap food or consumer goods. Ultimately therefore corporate harms are linked to wider issues of social justice.

Concluding Comments

It can be seen from the above therefore, that, when the victimological gaze is extended to corporate crime, the many victims whom we do not see include some of the least advantaged within Western societies and across the globe. Indeed victimization from corporate crime most probably vastly exceeds that from conventional crime. The role of criminology, criminal law and justice has inevitably been limited by a number of factors associated with the failure of corporate crime and victimization to "fit" conventional constructions of victimization. Nonetheless, some improvements could be suggested.

It is often argued, for example, that the different nature of victimization means that corporate crime is not appropriate for the widely used crime survey method of "counting" victimization. This is indeed the case for many offences, but, as seen above, research equivalent to victim surveys has been carried out in respect of those crimes of which victims are aware, and victim surveys could easily be adapted to include, for example, some offences which would perform the valuable function of exposing their extent and impact and comparing this to conventional crime. The exclusion of these harms is therefore as much ideological as it is related to technical difficulties of measurement, as crime surveys are designed around perceived governmental priorities and inevitably include only those activities which governments wish to know about – thus restricting their scope to conventionally defined crime and anti-social behavior.

Conventional constructions are also reflected in criminal law and criminal justice and, as seen above, the ambivalent criminal status of many corporate crimes raises complex issues about the extent to which the interests of corporate victims can best be met by criminal law and criminalization. While few dispute that there are limitations, and that compliance strategies can be cost effective, it can also be argued that the continued existence of so many corporate offences indicates the failure of current strategies to act as a deterrent. Moreover, the criminal law remains the sanction which best expresses public disapproval of any activities (Croall 2004) and continued corporate resistance to further regulations and criminalization also indicates that, for some at least, a fear of the stigma of the criminal sanction and reputational damage remain important.

Criminal law could also be considerably strengthened. While invoking victims' interests has been negatively associated with calls for more punitive treatment of conventional offenders, in respect of corporate crime, some tougher and more victim centered sanctions could be viewed positively. As outlined above for example, victims and their representatives stress the need to see the "guilty" publicly prosecuted and sentences could better reflect the harm done – all of which may be preventative by providing a greater deterrent. More innovative use of restorative and reparative measures, whether criminal or administrative, could go some way to including corporations in concepts such as "community payback."

The likelihood of such measures being introduced is however reduced by the current preference of many Governments for neo liberal deregulatory policies which, in a bid to reduce "red tape" and public expenditure, are likely to reduce resources available to regulatory agencies and reduce, rather than expand, the scope of criminal law. This underlines the importance of social as well as criminal justice in relation to corporate harms and researching, exposing and campaigning to prevent these harms is the province of a wide range of social movements for whom exposing victimization, calling for more stringent regulations, be they criminal or otherwise, is a vital aspect of their work.

Victims of State Crime

David Kauzlarich
Department of Sociology and Criminal Justice Studies, Southern Illinois University Edwardsville, Edwardsville, IL, USA

Overview

This entry reviews the definitions, measurement, extent, and nature of victims of state crimes as well as relevant justice system policies and resistance to victimization by the state. Current theorizing and research on victims of state crime are discussed as are public and criminal justice policy initiatives. Propositions on the victimology of state crime as well as current research findings suggest that the study of state crime victimization requires an appreciation of creative and innovative social and criminal justice policy changes that attend to the diverse needs of those victimized by the state.

As with definitions of state crime itself, there are many competing ways to conceptualize those victimized by the state. There is obviously a vast array of harm and victimization which result from state crime, as well as multiple types of actors, agents, and organizations which may be directly or indirectly involved in this form of organizational crime. The crimes can be against individuals, property, communities, groups, and states and may cause a range of psychological, physical, community, and emotional trauma. Despite differing ways to classify victims of state crime, most of the scholarly literature on this subject within criminology fit under the following definition: those individuals or groups of individuals who have experienced economic, cultural, or physical harm, pain, exclusion, or exploitation because of tacit or explicit state actions or policies which violate law or generally defined human rights (Kauzlarich et al. 2001). The range of victims of the state is very broad, and can include, but is not limited to, targets of genocide; ethnic cleansing; human and political rights violations; war crimes; natural disasters caused by state action or inaction; those discriminated against by any state agency, especially within justice systems; and, more broadly, those who suffer the worst pain and harm because of larger structural state systems that cause or correlate with unnecessary poverty, illness, and other troubles. Each form of victimization can be broken down into different types of injury. For example, Turkovic (2002, p. 206) has compiled an inventory of the harms experienced by victims of war. These include those killed, unemployed, wounded, forced to conscript, tortured, missing, confined, psychologically distressed (e.g., insomnia, depression), and sexually abused as direct personal harms, along with property victimization. To this we could add the destruction of schools, hospitals, water and food supplies, and so on.

There is some debate in criminology over how to define victims of state crime, especially as it relates to the implication of larger state policies, both implicit and explicit. No one would debate that citizens who are indiscriminately killed or raped in the course of a military invasion are victims of a state. Likewise, there would be little debate on the criminality of the genocide committed some years ago in Rwanda or Cambodia. However, differences do exist on whether states that allow homelessness, suffering because of treatable medical illness, hunger, and economic marginalization are really state crimes or simply social problems. On the one hand, those who favor legalistic definitions of state crimes are less likely to view capitalist or exclusionary activities themselves as criminal, while radical scholars are more likely to speak of victims of the economy in the same way others speak of victims of human rights violations. Further, extensive research has been conducted by Faust and Carlson (2011), Faust and Kauzlarich (2008), and Green (2009) on environmental and natural disasters that are linked to harmful actions or inactions by the state. Interestingly, there may be widespread disagreement among non-scholars in the use of the term victim as applied to natural disasters and indeed among victims themselves. This is very rare in traditional street crime victimization save for so-called public order crimes like prostitution, gambling, and drug use.

On an epistemological level, victimology in general must take into consideration the sources and values upon which it assumes candidacy for classification as a victim. A key controversy is about whether victims and their constituency, both of a state and non-state nature, should also define their experiences as victim-like or whether other standards should be used that may identify injustices and those harmed with or without those subject agreement. Any attempt at a universal definition of state crime victimization is questionable because of the subjective and objective elements of social life in general, let alone injury to a person or group. Using legal standards is not objective because laws and political processes are interest-laden, while more obviously subjective interpretations by people who may be candidates for classification as state crime victims may not accept the label of victim. Consider what Strobl (2010) offers as a constructionist concept of victims: (1) an identifiable event, (2) negative evaluation by the victim, (3) an uncontrollable event, (4) attributable to a personal or social offender, and (5) a violation of a socially shared norm. The second and last points are especially questionable given that the concepts of social norms and cognizance are subject to hegemonic effects in which the attitudes and beliefs of those in power are packaged to be understood as acceptable by the masses, whose interests are not served by elite definitions of social reality. For example, the recent global recession has links to state crimes of omission in terms of the underregulation of financial industries, yet many citizens who have lost jobs or their homes might be unlikely to view such negligence as criminal, or themselves as victims of crime. This debate is similar to what is seen in social problems research in sociology, wherein some scholars believe that in order for a social problem to exist, it should be recognized as such by a majority of people in the citizenry. From a radical approach, such a definition, as that with definitions of state crime victimization that depend on public cognizance, is unacceptable because of the ideological, material, and political control those in power have over those who are less powerful.

Core Propositions

Six propositions on the victimology of state crime were developed by Kauzlarich et al. (2001) and have guided several critical analyses of the phenomenon (see, e.g., Westervelt and Cook's use of the propositions):

1. Victims of state crime tend to be among the least socially powerful actors.
2. Victimizers generally fail to recognize and understand the nature, extent, and harmfulness of institutional policies. If suffering and harm are acknowledged, it is often neutralized within the context of a sense of "entitlement."
3. Victims of state crime are often blamed for their suffering.
4. Victims of state crime must generally rely on its victimizer, an associated institution, or civil social movements for redress.
5. Victims of state crime are easy targets for repeated victimization by the same organization or institution.
6. The unethical, immoral, or illegal state policies and practices, while committed by individuals and groups of individuals, are manifestations of the attempt to achieve organizational, bureaucratic, or institutional goals.

Indeed, unlike most victims of traditional street crime, those victimized by the state are likely to have even less power to address the injury. Victims of war crimes and genocide, for example, are often in conditions of chaos and most everyday or normative social processes are absent. In these conditions, it is not feasible for victims to contact policing or regulatory bodies for help or redress. Further, victims of state crime are usually harmed by a relatively large and organized institution or group, not by lone offenders as is the case with much traditional street crime. Depending on the organization of the state doing the offending, state crime victims may also have little to no way of finding justice. Citizens of states who are victimized by their own government will often not have any opportunity for redress in weak states, whereas in stronger states they may be able to work through a different arm of the government for a remedy. For example, Chinese citizens have very little chance of finding remedy for human rights violations through their domestic justice system, whereas in the United States, there are examples of victims of nuclear weapon experimentation who have, albeit over decades, received a measure of compensation for the harms. Others harmed by states may have to seek international help in addressing state crimes committed against them, such as systems developed under the International Criminal Court (ICC) or ad hoc international criminal tribunals. Some state crime victims may also be less likely to trace their harm and suffering to the particular offending organization. Unlike a traditional street crime such as robbery or rape where the victim is directly attacked and immediately experiences some or all elements of victimization, the suffering from state crimes and the identification of the offender, like with many white-collar crimes, may come years or decades later. For example, illegal government pollution of the environment or harmful chemicals and agents to which military personnel are exposed may cause health problems long after the initial exposure. Further, layers of bureaucracy and secrecy may hinder the pursuit of the key offenders. It is important to keep in mind, however, that some state crimes are exactly like traditional street crimes but differ only by the context. Sexual and physical assault, theft, robbery, and several other crimes do occur in times of war, genocide, and ethnic cleansing and are committed by state affiliated groups as a way to exercise power and control over a population.

It is not uncommon that revictimization, or compounded victimization, occurs in all kinds of crime situations, but with state crime it can be more profound. Consider only the emotional and social injury caused by illegal military aggression, genocide, and war. Whole families and communities may be killed or injured, and such demolition compounds the initial criminal events, possibly for generations. Rebuilding infrastructure, whether for public health, schooling, roads, or water sanitation, forces resources to be placed into fundamental human needs building rather than improving what once existed. Victims, then, are considerably vulnerable and often public sympathy, if there was any in the first place, relaxes if concerted organizational efforts are not sustained. In the United States, we have seen this take place in myriad circumstances, especially for the victims of Hurricane Katrina, who some even blamed for their loss of property and community. In the United States invasion of Iraq, some several hundred thousand people died by some accounts, and many of these appear to be forgotten in the West, if they were even recognized as victims in the first place. Drawing from studies of genocide and war in Bosnia, Ajdukovic (2006) outlines a host of repairs and initiatives that should follow such conflicts including provision of mental and physical health services, securing social support for families and communities, promotion of nondiscrimination in social, political, legal, and cultural contexts, training in conflict resolution, encouraging tolerance and diversity, and a range of other small- and large-scale social changes.

Measurement

Victims may or may not be recognized as such by formal legal, regulatory, or human rights commissions. With crimes of the state, this would necessarily include control mechanisms at the domestic and international levels. Consider, for instance, the victims of the Rwandan genocide at the state level, where the recognition is of Tutsis as victims. Yet, many Hutu were also victimized. Likewise, international institutions of control remain selective who they define and label as a victim. This has serious ramifications for victim recourse as well as victim healing and accurate accounts of facts and subsequent history of their victimization. Additionally, it must not be overlooked that in many cases the victim can be rightly labeled as victim/offender. Here again, looking at Rwanda, testimony of various Hutu highlight how they view themselves as perpetrator but victims due to the fact that they were faced with being killed or killing Tutsi. In many cases, the processes of labeling or lack thereof can result in new forms of victimization and/or revictimization. The complexities and multiple layers of seeing oneself as a victim, accepting such a label, being given a victims label by others, exclusion or inclusion as a victim in mass atrocity settings facilitates another issue: How can we measure and know the totality of state crime victimization (Rothe and Kauzlarich forthcoming a)?

A key issue associated with the study of state criminality is to know the actual numbers of victims (Bijeveld 2007). As we know with street crime, there is a dark figure involved. Yet, criminologists attempt to get beyond this and obtain estimates that are more reflective by using, though imperfect, multiple venues available (self-report surveys, the United States' National Crime Victimization Survey, and the British Crime Survey are well known examples). However, with international crimes, this dark figure is a "doubly dark figure" (Bijeveld 2007, p. 4). In part, this can be due to a state's unwillingness to disclose the information for multiple reasons, victims' desires to remain silent, lack of survivors, lack of pre-conflict census data, lack of post-conflict citizenry data, significant population displacements, and a score of other variables. As such, criminologists must attempt to use multiple methods to make the doubly dark figure of the crimes, at best, a dark figure of the crimes. The important task of counting the precise number of victims remains a laborious task, yet not only is it important but it also speaks to the difficulty of using quantitative methods. For example, the death toll in Darfur has been estimated to be between 60,000 and 160,000. However, the Coalition for International Justice reports estimates near 400,000. The number of victims from the genocide in Rwanda is estimated to be between 500,000 and 1,000,000. The mortality rate of Pakistanis, due to the conflict in 1971, varies by a threefold variation, between one and three million, and estimates of the death toll in Congo between 1964 and 1965 varies tenfold. During the twentieth century, it has been suggested that 170 million people have been killed in “conflicts of a non-international character, internal conflicts and tyrannical regime victimization” (Bassiouni 1996, p. 2). Since the beginning of the twenty-first century there have been hundreds of thousands more killed, maimed, tortured, displaced, and/or raped. For those who use a more expansive definition of state criminality, the harms are even more insurmountable when we consider those generated by states’ omitting to alleviate specific conditions, or respond to natural disasters, cases of institutionalized racism, ethonocism, classism, and a host of other injuries. As you can see, figures for victims display enormous variance.

There are various forms that can be used to obtain statistics, no different than those used for traditional street crime, namely, victim surveys. These have been used for estimating mortality. Yet, in situations of these types of crime, significant portions of the population may have fled the country or may reside in refugee centers abroad, making it more difficult to account for the double-dark figures; or, if entire families were killed, mortality would be underestimated. An additional barrier to obtaining exact numbers or using victimization surveys is the inability to often go to the regions affected if the conflict is ongoing. Security issues can affect access to areas and thus the representativeness of the total numbers of victims. Further, some victims may not be willing to open up and share their experiences; this is particularly the case with victims of genocidal rape. Additionally, many victims may not know or perceive themselves as victims of state crime. Others may self-identify as such but be denied the status through efforts to ensure state legitimacy and to cover state criminality. Regretfully, the true numbers of victims of state crime will remain a “doubly-doubly-doubly” dark figure that is really beyond what most of us could comprehend (Rothe and Kauzlarich forthcoming).

Justice

Popular thinking about victims often dubiously assumes that victim healing can be accomplished simply through the formal processing of the offender(s). The logic here is that if the perpetrator is caught, tried, convicted, and punished, the victim will be able to somehow regain what she or he has lost. This common-sense belief, however, has been shown to be overly optimistic and quite naïve (Lobwein 2006). While it is true that some victims report feeling better about, for example, honoring their dead family members by telling their story on the stand, just as many appear to find formal criminal justice procedures alienating, frustrating, and without much healing power (Stover 2005). This is an exceptionally common finding in traditional street crime victimological studies.

Most truth commissions and international courts cannot regularly deliver outcomes or structure their proceedings in an expressly victim-centered manner. With truth commissions, it is often uncertain before and sometimes after a commission completes its investigation whether or not individual offenders will be named, and further, whether trials may be conducted on the basis of the information collected in a truth commission proceeding. The record shows that of the several dozen truth commission convened to date, only four have named the perpetrators. In some instances, complete and wholesale amnesty was given to offenders, as in the case in El Salvador, while the Argentinean truth commission investigation eventually led to criminal trials (Hayner 2001, 2006). In the case of South Africa, the Truth and Reconciliation Commission was allowed to offer amnesty or a case by case basis, although the names of offenders were a matter of public record. Indeed, Hamber et al. (2000) study shows that almost all of the South African victims they interviewed felt that granting amnesty to offender is unfair or simply "wrong." Victims of the Lord's Resistance Army in northern Uganda echo this sentiment in a sense as almost half of those surveyed indicated that, among other things such as restorative justice processes, perpetrators should be held accountable for their crimes and punished (Pham et al. 2005). It must also be understood that truth commissions are principally fact finding units, not a victim services center. Historically, truth commissions tend to be carried in places trying to recover from war, massive oppression, and economic and political crisis. The lack of material resources along with the primary business of fact gathering often lead to dissatisfaction and anger.

There are better alternatives for victims than these bureaucratic justice procedures that rely on principles of restorative rather than retributive justice. Some justice systems use a combination of these justice philosophies, while others are strictly one or the other. An interesting hybrid is evidenced by the relatively new International Criminal Court (ICC) which has an unprecedented system for helping victims. While the Court is still very traditional in terms of adversarial justice processes, the promising Victims Trust Fund has done much more than simply focus on punishing offenders. The trust fund has primarily helped victims of state crimes in Congo and Uganda, and has provided resources for psychological counseling, physical rehabilitation, education, various health services, and material support for education and agriculture. The Trust Fund is especially concerned with the following groups: Victims of sexual and gender-based violence, widows/widowers, former child soldiers and abducted youth, orphans and other vulnerable children, and victims suffering from physical and mental trauma (Trust Fund for Victims 2011). Interestingly, a sitting judge on the ICC has recently written a fascinating essay on her concerns with the manner in which the ICC can truly give victims voice, provide reparations, and facilitate healing (Van den Wyngaert 2012). Her main concerns are that the ICC is a bureaucratic, formal legal-adversarial system, and not a fully victim-centered process, and that because the Trust Fund is based mostly on individual and state donations, one should expect less than ideal results for victims. Alternatively, a fully restorative justice approach to harm and healing would center on three major stakeholders, the victim, the offender, and the community. The goals would be for offenders to recognize, apologize, and atone for their crimes, for victims to be free to voice their pain and suffering and be given resources to heal, and for the community to rebuild itself after crime or violence.

Resisting state crime and victimization has become a major point of interest for criminologists. Stanley and McCulloch (2013) have produced an anthology that considers a whole range of techniques and approaches that may be used to object to state crimes such as human rights violations in the Middle East, West Papua, Sri Lanka, the United States, the United Kingdom and other areas focusing on civil, popular, state, and international forms of resistance. The main question for scholars is what actions may be taken to reduce the harms caused by states, whether in official criminal or civil law, international regulation, social movement activities, social media outlets, or structural changes in the essential functions of states. As with any scholarly examination, the crime and the victim are obviously intertwined, but because of the likelihood for state crime to directly involve politically legitimate entities as offenders and their subjects or enemies as victims, the fundamental relationship between institutional power and individuals or groups of individuals with considerably less power reveals two major dynamics. First, resisting some types of state crimes, such as discrimination against the rights of gays and lesbians to marry may be facilitated by a combination of legal challenges, publicity, and social movement activities. Likewise with incidences of police or correctional officer brutality, states with greater freedoms may be challenged quite directly through politics and the media. In these types of situations, challenges to victimization and repeat victimizations may ultimately sway social opinion, the legal or political systems, and the populace to take notice of state crimes and effectively challenge them through both civil and state avenues. For states with less freedom of the press and assembly, resisting victimization is considerably more difficult as any resistance itself may be criminalized. Numerous examples of resistance to state crime victimization in the form of human rights violations in China, Iraq, Cuba, and many other areas of the globe illustrate how without substantial social movement activity, as found in some revolutions in the Arab Spring, resistance is weak and further victimization is more likely. Second, state crime victimization can occur as a result of higher level international affairs issues, which is not at all how most traditional crimes and victimizations take place. War always results in innocent killing and injury, and both soldiers and civilians are victimized. Most actors caught in the crossfire are unable to resist victimization for obvious reasons, and international aid agencies such as the Red Cross or Doctors Without Borders become primary aides in helping address injury. As recently witnessed in the face of gross human rights violation in Syria, without substantial political agreement among major powers within the United Nations, especially within the Security Council, little can be done to relieve the suffering from war.

As the state crime literature in criminology has advanced over the last two decades, the study of the victims of this form of crime has lagged behind, but has been bolstered in the last few years with more interest in the subject matter. Enduring issues in this area of inquiry are the definition of state crime itself, conceptualizations of victims, measuring and recording victimization, resisting victimization, and justice processes, whether formal or informal, to address state harms both prior to and after the victimization occurs.

Victims' Rights in the Criminal Justice System

Jonathan Doak
Durham Law School, Durham University,
Durham, UK

Overview

The concept of victims' rights has come to bear considerable influence on the formation of criminal justice policy on both the domestic and international platforms. While commentators have long accepted the desirability of rights for accused persons, it is only in more recent times that a discourse concerning the rights of victims has emerged. Prior to exploring the evolution and extent of such rights, it is worth noting at the outset that the tendency of policymakers and politicians to adopt language couched in the terminology of *victims* rights' often departs from the notion of a *legal* right, in the sense that it can be enforced through the justice system. In other words, while certain benefits or dispensations may be framed as rights on paper, they frequently lack any enforcement mechanism and may not be considered binding on courts or other public authorities.

History and Development

There are diverse and varied accounts which document the ascendancy of victims' rights within the criminal justice system (see generally Kearon and Godfrey, 2007). Many such accounts begin with reference to Christie's (1977) critique, in which he argues that the State effectively *stole* the conflict from its primary protagonists and resulted in the evolution of contemporary criminal justice system being normatively and structurally built around a contest between the state and the accused. For many centuries, victims were "underestimated, ignored and undervalued" (Walklate 2007: 11). It was not until the latter part of the twentieth century that the interests of the victim began to impact upon the shape of criminal justice reform in any meaningful way.

A growing awareness of victimization and its consequences emerged in the years following the Second World War. The postwar era was marked by a "shifting understanding of accountability and citizenship" (Walklate 2001: 204), which was evidenced in the shift towards welfarism, concern for vulnerable members of society, and the emergence of civil society. Although criminal justice policy was not a widely contested political issue during this time, it was within this climate of emerging social rights that a loose association of groups and individuals became involved in campaigning for victim-specific issues (Mawby and Walklate 1994). The feminist movement, in particular, played a key role in highlighting aspects of hidden victimization stemming from domestic violence, rape, and sexual assault across many countries, including the USA, Australia, and the United Kingdom (Dignan 2005; Wolhuter et al. 2009). Increased attention to the plight of children also showed that child abuse was much more prevalent than had been once thought and was a form of hidden victimization. In the United Kingdom, for example, several high profile cases came to light concerning the abuse of children in the care of social services, or where social services had failed to intervene (Mawby and Walklate 1994).

The 1980s and 1990s witnessed a dramatic growth in the number of specific interest groups in many different countries, including the USA, the United Kingdom, Australia, and New Zealand. These organizations included those campaigning for the registration of sex offenders, incest survivor groups, relatives of murdered and missing children, relatives of victims of drunk driving, and those concerned with combating racism, homophobia, and discrimination generally. While such groups were generally unconnected and pursued their own specific agendas, the net effect of their efforts was to highlight the plight of weaker and more vulnerable members of society on many different levels under existing legal and political frameworks (Mawby and Walklate 1994).

Notwithstanding this fragmentation, the victims' movement was becoming gradually more coherent. Despite their differing agendas and policy objectives, Karmen (1992: 159) argues that, from an international perspective, the movement reinforced a fivefold basic critique of the criminal justice system:

> (1) That criminal justice personnel – the police, prosecutors, defence attorneys, judges, probation officers, parole boards... were systematically overlooking or neglecting the legitimate needs of crime victims until they all began their campaign; (2) that there was a prevailing tendency on the part of the public as well as agency officials to unfairly blame victims for facilitating or even provoking crimes; (3) that explicit standards of fair treatment were required to protect the interests of complainants and prosecution witnesses... (4) that people who suffered injuries... ought to receive reimbursement... (5) that the best way to make sure that victims could pursue their personal goals and protect their own best interests was by granting them formal rights within the criminal justice system.

The victims' lobby in the USA has been traditionally perceived as being much more proactive and rights focused than its European equivalents, and the movement grew rapidly during the latter part of the 1970s into the 1980s. The National Organization for Victim Assistance (NOVA) was founded in 1975 and has since been involved in a campaign of national advocacy, championing the victim's cause and exerting pressure on federal and state authorities. Although many European countries also witnessed the formation of more consolidated national organizations, these tended to focus on meeting the needs of individual victims rather than leading political campaigns to enhance their rights. In the United Kingdom, local associations came together to form Victim Support in 1979, and the organization rapidly expanded its operations during the 1980s and 1990s and secured a twofold increase in Home Office funding (Dignan 2005). The organization now performs the role of a quasi-public body in championing victims' rights and supporting victims in their capacities as witnesses in court. Similar victim assistance organization evolved in Germany (1976), Ireland (1983), and the Netherlands (1985) (see generally Hall 2010).

As crime victims became more visible, western governments became increasingly concerned with being seen to address their needs as well as the wider problems stemming from the perceived fear of crime. As Geis (1990: 260) describes, "[t]he plight of the crime victim is dramatic and determinable. Their relief is feasible. It has strong political, social and personal appeal. Any of us, at any time, could become a crime victim." In Garland's (2001) view, such politicization stems from the wider collapse of *penal welfarism* and the subsequent need for governments to redefine the role of the criminal justice system. Concerns have, however, been expressed in some quarters that governments throughout the western world are increasingly willing to use the crime victim as a front so that they are perceived as doing something about crime (Garland, *ibid*.). In this sense, official rhetoric may be used as a mask to introduce policies that are primarily aimed at securing the interests of the state as opposed to victims (Jackson 2003). Such a trend has arguably resulted in governments embarking upon piecemeal and hurried approaches to statutory reform in the name of the victim, in order to maximize the political appeal of certain policies and, arguably, to increase conviction rates. Koffman (1996), for example, has warned that piecemeal measures couched in the language of victims' rights make it appear that the government is addressing concerns over apparently rising crime while avoiding having to incur the major outlay of expenditure that would be required for more far-reaching reviews of the criminal justice system or major programs of reform.

The 1990s and 2000s witnessed a drift away from a needs-based or welfare-orientated approach to victims' issues, and a rights-based discourse dominated the policy agenda in the following years (Wolhuter et al. 2009). Many jurisdictions began to produce minimum standards for victims in the form of charters, codes of conduct, or statements of rights. In the United Kingdom, the first Victims' Charter was published in 1990. The Charter consisted of a set of aspiring principles, while the second edition of the Charter, published in 1996, committed the government to benchmarking existing practices through a set of standards which victims could legitimately expect in relation to criminal justice services. Specific standards were laid down in relation to the role of the police, Victim Support, compensation, prosecution, and conviction/ release of an offender. However, its provisions remained unenforceable through the courts, and the implementation of these standards was largely dependent upon the discretion of individual criminal justice agencies (Koffman 1996). Similar charters were launched in New Zealand (1987), Australia (1993), and Ireland (1999).

In the USA, many states amended their constitutions to give effect to victims' rights, while others opted to entrench rights through specific legislation. At the federal level, Congress passed the Victim and Witness Protection Act 1982, which sought to guarantee fair treatment for victims and witnesses in criminal courts, and the Victims of Crime Act 1984 established the Crime Victims Fund, comprising federal fines and bond forfeitures to support state victim compensation and local victim assistance programs. Since 1980, all 50 states have adopted over 1,000 pieces of legislation enshrining victims' rights within their legal systems, including Bills of Rights (Doak 2008).

The beginning of the twenty-first century heralded further advances for victims, with governments seemingly more willing to introduce legislative reforms and revise charters in order to give effect to more radical rights. In the USA, the Crime Victims' Rights Act 2004 (forming part of the Justice for All Act) conferred victims with eight specific rights, these being the right to protection from the accused, the right to notification, the right not to be excluded from proceedings, the right to speak at criminal justice proceedings, the right to consult with the prosecuting attorney, the right to restitution, the right to proceedings free from unreasonable delay, and the right to be treated with fairness and respect for the victims' dignity and privacy. In contrast to legislative attempts elsewhere, the rights contained in the legislation are justiciable in the sense that victims are given legal standing to petition the federal (though not the state) courts in the event that any of the above rights have been breached.

In the United Kingdom, the Victims' Charter was replaced by a statutory code of conduct pursuant to the Domestic Violence, Crime and Victims Act 2004. The new code of practice conferred victims with statutory rights to support, protection, information, and advice in relation to all the major criminal justice agencies. If victims feel the code has not been adhered to by any criminal justice agency, they can file a complaint in the first instance, with the respective agency, and then, via their Member of Parliament, with the Parliamentary Ombudsman. In addition, the legislation has created the office of an independent commissioner for victims to promote the interests of victims and witnesses. Exercising an oversight role, he or she is also responsible for reviewing the code on a regular basis and encouraging good practice. However, the limited extent of the powers conferred on the commissioner underlines concerns that the code fails to provide for any effective enforcement mechanism. Section 34 of the Act provides that a failure by any agency to abide by a duty contained in the code "does not of itself make [any person] liable to criminal or civil proceedings." There is thus no freestanding right for victims to enforce the code through the courts: the judiciary is generally unable to give it legal effect. Manikis (2011) criticized the complaints process on the grounds that it was overly complex and largely inaccessible for many victims. Hall (2010) reported that the lack of effective enforcement mechanisms is a common limitation found in most charters, with the US Crime Victims' Rights Act constituting the most robust system of protection.

The International Context

The ascent of victims' rights within domestic criminal justice systems has been mirrored – and indeed partly driven – by developments on the international platform. Williams and Goodman (2007) suggest that this is particularly true of European jurisdictions, which took their cues from international benchmarks as opposed to Anglo-American countries, where the victims' movement had been more *proactive* in nature.

The first major development came in 1985, when the United Nations issued the Declaration of Basic Principles for Justice for Victims of Crime and Abuse of Power, which defined crime prevention as a victims' rights issue, and enshrined victims' rights to access to justice, fair treatment, information, assistance, and access to informal dispute resolution methods. Since then, a range of UN instruments, including the Basic Principles for the Treatment of Prisoners, the UN Convention against Transnational Organized Crime and the Standard Minimum Rules for Non-custodial Measures, and the Vienna Declaration on Crime and Justice, have required that the rights of victims to be taken into account in various ways.

On a regional level, crime victims have also been subject to a range of protections. In Europe, both the Council of Europe and the European Union have also been involved in standard setting. In 1983, the former organization was responsible for formulating the European Convention on the compensation of victims of violent crimes which lays down minimum standards for the provision of state compensation to victims of crime. Signatory states to the Convention are required to ensure that victims suffering serious bodily injury or impairment of health receive compensation for at least the loss of earnings, medical and funeral expenses, and the loss of maintenance to any dependents. The Convention was followed in 1985 by the adoption of Recommendation 85(11) on the position of the victim in the framework of criminal law and procedure, which contained guidelines aimed at protecting victims of crime and safeguarding their interest at each stage of the criminal procedure as well as calling on signatories to examine the possible advantages of mediation and conciliation. Since then, the Council of Europe has published many more recommendations, setting down a range of standards in relation to the provision of support, protection, and assistance for victims and witnesses (see especially Rec 87(21), calling on member states to adopt a range of measures to develop assistance and support programs for victims, and Rec 06(08), which stipulates that states should assist victims in obtaining compensation from the offender through both criminal and civil proceedings).

The European Union has also been active in standard setting. In 1999 the commission issued a communication to the European Parliament entitled *Crime Victims in the European Union: Reflections on Standards and Action*. This document contained 17 proposals grouped under five main headings: prevention of victimization, assistance to victims, standing of victims in the criminal procedure, compensation issues, and general issues (information, language, training) and called on all member states to implement fair and effective legislation in these areas. Following its adoption by the European Parliament, in March 2001, the Justice and Home Affairs Council adopted the *Framework Decision on the Standing of Victims in Criminal Proceedings*.

The Framework Decision is particularly significant because, in contrast to the various declarations, recommendations, bodies of principles, and other soft law pronouncements of international bodies, the Framework Decision is legally binding and, as such, is directly applicable in all member states of the European Union. More recently, the commission has proposed that the Framework Decision be replaced by a new directive. The *Directive establishing minimum standards on the rights, support and protection of victims of crime* replicates much of the original wording of the Framework Decision. Given that the objectives of the Framework Decision were not wholly realized, concerns have been expressed that the new Directive will similarly fail to meet its own objectives and will not really add anything new in terms of concrete measures to protect victims (Doak and Taylor 2012).

The Substance of Victims' Rights

Victims' rights are commonly classified as falling within two broad groups. First, victims may possess *service* or *social* rights, which encapsulate those specific entitlements which the state makes available to victims in the aftermath of a crime. Secondly, victims may be afforded *procedural* rights, which entail some form of participation within criminal procedure itself. In addition to this conventional taxonomy, it can be noted that victims are also entitled to the same *human* rights as everyone else in society, which may (depending on jurisdiction) be entrenched through a constitution or legislation act and enforced through the courts.

Service Rights

The first group of rights to which victims may be entitled has been variously labeled *service* or *social* rights. These cover matters such as access to practical support and counseling and the provision of information about the case as it passes through the criminal justice system. The past three decades have witnessed a growing body of evidence which suggests that the lack of information is one of the greatest sources of dissatisfaction for victims and witnesses (Wolhuter et al. 2009). The European Framework Decision sought to address this deficit through stipulating that victims must be given access to any information relevant to the protection of their interests, which should include the types of support and services or organizations available for victims, places and formalities for reporting an offense as well as the ensuing procedures, conditions for obtaining protection, conditions for access to legal or other advice and aid, requirements for receiving compensation, and arrangements available for nonresidents. However, a particular difficulty in providing for such a right in practice is that criminal justice agencies tend to have discrete responsibilities at different stages of the criminal process. This means that information is not readily shared between the different agencies, and it is not always clear which agency bears the burden of sharing which part of the information with the victim (Dignan 2005).

The European Framework Decision also commits member states to ensuring that “victims are treated with due respect for the dignity of the individual during proceedings” and that “victims who are particularly vulnerable can benefit from specific treatment best suited to their circumstances.” There is, however, considerable leeway as to how terms such as *due respect*, *dignity*, and *treatment best suited* are interpreted, let alone realized in practice (Doak 2008).

While such service rights may prove often expensive or burdensome from an administrative perspective, they are not generally contentious since they only touch upon the passive or indirect role of the victim. Two further major service rights are more radical in nature and have been the subject of significant critique, these being the provision of compensation for criminal injuries and the use of special measures to support vulnerable victims and witnesses while testifying.

Compensation

Many international instruments now recognize that victims of crime ought to be able to exercise a right to receive compensation in the aftermath of violent crime that has caused death or bodily injury. Examples include the European Convention on the Compensation of Victims of Violent Crimes, Council of Europe Recommendation 06(8), and Article 9 of the EU Framework Decision. However, provision for criminal injuries compensation was one of the first service rights acquired by victims many years before such needs were recognized by international benchmarks.

New Zealand was the first to develop such a scheme in 1963, followed by the United Kingdom the following year. Schemes were created in California and New York in 1965 and 1966, respectively, while New South Wales became the first Australian jurisdiction to launch a program in 1968. Schemes are now widespread throughout Europe, Australasia, and North America, with a number of developing countries including the Philippines and Colombia also operating similar programs.

While schemes vary considerably in terms of scope and reach, they usually provide compensation to victims of violent crime, either using a tariff-based approach or assessing each case on its individual merits. Some such schemes have come under criticism for failing to guarantee access as a *right* to all victims; payments are usually made on an ex gratia basis and are only available to those who meet strict eligibility criteria. While compensation is paid by the state, it can be noted that criminal courts in many jurisdictions have the power to order offenders to make compensation payments to victims directly for any loss or damage resulting from the offense.

One of the criticisms that is most frequently levied at state compensation schemes is the fact they appear to distinguish between *deserving* and *undeserving* victims. Most schemes, including that in the UK, only pay out in those cases where the victim is free from blame, thereby promoting the dangerously inaccurate concept of the *ideal* victim and precluding *deviant* victims from accessing any recompense (Miers 2000). Only those victims who strike a chord with society's view of the *innocent* victim are deemed to deserve state support; *bad* victims are cast aside by the system (Freckleton 2004). The *ideal* victim will be happy to cooperate fully with the criminal justice system and the police. Failure to report an offense promptly, failure to make a statement, failure to participate in an identity parade, and failure to attend court have all been cited as grounds for refusing compensation (Spalek 2006).

Despite the widespread proliferation of state compensation schemes, many jurisdictions will seek to prioritize mechanisms that purport to achieve reparation directly from the offender. Such mechanisms, however, are prone to two major shortcomings. First, as noted above, they can only be used where the offender is actually identified. Secondly, most offenders do not have the means to make substantial compensation payments to victims. In the United Kingdom, there are two main avenues for victims to achieve reparation directly from the offender: these are through a legal action in tort through the civil courts or through a compensation order issued by a criminal court.

Since 1973, courts in England and Wales have been empowered to order the offender to pay compensation as part of a sentence for any personal injury, loss, or damage resulting from the offense. Originally introduced as an ancillary penalty, from 1982, courts were given the power to award compensation orders as penalties in their own right. While it is still the norm for them to be awarded in conjunction with other penalties, the court may make a compensation order either instead of, in or addition to, any other penal sanction. Similarly, the German *adhesion* procedure, distinct from subsidiary prosecution described above, also makes it possible for civil damages to be claimed within the criminal action.

Special Measures

The past two decades have witnessed considerable efforts to reduce secondary victimization in the courtroom, which had become widely documented in adversarial jurisdictions (see generally Ellison 2001). Common measures adopted to alleviate the stress of testifying include the use of screens, televised links, and prerecorded video evidence. Jurisdictions differ in terms of which witnesses may benefit from such measures. Although many schemes were originally introduced with the specific aim of protecting child witnesses, some have been extended to include, inter alia, complainants in rape and sexual assault cases, witnesses in fear of intimidation or reprisal, elderly and disabled witnesses, and witnesses suffering from psychiatric or developmental disorders.

Vulnerable witnesses in inquisitorial jurisdictions have generally not had to contend with the same degree of secondary victimization as their counterparts in adversarial trial systems (Ellison 2001). However, screens and video links are becoming more commonplace in continental systems, with trial judges generally being able to exercise a broad discretion as to what general steps might be taken to accommodate or protect vulnerable witnesses (Doak 2008). Other common measures that may be adopted include the use of written evidence taken in advance of the trial, holding some or all of the trial *in camera*, or imposing restrictions on media reporting (Doak, *ibid*). Some countries also make special provision for complainants to be questioned in the absence of the defendant. For example, Spain provides that the offender can be expelled from the court if he behaves in a way that upsets the victim by behaving in an inappropriate manner (Brienen and Hoegen 2000: 875), and the Dutch courts may make provision for a threatened witness to testify anonymously, subject to strict conditions (Ellison 2001).

Procedural Rights

Procedural rights entail some form of participation by the victim in criminal procedure. As such, they raise much deeper questions concerning how far the victim's interest ought to be accommodated in what is often perceived to be a contest between the State and the accused. International standards have tended to shy away from laying down explicit requirements in terms of stipulating that victim participation ought to be enshrined as a generic benchmark, and the concept of participation does not feature at all in any of the Council of Europe's recommendations. Those instruments that touch on the issue tend to do so in a relatively vague or non-prescriptive manner. For example, Principle 6(b) of the UN Declaration on Victims states that the judicial process should allow "the views and concerns of victims to be presented and considered at appropriate stages of the proceedings where their personal interests are affected, without prejudice to the accused." Likewise, Article 3 of the EU Framework Decision grants victims a "right to be heard and supply evidence." Neither instrument, however, offers specific details as to how such rights are to be realized in practice or as to what stage(s) of the process they are to be applied.

Yet, most jurisdictions from both the common and civil law traditions do make provision for some form of participatory rights. The common-law system of England and Wales, for example, still permits victims to commence and conduct private prosecutions. This procedural right is mostly alien to civil law systems, although for various reasons, it is rarely resorted to in practice (not least because of costs and access to evidence). If victims feel disenfranchised by a decision not to prosecute, it may instead be possible for them to challenge the decisions of public prosecutors by means of review. This means of challenge is found in many continental European systems. Review will either lie with a superior authority, as in Denmark, Luxembourg, and Norway, or a court, as in Germany, Portugal, and the Netherlands (Brienen and Hoegen 2000).

Participation in the Trial Process

The ability of victims to actively participate in the trial process is generally limited, and international standards do not lay down any requirement that victims ought to be considered parties to proceedings. However, it can be noted that Article 68 of the Rome Statute confers victims with a general right to participate in proceedings at the International Criminal Court. Victims may choose their legal representatives, who have the right to present their views and make submissions to the court when their interests are likely to be affected. Such views and submissions may be made at all stages of the court proceedings with only the limitation that it would not be prejudicial or inconsistent with the rights of the accused.

By contrast, victims have little opportunity to participate within domestic criminal trials in common-law jurisdictions. Victims in England and Wales have no right to be present at the trial, no right to legal representation, no right to question witnesses, and no right to present evidence. Other adversarial systems have relaxed their rules in this regard. In the USA, a number of individual states have already adopted amendments to their constitutions and have created a special office of "victim advocate" to enforce provisions contained in their constitutional amendments. For example, *a* victims' service advocate was added to the New Mexico Office of the Attorney General in 1999 to provide assistance to victims of violent crime and their families. Some states make provision for the victim to rely on the presence of a legal representative at court. Washington State provides that victims of violence and sex crimes have the right to have an advocate present at any prosecutorial or defense interviews with the victim and at any subsequent judicial proceedings. Similarly, Illinois confers a constitutional right on victims to have the presence in court of "an advocate or other support person of the victim's choice" (Section 8(1), Illinois Bill of Rights). In these cases, however, the right is confined to the mere presence of a legal representative as opposed to any actual involvement.

Other US states now take a more radical approach and permit victims to hire their own attorneys to represent them at various parts of the criminal process, and certain states go further and permit victims' counsel to intervene in rape and sexual assault trials. Wisconsin, West Virginia, and New Hampshire allow complainants' representatives to make representations when questions governing the admissibility of sexual history evidence are being considered by the court. South Carolina Statute 16–3–1510 is even broader, insofar it permits representations from a victims' advocate in any type of case where the defendant alleges improper or illegal conduct on the part of the victim as part of his or her defense.

The inquisitorial jurisdictions of continental Europe have been historically more relaxed about concept of victim participation in the trial, with a number of jurisdictions permitting the victim to assist the prosecutor as a subsidiary counsel. Germany, Austria, Malta, Norway, Sweden, and various eastern European countries operate some form of *subsidiary prosecutor* schemes, which allow victims an active role in both pretrial decision-making and within trials themselves. The procedure will generally allow them to submit evidence, comment on representations made by the prosecution and defense, and express their opinions on key decisions taken. In Germany, victims of certain serious offenses or the relatives of a murder victim may act as a subsidiary prosecutor (*Nebenkläger*). By declaring his solidarity with the prosecution, the victim derives certain active participatory rights. These include a right to be present at all stages of the process, to put additional questions to witnesses, to provide additional evidence, and to make a statement or to present a claim for compensation. In this sense, the victim's lawyer can be an important ally to the public prosecutor, who nonetheless retains the burden of preparing and presenting the prosecution.

An alternative model which allows for the exercise of victims' procedural rights is commonly referred to as the *adhesion* or *partie civile* procedure. Participation of the victim as an independent civil party bears some similarity to the subsidiary prosecution model, although it has a distinct advantage in that it acknowledges the victim's status as a separate party to the trial. The procedure is widely utilized in France and Belgium, where the victim must formally demonstrate his or her intention of becoming a party to the proceedings by initiating an independent action before the *juge d'instruction* (*constitution de partie civile*) at any stage in the proceedings.

Victim Participation in Sentencing

Participation within sentencing procedure is more commonplace than participation within the trial *proper*. Many criminal justice systems now make provision for victim impact statements to be admitted as part of the sentencing procedure. Two common justifications are offered. First, such statements are said to have a functional purpose through giving the court a better picture of the physical, emotional, or financial harm suffered by the victim as the result of an offense. Alternatively (or in addition), victim impact statements are commonly said to provide a communicative or expressive function, insofar as they provide the victim with a means to exercise voice within sentencing hearings (Roberts and Erez 2004).

Schemes vary somewhat in their nature, and legislation often fails to stipulate precisely how victim impact statements ought to be taken into account by the court or the degree of weight that ought to be attached to them (Roberts and Manikis 2010). Such matters are generally left to the judiciary in common-law settings (Roberts and Manikis, *ibid*.). The content of victim statements may also differ substantially. For the most part, statements are restricted to explaining the impact of the offense on the victim, though some schemes permit victims to lay down specific penal demands. Different methods are also used to tender the statement. These may be appended in written form to the judge's papers (as in England and Wales) or may form part of a presentence report compiled by probation or social services. Alternatively, statements may be tendered orally in court by the prosecutor, victim, or victim's lawyer (see generally Booth and Carrington 2007).

Research has revealed that, in general, victim statements only have a minimal impact upon sentencers. In their interviews with judges in Scotland, Chalmers et al. (2007) found that many found it difficult to isolate the effect of the victim impact statement from the vast array of other factors that were built into the sentencing equation, though the researchers do note a number of incidents where judges were minded to "consider a sentence of a different nature from the one they were initially minded to impose" (at 376). Similar findings have been reported elsewhere (see Roberts and Erez 2004).

Substantive Rights

In addition to the service and procedural rights discussed above, crime victims – as citizens – are also entitled to rely on substantive human rights provisions which may be triggered in the aftermath of an offense. Human rights law has developed rapidly in recent times. Although for many years primarily associated with victims of state crime or abuse of power, it is now becoming frequently recognized that its provisions may also be significant for victims of *ordinary* or *non-state* crime (Doak 2008).

For example, various international treaties require states to put in place legislative frameworks together with practical measures to protect individuals from serious forms of crime that threaten their life or physical integrity. Article 2 of the Convention Against Torture provides that "each State Party shall take effective legislative, administrative, judicial or other measures to prevent acts of torture in any territory under its jurisdiction," and Article 25 of the United Nations Convention against Transnational Organized Crime states that "[e] ach State Party shall take appropriate measures within its means to provide assistance and protection to victims of offenses covered by this Convention." Preventative obligations are particularly commonplace in circumstances where particularly vulnerable parties are perceived to be at heightened risk. Children, those at risk from domestic violence and those at risk from intimidation or repeat victimization, have all been subject to some form of special recognition within international instruments.

Under the European Convention, very specific demands are placed upon signatory states. These include a duty to put in place preventative measures to ensure that non-state parties do not breach the human rights of others, and the

European Court has made clear that states must not only refrain from taking life but must also take steps to protect life against threats from third parties (see e.g., *Osman v United Kingdom* (1998) 29 EHRR 245 and *Edwards* v *United Kingdom* (2002) 35 EHRR 19). It has also been held that the State has a duty to take positive steps to protect the rights of victims under Article 3 (prohibition against torture and inhuman or degrading treatment) by ensuring that they are afforded adequate protection under the criminal law (see *A* v *United Kingdom* (1999) 27 EHRR 611; *MC* v *Bulgaria* (2005) 40 EHRR 20). Similar approaches have been adopted by the Inter-American Court of Human Rights (see, e.g., *Velasquez Rodriguez* v *Honduras* (1989) 28 ILM 291; *Jessica Gonzalez v. United States*) (Case 1490–05, Report No. 52/07, 2007). Where a witness is in fear of intimidation or reprisal, the European Court has also accepted that evidence may be given anonymously in exceptional circumstances, providing sufficient counterbalancing measures are in place (*Doorson* v *Netherlands* (1996) 22 EHRR 330). Articles 3 (prohibition against torture and inhuman or degrading treatment) and 8 (right to privacy and family life) may also be relevant to victims if called on to testify at court. It has been suggested by Doak (2008) that the treatment experienced by victims of rape and sexual assault under cross-examination in adversarial courtrooms could raise potential issues under both of these provisions.

Controversies: Victims' Rights and Defendants' Rights

The idea that the rights of victims and offenders are strictly oppositional is reflected by frequent resort to the metaphor of *balance* in political rhetoric and official publications (Hall 2009; Jackson 2003). In the UK, a number of commentators have drawn attention to the fact that a number of policy initiatives, launched in the name of *victims*, have done very little to assist them while actively encroaching upon the rights of the accused (Jackson 2003, 2004). Some commentators have been keen to stress that it does not necessarily follow that the interests of victims and offenders will always conflict (Hall 2009, 2010; Klug 2004; Walklate 2007); Doak (2008) cites the provision of information, support at court, and the provision of good facilities as examples of recent improvement to victims' services which carry little or no impact on the rights of the accused. Indeed, there are a number of scenarios in which the victim and the defendant will share mutual concerns, such as the desire for a prompt and efficient trial process and to be provided with information about procedure.

However, concerns about recent initiatives designed to increase the procedural rights of victims have been expressed (Ashworth 2000; Coen 2006), and both domestic and international case law are replete with conflicts between the rights of victims and offenders. For example, a victim may well object to a decision not to prosecute, to release a suspect on bail, to pursue a particular line of questioning in court, or to impose a community sentence. John Spencer (1994) has argued that the fair trial standards laid down in the Convention are not absolute, and a fair trial does not mean a trial which is free from all possible detriment or disadvantage to the accused. A similar view was expressed by the Strasbourg Court in *Doorson v Netherlands* (*supra*, see para 70).

A number of commentators have argued conceptualizing victims' rights as human rights provides a framework whereby competing rights can be assessed (Doak 2008; Klug 2004; Wolhuter et al. 2009). There are relatively few attempts, however, to devise very specific frameworks where this can be done. Sanders et al. (2010) propose a quasi-utilitarian *freedom model*, which basically states that where competing sets of rights or values are in conflict, those that safeguard the freedom of others to the greatest extent should prevail. Other models of note include Cavadino and Dignan's (1997) *integrated restorative justice* model (Cavadino and Dignan 1997), Doug Beloof's *victim participation* model (Beloof 1999), and Kent Roach's *non-punitive victims' rights* model (Roach 1999). Others have suggested utilizing theoretical models to resolve rights-based conflicts is not necessarily a fruitful exercise and that such conflicts can realistically only be on a case-by-case basis (Doak 2008).

Video Technology and Police Interrogation

David Dixon
Faculty of Law, University of New South Wales,
Sydney, NSW, Australia

Overview

The audio-visual recording of police interviews with suspects provides a good example of several important issues in the relationships between technology and policing. Beyond matters of technological development and deployment, this entry notes the social and political reception by police of new technology; the relevance of the social meanings of technology as a potential solution to policing problems; problems which are raised by over-reliance on technological solutions; and problems in the social reading of images produced by audio-visual technology.

Key Issues

Technological Development and Deployment

The recording of questioning has a long history before introduction of the electronic recording which is the focus of this entry. In the thirteenth century, technologies (record-keeping procedures, synopses, archives, and indices) were developed by those responsible for the Inquisition along with bureaucracies to store and retrieve records of procedures, hearings, admissions, and confessions (Murphy 2012: 40–43). Interest in using electronic recording in police interviews tracked the development of accessible, reliable, and simple recording equipment. Serious interest in the topic emerged in the 1960s and field trials and informal local use occurred in a number of places (Baldwin 1992; Geller 1992). However, widespread systematic use emerged in response to concerns about policing practices in the 1980s.

In a number of jurisdictions, courts and legislatures have required the use of electronic recording, notably in response to recognition of miscarriages of justice. Notably, audio-recording was one of the products of the reform of criminal procedure in England and Wales resulting from the Confait Inquiry and the Philips Royal Commission (Dixon 1997). The Police and Criminal Evidence Act 1984 required police manually to record contemporaneous notes from the time of the legislation's implementation in 1986 until audio-recording equipment and procedures could be made available. In Australia, the various federal, state, and territory policing agencies introduced general audio-visual recording in the 1990s: a High Court decision restricting the admission of confessions and admissions which were not electronically recorded hurried this process along (Dixon 1997: Chap. 5).

The availability of reliable, economical audiotaping made a crucial difference in consideration of this issue. Judicial willingness to allow police the benefit of the doubt in admitting contested confessions waned. There was, it could be argued, no need for any such doubt if electronic recording facilities could provide an indisputable record of what was said. It then found legislative standing in a series of federal and state reforms of criminal procedure. There were similar developments in New Zealand and Canada. In the USA, there has been widespread adoption of electronic recording across the vast archipelago of policing agencies. Illinois, Maine, and the District of

Columbia legislated to require electronic recording of custodial interrogation in homicide investigations. In addition, taping is required in Alaska and Minnesota as a result of court rulings (Sullivan 2010). Such recording is often limited to a rehearsed confession rather than the whole interview. (Problems with this approach are addressed below.) Other jurisdictions are drawing on these experiences as reforms of criminal process are considered: for example, Japanese authorities are currently looking with interest at the audio-visual recording experience in Australia.

Rapid developments in technology facilitated the spread of recording. Notably, the replacement of bulky, relatively fragile VHS tapes with digital recording has made electronic recording much more manageable. (The basic responsibility to store recorded VHS tapes created great difficulty in some stations.) Jurisdictions have differed in their choice of audio or audio-visual recording. England and Wales rely primarily on audio-recording, despite recurrent sporadic interest in audio-visual recording and various field trials. As well as cost and equipment reliability, there has been concern about the interpretation of visual images (an issue to be addressed below). By contrast, audio-visual recording has been the norm from the start in Australia.

Parochialism in development has been a common theme. In decentralized jurisdictions such as Australia and the USA, there has been considerable inefficiency in development as neighboring agencies go through similar development processes independently. Lack of knowledge and policy sharing, conflicts and jealousies, and the career benefits to those seen to innovate rather than follow neighbors have been common. Unfortunately, there have been similar trends at international level. Notably, in the USA, academics and criminal justice professionals continue to produce numerous discussions of the possibility of audio-visual recording as if its introduction would be novel: there is little recognition that several Australian jurisdictions have been using audio-visual recording since the early 1990s, not just in field trials, research experiments, or selected cases, but routinely for questioning about all indictable offenses. Simple ignorance is not the issue: some such commentators have attended conferences at which Australian practice has been discussed. An American colleague acerbically explained this as a product of the belief that any innovation from outside the USA was either second-rate, socialist, or, most likely, both.

In Anglo-American discussions of audio-visual recording, technology provided a simple solution to one of the common concerns about recording police questioning, that the record would be subject to interference and alteration. VHS and audiocassette tapes were inscribed with a timeline, making any editing clearly detectable. Even more simply, recording machines were developed which simultaneously recorded several tapes, one of which was given to the suspect on completion of interview. Similar security procedures apply to digital recording. No doubt, interference with a recording may exist as a technological possibility: however, this has not been a practical concern in jurisdictions which have implemented general recording regimes. Digital recording provides an additional level of security. In sophisticated, connected digital systems, it is increasingly difficult to delete a record permanently and comprehensively. One of the less-noted scandals in the Guantanamo story was the destruction of tapes recording the torture and coercive interrogation of detainees. Such interference with justice processes should be more difficult today.

Emerging technology should solve one current problem, resulting from the involvement of people in the process. In England and Wales, significant problems have been reported in the accuracy of synopses and transcriptions of interviews (Baldwin 1993; Gudjonsson 2003: 86, 114). In the state of New South Wales, Australia, police rely on transcripts produced by an external contractor. This introduces a new realm of potential problems, with concerns over the security and reliability of such contractors. As the accuracy and reliability of voice recognition technology improves, the need for human transcription diminishes.

The Problem Which Technology Is to Address

Police interrogation has long been a source of problems and controversy in criminal justice around the world. Police malpractice has ranged from unintentional inducement of false confessions, to fabrication of confessions ("verballing"), to torture. Sometimes of equal concern to the authorities have been allegations of abuse which have been false or unverifiable, but which cause delay in the justice process and harm the reputation of police. A series of connected responses developed in English-speaking countries. In the 1960s, the US Supreme Court interpreted the Constitution to require protection of suspects' rights, notably through access to legal counsel (*Miranda v Arizona* 384 US 436, 1966). In the 1980s, detailed statutory regulation of custodial interrogation was introduced in England and Wales via the Police and Criminal Evidence Act 1984. In Australia, the High Court developed the law of evidentiary admissibility, and Commonwealth and state statutory regulation was introduced (Dixon 1997: Chap.5).

In the wake of these responses, official concern about interrogation and confessions waned, partly because it was thought that judicial and statutory responses had been adequate, partly because of the shift in public concern from due process to crime control, partly because other issues became more fashionable for policy-makers, grant-funding agencies, and academic researchers. However, such concern has been sharply revived in this century as false confessions emerged as a significant source of the miscarriages of justice which have been disclosed by the use of DNA analysis. This is particularly the case in the USA, where the limits of judicial supervision even in capital cases have been exposed by the acknowledgment of a mass of miscarriages of justice through use of DNA. False or coerced confessions have been a significant contributor to the wrongful convictions which have become a national scandal (Gross 2008; Justice Project: 2007). Similarly in England, some of the contentious disputes over alleged miscarriages of justice stemming from false confessions have been resolved by DNA analysis.

There has been a common theme in many responses to these controversies: police interrogation should be audio-visually recorded. Indeed, electronic recording is frequently presented as a solution to the ills of custodial interrogation. Interest in such recording is not new: there had been calls for its use from the time that recording equipment was widely available. These inquiries did not just identify the problem: they also usually reported that a solution was available in the form of electronic recording. In 1987, McClintock and Healey observed that in "Australia over the last 20 years, virtually every report which has touched on the law relating to criminal investigation" had recommended the tape recording of interviews and that the "same concerns have been echoed in nearly every common law jurisdiction across in the world" (1987: 7). However, the contemporary calls for audio-visual recording are more widespread, united and urgent than before. They draw on the widespread familiarity with electronic recording as a means of social control via CCTV (Newburn and Hayman 2002).

Notably, calling for the use of electronic recording has become a standard component of proposed programs to avoid miscarriages of justice in Canada (FPT Heads of Prosecutions Committee 2004; PPSC 2011: Chap.6) and the USA (Drizin and Reich 2004; Leo 2008). A prominent example was provided in 2003 by the state of Illinois. In response to concern about the execution of people who had been wrongfully convicted, Illinois required police to electronically record interviews with murder suspects. The reform was designed "to restore the integrity of the criminal justice system." (Governor Rod Blagojevich, quoted "Ill. Law 1st to order taping murder confessions" *USA Today*, 18 July 2001, 3A.) All too often, electronic recording is put forward as a panacea. There is little consideration of how it will deal with the problem: it is taken for granted that it will.

Police Attitudes to Electronic Recording

In the 1980s, many police officers expressed outright opposition to mandatory recording schemes, stressing the practical problems of audio or audio-visual recording: it was claimed that electronic recording would be expensive, mechanically unreliable, difficult to arrange in remote locations and open to manipulation by suspects pretending they had been assaulted by investigators during audio-recording or playing to the camera in audio-visual recording. (Some objections were dealt with the way electronic recording was introduced: notably, the incorporation of video recording met the concern that suspects would pretend they were being assaulted.) These instrumental police objections to electronic recording are only part of the story. They were often vehicles for expressing opposition to proposals seen as a slight on their integrity and an inappropriate interference in their business. Specifically, the interrogation room has been the heart of private police territory and interrogation practice seen as a confined, confidential police concern. Having outsiders intrude both symbolically and instrumentally into the interrogation room touched raw nerves among many police.

However, such opposition is usually short-lived. Experience in several jurisdictions suggests that most fears about electronic recording of interviews with suspects were exaggerated or misplaced. Police reluctance to adopt electronic recording inevitably raised suspicion that they had something to hide. It also sat uncomfortably with their enthusiasm for other technological developments, such as wiretapping. As appears to be typical, police resistance to taping faded away as officers were reassured about its detrimental effect, or simply came to accept electronic recording as part of normal, everyday practice. Police also came to appreciate the benefit of electronic recording: they could rebut accusations of malpractice and (when using audio-visual) present to courts images of the defendant as they were when arrested, which often contrast unfavorably with that of the polite, well-dressed person in the dock. Police officers and prosecutors routinely were enthusiastic about the court being able to see the contrast between the neatly dressed, polite defendant in the dock and the scruffy, abusive suspect shown in the audio-visual record. The outcome is that police and prosecutors are much more favorable towards electronic recording than defense lawyers. More worryingly, police have come to rely on images for other purposes.

Reading Images and Detecting Deception

In Australia, there was concern that using visual images in evidence could be problematic, considering whether "a record of things such as tattoos, speech, mannerism, dress, demeanor and language" might be prejudicial to some defendants. This was balanced by advantages to suspects, such as showing the pressure applied by police or the drug-affected condition of the suspect (CLRD 1986: 15). However, the CLRD did not foresee that the problem would be not responses to objectively identifiable matter such as dress and tattoos, but subjective interpretations of behavior – the reading of "body language" in order to draw inferences and, particularly, to detect deception. This meant that a potential problem of using video was (and continues to be) underestimated.

In the USA, an industry has grown providing training to police in detecting deception. The major interrogation trainers include deception detection as a key part of interrogation training. The availability of videotaped records of interview encourages such training, but also allows prosecutors, judges, and juries to participate in deception detecting. In Australia, some judges accepted unscientific claims about detection with remarkable ease. Judges and prosecutors are more likely than police to believe that demeanor is an indicator of veracity (Dixon 2007). Such judicial enthusiasm led to pressure for improvement in audio-visual technology picture quality, and, most significantly, the introduction of technology providing an image alternating between a general picture of the interview room and those present to a close-up of the suspect.

Alternating images have both advantages and disadvantages. The most obvious advantage is that for the first time the viewer can see a large, clear image of the suspect's face during the interview. After years of (at times frustrating) attempts to make out how the suspect looks (Are his/her eyes closed? Is he/she falling asleep during some questions? How serious an injury is that mark on the forehead which is a blur from the distance? Is she visibly alcohol affected?), it is good to be offered such a large clear image of his or her face. The size and clarity of this image of the suspect greatly reduces what previously may have remained in the realm of guess work.

Among the disadvantages are that other persons present in the interview are only seen briefly, if at all. The camera records the whole interview table only for some 20 s every 3 min, before reverting to the face of the suspect. For most of the time, the interviewers are not on screen. If audio-visual technology is to be used as a mechanism of supervision and accountability of interviewing officers, something is lost by focusing on the suspect. There is a relatively simple technological solution to this aspect of the problem. Replacing audio-visual recorders with units including two cameras which could produce split image or "picture in picture" images would allow simultaneous recording and presentation of both the suspect's face and the room as a whole. However, this would not deal with the problem of misinterpretations of images.

This is not the place for a review of the extensive psychological literature on this topic. It is sufficient for present purposes to point out that the research evidence clearly establishes that, whatever a highly trained psychologist may be able to do in detecting deception, a judge (or indeed prosecutor, jury or police officer) cannot do so accurately, and that standard interview training does not increase the capacity to correctly identify deception (Vrij 2008). The widespread dissemination of schlock psychology through magazine articles or brief professional education courses is a matter of real concern, indicating the need for a vigorous program of appropriate education and training for criminal justice professionals, including judges and prosecutors, in any jurisdiction considering the use of video to record interviews with suspects.

The value of good psychological research in this area is shown by studies by Lassiter et al. (1986, 1992) which show how changes in the angle and direction of video-recording significantly influence understandings of interaction and assessments of police and suspects. This reinforces the crucial lesson that technology is not neutral: its social and psychological impacts are as important as its technical details.

The Context of Recorded Interrogation

In the USA, electronic recording has set a significant challenge to criminal investigation practice. The dominant approach to police interrogation, the Reid Technique, emphasizes the psychological benefits to police of isolating suspects. Employees of Reid & Associates explain that interrogation involves psychological pressure on the suspect via "pretense and duplicity. It is therefore understandable that investigators were reluctant to publicly disclose these techniques to criminals who may benefit greatly from this knowledge and thus fortify resistance to telling the truth" (Buckley and Jayne 2005: 1). Perhaps a more substantial concern should be that judges, juries, and the general public who saw the whole interrogation process might disapprove of investigators who "may use vulgar language, may have physical contact with the suspects, may look at the suspect in an intimidating fashion, may make reference to incriminating, sometimes fictitious evidence against the suspect" (Buckley and Jayne 2005: 42) and other types of psychological coercion which the Reid Technique involves. If investigators fear criticism if their techniques were to be seen by courts, an obvious corollary is that they should not use them. If the introduction of comprehensive audio-visual recording leads to US police following their colleagues in the UK and Australia in abandoning interrogation techniques which have been shown to produce unreliable confessions, this would be a beneficial effect of the technology (Dixon 2010).

By contrast, in Australia, when audio-visual recording was introduced, it was presented as a technology which would deal with the problems – real and alleged – of police questioning by allowing outsiders to see what happened in the police interview room. It was taken for granted that the full interview, not just a rehearsed confession would be recorded. Through this clear "objective" window, the court should be able to see how a defendant came to confess.

As McConville comments, “What seems to be on offer, for judges, lawyers and juries, is the chance to have the past replayed, enabling the viewer to look on as reality is being constructed. It is that promise which invests the video with such persuasive character” (1992a: 548). If, however, the recorded interaction is the product of earlier, unrecorded questioning, then video’s promise may be illusory. The danger that video may give a false gloss of authenticity is real: simply by virtue being on camera, the interview seems more compelling and tends to be accepted as legitimate.

Anyone who feels complacent about police questioning practices in an age of audio-visual recording would do well to read McConville’s disturbing account (1992a) of how some English police officers evaded controls on the questioning of suspects and were able to present audio-visually recorded accounts which gave no indication of the unrecorded misconduct in “interviews” which preceded them. While these were not officially recorded, they were captured by cameras and microphones installed in the station as part of a documentary project by a television company. The police force was experimenting with the use of audio-visual recording. In England and Wales, a system based on audio-taping was introduced in the later 1980s: there has been spasmodic interest in videotaping (Newburn et al. 2004). Apparently voluntary confessions given in bland interviews were shown to have been produced by deals, threats, and inducements. The official record of these interviews gave a misleading account of what occurred in a way that would have been convincing had not an unofficial record been available.

McConville argues that the misrepresentation effected by incomplete recording jeopardizes suspects, and that, far from protecting suspects’ rights, electronic recording undermines them. He warns that “where the police make threats or inducements or strike deals with suspects in private which then lead to a confession in the formal interrogation, the position of a complaining suspect will be weakened rather than strengthened by the supporting videotaped record of the confession because of its apparent ability to capture reality” (1992b: 962). Responding to similar earlier concerns in Australia, the Criminal Law Review Division had warned of the danger that electronic recording might be used to record rehearsed interviews, and consequently recommended that all questioning should be recorded (CLRD 1986:17, 41–42).

Much of this preparatory interviewing is innocuous. Far from the dramatic myth, many police investigations and interviews are mundane and not contentious. An assumption that unrecorded questioning routinely involves attempts to coerce or persuade suspects into confessing distracts attention from a less dramatic reality. Typically, officers talk to suspects to find out how they will respond to formal questioning and to prepare themselves for a formal interview. From this perspective, much informal interviewing is part of the process of planning and preparing for the formal, recorded interview. At its simplest, it tells an officer how much work he or she is going to have to do for the interview to be successful. These comments seek to be realistic about the nature of everyday police investigations without being complacent. It is recognized that, as McConville’s examples showed in England, an audio-visual record may present a completely misleading picture from which unreliable, unfair, and inappropriate tactics used during preparatory interrogation are obscured.

Equally, even if such tactics are not employed, a suspect or defendant could allege that they were. The result could be to revive the costly and damaging cycle of allegation and denial which electronic recording was intended to kill off. Dixon’s (2007) research reported some confessions which may have been obtained entirely properly, but the recording of which raises rather than dispels doubts. In one, a suspect confessed on a tape to a long series of armed robberies, including several for which he had apparently not been a suspect. On tape were merely the bland confessions, with no indication of the circumstances of their production. The investigating officers were at pains to record the suspect’s statement that he had not been offered any inducement. However, incidental references to access to legal advice and entry to a witness protection program indicated that these were important factors in the production of his confession. The potential for conjecture, and for lengthy legal dispute, about the reliability of such confessions is evident.

Competing claims have been made about whether malpractice preceding formal interviews can be detected from observing tapes. On one hand, McConville asserts that "it is not possible to tell from the video recording whether suspects have been the subject of improper pressure" (McConville 1992b: 962). Those of us who are skeptical about the ability of police interviewers to detect deception should be modest in their own claims that they can identify deception by police officers (Dixon 2007). Baldwin is slightly more optimistic, suggesting that "a recording is valuable in offering some insight into what has happened when a suspect is questioned and in providing a means by which an assessment might be made of whether a suspect has been bullied or primed beforehand" (Baldwin 1993: 328). Identifying pre-recording police misconduct was not straightforward, even with the availability of a visually recorded police interview. The audio-visual record may be valuable in indicating how a suspect has been treated earlier, but it is by no means conclusive (Dixon 2007).

Baldwin also suggests that "the techniques of discourse analysis have already been used in the courts in challenges to various forms of confession evidence, and there is no reason why they could not be used to good effect to expose indications of earlier conversations from the transcripts of formal interviews" (1992: 1096). Discourse analysis will, of course, only be a resort available to a small minority of suspects. For most of those who confess and plead guilty, the prospect of obtaining linguistic experts to analyze their interview will be remote.

It would be naive to think that the need to produce an audio-visual record exerts no influence on officers' behavior, or that suspects can be coerced into agreeing to anything. Even officers who are prepared to coerce suspects have to be confident that any mistreatment of, pressure on, or deal struck with a suspect is going to be effective enough to ensure that there is no embarrassing outburst when the interview is recorded. Equally, it would be naive to suggest that it is only police who prefer some interaction to be unrecorded. Some suspects may be prepared to speak informally, but not to cooperate during the recorded interview. Some detectives suggest that many experienced criminals will talk to the interviewer informally, but will not cooperate when what they are saying is recorded (Dixon 2007). Perhaps more significantly, suspects may well be reluctant to talk on the record about other people's involvement in offenses, or indeed their own involvement in offenses other than that for which they were arrested.

Concentrating on coerced confessions which have been obtained before the audio-visual recorder is activated would divert our attention from more mundane but significant issues. It would be valuable to pay closer attention to cases in which such interviewing is openly acknowledged. For example, from a psychological perspective, the compliant and responsive role allocated to the suspect in procedures for adopting previous questions and answers may have significant effects. Dixon reports one extreme instance in which a suspect was asked no less than 96 "Do you agree . . . ?" questions in 15 min, all of which were answered "Yes." The repetition of questions in this form is highly conducive to compliance. Psychological and linguistic analysis may demonstrate the subtle reconstruction of statements in these processes. Almost inevitably, a DYA question will contain the officer's paraphrase of the original exchange even if an attempt at contemporaneous note-taking is made: a suspect's cursory signature confirms the semblance of quoted speech.

This point must not be overstated. It is certainly better that a suspect is asked to "adopt" on tape a confession or admission which has been made away from recording facilities than that police are permitted to give evidence of unrecorded confessions and admissions. This was vividly demonstrated by a case in which the High Court of Australia unfortunately declared admissible police evidence of an unrecorded, incriminatory comment made by a suspect in police station car park soon after the conclusion of a recorded interview in which he had denied the offense. (*Kelly* [2004] HCA 12. By contrast with this narrow legalism, the High Court adopted a purposive approach in *Nicholls and Coates* [2005] HCA 1.) This approach simply invites process corruption.

Responding to the Problem of Unrecorded Questioning

It has been suggested here that unrecorded, preparatory interviewing is usually a matter of routine. Nonetheless, it threatens the integrity of the system. An audio-visual recording shows that a suspect made confessions or admissions, not how he or she came to do so. As noted above, establishing the reliability of a confession is harder than merely proving that it was in fact made. Given what we know from many jurisdictions about deliberate misconduct and inadvertent influence by interviewers and about apparently irrational responses by suspects, there is no room for complacency. It is necessary to have as much questioning recorded as possible. The problems of recording field interrogations mean that questioning should be conducted in police stations wherever feasible. This should not put unrealistic demands on police. Claims that spontaneous outbursts make recording impracticable echo arguments from the 1980s that electronic recording would be impossible. The response now should be same as then: of course, exceptions must be allowed, but these must be in defined circumstances and/or subject to rigorous scrutiny.

So long as much interviewing is conducted before the recorder is activated, there will be room for controversy about what happened. Such controversy includes doubt about the reliability of recorded confessions. The potential benefits of electronic recording are dissipated if it is used to record rehearsed material. It should be stressed that, from all the evidence available, the costs and problems to police of comprehensive recording are minimal. If a police officer feels uncomfortable about using an interviewing technique on tape, then that technique may well not produce reliable results. The costs are minimal, but they exist. As explained above, there are going to be occasions when recording is impossible or inappropriate – for example, when a suspect insists that he/she will not name an accomplice while being recorded. This is not an unusual dilemma in policing: the objective is the minimization of problems, not some problem-free utopia. Police should record all questioning of suspects conducted within police stations and should only interview suspects in police stations (except in cases of exceptional need which fall within specified categories). Wherever possible, suspects should be asked to repeat unrecorded confessions on tape. If they are not asked to do so (or their refusal to do so is not recorded), there should be grave suspicion about such confessions.

Dealing with partial recording requires a more general remedy. What is needed is a renewed commitment to the legal regulation of policing by the development of rules, policies, and standards (Dixon 1997: Chap. 7). This does not mean more rules, a message which would find favor with no-one. It means having better rules which become "working rules," (i.e., part of the cultural and other norms which guide everyday working practice) rather than "inhibitory rules" (which are effective only if there is an immediate prospect of their enforcement) or "presentational rules" (whose main purpose is to placate a public audience).

Such rules must be made with legislative authority, not left to the police to produce. None the less, police should be directly involved in the production of the rules in this as in other areas (Dixon 1997: Chap. 7). While courts will play an important role in interpreting and enforcing rules, they cannot be expected to take the leading role in regulating policing. In their different ways, the experiences of the USA and Australia demonstrate that judicial control is inadequate because it depends on the vagaries of case law, which does not allow for detailed prospective regulation.

Legal regulation should establish positions from which a variety of pressures are put on the investigatory practice of police officers. Audio-visual recording is just one of those potential pressures. Others include proficient, well-resourced legal advisers (and, for vulnerable suspects, social workers trained to take the role of appropriate adult); rules of evidence in the hands of judges and magistrates who are prepared to be active in the control of policing; and senior officers who are prepared to supervise in order to ensure that investigators work within the rules and use approved techniques for questioning suspects. None of these is a panacea or a silver bullet. While it is as foolish to think of them as such, it is equally foolish to reject one or the other on the ungrounded assumption that it will not change police practices. Progress may be possible through the combination of various (admittedly flawed) mechanisms, of which audio-visual recording is one.

Conclusion

This assessment of electronic recording of police questioning of suspects raises much broader and more complex issue of regulating police practice. Audio-visual recording is not enough by itself: it must be used as a tool in a general regime of regulation. The recorded interview is just one stage in a suspect's detention. Its reliability and propriety depend substantially on legal regulation of the context in which interviewing takes place. Such problems can only be tackled by much more rigorous regulation of investigative practices and, in particular, by requiring that (with the caveats noted above) all interviews should be electronically recorded in full. There are obvious incentives for officers to question suspects before a formal recorded session. If electronic recording is to have a significant role in controlling police interviewing and ensuring the reliability of confessions by providing more than confirmation of what a suspect said in a rehearsed interview, then effective legal and supervisory regulation of investigative practices is necessary. Audio-visual recording offers significant benefits to criminal justice, but is no panacea. It can even be counterproductive if it instills a false confidence that all is well. Indeed, there is an urgent need to acknowledge and deal with other problems in the regulation of custodial interrogation.

Visualizing Data: A Brief History

Michael D. Maltz
Department of Sociology, Criminal Justice Research Center, The Ohio State University, Columbus, OH, USA
Emeritus, Department of Criminal Justice and Department of Information and Decision Sciences, University of Illinois at Chicago, Chicago, IL, USA

Overview

This essay describes the benefits and uses of data visualization. It provides an overview of its history, from the pioneering work of William Playfair to the more recent Web-based activity.

Introduction

Among the many attributes of the criminal justice system, one that stands out is the sheer quantity of data it generates. Since Western governments do not (generally) have secret arrests, trials, or imprisonments, almost every transaction is recorded in some database, most of which are computerized – and large. And these databases, although subject to restrictions on privacy and confidentiality, are (generally) open to public – and researcher – scrutiny and analysis.

Analyzing these data sets can be very useful, to look for patterns in offender and offending characteristics and to determine the effect of different policies on outcomes. As the criminal justice system focuses more and more on "evidence-based" policies, developing practical methods of analyzing these large data sets becomes more important. One very useful set of analytic tools for this purpose falls under the heading of data visualization techniques.

One problem with using these techniques is lack of training in their use. Rare is the criminology/criminal justice curriculum that has courses in data visualization. [One possible exception in North America is the criminology program at Simon Fraser University].

Consequently, data visualization has yet to be implemented to any great degree in criminology and criminal justice. This is the case despite the fact that criminal justice agencies provide a great deal of data suitable for graphical analysis. In fact, so much data exists in this area that it often makes it difficult to apply sample-based statistical methods: every test is statistically significant!

This essay first describes the pros and cons of using data visualization techniques. Then some examples of their use are presented. Following this, the early (pre-1950) work in this area is discussed, which leans heavily on works by Wainer (1997, 2005, 2009), and on an early history of graphical representation of data (Funkhouser 1937).

This is followed by some recent examples of visualized data, showing how it can be used to obtain a better understanding of its attributes. Of particular benefit is its use in checking data to insure its correctness and integrity, described next. Its early history is then covered, followed by a description of more recent work in data visualization. Following the conclusion, the reference section includes a partial listing of websites that contain interesting examples of visualized data. (Please note that websites are not necessarily permanent, so some links may cease to exist after a time).

Disadvantages and Advantages of Data Visualization

As previously mentioned, there is a noticeable lack of training in visualization techniques compared to statistical analysis techniques. This is in part due to the lack of a standard set of procedures for visualizing data, because the characteristics of the data should dictate the visualization technique. This means that the analyst needs to have an idea of how to present the data, and how to put that presentation into practice.

That often requires that the analyst first do some experimenting by hand, determining how best to portray the data. Once an idea presents itself, the analyst often has to do some computer programming, sometimes simple, other times more complex. This is probably the main reason that data visualization has not been used or taught to any great degree: normally one can't just import the data into a statistical package (e.g., the four Ss of social science – SAS, SPSS, STATA, SYSTAT), click on a few menu choices, and generate a beautiful and insightful plot. The analyst needs to consider the nature of the data, figure out how best to portray it visually, and write a sequence of commands to manipulate the data to achieve that result. That is, data visualization is more of an art than a (codified) science.

In addition, the lack of standard techniques means that the visual analyses can't be compared directly with other studies; each analysis is *sui generis*. This means that there is no particular number or figure of merit ("statistical significance") that provides a – supposedly – objective measure of the result of the analysis (Maltz 1994). Thus, it may work against the gradual accumulation of studies that then give weight to a particular understanding of a pattern in the data.

There are substantial advantages as well. Unlike other methodologies used to analyze data, data visualization requires no assumptions about the characteristics of the data: they need not be linear, normal, independent, homoscedastic, or have (or be assumed to have) any specific statistical characteristics. That is, one can consider the data without any preconceived notions or requirements. Data visualization permits the data to tell its own story. [After this essay was in final draft, an article was published

(Barbe and Horace 2012, 1) that underscored this advantage. In analyzing automobile searches conducted by the Maryland State Police, they showed that the "complex dynamics" in the data "preclude the use of standard statistical inference techniques," and instead "show that simple graphics are well-suited to capturing the nuances of the data."]

It may take the analyst some effort to determine how to best represent the data, but on the plus side of the ledger, and as will be seen in the following examples, the data becomes easy to interpret. This is in contrast to manipulating the data using a statistical package; in that case it is easy to run the program and get results, but it may mask some major anomalies in the data. While using a standard statistical method may be a good approach when testing specific hypotheses, there is an implicit assumption that the data fits the method and the method fits the data. These assumptions are often made without actually inspecting the data, especially when dealing with very large data sets.

This is where visualization comes into play. It is always useful to plot some of the data's variables, looking (with one's eyes) for errors and inconsistencies that too often creep into data sets, while at the same time discovering the unique characteristics of the data. One needn't be constrained by assumptions about the data that may facilitate analysis but are rarely true – rare is the behavioral variable that has a normal (or lognormal, or Poisson) distribution nor are there any behavioral variables that are linearly related to each other. Despite this, most statistical procedures assume that relationships among the variables are linear and additive, like the recipe for a cake – take two parts poor education, one part impulsivity, and three parts poverty and you cook up a delinquent.

Instead, data visualization permits the analyst to discover for oneself what relationships exist within the data. There are no quick-and-dirty (or cookie-cutter) techniques that can be applied; data visualization is more of an art than a specific set of procedures, and each analyst may have different ways of depicting data so as to bring out its qualities.

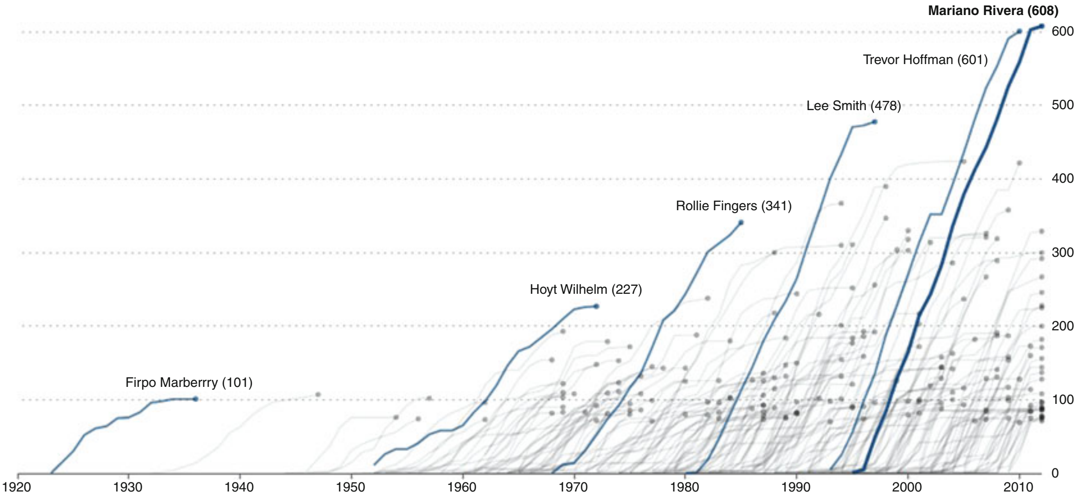
Examples

One of the best examples of visualizing data is found at http://www.ted.com/talks/view/id/92. Since it is a video, it cannot be put between the pages of a book, but it is well worth viewing. In it Hans Rosling animates a number of time series to tell a story of how infant mortality and other health-related characteristics of countries have changed over the past 50 years.

Another example, not as impressive or important, of how baseball "closers" (pitchers who pitch the last few innings to "save" games) compare, is depicted in Fig. 1. [A brief explanation for those not familiar with America's (so-called) pastime: the pitcher is the person on a baseball team who exerts the most control over the number of points scored by the opposing team. Toward the end of a game in which a team's point advantage is three or fewer, the team's current pitcher is often replaced by a "closer," a pitcher who, it is hoped, prevents the opposing team from adding a sufficient number of points to win, thereby closing out the opposing team and "saving" the team's win. Figure 1 compiles the cumulative success record of these closers over time]. Note how the figure shows:

- who first achieved a particular milestone (X00 saves),
- when the pitchers were active,
- their career length,
- how injury affected one pitcher's (Trevor Hoffman's) trajectory, and
- how fast they accumulated their saves.

Websites and books that describe this data visualization technique (and others) are included at the end of this essay. This graphic was created using R, a free graphics-oriented statistical program, one used by many analysts for visualizing data. A large number of specialized programs written in R are available on the Web, as are complete instructions of how to program in R. However, a graph like this can also be generated by Excel and other spreadsheet programs. The horizontal axis is the date (apparently only dates during the baseball season are included) and the vertical axis is cumulative number of saves.



Visualizing Data: A Brief History, Fig. 1 How Mariano Rivera compares to baseball's best closers (NY Times, May 5, 2012)

Visualizing Data: A Brief History, Table 1 Sex-specific correlation between age of victim and age of offender

		Sex of offender	
		Male	Female
Sex of victim	Male	0.300 (N = 170,969)	0.501 (N = 31,140)
	Female	0.483 (N = 60,717)	0.470 (N = 6,528)

Another example (Maltz 2010) is found in criminal justice: suppose an analyst is interested in the relationship between age of victim and age of offender for homicide cases in which there was one victim and one offender. [Note that this is a biased sample with unknown bias, since it includes only those cases for which the offender (and his/her age) is known].

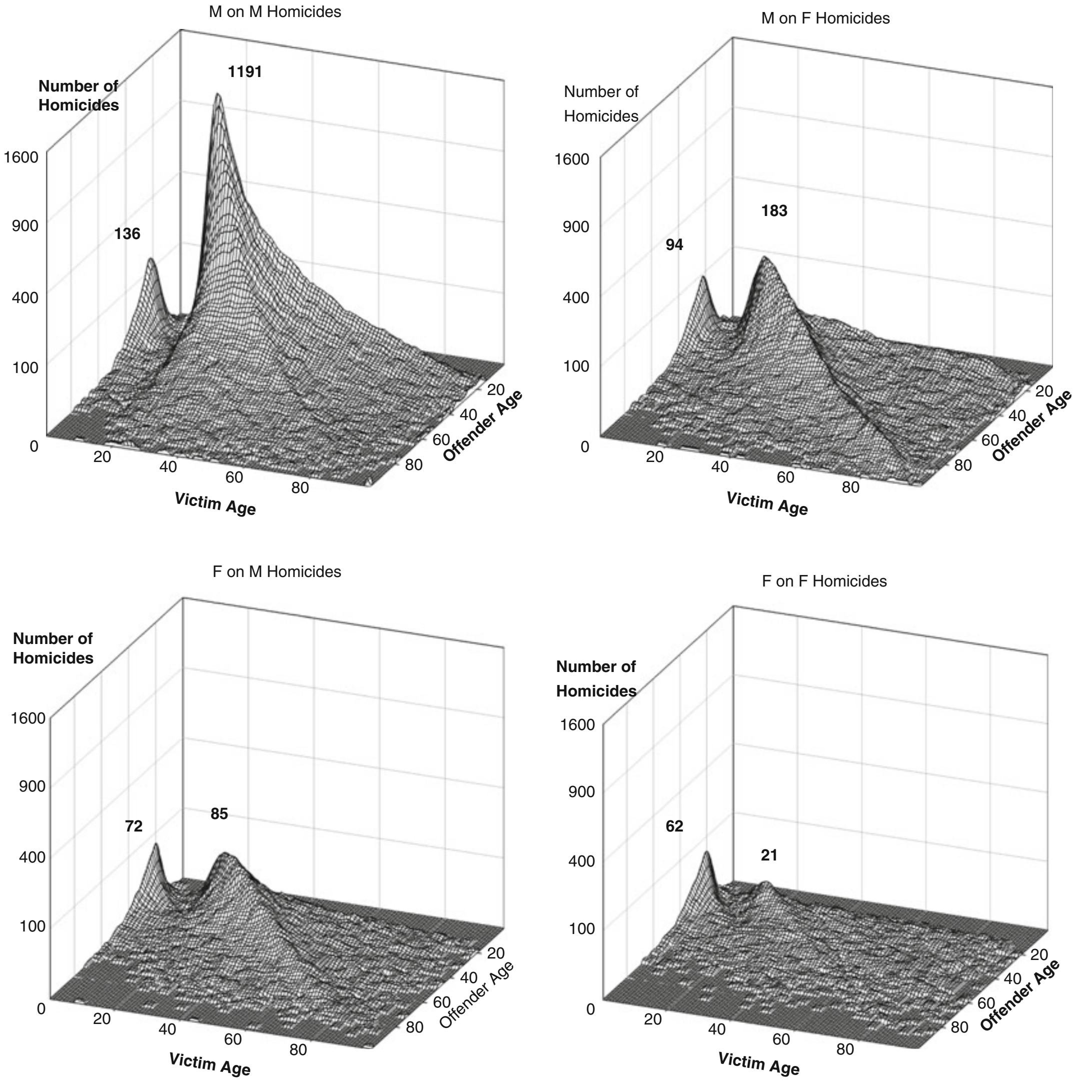
A simple correlation is run and a reasonably strong correlation (0.393) is found between the victims' and offenders' ages. But after partitioning the data by victim's and offender's sex, some stronger correlations are found (Table 1).

Obviously, statistical significance is not a useful indicator, because with such large Ns all of the correlations are "significantly" different from each other.

But then four crosstabs (age of victim vs. age of offender by sex) are generated, smoothed, and plotted (Fig. 2). The vertical axis is the number of cases, which are plotted against the age of offender (axis heading southwest) and age of victim (axis heading southeast). [Because the M-on-M peak is so, over 50 times higher than the corresponding F-on-F peak, a square root transformation was applied to the vertical axis to enhance visualization].

It shows that certain patterns of each of the four graphs are similar but others are different. All have a peak (a "homicide hill") at around age 20 for both offender and victim, indicating that most homicides occur between the young (mostly males), generally peers killing peers. There is also an "infanticide hill" on the left side of the graphs, probably committed by offenders we normally call "caretakers," who are generally between ages 15 and 40. Between these two hills is what may be called "the valley of the shadow of death," considering the paucity of victims between ages 6 and 12: the victims are no longer endangered by caretakers and not yet endangered by peers and others.

The strong diagonal ridges in the M-on-F and F-on-M figures imply that those deaths may be

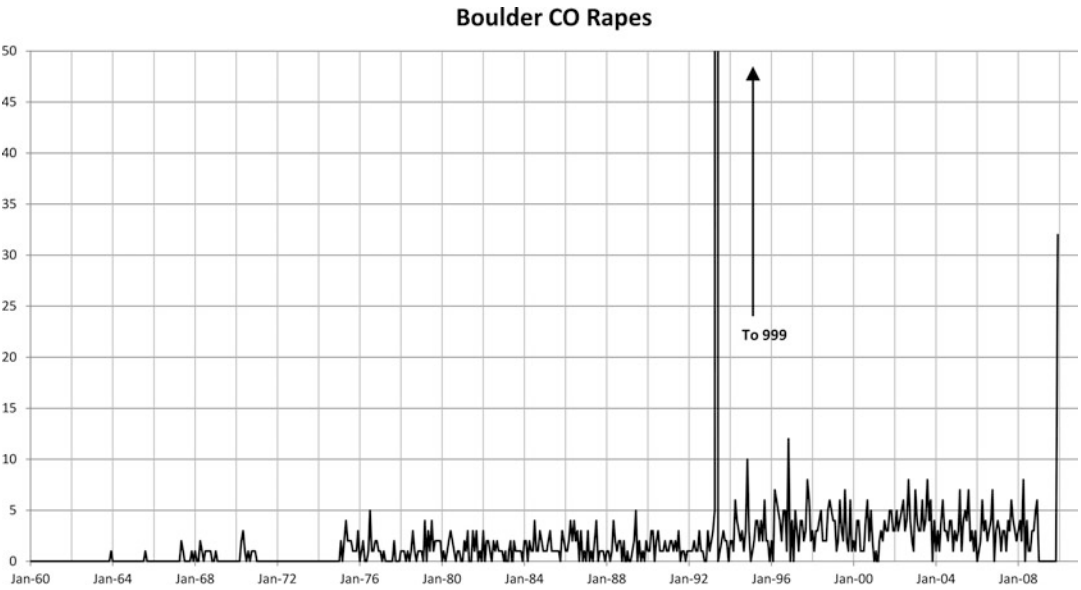


Visualizing Data: A Brief History, Fig. 2 Smoothed SHR data, 1976–2005, disaggregated by sex of victim and sex of offender; vertical axis plotted using a square root transformation (Maltz, 2010)

attributable to intimate partner homicide. Also, while not as evident without rotating the figures, there are horizontal ridges in the M-on-M and M-on-F figures, which indicates that victims of both sexes and all ages are being killed by young males, many perhaps during the commission of a felony.

These data plots were generated using SPSS to generate the crosstabs, Excel to make and smooth the original plots, and SigmaPlot to prettify the figures. In other words, this visualization is (or should be) well within the ability of most criminologists and social scientists, even those who cannot program.

These simple visual analyses of a data set should show the advantages of visualizing data: while it may not be useful for testing hypotheses, it is incomparable as a means of understanding patterns in the data. The patterns that emerge from the data are hidden when using standard analytic methods, since those standard methods require, in some sense, standard types of data. Moreover,



Visualizing Data: A Brief History, Fig. 3 Boulder rape data, showing a missing datum coded as 999 (FBI, Uniform Crime Reports, 1960–2009)

since the data set is usually dropped into the software package without first inspecting it for inconsistencies (and with the hope that outliers will emerge from the analyses), there is no guarantee that the data set does not contain inconsistencies.

Other Uses

Data checking. "Some of the hardest errors to detect by traditional methods are unsuspected gaps in the data collection (we usually discovered them serendipitously in the course of *graphical checking*" (quoted in Unwin et al. 2006, 19). This is one of the most beneficial uses of data visualization.

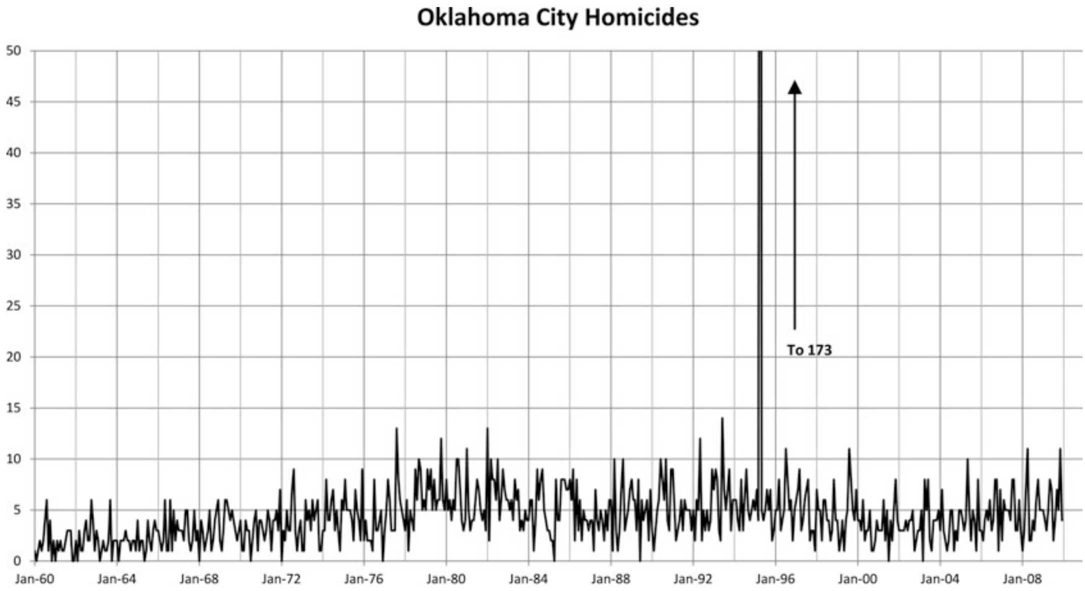
Sometimes a graph can help spot an error, as in Fig. 3, where an outlier in Boulder CO rape data was coded as "999," which some statistics packages use to designate a missing datum. [Note also that Boulder's 2009 rape data was not given by month but was aggregated for the entire year (32) and reported in December of that year].

At other times an outlier is a valid datum, as in the 19 April 1995 bombing of the federal office building in Oklahoma City (Fig. 4), which killed 168 of the 173 homicides on that day.

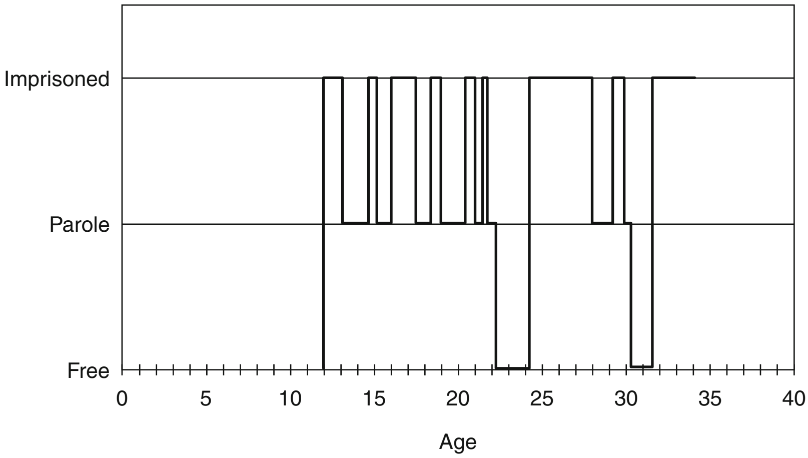
Error-checking is also useful in dealing with life course trajectories. Figure 5 shows the (hypothetical) transactional history of a prisoner. Note that it starts at age 12, so obviously the date of birth was entered incorrectly. That is, the person entering the data probably entered the wrong year; all of the other dates were likely correct, since most correctional systems nowadays enter new transactions automatically.

The figure shows that the prisoner bounced from parole back to prison five times before his first release from custody. Creating a plot of this type can be accomplished pretty easily. All that one needs to do is code changes of status to 0, 1, or 2, reflecting release from prison, release to parole, or imprisonment, respectively. Then one merely creates a graph with coded status plotted against date of status change. [It is slightly more complicated, since the figure needs to reflect two statuses on the same date, too show the transition from the old status to the new one on that date].

To see how visualization can assist in finding missing data in this type of trajectory,



Visualizing Data: A Brief History, Fig. 4 Oklahoma City homicide "outlier" is a true datum (FBI, Uniform Crime Reports, 1960–2009)



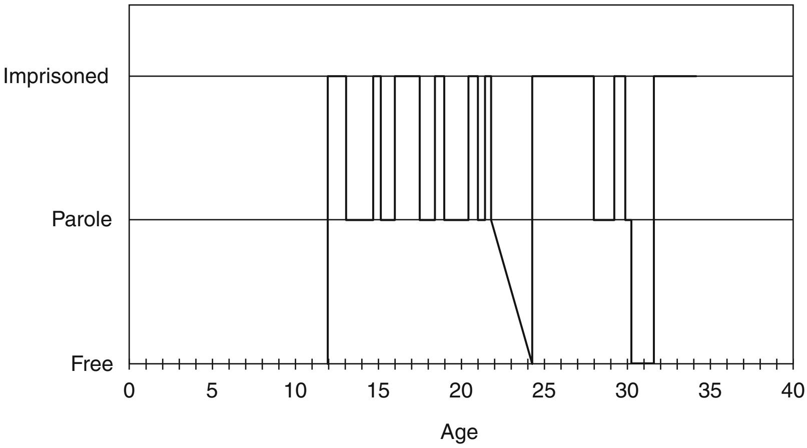
Visualizing Data: A Brief History, Fig. 5 Hypothetical offender trajectory

Fig. 6 shows the same trajectory with a missing date of release from custody.

Crime mapping. Although this topic is covered in other essays, it bears noting as a visualization method. This is one of the more tactical-oriented data visualization techniques, used by police agencies throughout the world. Prior to computerization, police departments spotted trends and "hot spots" with pin maps, different pin colors denoting different kinds of offenses or times of day. The first implementations of computerized crime mapping required the data to be entered by hand into the computer (Maltz et al. 1991). As computers became more prevalent in police departments, and as crime data entry began to include geocoding of offenses, crime mapping and crime analysis became more fully integrated into police work.

Automated crime maps become useful as the collective memory of a police beat. Beat officers

Visualizing Data: A Brief History, Fig. 6 The same offender trajectory showing a missing date of parole completion



know their beats' activity, but only during their own tours of duty – and a neighborhood's daytime and nighttime activity may be radically different. An officer coming on duty can call up his/her beat map to see the activity the beat experienced during other shifts. Moreover, many police departments give the public access to these maps, allowing people to see for themselves the frequency and nature of crime in their own neighborhoods.

One of the most interesting uses of visualization, especially (but not exclusively) in crime mapping, comes with *animated data*, that is, with data that play out over time, permitting chronological patterns to surface. By judicious choice of time intervals (sometimes hourly, sometimes daily, weekly, or annually), the observer can often find patterns that elude the most sophisticated algorithms.

Additional uses. *Scatterplots* of data can show both relationships and outliers; *networks* can be examined for unusual features; *trellis plots* can uncover features that remain hidden in mixed (continuous and categorical) data. Examples of these are given in Maltz (2010).

Early History

There is a long history of using visualizations to convey meaning from person to person, stretching back to antiquity. As Funkhouser (1937, 270) notes, cave dwellers drew pictographs on cave walls, and symbols in some writing systems were originally based on graphical representations of objects. In other words, pictures seem to be central to human cognition.

The geography of graphs and coordinate systems also has a long history. Specifically, latitude and longitude were used by early Egyptian surveyors in locating points on the earth (Wainer and Velleman 2001, 306). And orthogonal coordinates were used by Nicole Oresme in the fourteenth century to represent the variation of functions (Funkhouser 1937, 274), antedating their use by René Descartes (and the eponymous Cartesian coordinates) by three centuries.

The most prominent early use of visualization techniques in inferring patterns from data was produced by William Playfair in the late eighteenth century; his book, *The Commercial and Political Atlas and Statistical Breviary*, depicted year-to-year trends in economic data. Wainer and Spence (2005) republished the 1801 version of Playfair's treatise, bringing to light one of the classics in data visualization. In it they note (pp. 23–27) "only a small sample of Playfair's innovations," which include:

- the time series line graph,
- the divided series area chart,
- the bar chart,
- gridlines,
- using color to distinguish different patterns,
- labeling of axes,

and many other features of graphs that we now take for granted. In his book Playfair (Wainer and Spence 2005, p. xii) noted that "as much information *may be obtained in five minutes as would require whole days to imprint on the memory*, *in a lasting manner*, *by a table of figures*" (italics in the original), thus describing one of the major advantages of graphs, the ability to present a time series that shows how the relationship varies over time: whether a sequence is rising or falling, or behaving in some other manner.

Moreover, when another time series is plotted on the same coordinate axes, it can indicate how one series affects the other. Many of his figures are plots of exports to and imports from England by other countries, clearly showing when the balance of payments was positive or negative.

Before long the use of graphs went beyond depicting only financial data, and soon turned to crime. Funkhouser (1937, 299) notes that Adolphe Quetelet, a Belgian statistician, "appears to have been the first to represent graphically a frequency distribution in the drawing of a curve showing the percentage of crimes committed at various ages." Quetelet called this type of analysis "social physics." Graphical analysis of crime data was used by another statistician, Frenchman André-Michel Guerry, as well:

> Guerry's *Essai sur la statistique morale de la France* (Paris, 1833) which was honored by a medal from the French Academy, is a splendid example of how much the presentation of a subject can be enhanced by the use of well-made graphical illustrations. Several new types of graphs make their appearance in this work. One is a chart in which crimes are listed in order of frequency for various ages. Colored lines trace the shifting position of a particular crime from one age group to the next. (Funkhouser 1937, 304)

One of the more famous data visualizations is Charles Minard's graphical (and geographical) portrayal, in 1869, of the severe attrition of Napoleon's army (Fig. 7) as it marched toward Moscow in 1812 and retreated in 1813, having been beaten by "General Winter," the fearsome subzero temperatures and accompanying snowfall that decimated the French troops. As Marey (1878, 73) wryly states, this figure attains "a degree of brutal eloquence" that "seems to defy the pen of the historian." A number of different visualizations using Minard's data have been collected by Michael Friendly (under the heading "Re-Visions of Minard") at http://www.datavis.ca/gallery/re-minard.php, showing how others may depict the same data.

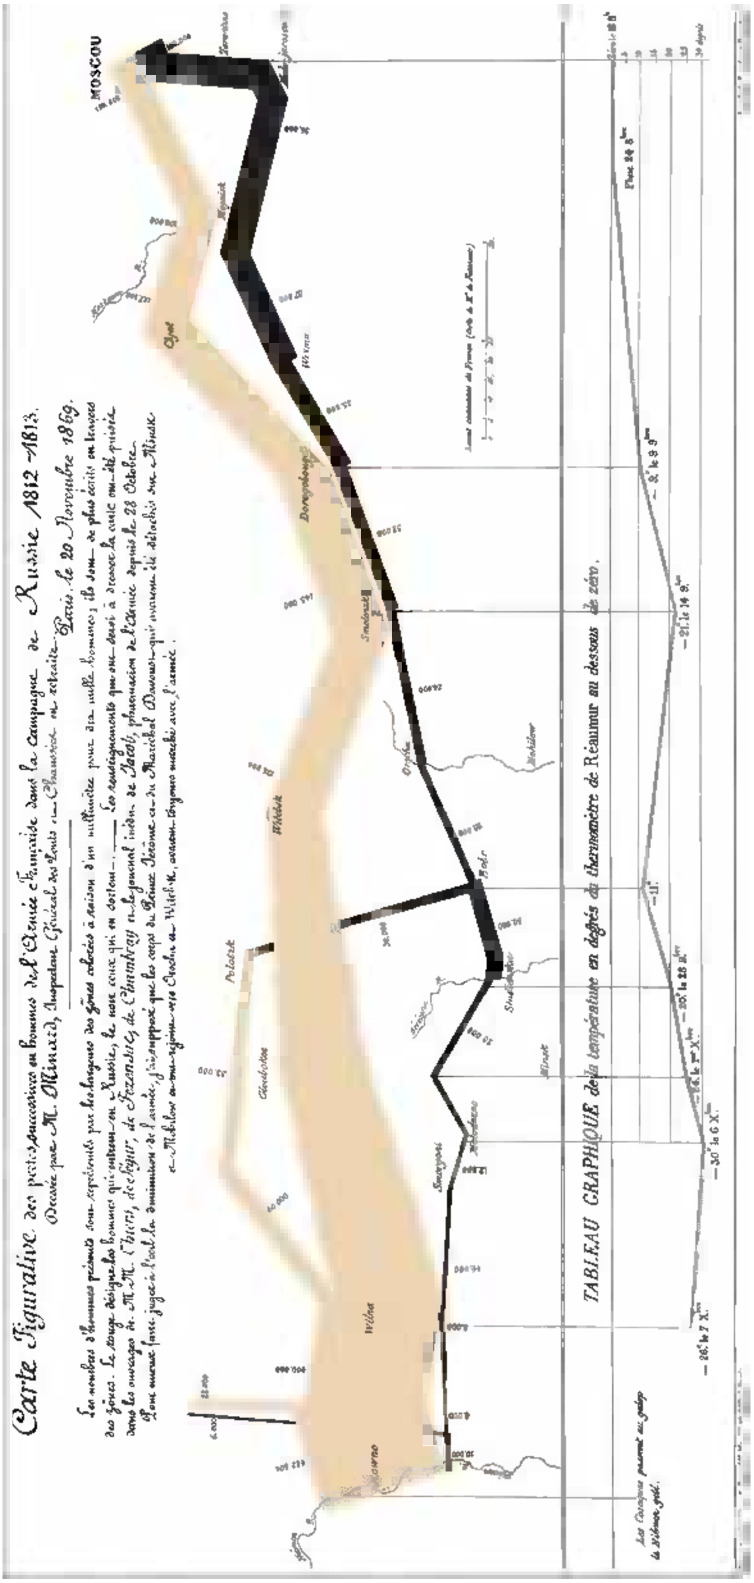
Another early use of graphics was produced by Florence Nightingale during the Crimean War. A nurse with mathematical training, she was appalled by the lack of sanitary conditions experienced by wounded soldiers. She wrote a report that contained circular charts, with 12 segmented wedges (Fig. 8). The wedges portrayed the monthly number of deaths due to military action, and those due to the unsanitary conditions she encountered as a nurse at the front (Wainer 1997, 103). By detailing the number of preventable deaths, her report was instrumental in improving sanitation during and after the war.

Recent History

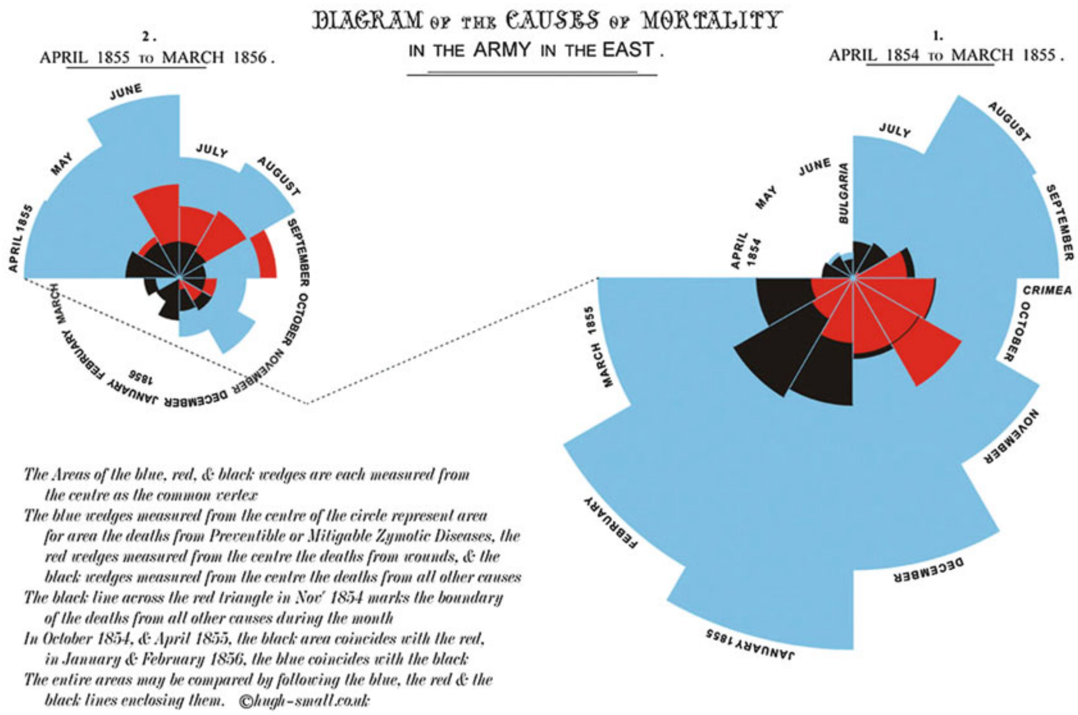
The first half of the twentieth century saw an upsurge in the development of algorithmic methods of analyzing data, to some extent to the exclusion of visual methods. The names Galton, Pearson, Kendall, Yule, Gosset, and Fisher are associated with these methods.

The first modern treatment of visualization-based methods was Jacques Bertin's book, *Semiologie Graphique*, published in 1967. It was an attempt to develop a schema of visual sign systems that are used in understanding data. It was translated into English (*Semiology of Graphics*) in 1983; the translation was reissued in 2010.

Bertin's book focuses primarily on the structure of graphs and the perceptual processes that are used to understand them, e.g., the use of color, texture, and line weight, more than it does on data analysis. In much the same way that most westerners can't decipher the sign systems encoded in Middle Eastern (or Asian or Mayan) alphabets (or syllabaries or symbols), a person with no knowledge of or experience in deciphering graphs and other visual representations of data would have a hard time interpreting the lines, dots, and symbols used to visualize data.



Visualizing Data: A Brief History, Fig. 7 Minard's graphic of Napoleon's march to (*tan*) and from (*black*) Moscow, detailing the temperature on the return from 18 October to 7 December 1812. Downloaded from http://upload.wikimedia.org/wikipedia/commons/2/29/Minard.png, accessed March 30 2013



The Areas of the blue, red, & black wedges are each measured from the centre as the common vertex
The blue wedges measured from the centre of the circle represent area for area the deaths from Preventible or Mitigable Zymotic Diseases, the red wedges measured from the centre the deaths from wounds, & the black wedges measured from the centre the deaths from all other causes
The black line across the red triangle in Nov' 1854 marks the boundary of the deaths from all other causes during the month
In October 1854, & April 1855, the black area coincides with the red, in January & February 1856, the blue coincides with the black
The entire areas may be compared by following the blue, the red & the black lines enclosing them. ©hugh-small.co.uk

Visualizing Data: A Brief History, Fig. 8 Florence Nightingale's "rose" (Note: Number of deaths is proportional to the radius lengths, not to the areas of the wedge)

Bertin tries to systematize the construction of graphic representations. He deals with how the eye and the brain translate marks on a piece of paper to convey meaning. This requires familiarity with the "language" of graphics, e.g., the fact that a line connecting two points means that they are associated in some way with each other. He deals with the selection of shapes and their shading, colors, hue and saturation, orientation, texture, and size, and how they may be used to denote different variables.

The second milestone in modern graphical analysis and data visualization was the publication of John Tukey's 1977 book, *Exploratory Data Analysis*. Although it predates the current ubiquity of digital computers – he notes (p. x) that the included problems "can be done with a pencil and paper" – Tukey described a number of visual techniques that are useful in understanding data sets. They include stem-and-leaf plots, box-and-whisker plots, data smoothing procedures, and binning procedures. In addition, the book includes numerous examples of how to deal with numerical data in ways that guide the reader to become more numerically astute, explaining, for example, how to think about logarithms, how to develop scales for axes, and how to use residuals in interpreting data. Much of this book bears retelling, including a number of his propositions (Tukey 1977, 157, emphasis in the original):

- **Graphs are friendly**.
- **Graphs force us to note the unexpected; nothing could be more important**.
- **Different graphs show us different aspects of the same data**.
- **There is no more reason to expect one graph to "tell all" than to expect one number to do the same**.

His book also gave lie to the belief by many social scientists that looking at the data before running analytic tests is "cheating" or "data snooping." In fact, as Wainer and Velleman (2001, 314) point out, "Tukey's Exploratory Data Analysis changed things. Suddenly terms like data snooping, data dredging, and the currently trendy 'data mining' were no longer pejorative."

For example, there is no way that a statistical procedure can convey the richness of interpretive findings produced by graphing the data, as in Fig. 2.

Tukey's book was soon followed by what is considered by many to be the best primer on data visualization, Edward Tufte's *The Visual Display of Quantitative Information* (1983). Using examples collected from many countries over the centuries, from newspapers, academic journals, and business and government documents, Tufte provides details of the frequency with which data has been misrepresented in graphs. Among his prescriptions to improve the graphical presentation of data are avoiding "chartjunk" (his term for overly ornate figures like a bar chart consisting of dollar bills to represent money), avoiding the use of pie charts, and maximizing the data-to-ink ratio (so that the data points are not overshadowed by other elements in the figure).

Tufte's subsequent books, *Envisioning Information* (1990) and *Visual Explanations* (1997), are further excursions in the realm of data visualization and, as with his first book, continue his efforts to educate both technically sophisticated and lay people about accurate (and attractive) graphical presentation.

In more recent years, the work of Cleveland (1993, 1994) provides useful examples for those who actually need to develop graphs themselves. His description of how R. A. Fisher apparently reversed the years in one of his data sets – and never noticed it nor did others who analyzed the same data set – again underscores the utility of graphical analysis as a first step. His visualization of this data set also shows the benefit of using trellis plots in analyzing data containing both categorical and continuous variables.

Those who want to understand how good graphs can tell a story and poor graphs can misrepresent data could do no better than read the books by Howard Wainer. His *Visual Revelations* (1997), *Graphic Discovery* (2005), and *Picturing the Uncertain World* (2009) contain entertaining and telling examples of appropriate and inappropriate uses of graphs, sometimes to deliberately muddy the waters but in most cases because of inadequate attention to the data or to the needs of the audience.

There have been instances of researchers who used standard statistical tests on large data sets and, finding every test to be "significant," decided to sample the data. However, an analyst who decides to select, for example, a 10 % sample of the data is essentially throwing out the other 90 % (which offends data mavens!). A better alternative would be to take advantage of the entire data set to "drill down" to find relationships and other characteristics that are often missed when using sampling statistics. That is, unnecessary sampling can be seen as equivalent to squinting at an object instead of opening one's eyes fully; it permits the viewer to see some broad features, for example, the mean . . . but at the expense of missing the details, the very features that make research an exciting art rather than a formulaic "science." Unwin et al. (2006) describe a set of procedures and software useful in visualizing large data sets and provide links to some of those data sets. But however rigorous the analyses, there are no hard and fast rules that work at all times for all cases.

The generation of large data sets – of business transactions, of Web searches, and of criminal activity and correctional information – has led to an increasingly strong interest in data mining. This has tended to bring data analysis and visualization techniques out of the academic world and into the business and policy world. As a result, a number of books on data visualization have been written to fill this market gap. They include Few (2004), Ware (2004), Segaran and Hammerbacher (2009), and Yau (2011).

One book worthy of special note is Wilkinson's *The Grammar of Graphics* (1999, 2010). Like Bertin's (2010) book, it aims to put graphics on a firm footing, codifying it and grounding it in underlying principles. However, it focuses on how to put together a graph's elements – data, transformations of and operations on the data, specification of graphic elements, scales, and coordinate systems – to create a visual representation of the data. As the original author of SYSTAT and its graphics package, and later of the SPSS graphics package, Wilkinson has intimate knowledge of efficient coding, and uses this knowledge to detail the different components of a graph.

Conclusion

Over the past few decades the use of visualization techniques to elucidate patterns in data has been growing at breakneck speed. Its growth parallels the changes in computing over the same time period. At first, computers were basically (international?) business machines, useful in developing and analyzing quantifiable data. Input to these machines consisted of oblong punched cards, laboriously generated by programmers and read by high-speed card readers; output of these machines consisted of reams of accordion-folded paper, through which the programmers had to sift to find their results (or, more frequently, the coding errors in the programs they wrote that rendered the results useless).

[They also produced sound as well as paper. I remember in the early 1960s watching a computer analyst hold a transistor radio, detuned from any station so as to pick up and amplify stray signals, near the IBM 1620 we were using, trying to find the error in a program. The pitch of the squeal the radio picked up told him something about the length of the infinite loop in which the program seemed to be stuck].

In the late 1970s computer aficionados began to buy home computers, using televisions or monitors as well as paper to write programs and view results. They began to draw pictures that were of low resolution but adequate for some purposes (such as simple computer games).

Computer visualization and crime mapping soon became more useful when the first Apple Macintosh came out in 1984, with a relatively high-resolution screen (e.g., Maltz et al. 1991, 154). Fast forward to today, when smart phones have substantially greater power and higher resolution and more flexibility, and at a much lower cost.

Isaac Newton once wrote to a colleague, "If I have seen further it is by standing on the shoulders of giants." We can certainly extend that remark to this topic: if we can visualize patterns in data to a greater extent, it is because we are standing on the shoulders of the data analysts, statisticians, and computer scientists who preceded us and provided us with their own visions of data accessibility and understanding.

White Collar Crime

Nicole Leeper Piquero and Stephen Clipper
The University of Texas at Dallas, Richardson, TX, USA

Corporate crime

Overview

White collar crime has progressed since Edwin Sutherland introduced the term in 1939; his goal was to bring attention to the more affluent criminal element, which was often overlooked in traditional criminological theory. Since its introduction, white-collar crime has become a debated issue in criminological theory. One source of debate is over the definition of white-collar crime. Several studies were published during the 1940s, addressing white-collar crime at the individual and organizational levels. After a hiatus during the 1950s and 1960s, scholarship in this area was revisited using a new definition based on the offense rather than the offender, as had been used in the past. Redefining white-collar crime in this way led to a division in its fields of study; Clinard and Quinney (1973) identified the two fields as corporate crime and occupational crime. Despite the division, the debate is far from resolved. Unresolved issues include crime types and measurement. The former is of particular interest as technological advances promote the development of new crimes. Scholarship in the area of white-collar crime has expanded knowledge about both the offenders and victims of these crimes utilizing official statistics, self-report surveys, and victimization surveys.

Fundamentals

White collar crime is an umbrella term which incorporates various types of unlawful acts and a different type of actor than many people often associate with the concepts of crime and criminals. As a consequence, the term white-collar crime has all too often become a shorthand way of distinguishing specific types of offenders and offenses. For many scholars, the theoretical and empirical study of white-collar crime should focus on powerful elite offenders, and as such,

G. Bruinsma, D. Weisburd (eds.), *Encyclopedia of Criminology and Criminal Justice*,
DOI 10.1007/978-1-4614-5690-2, © Springer Science+Business Media New York 2014

the white-collar criminal forms a polar opposite to the typical offender found in the criminal justice system. For other scholars, white-collar crime studies are designed to examine offenses committed by organizations or corporations (also known as corporate crime). Finally, another group of scholars suggests that white-collar crime studies should more closely mimic other studies of crimes and criminals by focusing on the specific acts that violate a law. There is likely no other term in criminology that has garnered such debate.

Key Issues

Edwin Sutherland, an American sociologist, introduced the term white-collar crime on December 27, 1939, in his presidential address entitled "The White Collar Criminal" to the American Sociological Society in Philadelphia, Pennsylvania (Sutherland 1940). The point of his address was to challenge existing conceptions of the stereotypical criminal and to critique extant criminological theories of the day which he viewed as narrowly focusing on only one part of the crime problem. At that time, crime was viewed as a lower class phenomenon which was committed by disadvantaged young men from broken homes and decaying neighborhoods. Sociologists working at the University of Chicago in the late 1920s and early 1930s argued that there was a link between socially disorganized neighborhoods and crime (Shaw and McKay 1942). During this time period, social disorganization theory was at the height of its popularity, arguing that crime was caused by social disorganization which was most often found in neighborhoods that were poor, had high levels of population turnover, and were predominately comprised of minorities. In due time, the image of the typical criminal began to emerge. In both scholarly writings and through the popular media, the stereotypical image of an offender was that of a tough guy growing up on the wrong side of town. The emergence of other criminological theories, such as classic strain theories, continued to focus on crimes and criminals as originating from the lower classes and did little to alter the public image of a typical offender.

By no means was Sutherland the first person to recognize that crimes were not exclusively a lower class phenomenon. Other scholars and popular writers also noted that crimes and misdeeds were also being committed by businessmen and other respectable members of society. However, crimes committed by such people were seldom seriously considered by those scholars who wrote about or studied crime and were not a major concern of the public or policy makers when addressing the crime problem.

When Sutherland gave his groundbreaking speech to the American Sociological Society, he set out to challenge the traditional image of criminals and the predominant etiological theories of his day. The white-collar criminals he identified were often middle-aged men of respectability and high social status. They lived in affluent neighborhoods and they were all well respected in their communities. He went on to define white-collar crime "as a violation of the criminal law by a person of the upper socioeconomic class in the course of his occupational activities" (Sutherland 1941, p. 112). Despite Sutherland's recognition of the importance of the white-collar crime category, it never achieved the centrality in criminological study that he proposed.

Where Sutherland did succeed was in generating lively discussions and heated debates surrounding the definition of white-collar crime. The ambiguities associated with the lack of a precise definition of white-collar crime can be traced back to Sutherland's own writings. Geis (1992, p. 33), in reviewing the development of the term, notes that Sutherland "buried part of his definition in a footnote," suggesting that this "attests to his indifference to the matter." Sutherland himself would suggest that "this definition is arbitrary and not very precise. It is not necessary that it be precise, for the hypothesis is that white-collar crime is identical in its general characteristics with other crime rather than different from it" (1941, p. 112).

While Sutherland's original – and now commonly considered as an offender based – definition of white-collar crime refers to an individual's social status (e.g., respectability) and an occupational opportunity to commit the crime, many of his earliest examples of white-collar crime came from his study of seventy of the largest industrial and mercantile corporations in the United States (Sutherland 1945). The shift in the unit of analysis, from individual to organization, only added to the conceptual confusion of the concept. Sutherland argued that white-collar crime is crime because it is a violation of law, albeit criminal, regulatory, and civil laws, but a violation of law nonetheless. In order to further illustrate his point, Sutherland (1945) examined court decisions regarding antitrust violations, cases of false advertising, national labor relations infractions, and infringements of patents, copyrights, and trademarks. He found a total of 547 adverse decisions against the seventy corporations he examined and 473 of those decisions related to actual crimes committed. He noted that less than ten percent of the total decisions made it into the criminal court but argued all the same that the violations of regulatory and civil laws were also indicative of a crimes, those that he labeled as white-collar crimes. Legal scholars took issue with Sutherland's (Caldwell 1958; Tappan 1947) inclusion of civil and regulatory violations as crimes as they are not violations of criminal statutes.

While Sutherland had hoped that the introduction of the concept of white-collar crime would ignite new strands of research and broaden the scope of acts considered by criminologists as normative criminal behavior, such was not the case. The study of white-collar crime fell into an inactive state for most of the 1950s and1960s (Geis 1992; Payne 2012). During this period of inactivity, some scholars argued for further restricting or tightening of the definition of white-collar crime. For example, Geis (1962) argued that white-collar crimes should be limited to the realm of corporate violations. This push toward a more restrictive definition of white-collar crime led to a fracture or a divide in the study of white-collar crimes, a distinction that Clinard and Quinney (1973) would later conceptualize with the terms corporate crime and occupational crime.

Research in the area of white-collar crime saw a rebirth of activity in the 1970s when definitions of white-collar crime began to move away from a myopic focus on offenders with high status or respectability and shifted to what is now referred to as an offense-based definition of white-collar crime. Edelhertz (1970, p. 3, 19–20) preferred a broad legally based definition of white-collar crime by defining it as "an illegal act or series of illegal acts committed by nonphysical means and by concealment or guile, to obtain money or property, to avoid the payment or loss of money or property, or to obtain business or personal advantage." He further identified four subdivisions of white-collar crime: (1) personal crimes, crimes by persons operating on an individual, ad hoc basis, for personal gain in a nonbusiness context; (2) abuse of trust, crimes in the course of their occupations by those operating inside businesses, government or other establishments, or in a professional capacity, in violation of their duty of loyalty and infidelity to employer or client; (3) business crimes, crimes incidental to and in furtherance of business operations but not the central purpose of such business operations; and (4) con games, white-collar crime as a business or as the central activity of the business. This offense-based approach to defining white-collar crime was favored by many scholars and practitioners, though some preferred the term "economic offenses" over the already established "white-collar crime" phrase. The United States Department of Justice also utilizes an offense-based definition of white-collar crime, defining it as "nonviolent crime for financial gain committed by means of deception by persons whose occupational status is entrepreneurial, professional, or semi-professional and utilizing their special occupational skills and opportunities also, nonviolent crime for financial gain utilizing deception and committed by anyone having special technical or professional knowledge of business and government, irrespective of the person's occupation." The use of an offense-based definition of white-collar crime also created new avenues for studying and understanding these types of crimes.

The distinction between offender- and offense-based definitions of white-collar crime created somewhat of a fracture in theoretical and empirical scholarship on white-collar crime. Clinard and Quinney (1973) provided a clear distinction between the study of corporate crime and the study of occupational crime. Corporate crime would consist of illegal acts that are committed by an employee or an officer of the corporation or of the actions of the corporation itself when such actions would promote corporate interests or somehow benefit the organization. Occupational crime, on the other hand, was defined as "violation of the criminal law in the course of activity of a legitimate occupation" and would include any persons, regardless of position in the social structure, who commit an illegal act for his or her personal benefit in the course of their occupation (Clinard and Quinney 1973, p. 188).

Many researchers today continue to use the corporate crime versus occupational crime distinction when conducting research. Corporate crime scholars, for example, investigate both organizational defendants as well as individual actors engaging in crimes and misconducts that are designed to further the interests or benefit the organization. On the other hand, those who study occupational crime are more interested in the acts that are committed by individuals for their own personal gain. Corporate crime scholars tend to focus on understanding the criminogenic aspects of the organization and the surrounding business environment and as such, focus attention on examining the organizational context and the role that it plays in the decision-making process. Some have suggested that "corporate crime differs from other kinds of white-collar offenses (e.g., embezzlement) in three main ways: (1) offenders can be official representatives of the company or the company itself; (2) offenses are undertaken in the pursuit of corporate goals; and (3) violators are subject to criminal, regulatory, and civil law" (Simpson and Piquero 2002, p. 510).

Much has been written on the definitional issues surrounding the study of white-collar crime, but this debate is far from being settled. While the emergence of offense-based definitions created new opportunities for studying white-collar crime by using official measures of criminal behavior (e.g., police arrest records), the use of such data also provoked controversy. The Federal Bureau of Investigation's Uniform Crime Reporting (UCR) system records data on white-collar crimes include fraud, forgery, and embezzlement; yet, because offenders arrested for these three crime types do not necessarily need to be employed to carry out the offenses, many critics argue that these are not really white-collar crimes. For example, Steffensmeier (1989, p. 347) argued that "UCR data have little or nothing to do with white-collar crime." The category of fraud, for example, would include those offenders arrested for welfare fraud, check fraud, welfare fraud, wire fraud, and credit card or ATM fraud. Many critics would rather view these crimes as versions of theft rather than including them into the category of white-collar crime.

Further contributing to the definitional dilemma is the invention of new crime types, such as cybercrimes, intellectual property offenses, and the crime of identity theft. These offenses are often studied by white-collar crime scholars but do not nicely fit into the two-pronged categorization created by Clinard and Quinney (1973) as they are neither corporate crimes nor occupational offenses. Crimes such as these, however, would easily fit within one of the four subdivisions as identified by Edelhertz (1970) in his broadly defined definition of white-collar crime. The continued growth of technology and specialized skills sets is only going to further hamper the precise definition of white-collar crime. The irony to this definitional conundrum, which has plagued the study of white-collar crime since Sutherland first sensitized scholars and the general public to its existence, is the unnecessary focus on spurious offender attributes. The focus on identifying offenders by their attributes is precisely the point that Sutherland was fighting against.

Research Directions

For the most part, the study of white-collar crime has copied, mimicked, and otherwise followed the methodologies used to study crime more generally albeit at a much slower pace. The definitional problem plaguing the white-collar crime field has historically made studying this crime type somewhat difficult. As a way around this impediment, white-collar crime scholars have relied upon three primary means of data collection, case studies, official reports, and surveys, to study white-collar crime.

The earliest and most popular methods for studying white-collar crimes came in the form of case studies. The case study approach involves an in-depth study of one single specialized crime, criminal, or event. Data for such an approach are gathered from a variety of sources, including archival data including court records and news accounts, field research, and interviews (Payne 2012). The extant literature is replete with examples of notorious case studies of white-collar crimes and criminals. Perhaps the most notable example of a specific crime is Geis (1967) description of the 1961 price-fixing conspiracies in the electrical industry, and the most notable description of type of specialized offender comes from Cressey's (1953) and later Zietz's (1981) examination of convicted embezzlers.

Until the late 1980s, a statistically valid picture of white-collar crime and offenders was nearly impossible to create because of the dearth of quantitative data on the crimes and criminals. The shift toward an offense-based definition of white-collar crime allowed scholars to use official data sources such as police arrests, court and conviction records, as well as regulatory agency data to study white-collar offenses and offenders. For the first time, data collection efforts in the 1980s permitted a greater understanding of the offenses, offender characteristics, and overall criminal career patterns of white-collar offenders. Most notably, the Yale studies on white-collar crime, which were led by Wheeler et al. (1988; also see Weisburd et al. 1991), defined white-collar crime as "economic offenses committed through the use of some combination of fraud, deception, and collusion." Wheeler and his colleagues proceeded to investigate a sample of 1,342 "white-collar offenders" drawn from persons who were convicted in seven selected Federal United States Districts over a three-year time period for eight different white-collar offenses including antitrust offenses, securities fraud, mail fraud, false claims, bribery, income tax fraud, lending/credit fraud, and bank embezzlement. Data on each offender was collected from presentence report and investigation reports which are prepared by a probation officer after an offender has been convicted for the sentencing judge. These reports contain an abundance of detailed data about both the offense and the offender; such information includes the circumstances of the current offense, the offender's criminal history, as well as demographic and background information of the offender (e.g., level of education, employment status, familial situation). In addition to gathering information on white-collar offenders, data was also collected for a comparison group of offenders convicted in federal court for nonviolent financially oriented property crimes (e.g., postal fraud and postal forgery).

The Yale studies were extremely important and influential because they were among the first set of empirical studies that allowed white-collar crime scholars to investigate whether or not there were identifiable differences between white-collar and street offenders. Wheeler et al. (1988) found differences in the violation of different criminal statutes, differences in the pools of criminal victims, with victims of white-collar crimes more likely to be organizations as opposed to individuals, and differences in the complexity and duration of the offenses, with white-collar crimes involving more than five persons and lasting longer than one year. When examining the offenders themselves, it became clear that white-collar offenders were better educated than the comparison group of common criminals, were more likely to be white, and were less likely to be unemployed. Overall, two conclusions regarding white-collar offenders emerged: (1) the vast majority of convicted white-collar offenders were not, as previously believed, members of the highest social classes; rather, they appeared to be average middle-class citizens, and (2) a substantial number of the convicted white-collar offenders, approximately 40 %, had a criminal record (Piquero and Benson 2004; Weisburd et al. 1990). As Weisburd et al. (1991, p. 73) concluded, "whatever else may be true of the distinction between white-collar and common criminals, the two are definitely drawn from distinctly different sectors of the American population." Finally, as is the case in the general criminological literature, subsequent analyses of the Yale data indicate that there is important variation within the group of white-collar offenders, such that overall offending patterns among individual offenders do not follow in "lock-step" (Piquero and Weisburd 2009).

The use of survey data has also been a popular way to study both street crime as well as white-collar crime and affords researchers much flexibility in the content and the specific types of questions asked. Two common approaches to survey research as it relates to collecting crime data are the use of self-report surveys, that is, directly asking offenders to indicate their involvement in criminal activities, and the use of victim surveys, where victims directly report their experiences with crimes. The use of self-report surveys is a challenging endeavor depending upon the specific criminal offense of interest. For offenses that are rare events, such as many types of both violent crimes and white-collar crimes, the base rate of positive reporting tends to be very low. Therefore, these types of survey approaches are best utilized with normative offenses such as drug and alcohol use and abuse.

The National Crime Victimization Survey (NCVS) provides an alternative method for attempting to describe the amount of crime occurring throughout the United States. The NCVS is a household survey that specifically inquires about the level of victimization experienced by individuals living within the households selected into the study. Unfortunately, the focus of the NCVS has been almost exclusively on street crimes, primarily on crimes such as sexual assault, robbery, burglary, larceny, motor vehicle theft, and vandalism. While the NCVS has not been extremely useful in identifying and documenting the extent of white-collar crime, in 2004, the NCVS conducted a supplementary analysis that specifically asked victims to report on their experiences with identity theft – defined as the unauthorized use or attempted use of existing credit cards, the unauthorized use or attempted use of other existing accounts such as checking accounts, and the misuse of personal information to obtain new accounts or loans. The findings from this survey indicated that identity theft was a type of crime experienced by at least one person in 5.5 % of all households.

In order to gain a broader understanding of victimization experiences with white-collar crimes, the National White Collar Crime Center has conducted a series of national household surveys (conducted in 1999, 2005, and 2010) entitled, "National Public Survey on White Collar Crime" that examine a variety of different types of fraud. The most recent study asked respondents to report whether someone in their household had been victimized in the past twelve months of any of the following offenses: credit card fraud, price misrepresentation, unnecessary repairs, Internet monetary loss, identity theft, fraudulent business venture, false stockbroker information, or mortgage fraud. Findings showed that approximately 24 % of the respondents indicated that someone within their household experienced at least one type of victimization (Huff et al. 2010). Other more specialized databases collect information regarding the victim's experiences with specific white-collar offenses. For example, the Federal Trade Commission (FTC) collects information in their Consumer Sentinel database on offenses such as complaints of fraud and identity theft, while the Internet Crime Complaint Center (IC3) focuses on Internet-facilitated crimes.

One final survey approach to understanding white-collar crime is the use of public perception surveys. This methodological approach allows researchers to understand how the general public and even specialized groups such as criminal justice personnel view crimes relative to one another. This line of research tends to ask respondents, by phone or in-person surveys, how they perceive and/or view certain crimes, their seriousness, and how they believe each should be punished. The underlying focus of this line of research is to try to determine which crime types are deemed as "serious" by the survey respondents and also to gain an understanding of what the public believes the criminal justice system should do and how they should respond to such crimes. This information is seen to be important by many scholars because it has the potential to provide policy makers with a better understanding of public sentiments and lend some insight into which issues should be addressed first and possibly describe some potential courses of corrective action.

Measuring public perceptions of white-collar crimes has closely followed the existing criminological scholarship that examines the ranking of street crimes in terms of perceptions of the seriousness of the crime. Sellin and Wolfgang (1964) conducted the first public perception study that ranked the crime seriousness of a variety of crimes and found consistent responses across the seriousness ratings especially as they related to violent crimes. More recent public perception studies tend to show that Americans consistently rank white-collar crimes just as serious as street crimes (Kane and Wall 2006; Piquero et al. 2008; Rosenmerkel 2001; Schoepfer et al. 2007).

Summary

Historically, white-collar crime had been largely regarded as a deviant case, invoked primarily to provide a contrast to the common crimes and street criminals that dominate the field's theory and research about crime and criminals. As such, the study of white-collar crime has not developed at the same pace or with the same specific level of detailed methodology that has been evinced in the larger criminological literature. For many scholars, this approach focused on an understanding of white-collar crime that is not only distinct from crime more generally but has led some observers to believe that the study of white-collar crime can contribute little to our understanding of crime more generally. Fortunately, this myopic view of white-collar crime is now clearing, and the study of white-collar crimes and criminals is beginning to be located within the larger criminological literature. White collar crime scholars are applying research strategies, techniques, and theories from the more general crime literature to the study of white-collar crime and offenders and scholars who in the past had little interest in understanding white-collar crime and now beginning to consider, discuss, and research its importance.

Overview

Women's involvement in white-collar crime has received little attention in the popular press and scholarly literature. A similar pattern of indifference occurred for most aspects of gender and crime until the 1970s, primarily because women were far less likely to engage in illegal behavior.

The mid-1970s represented a period of transformation in criminological studies which coalesced with the momentum of the women's rights movement. The next three decades placed gender and crime on the research forefront as feminist scholars sought to challenge and change the masculine focus of criminal behavior – except in corporate and occupational crime. The higher crime rates among women were perplexing, with little theoretical explanation and scant data to provide a framework for scholarly examinations. The 1980s and 1990s resulted in remarkable efforts by academics to explain gender differences related to the ratio gaps, motivations, and arrest patterns. Men, however, for a multitude of reasons, continue to commit the majority of crime in the United States.

Key Issues and Controversies

Historically, female criminality was attributed to maladjusted upbringing, psychological neuroses, and desperate attempts to provide monetary assistance to family and friends. These explanations of why women engage in crime meshed nicely with arrest rates for female offending: prostitution, check-kiting, child abuse, and shoplifting. During the 1950s, female criminality often was attributed inaccurately to sexual promiscuity. Female delinquents were described as troubled, disturbed girls with poor self-esteem whose frustration resulted in inappropriate sexual behavior. Overall, attempts to understand female criminality were dismissed, ignored, and hampered by the idea that crime was a male activity committed and studied by men (Brown et al. 2007; Daly and Chesney-Lind 1988). A transformation of stereotypes associated with female behavior, legal and illegal, occurred as an increasing number of women left the private sphere and entered the public domain. Ideas that women were more compassionate and ethical compared to men were challenged in the public sphere. The workplace demanded competitive behavior and provided new opportunities to engage in crime. The changing role of women was noted as early as 1922 by Clarence Darrow:

> No doubt as women enter the field of industry formerly occupied by men, and as she takes her part in politics and sits on juries, the percentage of female criminals will rise rapidly. As she takes her place with men she will be more and more judged as men are judged, and will commit the crimes that men commit, and furnish her fair quotas of the penitentiaries and jails. (cited in Steffensmeier and Streifel 1993, p. 79)

In 1975, Freda Adler and Rita James Simon's groundbreaking work brought female criminality into the public domain. Adler's acclaimed, though controversial book, *Sisters in Crime*, raised awareness about the offenses women did and would commit; she also set forth expectations that women would participate at increasing levels in all types of crime given the opportunity. In perhaps the most prophetic line in Adler's book, she wrote:

> In the future a greater proportion of wealth and power will pass through feminine hands, and almost all of it will be wielded responsibly. But it would be unrealistic reversion to quixotic chivalry to believe that, for better or worse, women will be any more honest than men. (p. 169)

Adler noted the importance of the context of social roles and criminal behavior: "The kinds of crimes one commits are related to the illegal opportunities to commit them. While a shopper might pilfer from commercial establishments, it is not possible to be involved in insider trading, unless one is 'inside' the corporate community" (Dodge 2009, p. 180).

Similarly, Simon predicted in her book *Women and Crime* an increase in white-collar offenses among women and believed that opportunity was the essential element in rising female crime rates. She accurately anticipated an increase in incidents of fraud, embezzlement, larceny, and forgery as women began to participate at higher rates in typically male-dominated, nontraditional occupations. Simon explained her position in a 2007 interview: "Women are no more honest, no more decent, and no more moral than men. The only reason they have lower crimes rates, particularly, white-collar crime, was because they had fewer opportunities to commit crime" (Dodge 2009, p. 12).

Critics, however, argued the work by Adler and Simon lacked empirical integrity and debates continued over whether or not the predictions related to increased female involvement in traditionally male offenses actually emerged (see, e.g., Daly and Chesney-Lind 1988; Steffensmeier and Allan 1996). Clearly, current research shows a trend toward more female participation in monetary crimes. Arrest statistics, according to Simon and Ahn-Redding's (2005) analysis, have shown an increase in the number of women in high-status positions with fiduciary responsibilities which appears to correlate with higher arrest rates for white-collar offenses.

More recently, scholars and practitioners have sought to explain the perpetration by and victimization of women in the field of white-collar crimes. Women who commit white-collar crime are thought to be on the rise, though a lack of data restricts any definitive conclusions. Debates related to the extent of involvement for women in white-collar crime arise from several significant issues. First, definitions of white-collar crime often focus on the offender who is typically described as a person who holds a position of authority, status, or trust. Generally, white-collar criminals are business and professional men engaging in illegal or unethical behavior in the course of business. Women, more likely to be relegated to the private sphere or pink-collar jobs, have lacked opportunity to engage in elite crime. Second, disagreement exists over what types of crime constitute a white-collar offense, which typically focuses on corporate and occupational violations and wrongdoing. More recent work suggests that the category of status include middle-class and working class people, and even juveniles (Shapiro 1990; Pontell and Rosoff 2009). Despite disagreements on offender and offenses, arguably both genders are motivated to engage in white-collar crime for similar reasons related to opportunity, greed, and the American Dream.

Women Who Commit White-Collar Crime

The increasing number of white-collar violations by women has received some recognition by scholars and the popular press. In 1984, an article in the *U.S. News & World Report* reported on the concern over rising incidents of white-collar by professional and corporate women. Examples included Nancy Young, a lawyer, who stole $300,000 from clients' accounts; Frances Cox who embezzled $48,000 from the Virginia government; Mary Hudson, board chairman of Hudson Oil, who was accused of involvement in a scheme to fix gas pumps to rip-off customers; and Mary Treadwell who defrauded tenants in a housing project. In 2004, reporter Anthony Paonita presented a laundry list of women involved in high-profile crimes such as price-fixing, racketeering, fraud, and political corruption.

Previous empirical work shows the trend toward greater participation by women. Jay Albanese (1993) reported an increase in the number of women employed in white-collar jobs along with an upswing in the number of arrests for fraud, forgery, counterfeiting, and embezzlement during the 1970s and 1980s. Haantz (2002) discovered from a sample of 1,016 federal prisoners incarcerated for white-collar crimes in 2000 that nearly one in four was a woman. Simon and Ahn-Redding (2005) found, in 2001, women accounted for more than one-third of all arrests for larceny and almost half of all arrests for embezzlement and fraud. Overall, the results indicate women are committing more white-collar crimes because of greater participation in the labor force which provides increased opportunities.

Embezzlement represents a category of crime in which women excel. Despite debates over the classification of embezzlement offenses, many scholars and law enforcement agencies recognize the theft of money by a person in a position of trust as a form of employee crime as white-collar crime. Much of the debate over including embezzlement in the realm of white-collar is offender focused. Often embezzlers are low-level employees such as clerks or bookkeepers, though they hold a position of fiduciary trust and may steal high dollar amounts. Friedrichs (2010) noted embezzlement also is readily apparent in the high monetary losses companies suffer from managers, often female, who award themselves outrageous bonus and perks.

Embezzlement is the one category of the FBI's Uniform Crime Report that shows the arrests for women at a rate equal to or higher than men. Joseph Morales, Chief Deputy District Attorney in Denver, Colorado, estimated approximately 73 % of the embezzlement cases reported to their office were female offenders (personnel communication, October 2011). *The Marquet Report on Embezzlement* described 2010 as a "banner year for employee theft in the United States" (p. 4). Marquet's analysis of 483 major embezzlement cases (defined as losses of about $100,000 or more) revealed 64 % of the crimes were committed by women, though males stole significantly higher dollar amounts. The largest monetary case, however, was carried out by a Melissa G. King, who stole over $42 million from union benefit accounts over a 7 year period. According to the report's findings, the motivations of the majority of embezzlers involved the desire for a more lavish lifestyle rather than financial problems.

Early research on embezzlers by Donald Cressey (1953) included interviews with male offenders at three prisons. The criterion for participation was operationalized as "violators of financial trust" and included a sample of embezzlers, forgers, and other fiduciary offenses. The men self-reported having a "non-sharable" financial problem and viewed their embezzlement as a means to secretly solve their dilemmas. Participants also noted a sense of entitlement and resentment toward their employers. The embezzlers used "vocabularies of adjustment" to justify their theft as borrowing money. In the first study of female embezzlers, Dorothy Zietz (1981) interviewed women at the California Institution for Women. At the time of the interviews of the 900 women inmates, 45 % had been convicted of felonies against property. The 100 participants in her study were identified as either embezzlers (i.e., "honest women who violated financial trust") or fraudulent operators ("women who intended to steal or defraud"). The honest women embezzlers, an oxymoron at best, included four types: Obsessive protectors, romantic dreamers, greedy opportunists, and victims of pressure or persuasion. Unlike Cressey's embezzlers, the women rationalized their actions as benefiting their families.

A recent study of 40 individuals convicted of a variety of fiduciary frauds compared interview data of 20 male and 20 female offenders (Klenowski et al. 2011). The findings revealed that both genders engaged in rationalizations to frame their criminal conduct as legitimate in order to maintain a respectable self-identity. All offenders made attempts to justify their crimes as a method of helping their families and friends. More commonly, women were likely to blame the inability of male members of the household to act as providers, whereas men faulted their own inadequacies. The responses analyzed in terms of techniques of neutralization discovered that male offenders were more likely to deny injury, make claims of normality, and condemn their condemners. In contrast, women defended their actions as necessary to resolve financial issues related to family and health. The small sample size in the Klenowski, Copes, and Miller study limits any definitive conclusions related to gendered motivations, though the findings are similar to early work that found women were more likely to rationalize their financial crimes as attempts to solve family problems.

Current research on women who commit fiduciary crime is limited and their means and motives not fully explored. In some cases, women engage in embezzlement because of family concerns; however, a multitude of examples show the complexities of the psychological and social contextual variables associated with their decisions. In 2004, for example, Ruth Cameron misappropriated $150,000 from the University of Colorado Boulder to supplement a more lavish lifestyle. Mary Ellen Wilson was charged with stealing almost $300,000 over 8 years and admitted to spending the money on gambling and extravagant trips to Europe. In one of the largest financial swindles against the state of Colorado, Michelle Cawthra, a supervisor of the Colorado Department of Revenue's Taxpayer Service Office, stole over $5 million, which she shared with her married boyfriend who accompanied her on trips to Las Vegas.

Case studies also reveal women are active participants in major white-collar crimes including insider trading, price-fixing, political graft, and corporate fraud. The media hoopla surrounding these cases, however, often distorts the crucial elements of the crimes and reduces analyses to gender stereotypes. Women who step outside their roles as "feminine" and dare tread on the toes of the powerful male executives and prosecutors are likely to be treated harshly as white-collar criminals.

Martha Stewart's alleged wrongdoings present all the complexities of a white-collar crime, particularly one committed by a woman who epitomizes and profits from the domesticity and corporate spheres. Insider trading was the most serious allegation, though Stewart was never charged or tried for the crime. The prosecution of Stewart was contentious and many commentators and loyal fans believed she was a victim of an overzealous prosecutor. Newspapers reported she may have been singled out based on gender, but the more likely scenario for pursuing charges of perjury was because she was unlikeable and arrogant.

Stewart was not the first unlikeable powerful woman to face criminal charges related to white-collar offenses. In the 1980s, Leona Helmsley was indicted for conspiracy to defraud the government, tax evasion, mail fraud, and extortion. Helmsley was well known for her fierce intensity and compulsion to demand perfection in employees. Helmsley, a powerful business woman in New York, became more famous when she married billionaire, hotel and real estate magnate Harry Helmsley. The holdings of the Helmsleys were extensive and included ownership of the Empire State Building and the Park Lane and Carlton House hotels. Leona Helmsley managed the Palace Hotel as queen of her own realm and was viewed by many employees as an evil dictator.

In 1986, a reporter for the *New York Post* first reported the allegations and provided evidence of wrongdoing by the Helmsleys. The Helmsleys were accused of falsifying millions of dollars of renovations to their mansion as business expenses. The article prompted the US Attorney to launch an investigation. Leona also was said to have charged clothing and gifts to business accounts. One such gift for her husband was a $45,000 silver clock designed in the shape of the Helmsley Building. Prosecutors argued the billing schemes were a blatant attempt to avoid paying taxes.

Leona Helmsley's reputation became a focal point for the media and ensuing trial. Her mean spirited reputation and mistreatment of employees became legendary. Scores of scorned employees related horror stories of her verbal abuse and threats. One employee commented: "She's just like the Red Queen in Alice in Wonderland. She makes the rules, and if you don't live by her rules, then off with your head" (cited in Pierson 1989, p. 355). Former employees claimed that she extorted money and services from contractors and suppliers. One accusation involved RCA and her demand for free televisions for the Helmsleys' mansion in order for the company to secure the hotels' accounts. Leona's reputation as a cold and nasty person was perpetuated by the mayor of New York, Edward Koch, who called her the "Wicked Witch of the West" and *Newsweek* magazine which headlined an article "Rhymes with Rich." Even her defense lawyer joined the fray and referred to his client as one "tough bitch," despite his client's aversion to the characterization (Blum 1989).

The unflattering characterization of the 69-year-old Helmsley likely represented a major obstacle to winning the jury trial. Her husband, who was 80 years old at the time, was found mentally incompetent and avoided the ordeal of a trial. Leona, however, was faced with countering prosecutor's assertions that her status as one of the socially elite made the allegation of tax evasion far more despicable compared to the average person. During the trial, she was described as a cheat and a cheapskate. Testimony by an Internal Revenue Service agent detailed the personal items charged as business expenses including her hair rollers, a $13 girdle from Bloomingdales, a $58 Itty Bitty Book Light, and a $21 crossword puzzle club subscription (Pierson 1989).

The 10-week trial included over 40 prosecution witnesses and 10,000 pages of documentations. The jury of six men and six women deliberated for 6 days and found Helmsley guilty of 33 felonies. Many spectators and commentators believed Helmsley was unlikely to garner much sympathy from the jury; despite her age, gender, and caregiver role to her husband. She denied any wrongdoing and placed the blame for her situation on people who were jealous of her position and her husband (Pierson 1989). She also shifted blame to former employees, who she asserted were stealing from the companies. Helmsley was sentence to 4 years in prison, fined $7.1 million, and ordered to pay $1.7 million in owed taxes. She was released after serving 18 months at the Federal Correctional Institution in Danbury, Connecticut. When Harry Helmsley died in 1997, he left an estimated $1.7 billion estate to his wife. When Leona Helmsley died in 2007 she left most of her estate to a charitable trust and a $12 million trust fund to her dog, Trouble.

Cases of women who commit corporate, professional, and political crime are plentiful and as a whole suggest increased female participation. Diana Brooks, labeled as one of the most powerful women in the world of art was charged and pled guilty to a price-fixing scheme between two of the most powerful auction houses in the world, Sotheby and Christie's. In 2003, Lea Fastow, the only woman charged in the Enron case, was indicted for conspiracy to commit wire fraud, money laundering, aiding and abetting, and tax fraud. Fastow accepted a plea bargain and received a 1 year prison sentence for a misdemeanor conviction. Betty Vinson, the corporate reporting director for WorldCom, was sentenced to 5 months in prison for attempting to hide $7 billion in expenses and inflate earnings. The WorldCom scandal represented one of the biggest corporate meltdowns and involved fraud amounting to over $11 billion. Robin Szeliga, former chief financial officer at the telecommunications company Qwest, accepted a plea bargain on one count of insider trading for her role in the multibillion-dollar accounting scheme.

The list of women involved in political crime also is growing and opportunities are expanding. Political corruption often involves bribery by individuals, organizations, and corporations. The estimates of money paid to public and private officials in the United States range from $3 billion to $1 trillion in bribes annually (Baird 2006). Bribery is the most common form of political corruption, though other major offenses include violating public trust and influencing governmental contracts awards (Ross 2003). Overall, given the lack of participation by women in politics, the number of cases of corrupt female officials is surprising.

The Bess Myerson case represents the quintessential example of illegal and unethical behavior developing from a political appointment that mixed street and suite crimes. In 1945, Myerson was the first Jewish woman to be crowned Miss America. She hosted the television game show *The Big Payoff* and was a regular panelist on *I've Got a Secret*. *The Big Payoff* was cancelled during the quiz-show scandals in the mid-1950s when evidence emerged that the games were rigged. In the late 1960s, Myerson entered the world of politics as a champion for consumer protection legislation when she was appointed by Mayor John Lindsay as New York City's first Commissioner of Consumer Affairs. She became a beloved political figure and set out on a campaign to protect consumers. In her new position, Myerson frequently appeared on television to attack "shamburgers," unlicensed auto mechanics, and unsafe toys (Alexander 1990). In her first 4 months as commissioner she issued 1,300 summonses to companies for consumer violations.

Myerson was a frequent social companion of Ed Koch during his unsuccessful 1982 Governor's race. Many people in the Democratic Party believed that with Myerson attending events with Koch rumors that he was gay would be dispelled after a nasty campaign slogan; "Vote for Cuomo, not the homo" began circulating. While Koch served as Mayor he appointed Myerson to the position of Commissioner of Cultural Affairs of New York City. Myerson, though popular, often was criticized for engaging in underhanded tactics and questionable behavior.

While acting as Commissioner of Consumer Affairs, Myerson's role as a consultant to

Bristol-Myers became a source of controversy. Myerson developed a consumer products guide for Bristol-Myers that failed to mention the possible carcinogens in Clairol hair dyes that were being targeted by the Food and Drug Administration. Her history of shoplifting also raised questions about her credibility.

Myerson took advantage of her fame and relished in the special treatment it afforded her. She ate at restaurants that provided free meals, accepted merchandise from vendors at wholesale prices, and neglected to pay for items (Alexander 1990). Her reputation as a cheapskate was widely known, though in the 1980s her net worth was $4 million. Myerson's personal and professional lives became fodder for the New York newspapers and her behavior was seen as increasingly scandalous. Her partnership with reputed mobster Andy Capasso became legendary when she used her political position to influence the outcome of his divorce case. Then revelations of widespread corruption in the Koch administration became public and five top city officials were indicted and convicted for bribery, racketeering, and fraud (Alexander 1990). Later, Prosecutor Rudolph Giuliani indicted Myerson and several codefendants on conspiracy and mail fraud charges.

When Myerson, who denied any wrongdoing and labeled the ordeal as a "witch hunt," was served with a subpoena at her office she screamed: "I don't give a fuck about any of this shit! I'm still commissioner around here? To hell with...Giuliani! I don't want anybody cooperating with those guys!" (Alexander 1990, p. 17). The *Daily News* reported: "At long last, the Bess Myerson rock has been kicked over, and what's crawling out is sickening: arrogance, abuse of power, payroll manipulation, case-fixing, cover-up" (Alexander 1990, p. 207). Koch sided with public sentiment about her guilt and claimed to be shocked, calling her actions deplorable, dishonorable, and disgraceful, though he had received a report that confirmed the allegations against Myerson several months prior to the indictment.

Myerson was acquitted of all the charges, but the scandal and trial destroyed her already questionable reputation. People blamed her plight on her arrogance and inability to play by the rules. Alexander noted the fall of Myerson was directly related to her gendered perspectives: "Her attitude has very much to do with her view of men and women—that at bottom we women are alone in the world, and we have to do the most we can to defeat or outsmart or outrun the men. Basically, she hated men" (p. 55).

Examples of political crime by women are surprisingly numerous. Sara Bost, who served as mayor of Irvington, New Jersey, was indicted for taking bribes from developers and engaging in witness tampering. After a year-long investigation by the federal government and 1 month into a jury trial, Bost pled guilty to one count of witness tampering and the charges that she had received $8,500 in kickbacks. She was sentenced to 1 year in prison, a $2,000 fine, and 150 hours of community service work. Commentators sarcastically noted that Bost had broken the glass ceiling to join the ranks of the boys club—in prison (Dodge 2009). Bost, like Stewart, served her time at Alderson prison. Nidia Davila-Colon, a long-term freeholder in New Jersey, resigned her position after her conviction for bribery. Davila-Colon was charged with mail fraud and aiding and abetting an attempted extortion scheme. She was sentence to 3 years and 1 month in a federal prison. In a similar case, Chicago Alderman Arenda Troutman was arrested in 2007 on federal bribery charges. Troutman, according to an FBI report, accepted a $5,000 cash bribe with an additional payment of $15,000 as political contributions after supporting zoning changes and alley access for a private developer.

In 1994, Linda Schrenko became one of the first women in Georgia to be elected to a statewide office as school superintendent. She was responsible for a $7 billion budget. When she ran for governor on the Republican ticket in 2002, she genderized the campaign race. In her first commercial she informed the public: "I'm asking you to send a woman to clean the House and I'll throw in the Senate for free." Throughout her campaign, she noted she was "obviously not a good ol' boy" and wore a name tag "I Am 'That Woman.'"

Schrenko's gubernatorial campaign ran short of money. In August 2001, the account balance was $113 and a number of bounced checks surfaced. Sometime later, significant amounts of cash deposits were made, including federal education money that was earmarked for Georgia Schools for the Deaf and the Governor's Honors Program. Meanwhile, Schrenko was writing checks for cash to her family and transferring funds to offshore accounts. Stolen money was also used for a face lift and to purchase a new car.

Schrenko faced over 40 criminal counts and eventually pled guilty to felony charges of conspiracy and money laundering. She was sentenced to 8 years in prison, ordered to pay restitution of $415,000, 3 years probation, and 100 days of community service. The presiding judge called her crimes "an egregious abuse of the public's trust." Schrenko denied any responsibility and placed the blame on her campaign manager and lover, Merle Temple. When she was asked during a television interview how she could be unaware of how the money was being handled, she stated: "Utter stupidity." She also commented in the same interview: "I don't want to handle the finances; I'm not good at that. I just want to improve the educational system and help kids: it wasn't about the money and the power."

Overall, the number of women involved in political wrongdoing, given their low representation, is surprising. Betty Loren-Maltese, former Illinois town president, was accused of racketeering and fraud in connection to an insurance scheme that resulted in $12 million in losses to the town. Loren-Maltese was known to be a flashy gambler and extravagant spender. She allegedly lost $1.2 million in Las Vegas gambling, while authorities attempted to seize her assets (Paonita 2004). Janet Rehnquist, the daughter of former chief justice William Rehnquist, was appointed inspector general of the US Department of Health and Human Services by President Bush. In 2003, a GAO report uncovered unethical and illegal activities including improperly obtaining law enforcement credentials that allowed her to carry a gun in the office and she allegedly traveled for pleasure at the expense of the taxpayers (Paonita 2004). Colleagues claimed she created an atmosphere of anxiety and distrust. Rehnquist resigned from her position after the report uncovered numerous unethical and illegal behaviors.

Political crimes, perhaps more than other white-collar offenses, tend to undermine essential elements of trust between the public and elected officials. The loss of faith in public officials increases citizen apathy and public cynicism. Moore and Mills (1990) noted:

> Whenever citizens see corrupt public officials and other white-collar offenders violate the law with impunity they inevitably must question official integrity and commitment to fairness. In many ways, the greatest harm to the victims of white-collar crime may be this loss of faith in the very possibility of fair, impartial government. (pp. 414–415)

Women are obtaining more and more positions in the traditionally male-dominated political arena. It appears women are just as likely as men to take advantage of an imperfect system.

Future Directions

The United States has seen a substantial increase in the number of women who have assumed powerful leadership roles in political, corporate, judicial, and academic spheres. The primary hypothesis to explore in empirical work is will women engage in more ethical behavior and commit fewer illegal activities compared to male counterparts? Fukuyama (1998) asserted that men tended to be more aggressive, engage in more violence, and seek dominance through competition at a higher rate than women. Fukuyama noted "a world run by women would follow different rules" and as women gain power, countries and leaders will become less "aggressive, adventurous, competitive, and violent." Some previous research supports the idea that women may act differently and value relationships, personal and professional, to a higher degree than men. Perhaps women will be successful at developing a sense of community and connectedness to the corporate and political worlds, though the argument is growing increasingly weak as the number of women white-collar offenders increases (Dodge 2009).

Stereotypes that women are more trustworthy and ethical compared to men are common, though evidence these female characteristics actually exist is equivocal. Researchers find that women and men share similar work values and are similar in their perceptions of ethical and unethical behavior (Kidwell et al. 1987). A reasonable extrapolation from the acts of embezzlement by women would suggest in higher positions females would be just as likely to engage in white-collar crime under the right circumstances. In fact, discriminatory practices in job placement and salaries may contribute to more women committing white-collar offenses as opportunities widen. Women in positions of authority in the business world are rare and they are unlikely to be placed as supervisors with demanding responsibilities (Alkadry and Tower 2011). In 2011, only 12 women served as CEOs of Fortune 500 companies. Women, nevertheless, are moving into high-level business and political positions.

The controversies over workplace behavior are far from resolved. Arguments related to females as the more ethical gender in business further perpetuates gender-based stereotypes. The idea that women will enter into traditionally masculine positions, which demand assertiveness, risk-taking, and competitive behavior, and not commit white-collar crime is questionable. Women face the same strain and demands as men. West and Zimmerman (1987) introduced the theory of "doing gender," which is the "activity of managing situated conduct in light of normative conceptions of attitudes and activities appropriate for one' sex category" (p. 127). Both men and women actively monitor their behavior to ensure they will be perceived not simply as male or female but also as masculine, feminine, or neither. Corporate officers, both male and female, must do gender in ways that support their career activities (West and Zimmerman 1987). The combination of formal organizational forces and informal occupational values creates a social world which emphasizes masculinity. Women in the workplace find ways of doing gender; whether or not this is accomplished by adapting masculine methods is unknown. The combination of formal organizational forces and informal occupational values centered on machismo and competence creates a social world which relishes masculinity (Herbert 1998).

In 2006, Carly Fiorina, the former CEO of Hewlett Packer, was named by Fortune as the "Most Powerful Woman in Business." Fiorina was quick to express her displeasure of being placed in a special category that differentiated women from men, though she acknowledged the higher level of scrutiny and criticism females face in business. Fiorina (2006) noted her thoughts about being the most power woman in the corporate world: "I've never been a man" and I never thought of myself as a woman in business. I've thought of myself as a person doing business who happens to be a woman (p. 145). In her book, *Tough Choices*, she described her impression about her imminent firing:

> I knew the announcement would be big news. I was a woman, and a bold one at that, and things had always been different for me. All the criticisms that have ever been leveled against me would be recycled and thrown back in my face with new delight: "She's too flashy." "She's just marketing fluff." "She's too controlling." "She's a publicity hound." "She's imperious, vindictive and employees didn't like her." "It would be ugly and it would be personal." (p. xii)

Fiorina believes she was never able to escape the label of "Female CEO," and the media was preoccupied with describing her dress, hair, or clothing rather than her business acumen. She was routinely described as a bimbo, a bitch, too soft, too hard, and too ambitious (Fiorina 2006).

Women in high-status position are placed in a no-win situation. Rhode (1989) labeled the circumstances as a double bind: "Women are criticized for being too feminine or not feminine enough. Those who conform to accepted stereotypes appear to lack ideas or initiative, while women who take more assertive stances are judged arrogant, aggressive, or abrasive" (pp. 169–170). In the cases of Stewart, Brooks, and Helmsley, they were praised for their business acumen until accusations of white-collar crimes became public. Perceptions of these women, despite some known character flaws, turned to negative feminine stereotypes that described their personalities and behavior – which rarely happens with male offenders (Dodge 2009).

Women face many professional barriers that prevent them from seeking or obtaining upper management positions. Work and family responsibilities often clash and demanding corporate jobs with long hours are problematic. Men hold leadership positions in most professions and cultural views about suitability for leadership roles may exclude women. Societal and organizational subcultures present a significant barrier for women and perpetuate marginalization (Schein 1992). Additionally, the isolation women experience in male-dominated professions can limit access to upper-level positions. Females, on the one hand, often are excluded from informal mentoring networks within the organization (Gold 1999). On the other hand, women who are able to penetrate and become part of the boys club may learn that being a member of the inner circle demands cooperation and, sometimes, illegal behavior.

Many women who have committed white-collar crime are forgotten after the initial media hoopla. Martha Stewart's comeback after her felony convictions and short prison term demonstrated the business acumen that gave rise to her empire. While Stewart may have experienced a type of reintegrative shaming that overcame the stigma of being a criminal, as described by Australian criminologist John Braithwaite, Helmsley never recovered from the negative perceptions and continued to bully people after her release from prison.

White-collar crimes committed by women continue to surpass those of the past in terms of financial theft and offense seriousness. White-collar crimes, unethical or illegal, are committed to increase personal and corporate wealth. Such acts are no longer limited to men, and women are taking their place at a steady pace as opportunity and motive become more readily available.

Overview

Women rarely entered policing at the inception of a nation’s police force(s), rather their entry was delayed and then often marked by circumscribed roles and limited occupancy of all available ranks. Four broad phases can be identified when women officers were recruited into the police: after World War I, the interwar years, after World War II, and the modern period from the 1980s onwards. With some variations, one familiar pattern is observable whereby there is a period of omission, followed by limited succession, formation of separate women’s departments, and in some jurisdictions a further stage of working towards full integration. At time of writing, there is no evidence of a fully integrated police organization where women represent 50 % of the officer workforce and enjoy an equivalent share of the full range of roles and ranks within the police hierarchy.

The experiences of women in policing were not subjected to systematic study until the 1970s when Susan Martin undertook a landmark participant observational analysis of American women police officers (Martin 1980). Since then there has been a great deal of scholarship addressed at women in policing, e.g., evaluating their efficacy; determining roles and rank progression women officers have achieved; charting their incursion into specialist areas such as firearms; examining stress, styles of policing, and how they handle violence; and looking at the ways in which they lead.

Some advances have also been made in terms of theorizing. Much conceptual work examines women in policing through the lens of gender relations and masculinities and women’s subordinated status (Martin and Jurik 1996). A model of women’s progression has been advanced (see Brown et al. 1998) which has been applied and extended by Strobl (2010) and Natarajan (2008). However, in the area of internal diversity, there are relatively few comprehensive evaluations taking into account developments concerning recruitment, promotion, and retention simultaneously (Van Ewijk 2012), and comparative studies are still scarce (Brown and Heidensohn 2000). While empirical data on gender diversity within police forces is limited, obtaining these data represents more of a challenge in some regions than in others (Van Ewijk 2012).

The task of comparing the progress made by women worldwide is too large to be encompassed within the constraints of this entry, and research papers are too patchy to enable exhaustive coverage; thus, the analysis presented here is necessarily selective. It is noteworthy that women's progress into police services has frequently accompanied periods of reconstruction, as in Europe after the two World Wars, and nation building as in the postcolonial era in the Middle East, Asia and Africa and emerging democracies in South America and Eastern Europe. The numbers of women police officers and their status are often an indicator of the progressiveness of police force's policies, especially with regard to internal diversity and the policing of sexual violence, and provide an indicator of that nation's progress in terms of the equality of women more generally.

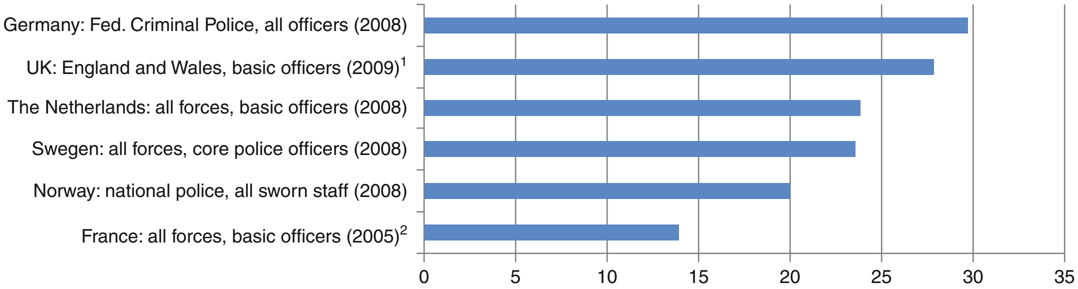
Women's Representation in Policing

Brief Global History

It is generally acknowledged that the first woman to be appointed as a police officer was in Stuttgart in 1903 (Heidensohn 2000). Heidensohn notes some similarities and differences between countries in this pioneering phase. Shared characteristics include focus on social and welfare work, use of well-educated recruits from upper- or middleclass backgrounds, and an impetus provided by an external movement lobbying for the presence of women in policing. Prenzler (1994, p. 88) observes in respect of early Australian policewomen that they "were used to fill a gap between law enforcement and welfare and to mitigate difficulties experienced by policemen in managing female offenders and female victims of crime." Heidensohn (2000) suggests differences that reflect Prenzler's dichotomy, in the sense that in New Zealand, USA, and Sweden, women did not adopt a police uniform and were employed as matrons, nursing sisters, or social workers. This contrasts with countries elsewhere, such as Great Britain, where women had a clear aspiration to be part of the police uniformed service and have an involvement in crime and public order (Brown and Heidensohn 2000). The ostensible impetus to employ these first women in policing was to manage female suspects or victims of crime, but the more pragmatic reason was the shortage of men as a consequence of conscription during World War I and the control of sexual morality (see Brown et al. 1998 for a more detailed discussion). Brown and Heidensohn (2000) find evidence for the opposition to the entry of women in policing in all these countries which they state was a combination of paternalistic concerns to protect women and patriarchal exclusion of women as being unsuitable for the rough and dirty tasks required.

During the interwar years, countries such as France, Poland, Spain, and Portugal introduced women into policing. This was in line with either moral policing whereby women officers dealt with trafficking, prostitution, and those classified as moral delinquents or performing support functions such as of typing or administration (Brown and Heidensohn 2000).

After World War II, more countries employed women as officers again in the wake of reconstruction. For example, in Hong Kong, Chinese women were introduced in 1949 although confined to clerical duties, interpreting and taking statements in the Criminal Investigation Department. Interestingly, serving women officers from established forces such as Great Britain were seconded to develop these units of policewomen. American police advisors were sent to South Korea after the ending of World War II to develop a 500-strong female police workforce to work primarily with women prisoners and undertake some crime-related work (Moon and Morash 2008). This pattern of sending advisors to help form policewomen's units could also be observed in postcolonial Africa, where models of policing very much followed patterns established in the former colonial power (Igbinovia 1981). Using the police forces of Ghana and the Ivory Coast as examples, Igbinovia compares Anglophone and Francophone police forces, whose organization and administration were modelled on the patterns of pre-independence British and French colonial rule.



Women in Policing, Fig. 1 Percentage of female officers in various police forces of established democracies in Europe (percentage of basic police officers where possible, otherwise percentage of total police officers) (Sources: European Network of Policewomen (2008), Home Office (2009), Pruvost (2009))

Women were deployed in more challenging tasks in the newly established Commonwealth countries, whereas in the African French community, they were limited to administrative tasks which reflected the roles policewomen played in the countries of the originating colonial power.

The modern era is marked by the reconstruction of democracies in the countries of Eastern Europe following the breakup of the USSR, the introduction of women police in the gendarmeries of Europe, developments in women-only police stations in Brazil and India, and new roles for women police in Arab countries.

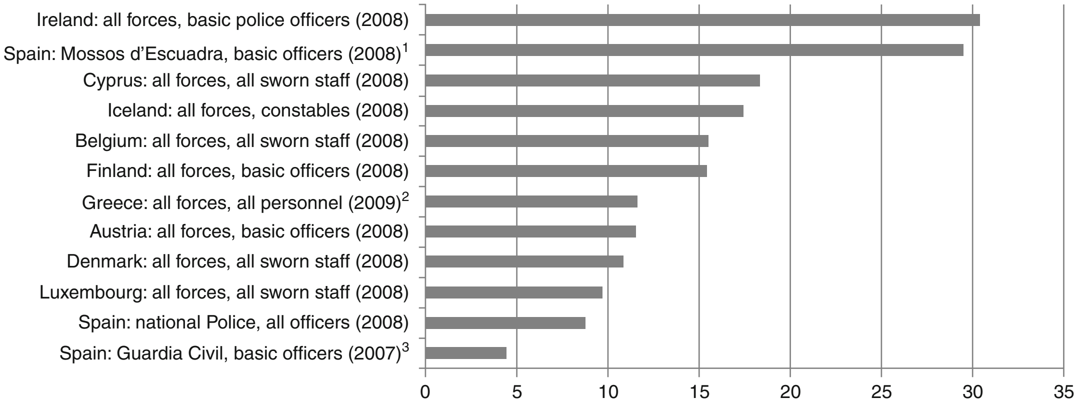
In sum, while countries vary in the dates that women were admitted into the police, opposition was almost universal. Political activation and lobbying contributed to changing attitudes towards the possibility of women police officers, but their actual entry was often precipitated by some crisis. For example, in India the idea of women police officers was thought incompatible with their role as homemakers, but their entry was occasioned by problems created through the mass movement of people following Partition in 1947. African women's attempts to form a women's police corps were often met with vilification and accusations of being unable to deal with criminals, yet the reality of trafficking problems in newly emerging nations provided an impetus to their recruitment. The progress of women into mainstream policing in established democracies of Western Europe, developed countries with long traditions of independence, and in America and Canada was to some extent assisted by equality legislation which provided an impetus to equal rights and treatment of women generally with policewomen being among the beneficiaries.

The following sections will take a brief stock-take of the current position of women police officers. Because there are no clear-cut jurisdiction classifications nor strict geographic divide, we have themed policing jurisdictions in terms of their democratic status.

Women Police in Established Western Democracies

The numbers of women police in established Western democracies are steadily increasing and have reached between 20 % and 25 % in some countries and almost a third of the officer complement of the Federal Criminal Police in Germany (Van Ewijk 2012) (Fig. 1).

Percentages of women among rank and file police officers have now risen to or beyond the point where women are generally seen as tokens, which is 15 % with 35 % said to be the tipping point when gender relations are normalized. In terms of their percentage share of management ranks, then this is between 22 % and 27 % for countries such as the Netherlands and Sweden, while in Great Britain those percentages are 16 %. In France however in 2005, 18 % of the commissioners were female, versus 14 % of the patrol officers. Possible explanations are as follows: firstly, a government feminist policy that originated in the 1970s focused on the higher ranks, for which higher education was more important than physical strength and, secondly, that senior French police officers were persuaded that women are especially fit to be police leaders



Women in Policing, Fig. 2 Percentage of female police officers in post-World War II reconstruction nations in Europe (percentage of basic police officers where possible, otherwise percentage of total police officers) (Sources: European Network of Policewomen (2008), Programa d'Equitat (2009), Ministry of Citizen Protection (website), and Guardia Civil (2007))

because of their feminine skills, but remained unconvinced that they are fit to be patrol officers because of the risks. A further contributory factor may be direct entry at officer level. As a result, female police officers are more likely to access higher ranks from the outside than by moving up internally from the lower ranks.

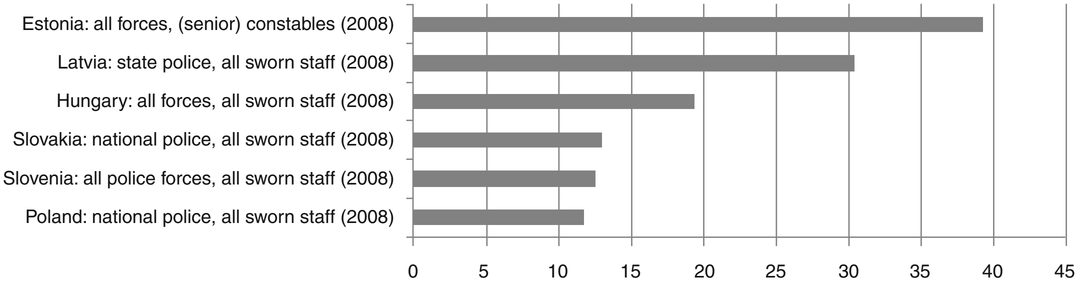
It is difficult to predict whether the increase of female police officers will continue in the future. On the one hand, the relatively high percentage of female police students in 2008 in Austria (27.1 % versus 11.5 % of female basic police officers) can be seen as promising for gender diversity. On the other hand, recent data, for example, on high-ranking female police officers in the Netherlands, appear to indicate that in some cases this increase has come to a halt (Van Ewijk 2012). This coincides with Prenzler's observation that in some jurisdictions, periods in which women in policing made gains have been followed by reversals. He illustrated this with reference to the Queensland Police where, following Commissioner Whitrod's reforms, more women were recruited. A subsequent commissioner, Lewis introduced quotas and reinstated the marriage bar, curtailed deployment of women, and systematically removed lesbian officers which resulted in a downturn in the percentage share of women in that force. In the United States there is evidence that the numbers of women in larger police agencies has either stalled or is reversing due to the decrease in the number of consent decrees mandating the hiring of women and sustaining their promotion (National Center for Women and Policing 2002).

Women Police in Postconflict Nations

The position of women in nations reconstructed after war remains somewhat equivocal. Moon and Morash (2008), e.g., looked at South Korea where a target of 14 % of women officers has been set for 2014. They conclude that women are yet to be fully integrated and have yet to have similar training nor undertake comparable work. They find that male officers are still negative about their women colleagues and about increasing their numbers or extending their duties.

We see similar dynamics of gender diversity within some European police forces post-World War II, although the percentage of female officers in the basic levels of police forces fluctuate considerably in this category: in Ireland, more than 30 % of the basic police officers are female, while this is only 4 % in the Guardia Civil of Spain (see Fig. 2).

Again, after post-World War II reconstruction in Europe, the percentage of female officers in managerial and senior ranks is considerably lower than that of rank and file officers (Van Ewijk 2012), with the so far unexplained exception of Ireland.



Women in Policing, Fig. 3 Percentage of female police officers in a sample of reforming nations in Europe (percentage of basic police officers where possible, otherwise percentage of total police officers) (Source: European Network of Policewomen (2008))

Women Police in Reforming Nations

Nations that have undergone reforms after seismic political upheavals often have to attend to relationships between the police, citizen, and state. Reams and Nelson (2008) looked at policing in Brazil which was characterized by brutality, corruption, and ineffectiveness. In the wake of democratic reconstruction from a dictatorship to a multiparty democratic system, efforts were made to reform the police to legitimate the new regime. The New Brazilian Republic created women-only police stations in 1985 as a way to combat sexual violence against women. Ten years on, there were 200 delegacies de defesa de mulher (DDMs) throughout the country. Yet many activists have withdrawn their support for this innovation because of poor service and lack of sustained funding and resources. Also, women in mainstream policing believe a secondment to DDMs compromises their long-term career goals, a finding confirmed by Natarajan (2002) when studying women-only stations in Tamil Nadu, India: these were under-resourced and women officers felt unappreciated and lacking rewards or incentives.

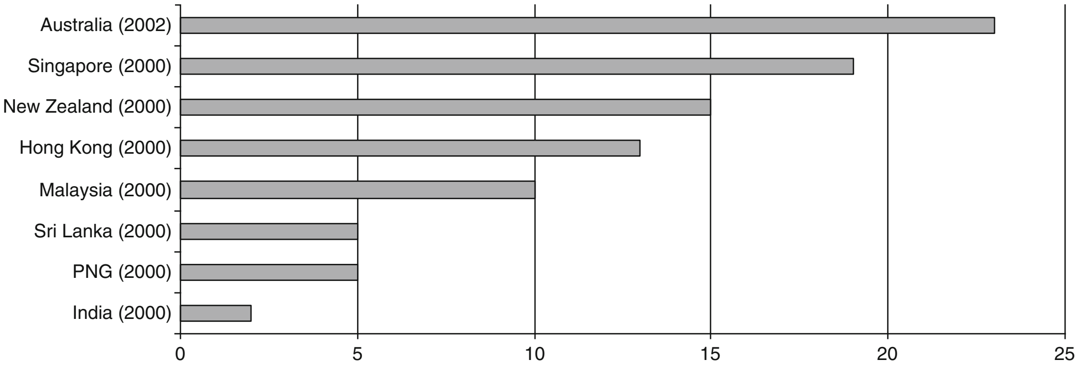
The percentage of women police in reforming nations in Europe after the disintegration of the former USSR fluctuates considerably. The high percentage of basic police officers in Estonia contrasts with that of Poland, Slovenia, and Slovakia (Van Ewijk 2012) (Fig. 3).

Despite the increase of female officers in the police force of Estonia, the relation between gender diversity and rank is the same as in the other countries: gender diversity diminishes as rank rises. Basic female officers represent 39.2 %, management female officers 28.9 %, and senior management female officers 4.5 %.

Women Police in Postcolonial Nations

Strobl (2010) reminds us of the importance of cultural differences when attempting to assess progress in justice organizations in developing nations. Asiwaju and Marenin (2008) undertook an extensive study of how community policing was conducted in Nigeria. Policing in that country was hierarchically rigid and defensive against criticism which caused an absence of meaningful communication between rank and file and very senior officers. They described that gender mainstreaming and pressure from civil society had increased the numbers of women from 4 % in 1993 to 16 % by 2006. Nevertheless, barriers remain, such as the current police regulations which do not distinguish recruitment criteria between men and women, the continued assignment of “women’s” duties, i.e., dealing with women and children, the fact that women (but not men) require permission to marry, and the fact that women are discharged when pregnant.

Banks’ (2001) study of women in the Papua New Guinea police notes that women were first recruited in the 1970s, 80 years after the formation of the force. In 1991, it was hoped that there would be full integration except for mobile and riot squads. The system of “wantok,” which is a web of family obligations, is found to be reproduced in the



Women in Policing, Fig. 4 Percentage of female police officers in a sample of postcolonial nations (percentages are of all police officers) (Sources: Natarajan (2005), Irving (2002))

workplace where women are treated as mothers or sisters, so that senior women find it difficult to exercise authority over men. Women did not perceive themselves as penetrating gender demarcations, rather they thought of themselves as proffering advice and being of assistance to men and adopted a submissive coping strategy to coincide with the traditional culture.

Strobl (2010) examined the emerging presence of women in policing in the Gulf Cooperation Council countries (GCC): Bahrain (10 %), Kuwait and UAE (unknown), Qatar (4.7 %), Oman (4.5 %), and Saudi Arabia (0 %). Women were introduced into the Bahrainian and Omani police forces in the 1970s, in Qatar in the 1980s, and in Kuwait in 2009. Strobl concludes that the duties of policewomen in GCC countries are more limited that those of their Western counterparts: in GCC countries policewomen are employed in segregated units that focus on women and juveniles as victims, witnesses, and offenders, and they work as security screeners at airports and investigate cases involving child and female offenders. According to Strobl, the Arab, particularly Muslim cultural context, is very different to the secular West. Thus, whereas in Western democracies equality legislation entitled policewomen to litigate when police forces failed to comply with the law in order to advance their progression, in Arab countries "gender as it relates to policing is negotiated in ways that are inconsistent with a secular, liberal feminist agenda" (Strobl 2010, p. 7). As such, she proposes a parallel model where segregation and integration operate simultaneously. In this, she coincides with Natarajan (2008), although in a follow-up to her original data collection Natarajan interestingly finds a shift in preferences with a greater number of mostly younger women officers opting for a fully integrated model, convinced that they can police alongside the men (Fig. 4).

Performance

Operational Frontline Tasks

As we have seen, most police services, during much of their histories, labored under untested assumptions about the unsuitability of women for police work. An exception to this was a series of innovative evaluation projects carried out in the United States in the 1970s and 1980s. These "performance" or "patrol" studies compared the profiles of male and female officers across a wide range of police tasks. The studies varied in their findings on arrest rates, traffic citations, sick days, accidents, academy results, and commendations and reprimands. However, overall, most differences were largely negligible (for summary of this research, see Lunneborg 1989). Other studies found that, while the public was generally accepting of women police, female victims of crime tended to prefer the assistance of a female officer and women police were better at providing practical advice and assistance to all victims of crime. In the USA, the performance studies were important for successful litigation taken under the Equal Opportunity Act 1972 which found that institutionalized impediments to women police did not relate in any way to genuine job requirements.

Research by Rabe-Hemp (2008) suggests that women officers themselves believe they bring some distinctive characteristics to the task compared to male colleagues, i.e., greater empathy, communication skills, and fewer forceful behaviors. Women she interviewed (in the United States) believed that they were better at serving the needs of women and children, especially those who had been subject to violent or sexual abuse, and that they were more likely to act as advocates to prevent their re-victimization. Community policing was a particular area where women (and men) legitimized more feminine ways of policing. Community policing stresses communication, familiarity, and building of trust and rapport between the citizen and community member rather than the rapid response required of reactive emergency policing.

Physical Aspects

The performance studies were also important for destroying the myth that women could not cope with the physical demands of policing, i.e., that women police lacked sufficient strength to control resisting subjects and that they were a safety risk to themselves and other officers. The studies provided support for the view that upper body strength is less important for effective policing than having good negotiating skills and physical restraint skills that involve a minimal force approach. By these criteria it appears that women are as capable, if not more capable, than men. Studies also found that female police were more likely to have a calming effect in confrontational situations, whereas male police tended to contribute to the escalation of conflict (for more detail of these studies, see Lunneborg 1989).

Specialist Roles

As implied above, women, when first entering a national police force, are unlikely to have the full range of roles available to them. Within their separate police units, they are able to achieve higher ranks, but since most national forces have significantly smaller percentages of women, then inevitably force of numbers will limit their proportionate share of the highest ranks within assimilated or integrated forces. It is noteworthy, even in forces that claim to treat women and men equally, they are likely to be excluded from public order or counterterrorism deployments.

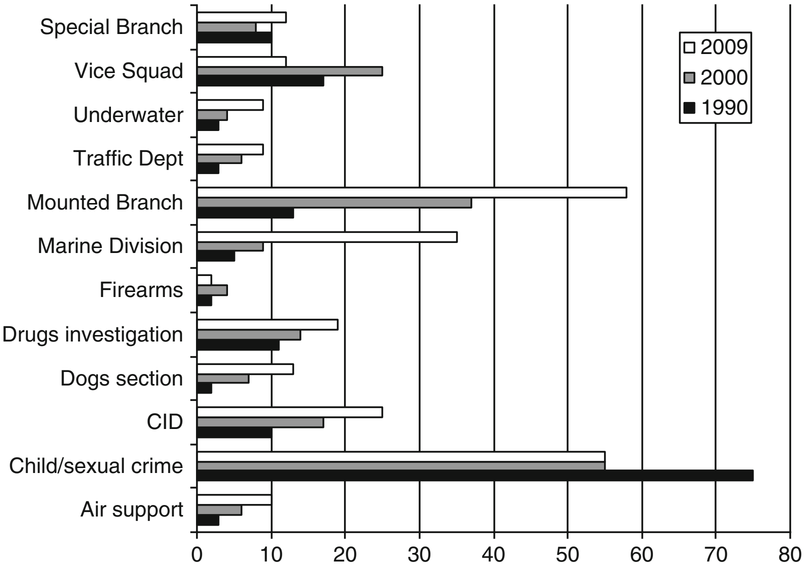
As forces achieve integration, women begin to perform tasks in areas of specialism that were previously limited to men. In England and Wales, e.g., it is possible to track the increasing percentage of women deployed in specialist roles (Home Office 2010) (Fig. 5).

The police services in England and Wales were legally mandated to integrate men and women officers by the 1975 Sex Discrimination Act. Migration of women into specialist areas of policing, dominated by men during the period of segregation, was slow and is still incomplete. In 1990, women predominated in the investigation of child crime, sexual offenses, and domestic violence. Their percentage share since then has actually dropped. Apart from the vice squad, traffic departments, and firearms units, which remain persistently gender segregated, women have been gaining access to areas of specialist operations and in several are approaching or have surpassed the 25 % threshold.

Ethical Standards

The issue of physical ability and use of force overlaps with the issue of police integrity and use of excessive force. Ethical climate surveys suggest women are not necessarily more ethical in their attitudes or more likely to report wrongdoing by other officers (Waugh et al. 1998). However, the research shows clearly that women attract fewer complaints from the public, including fewer complaints regarding assaults and excessive force. For example, an Australian study found that male police attracted two-and-a-half times as many allegations of assault as female police (e.g., Waugh et al. 1998). An observational study, also in Australia, found that

Women in Policing, Fig. 5 Percentages of women serving in specialist roles in an integrated police force: England and Wales as a case study (Sources: Brown (1998), Flannery (personal communication), Home Office (2010))



male officers were twice as likely as female officers to engage in threatening behavior and physical contact with members of the public, which in turn elicited greater resistance and aggression (Braithwaite and Brewer 1998). Research has similarly shown that women police appear to be less "trigger happy" and much less likely than male officers to fatally shoot offenders. In the USA, successful litigation for excessive force by male officers was estimated to cost taxpayers up to 5.5 times the amounts associated with the actions of female officers.

Barriers for Women Police Officers

Discrimination and Harassment

As described earlier, the entry of women in policing in most jurisdictions has been, for the most part, contested. Discrimination and harassment have been a consistent feature of policewomen's experiences (see review by Natarajan (2008)) and appear in many jurisdictions (see, e.g., Somvadee and Morash 2008). Forms of sexual harassment include sexist jokes, comments about women's appearance, use of derogatory or offensive language, being pressured for dates, and deliberate sexual contact, while discrimination includes differential deployments, blocked promotion, and "safer" station house assignments. As demonstrated above, women have not fully accessed the rank structure and areas of specialist policing work. But have things changed due to legislation, department policies, and practice reforms and gender mainstreaming? Somvadee and Morash (2008) looked at the experiences of female law enforcement personnel in the USA. They found that many women reporting potentially sexually harassing behaviors did not experience this as sexual harassment. Some women tolerated the behaviors as the price of fitting into a male occupational culture. Other women described how they confronted offensive language and behavior, resulting in men apologizing. What women in this survey found most bothersome was the notion that they, women, could not do the job. Foster et al. (2005) undertook research in England and Wales and reported that women officers still felt excluded, undermined, and undervalued. The participating officers felt that overt forms of discrimination were not so widespread but that they had to work harder than male colleagues to prove themselves equally capable. As alluded to above, policewomen in the women-only police stations perceived that their career opportunities were thwarted as a consequence of secondments out of mainstream policing. In sum, discrimination and harassment is still being experienced by women police officers.

Sexual harassment is very difficult to prevent in male-dominated organizations. The suggestions from the research literature are that the dynamics are complex and that there is interplay of other factors such as work environment which provides better explanations than demographics alone. Moreover, the presence and implementation of comprehensive anti-discrimination and harassment policies are insufficient by themselves as often victims were fearful of complaining or disenchanted that complaining would make any difference. Somvadee and Morash (2008), p. 494) advise that "police organisations need to consider the implications of high levels of continuing exposure to sexually oriented jokes and remarks" not least to the psychological harm experienced by recipients and reputational damage to the police itself.

Stress and Health

Police occupational culture is critical in understanding the pressures exerted on women officers that subjects them to some different stress experiences. Stressors impacting police officers tend to be divided into those that form part of the operational tasks, such as dealing with crime, public order, and arrests, and aspects of the police organizational climate, including shift work, promotions, and relationships with colleagues. For the most part, both men and women officers suffer similar stress loads and adverse reactions to the bulk of task deployments. However Thompson Kirk and Brown (2006) show that men and women officers experience their work environments differently, in particular concerning interpersonal conflicts. They found that interpersonal stress accounted for 31 % of the variance, organizational stress for 15 % of the variance, and operational stress for 8 % of the variance. The first two factors were more influential for senior women officers. This suggests the importance of social support both in operational confidence in women's abilities and organizationally in flexibility of working arrangements. Maintaining work life balance and managing domestic care responsibilities appear to weigh on women officers more heavily than men. This is in part due to cultural expectations about the roles of women, police organizations' ambivalence about flexible working arrangements, and to some extent women's own coping adaptations to domestic pressures (Dick and Cassell 2002).

Accessing Senior Rank

Relatively little research is available, charting the experiences of senior women police officers, with the work of Marisa Silvestri (2003) and Dorothy Schulz (2004) being notable exceptions.

Van Ewijk (2011b) shows how percentages of women officers in higher ranks drop more than what would be expected on the basis of the percentage of women officers in the average year of entrance of officers of that rank. This is so even in a police force where all officers enter at the same basic level and follow the same career path, and the outflow of (women) officers before retirement is practically nonexistent.

Silvestri (2003) records barriers including on call requirements, a promotion track demanding geographic flexibility, and career interruptions due to maternity breaks. This is confirmed by Schulz (2004) who describes how women achieving senior ranks in the United States made trade-offs in the sense that many of them were single (finding career and geographic mobility difficult to combine with domestic life) or rarely had more than two children to minimize disruption and care arrangements.

Policy Implications

When considering the progress made by women into policing, then, there are few police forces with generic policing tasks that omit women entirely, Saudi Arabia being among the exceptions. In Western democracies, all types of policing activity are open to women, but they are still likely to be a minority in specialist areas, such as those involving firearms, counterterrorism, traffic, and riot control duties. In practice, women are more likely to be present in general patrol duties and administrative and supportive functions, especially among non-sworn personnel. With some exceptions, sworn (or warranted) female officers have a higher presence among the rank and file of operational officers than in the higher ranks. In developing and reconstructed nations outside of Europe, women are more likely to be either employed in segregated units or engaged in limited roles focused around women and children. Even so, many police forces report difficulties concerning the retention and promotion of female officers, and a few have properly considered the implications of the increasing gender ratio of women officers in terms of women's great rates of sickness absence and maternity leave.

Removing formal barriers to women in policing and creating nondiscriminatory processes in recruitment, training, deployment, and promotion are relatively straightforward tasks. First steps include removing any female quotas and removing physical ability tests in recruitment – especially military-style obstacle course tests. These "physical agility tests" could be replaced with a general health test that assesses an applicant's ability to be trained in the basic physical requirements for general duty policing as demonstrated by research and case law (Lonsway 2003). Education should also be given a high profile in selection criteria. In addition, including female representation on recruitment and promotion panels may guard against bias in selection. Enforceable policies against sexual harassment and sex discrimination should also be introduced with an internal unit responsible for their implementation. These relatively straightforward measures are likely to make a contribution towards equity, or near equity, in the ratios between female applications and female appointments and also take the edge off the more blatant forms of sexual harassment and sex discrimination on the job.

Research in developed democracies indicates that these relatively passive policies of nondiscrimination will lead to a rapid increase in the number of female recruits to between 25 % and 33 % and a slower increase in the number of female sworn officers to between 20 % and 25 % (Prenzler et al. 2010). However, the goal of full numerical equality will be thwarted by a number of factors. The activation of anti-discrimination law often requires complaints and litigation, but aggrieved parties can be deterred by cost factors, ignorance of the law, and fear of retribution or difficulties proving bias. Disadvantaged groups such as women also frequently "self-select" out of applying for employment, promotion or specialist roles because of career expectations generated in childhood, the potential conflict between work and child-rearing responsibilities, and expectations of discrimination. Just as many women police become highly skilled and eligible for promotion, child-rearing commitments often mean they drop out of policing and do not return – even when maternity leave is available (Prenzler et al. 2010). In response to these problems across occupations, affirmative action programs have been introduced to provide greater encouragement and support to women. In some police departments, particularly in the USA, resistance to integration has led to the imposition of quotas on the recruitment of women (and other minority groups), often through court-ordered consent decrees. In other jurisdictions, the focus has been more on voluntary proactive support strategies, such as targeted recruitment campaigns, pre-application classes, career development courses and mentoring programs, flexible employment options, childcare advisory services, and rejoining policies (Prenzler et al. 2010).

Conclusions

The research literature reveals a difference of view about the current status of policewomen. On the one hand, it has been proposed that a gender-neutral position prevails, whereby the sex of the officers has a diminishing effect on work-related attitudes as recruits who are similarly socialized will converge in their behaviors. On the other hand, the continuing gender discrimination position argues that gender still matters, that the increasing percentages of women have fragmented traditional police cultural, and that training cannot erase the significance of gender socialization and gendered experiences so that men and women will do policing differently (Lundman 2009).

Some research supports the gender-neutral position, such as Lundman's own, whereas other research points to differences in men and women's approach to policing (see Lunneborg 1989 for summary). Lonsway (2006) indicates that men and women officers in an American force she studied had common motivations for joining the police and, once controlling for other demographic variables, gender alone was not a statistically significant differentiating variable in terms of job satisfaction, feelings of job security, and likelihood of remaining in the force. Women have reached the higher ranks and some have been promoted to lead their forces in Western democracies, but the gender ratio still is vastly in favor of men. Lonsway suggests that there are still impediments for some women in policing, notably the sustained negative attitudes towards them by co-workers, performance double standards, whereby women still perceived they have to do better than male colleagues to be seen as equally competent. She also reports that other women believed they faced no such barriers. Yet other research argues that actually women, by preference, preserve some of the differentiations between them and their male colleagues because either they are not attracted to working in male-dominated departments, such as traffic or firearms, or domestic convenience limits long working hours (Dick and Cassell 2002). Women in Arab nations would also appear to show no appetite for gender integration (Strobl 2010).

Research data indicate that increasing the number of women does not have an adverse effect on the ability of police to carry out their duties – provided standard controls are in place in recruitment, training, and supervision and monitoring. Rather, it is highly likely that more women will make for better policing. Actually, survey results show that improved relations between the police and the community will enhance community cooperation with the police and this process is boosted with more women police. However, there does not appear to be any empirical evidence at present to support the view that increasing the number of women police will lead to more crime being solved or reduced. Positive effects are to be seen in police conduct and police-community interactions with more women officers with de-escalation of conflict situations and increased support for victims of crime. These are, of course, utilitarian arguments. There is also the stronger, arguably, overriding, argument that a policing career should be open to women if they want one on equity grounds alone.

There is indicative research that the degree of women's incursion into policing may tell us something about the progressiveness of a force and the general state of equality and democracy in the country concerned (Ivkovic 2008). (Davenport 2008) argues that without a critical mass of women in policing, there is a democratic deficit. If policing is to actively engage with citizens, she argues that those citizens must recognize the value of the service, feel that the service is accountable to them, and be able to evaluate its performance. One way to achieve this is for the police service to "look" more like the communities it serves to underpin its legitimacy in a democratic society.

The move towards full integration for women police is perhaps more of a concern in Western democracies where the ideal of equality is well established following the "second wave" of feminism in the 1960s and 1970s. However, there are different paths to equality, and recent work by Natarajan (2008) suggests that in some jurisdictions it is advantageous to adopt a two-step approach to equality. She argues that in some societies the creation of separate police units is justified by the level of hostility to female police and the specific needs of female client groups. Research in other developing nations supports the case for a more culturally appropriate, staged approach to the involvement of women in policing (Strobl 2010; Natarajan 2008). Natarajan (2002) found an evolution in the views of Indian women police in traditional roles towards a preference for greater integration as their experience grows and they become more confident in their ability to carry out the full range of police duties. She concluded that models of policewomen's progression such as Brown's which was developed to account for the experiences of women in Western democracies can be applied more widely but that progress towards integration in traditional cultures is likely to be slower and suffer more reversals than in Western countries. Strobl (2010) proposes that women involved in policing in the GCC countries are deployed, as are policewomen elsewhere, in duties related to children and young offenders, yet are unsympathetic to the plight of migrant working women. Moghadam (2010, p. 4) observes "while women should be present in diverse occupations and professions for the sake of equality and rights, feminists should not be under any illusion about the extent of institutional change, especially in such domains of the state's repressive apparatus as the police force or the military apparatus". Similarly, Clarke (2008) showed that while postcolonial states in Africa took on the institutional machinery left by the colonial power, there was little critical analysis of new models, especially the ones where women may play full part in. Thus, an "add-in" women approach was adopted without questioning the gendered premise of security sector and its role on government.

So there do seem to be some universals: women's entry into policing was delayed and contested, women police everywhere suffer some form of sexual harassment and discrimination, and there is no evidence that having women in policing is detrimental to performance. The efficacy of policewomen's departments or women-only police stations is equivocal with often support for early successes but more dubious evidence of the sustainability of those successes. There is clear evidence that women are less likely to use or misuse physical force. As yet, there is no evidence of truly integrated police forces.

Women of Color and Crime

Hillary Potter[1] and Kenly Brown[2]
[1]Department of Sociology, University of Colorado Boulder, Boulder, CO, USA
[2]Department of Sociology, University of California, Santa Barbara, CA, USA

Overview

The most common profile of a woman imprisoned is one who is impoverished, is undereducated, has sporadic employment, and is a woman of color. While scholars in years past have cited the need for more research on women offenders of color (Britton 2000; Enos 1997; Russell-Brown 2004), there remains a dearth of information on this group, especially from a feminist perspective. Because of the varied perspectives of women of color, scholars argue that mainstream criminological theories may be inadequate to explain offending behavior by women of color (Joseph 2006; Russell-Brown 2004). Further, studies that have included women of color often fail to disaggregate women from men of color or from White women (Joseph 2006; Russell-Brown 2004).

This entry will focus on a variety of female offenders within the following races and ethnicities: African American, Latina, Native American, Asian, and Asian American. A summary of the theoretical background of feminist work and what feminist scholars have found to be pertinent when studying women of color is provided. This entry includes statistical data and analyses on offending, arrest, and incarceration rates. The races and ethnicities chosen are by no means exhaustive, but they represent growing interest in research on women of color involved in crime, particularly from a feminist or intersectionality perspective.

Theoretical Background

Mainstream feminist theory comprises three eras of development, referred to as waves, which began in the 1700s. *Mainstream* feminism or feminist theories include those efforts made toward gender equality by groups of predominantly White women feminists. The use of the term *mainstream* relates to the considerable attention – both negative and positive – given to the efforts of these women to seek social and economic equality with men, as opposed to that afforded smaller, marginalized groups of feminists. Mainstream feminist theory places gender as the primary consideration in women's liberation efforts (Hooks 2000). However, women of color have expressed difficulty in identifying with mainstream feminist theory because of its focus on this single aspect of womanhood and because the lives and concerns of White middle-class women were placed at the forefront of the liberation efforts (Collins 2000). Women of color regularly convey that they deal not only with issues of gender inequality but with racial inequality, as well (Crenshaw 1991; King 2003). It is this status, Kimberle Crenshaw (1991) argued, that relegates women of color to an invisible class and pulls these women's loyalties in two directions, that is, feeling the need to either choose between being loyal to feminist ideas and being loyal to their racial or ethnic community. A pioneer of intersectionality studies, Crenshaw has advocated that race and gender are not exclusively mutual, but instead these ascribed characteristics create a multitude of experiences for women that can no longer be seen as monolithic.

Studying women of color offenders allows for a more nuanced and holistic picture of women who participate in criminal offending. However, criminologist Vernetta Young (1986) emphasizes that few studies consider the race effect on gender and, likewise, few studies consider the gender effect on race. Young asserts that when African American women, in particular, are discussed in the research, they are often addressed in relation to Black men and White women, resulting in the unworthiness of research on Black women's experiences with crime. More than two decades later, criticisms continue to be expressed about the minimal amount of research on criminally offending African American women, suggesting that African American women do not warrant attention within the discipline of criminology (Russell-Brown 2004). The same criticism can be lodged about research focusing on other women of color, as even fewer investigations have been undertaken on Asian American, Latina, and Native American women.

The incorporation of a feminist perspective that insists on viewing multiple identities in conjunction with one another in criminology has aided in moving away from a view that there is something pathological about women of color's involvement in crime. Generally, feminist scholars assert that social disparities and the "get tough on crime" policies are major factors explaining the high numbers and rates of women of color found in the criminal justice system. Worsening economic conditions are seen as a particularly important factor in the criminal activity of women of color (Diaz-Cotto 2006; Johnson 2003b). There is ample research that shows there is a connection between one's social class and criminal behavior where those who encompass the more impoverished economic statuses in society commit more crimes than those who occupy middle or affluent statuses (Joseph 2006). Discrimination due to socioeconomic status, race, ethnicity, and gender is also purported to determine the inequitable representation of women of color in the criminal justice system (Diaz-Cotto 2006). Finally, similar to White women in the criminal justice system, a high proportion of women of color engaging in crime have experienced abuse and violence by family members, intimate partners, and others. Feminist scholars focusing on women of color – and placing women of color at the center of the analysis – highlight these factors as major contributors to the overrepresentation of women of color in crime and the criminal justice system.

Feminist and intersectionality theoretical analyses of the criminal experiences of women also place considerable emphasis on the effects of stereotypes. Positive and negative images abound when considering women of color. However, for some women of color, the adverse images surpass the more endearing images. Feminist scholars assert that stereotypes and negative images of African American women are a major contributing factor to their overrepresentation in the criminal justice system (Johnson 2003a). These include images of African American women as jezebels, sapphires, welfare queens, crack whores, matriarchs, and masculine and emasculating (Collins 2000; Goodwin 2003; Johnson 2003a; Huey and Lynch 1996; Young 1986). In the 1986 article "Gender Expectations and Their Impact on Black Female Offenders and Victims," Vernetta Young argues that criminologists' treatment of African American female offenders focuses primarily on how they are not like other women offenders and on the similarities between crimes committed by African American women and men. Huey and Lynch (1996) also discuss how stereotyping of African American women dictates how mainstream criminology has interpreted African American women's participation in crime. One example is the view of African American women as matriarchs or welfare mothers; these views support the ideology that the African American woman is responsible for all crimes committed by African Americans because she has emasculated men and is an inadequate parental figure for her sons who will, therefore, become irresponsible men. Assumptions are also made about other women of color and then connected to their offending behaviors, which will be highlighted in some research discussed in this entry.

Nature of Offending

As indicated above, there is a need for more research in criminology that considers, simultaneously, the intersection of race and gender and the comparisons between groups by disaggregating the study subjects. Although statistical information regarding the race of women under correctional supervision in the United States is made available from government sources, few additional statistical data are readily available that provide a comparison by race among women offenders within large data resources such as the FBI's Uniform Crime Reports and the National Crime Victimization Survey. While statistical information on variations between females and males and between certain race groups is included in these data sources, only a small amount of information is provided on gender-by-race comparisons by the US federal government agency that releases these data. However, some criminological research, which will be detailed later, has utilized these datasets to analyze gender by race. Further, a few other statistical analyses have been performed to gauge the overrepresentation of women of color in criminal offending and involvement in the criminal justice system. For instance, a study analyzing the Monitoring the Future survey of high school students across the United States found race/gender variations among girls' reports of their use of violence (Goodkind et al. 2009). African American girls were found to have reported engaging in fights at greater rates than girls of other races. The fighting rates reported by African American girls demonstrated that they are as likely to report fighting as Asian American boys and White boys (but less than Black, Latino, and Native American boys). Latinas, Whites, and Asian Americans succeeded African American girls' rates of fighting, and Native American girls reported the lowest rates of fighting.

Studies such as the Monitoring the Future survey provide some indication of prevalence of violence, showing differences by race and gender, but feminist and intersectional theoretical analyses provide explanations for the higher reported rates of violence among certain girls of color – in particular, African American girls. Nikki Jones's (2010) ethnography of the lives of African American girls who engage in violence affords a nuanced understanding of the social forces that propel certain girls to use violence. Examining African American girls living in low-income urban neighborhoods that experience a high level of street violence, Jones found their lives revolved around what she identifies as the three Rs: reputation, respect, and retaliation. Jones's Black feminist analysis dissects the negotiations that African American girls in violent urban settings must make between their identity, gender expectations, and the violence with which they are confronted in their communities.

Regina Arnold's (1990) research also provides insight into the way certain life conditions, beginning in childhood, lead some African American girls to engage in violence and other offending behaviors. Utilizing a feminist and intersectionality perspective, Arnold considered the social forces of patriarchy, racism, and economic marginality. In her study of 50 African American women in a city jail and 10 African American women in a state prison, Arnold discovered that gender- and class-based oppression, along with being blamed by criminal justice officials for their own victimization, was a pattern among the women she interviewed. This criminalization, while the women were young girls, was exacerbated by the women's "structural dislocation" from their families and their schools during their formative years. The women's young lives were besieged with sexual and other physical abuse, poverty, and inadequate educational experiences. This dislocation and lack of a stable familial alternative propelled the women into deviant and delinquent behaviors early in their lives, such as running away from home, thievery, and truancy. Criminal labels were applied to these women from their youth through adulthood. As the women continued engaging in criminal behaviors when they became adults, addiction to drugs became another obstacle to overcome. In sum, from an early age, the women in Arnold's study engaged in delinquent behaviors as an "active resistance" to their victimization.

Beth Richie's (1996) research also utilized a feminist perspective to reveal circumstances that lead women to crime. Richie explored the effect of abuse as a pathway to jail or prison for African American women and, in so doing, developed a theory of "gender entrapment." Richie explains why the women remained in abusive relationships and how being in these relationships led to women committing criminal acts by highlighting the compounding effect of African American women's experiences with marginalization in public arenas. Utilizing comparison groups of African American women in jail who had not been battered and battered White women, Richie concluded that battered African American women participated in criminal offenses as (a) a means of delaying further violence by their intimate partners, (b) an extension of their loyalty to the African American men who abused them because of a sense of racial identity and unity and the need to maintain some semblance of closeness with their abuser, (c) a perception of the duty to protect African American men from racism they experience in the public sphere, and (d) a way to get arrested and incarcerated in order to escape the violence from their intimate partners, for at least a short period of time.

Like Richie, other feminist scholars have also considered the outcomes of intimate partner violence against women of color. There is a notable scarcity of research on Asian and Asian Americans pertaining to criminality. Nevertheless, two feminist scholars who studied intimate partner violence among Asians and Asian Americans suggest that their violence is often a reaction to victimization by their partners, and it is criminalized within many US jurisdictions. Margaret Abraham (2000) considered South Asian immigrant women's resistance in her research. Although few women in Abraham's study used physical violence against their batterers, Abraham demonstrates how the emotional captivity of abuse, coupled with cultural standards of womanhood, can be a catalyst to resistance that would be deemed criminal behavior by many state laws.

In her study of Vietnamese immigrant women who had been abused by their intimate partners, Hoan N. Bui (2004) documents the women's legal consequences for physically defending themselves from their abusive partners. The implementation of mandatory arrest laws throughout the United States has had unintended outcomes for battered women who fight back. As evidenced in Bui's study, battered women were arrested because of physical evidence visible on their partners and many of the partners' exaggeration or misrepresentation of the incident. There are additional consequences for women of color. Bui demonstrates that the women's gender, race, class, and immigrant status place them at a disadvantage for receiving the assistance they need by considering them as offenders instead of victims.

Few scholars focus on female Native Americans' involvement in the criminal justice system as perpetrators of crime. However, like the approaches with Asian and African American women, the feminist and intersectionality work on violence against Native American women can be used as a basis to contemplate offending among Native American women. Native American activist and feminist scholar Andrea Smith (2005) provides a macrolevel approach to Native American women's involvement in criminal activity by focusing on state-sponsored and corporate-sponsored violence against Native American women. As with other research that has found a correlation between victimization and future offending among women, criminogenic effects of state and corporate violence may too compel criminal activity among Native American women.

The effects of drug use also play a role in women's offending. Self-report surveys, such as the Monitoring the Future survey, provide some indication of variations in drug use by race and gender. White girls had the highest reporting rates for alcohol use. Native American girls reported the next highest rate of alcohol use, followed by Latinas, Asian Americans, and then African Americans. For marijuana use, Native American girls reported the highest use, closely followed by White girls. Latinas, African Americans, and Asian Americans (in descending order) reported the lowest levels of marijuana use. Other research, conducted with women in prison, has shown that in comparison to other women who are imprisoned, Latinas are five to eight more times likely to abuse alcohol, ten times more likely to abuse drugs, and 27 times more likely to use cocaine (Covington 1998).

Feminist and intersectionality approaches provide important interpretations of these racial differences in drug use and participation in illicit drug markets. Lisa Maher's (1997) ethnography of women drug users considers the intersectional identities of her study informants. Importantly, Maher goes beyond the Black/White binary of racial analysis by including the experiences of Latinas and White women. Women in the study, mostly Latina, were typically involved in the consumption of drugs, in dealing drugs when men were found to be scarce due to arrests, and in sex work to keep up their addictions. Although identities of age, immigrant status, and familial and neighborhood ties affected the way labor was divided in the drug and sex markets, Maher asserts that race and gender were the most salient factors. Race and gender determined the extent of the earnings for women working in the illicit drug and sex trades, and White women sex workers initially were able to demand, and receive, higher rates for sex work than women of color.

Arrest and Prosecution

According to federally collected statistics, there has been a steady decrease in the overall US crime rate over the past couple decades; however, there has been a significant rise in the number of arrests and incarceration of women in the United States criminal justice system. The War on Drugs has had a more detrimental effect on women than on men with regard to the substantial rise in arrests and incarceration rates of women for drug-related offenses (Diaz-Cotto 2006). This is evident in that between 1980 and 2009, the female arrest rates tripled for drug possession (a 225 % increase) and doubled for drug sales or manufacturing (a 237 % increase) (Snyder 2011). Male drug arrest rates also increased, but at a lower rate, with a 104 % increase in male arrests for drug possession and a 205 % increase for drug sales or manufacturing. Snyder (2011) concludes that the male arrest rate for drug sale and manufacturing in 2009 was 68 % above the male arrest rate in 1980, while the female drug sale and manufacturing arrest rate in 2009 was 123 % above the 1980 rate. Women and girls have also been arrested at greater rates than males for other offenses. In 1980, females accounted for approximately 12 % of the arrests for aggravated assault. The proportion of female arrests for aggravated assault increased to 29 %

in 2009, which is double the rate in 1980. In contrast, the male arrest rates for aggravated assault in 1980 and in 2009 are similar. However, when examining the growth rate in arrests for aggravated assaults between 1980 and the peak year of 1995, female arrests for this offense increased by 150 % compared with a 63 % increase in male arrests. Similar arrest trends are evident for robbery, simple assault, and larceny-theft.

Certainly, women of all races have been significantly affected by policy and legal enhancements that have ensnared droves of women in the criminal justice system. However, statistical evidence indicates overrepresentation in arrest, conviction, and incarceration rates of women of color. Some research has established that African American women have a greater likelihood than White women of being arrested and charged for more serious crimes (Chesney-Lind 1997; Greenfield and Snell 1999). Analyzing the FBI's Uniform Crime Reports for three large states (California, Florida, and New York), Coramae Richey Mann's (1995) research also delineates variations in arrest rates of women by race. Women of color were found to have been arrested more frequently for violent crimes such as aggravated assault and robbery. Public order crimes, such as alcohol- and drug-related offenses and sex work, were the most frequent arrests for White, African American, and Latina women. However, Latinas and African American women have been arrested for sex work at higher rates than their proportion of the general population. The most frequent types of offenses Native American women are arrested for were drunkenness, thefts, and driving under the influence of alcohol. Only one of the three states (California) reported arrest data for Asian American women. The most frequent arrests for Asian American women were for theft-related offenses, while drug-related offenses were among the least frequent arrests. It is important to note that there are different ways crime is depicted based on race and gender depending on the source of information.

The experiences of women of color in the criminal justice system have been afforded growing attention from feminist scholars. One study addresses the utilization of the cultural defense tactic that can either reduce accountability or exacerbate punishment for Asian Americans. Legal scholar and critical race feminist Leti Volpp (1994) provides an extensive account of the influence cultural defenses can have on court cases specifically within the Asian American population. The case of *People v. Helen Vu* is one in which Vu is a female defendant who strangled her son with a cord from a window blind. She was ultimately convicted of second-degree murder and given 15 years to life in prison. When the defense counsel constructed a cultural defense case, the court ruled that the defendant committed the crime out of her own volition and ignored the defense attorney's argument that it was connected to her Asian background (Volpp 1994). Consequently, Vu did not meet her gender stereotype, which is to take care of her son as a mother is supposed to, and since she deviated from this role, she received a severe sentence (Volpp 1994). Volpp suggests that this case study shows the importance gendered stereotypes and expectations can play in a case and that if one were to meet those stereotypes, the less severe the punishment will be.

Involvement in drug markets is the leading crime for which women are charged and convicted. Scholars have researched the influence that culture can play on the verdicts Latina women receive. Holmquist (1997) analyzed the significance of Latinas meeting cultural expectations of docility and passivity to their partners and their involvement in the drug market. Two case studies were used, *United States v. Castaneda* and *United States v. Avila*, to exemplify how women are either taken advantage of by their partners or their naïveté of the work they are doing for their partners. The court found Maria Avila and Ana Reyes responsible for the distribution of cocaine and laundering money, even though their defense team argued that they were blindly following Jose Reyes. However, in Leticia Castaneda's case the court dropped her possession of six firearms to one because her defense was that she had no idea firearms were involved in the narcotics drug trafficking ring, and she was only following orders from her partner. Conclusively, the cultural defense upholds racial and gender stereotypes of Latina women when convicted of criminal acts; these stereotypes can either assist or be detrimental to these women. Feminist perspectives on Latinas' involvement in criminal activities have revealed that Latinas are often rebelling against the subordinate roles that society, in general, expects them to play (Diaz-Cotto 2006).

Sentencing and Incarceration

The number of women incarcerated, regardless of race, has gone up by 700 % since 1977, but Latinas and African American women make up 70 % of this population (Tapia 2010). While White women have a greater chance of being placed on probation after arrest and conviction, women of color are disproportionately sentenced to prison (Greenfield and Snell 1999). Almost two-thirds of women who are incarcerated are women of color, while two-thirds of women who are on probation are White women (Bloom et al. 2004). On December 31, 2009, one in every 703 Black women and one in every 1,356 Latinas were incarcerated in US federal and state prisons, while one in every 1,987 White women was incarcerated.

The War on Drugs in the United States, beginning in the 1970s, contributed to the spike in incarceration rates of women due to the requirement of mandatory minimums and sentencing guidelines, which lead to lengthy prison sentences served by convicted drug offenders (Levy-Pounds 2007; Shelden 2004). Due to women's lower status in drug organizations, they often do not have enough information to bargain with to reduce their sentencing when questioned about the drug operation or identifying the drug ringleaders (Sokoloff 2005; Morash 2006). Women, in general, are more likely than men to be given mandatory minimum sentences for much smaller quantities of drugs (Sokoloff 2005). Currently, about 40 % of women in prison are in prison for drug-related crimes, with a majority of these being women of color (Shelden 2004). Juanita Diaz-Cotto (2006) reports that, in New York, Latinas were more likely to be imprisoned for drug-related offenses than were Latinos (males). Mann's (1995) study found racial disparities among African American, Latina, and White women regarding drug-related offense sentencing. Of the women in the study, which compared several states, 18.7 % of them were Latinas in California who had been arrested for drug offenses and represented 26.1 % of women imprisoned for drug offenses. African American women comprised 30.5 % of arrests and 34.1 % of prison inmates for drug offenses. While African American women and Latinas were overrepresented in prison for drug offenses, White women comprised 48.5 % of arrests, but only 38.3 % of prison sentences. It is evident that the consequences of the War on Drugs campaign disproportionately affected impoverished women of color and their families (Levy-Pounds 2007). As such, some feminist researchers have declared the War on Drugs as a war on women of color (Bush-Baskette 1998).

There are a small number of studies that have looked at the number of Native American females incarcerated, and official prison statistics have been challenged by some scholars as inaccurately depicting the number of Native American females incarcerated. According to one study (Abril 2003), incarcerated Native American women were undercounted in the Ohio Reformatory for Women in Marysville, Ohio. Data retrieved from the institution through responses to open-ended questions distributed to all of the women in the facility revealed discrepancies between the numbers of self-identified Native American women and the numbers reported by the prison. Results from the survey showed that the agency reported there were only two Native Americans, while 255 reported that they self-identified themselves as Native American. This finding is important to the criminal justice system because officials believe Native American women are an insignificant proportion of the prison population and therefore warrant little research attention (Abril 2003; Russell-Brown 2004). Though occurring at a slower rate than feminist research on African American women, feminist scholars have begun to consider the lack of research on the criminal justice system involvement of Native American, Latina, and Asian American women.

Conclusion

Feminist scholarship has shifted its theoretical perspective to be more inclusive of girls' and women's racial backgrounds and the influence this ascribed status can have on social attainment, or detainment. Women of color are in a unique position where social stereotypes and images and bias can influence arrest, conviction, and incarceration rates. It is essential to consider the experiences of women of color offenders from a feminist perspective in order to understand some of the unique ways in which they are propelled into criminal behavior and to help explain their overrepresentation in the criminal justice system.

Women Police

Dorothy Moses Schulz
John Jay College of Criminal Justice, The City University of New York, New York, NY, USA

Overview

Women entered policing in a number of countries, including the United States, at the end of the nineteenth century and in the early twentieth century as educated specialists to assist male police officers in their interactions with women and juvenile offenders and victims. Their entry into municipal policing was part of a movement of women out of the home and into charitable work that had a few years earlier led reformist women into jails and prisons.

Women's official presence in policing in the United States is often recognized with the granting of enforcement authority to social worker Lola Baldwin by the Portland, Oregon, Police Department in 1905 to protect women and girls from the expected crowds of rowdy men at the Lewis and Clark Exposition (a type of world's fair) and the department's decision in 1908 to create a Department of Public Safety for the Protection of Young Girls and Women with Baldwin as director. Due to the localized nature of law enforcement in the United States, the recognition given to Baldwin, and in 1910 to Alice Stebbins Wells by the Los Angeles Police Department (LAPD), has tended to minimize the women who as early as the 1870s were employed as sheriffs' deputies, assisting their sheriff husbands either officially or unofficially. Women also entered federal law enforcement before they entered local policing; women deputy US marshals have been identified as early as 1890, mostly in the American west (Schulz 2004, 2005). Despite these earlier appointments, the backgrounds, aims, and duties of Baldwin and Wells have come to personify the initial roles of policewomen primarily as social workers assisting women and juveniles who came into contact with police as victims or offenders.

From their first entry into corrections and law enforcement, women's roles evolved from volunteers to paid professionals. They developed a professional ethos closely aligned with social workers rather than male police officers. Their numbers and roles expanded during both World War I and World War II and contracted during periods of economic depression, but with few exceptions, women police officers' responsibilities were closely associated with juveniles, women, and vice enforcement until the 1960s, when they diverged from their specialist roles to undertake the full range of police duties on an equal basis with their male colleagues. This was the result of a number of legal changes precipitated by women's changing roles in the work force and in society generally. Conflict over the changes within the police establishment was evidenced by the large number of court cases and legal consent decrees that enforced women's demands for expanded access to assignments throughout police departments and for promotional opportunities.

Outside municipal policing, at the county level, a small number of women became not the sheriff's wife or widow, but the actual sheriff. Although in each case her status was an outgrowth of her husband's status, a few of the women were active sheriffs and in many ways were not that different from many women in politics who have and continue to literally or figuratively inherit their positions from spouses or fathers. By the 1970s, though, a few women broke direct family links and were elected on their own merits (Schulz 2004).

By the first decade of the twenty-first century, women constituted about 15 % of law enforcement officers nationally (Schulz 2012). Percentages varied considerably by size of department and type of agencies. With only few exceptions, women constituted a larger percentage of officers in large municipal police departments, and a smaller percentage of state police agencies. Within federal law enforcement, the figures varied widely, from female special agents making up about 30 % of Internal Revenue Service (IRS) agents to only single digits in the Drug Enforcement Agency (DEA) (Reaves 2006). Women today hold all ranks, including having served as chiefs of such large city departments as Atlanta, Boston, San Francisco, Milwaukee, and Washington, DC; two have led state police agencies, and a small number have risen to the highest ranks of federal law enforcement.

From Jail and Prison Reformers to "Municipal Housekeeping"

The entry of women into policing first as matrons and then as policewomen can be traced directly to the period that began in the 1820s, when in England and somewhat later in the United States, Quaker and evangelical women entered penal institutions as volunteers to provide religious and secular training for female inmates. Within a short time, other upper-middle-class women joined these volunteers in trying to reform the inmates, primarily through religious instruction, and training them for jobs as domestics in Christian homes (Freedman 1981; Rafter 1992). By focusing on sexual exploitation as a major cause of women's criminality, these volunteers helped to formulate what would become a major focus of early policewomen, specifically working with women and young girls to keep them away from places deemed immoral. This included dance halls, pool rooms, movie theaters, and other public entertainment venues, due in large part to the presence of unattached men. The availability of alcoholic beverages at many of these locations was also seen as contributing to promiscuous behavior. Policewomen also became involved with the mothers of these juveniles, often reflecting class distinctions that resulted in their criticism of the parenting styles of immigrant and poorer women.

Women's expanding roles in society were also fostered by the American Civil War in the 1860s, which led to great activism among women in both the north and the south (O'Neill 1969). With so many men off to war, women formed vast networks of voluntary associations that led them to develop the concept of "municipal housekeeping" – which allowed them to move into the public sphere without violating women's traditional role in the home. Beginning at this time and continuing through the Progressive Era, generally defined as from the 1890s to the post-World War I era in 1920s, municipal housekeeping came to encompass virtually all activities that placed newly established government agencies in contact with women and children.

At a time when fewer social welfare organizations existed, portions of what is now the criminal justice system provided an entry for women into these areas. Concerns for women in jails and prisons gave way to concerns about those in police custody. Police stations often functioned as homeless shelters, and many of those housed there were women and their children. This led female reformers to demand that women be available to assure that women seeking shelter, almost always poor and frequently inebriated, were not vulnerable to the advances of male keepers (Schulz 1995). Behind the considerable efforts of the Women's Christian Temperance Union (WCTU), joined later by the General Federation of Women's Clubs (GFWC), and the Florence Crittenden Circle (which financed homes for unwed mothers), these women were able by the 1880s to convince a number of police departments to hire matrons.

The matrons generally lacked full police authority and were often widows selected by the reformers because the position came with a small set of rooms in the police station. They provided custodial care for incarcerated women and children or those using the police stations as shelters. Within a decade, some matrons had expanded their duties to assist police in questioning women. By the time Lola Baldwin and Alice Stebbins Wells were appointed to duties outside the stationhouse, many matrons were doing similar tasks without official recognition.

Despite difficulties in generalizing, policewomen differed from matrons in a number of important ways: they possessed powers of arrest similar to male police officers, they investigated cases involving women and children rather than merely providing custodial care, and they were generally educated, upper-middle-class women who viewed themselves as superior to their male colleagues, most of whom were immigrants with less education and of lower social class than the policewomen (Schulz 1995). Yet these distinctions could often be blurred; some cities, particularly small ones, often used the titles matron and policewoman interchangeably.

Developing a Professional Ethos

In large part due to their different backgrounds from policemen and their focus on issues surrounding women and juveniles, policewomen developed a professional ethos in advance of policemen and one that placed them within feminist and reformist movements. Until they formed their own organization, the International Association of Policewomen (IAP), in 1915, many participated in the annual meetings of the National Conference of Charities and Corrections (NCCC – later the National Conference of Social Workers [NCSW]). It was at an NCCC conference that Wells announced the formation of the IAP. Only in 1922 did the International Association of Chiefs of Police (IACP), recognize policewomen as essential members of modern departments. The recognition came at the urging of Chief August Vollmer, of Berkeley, California, who served as president that year. Vollmer, a reformer remembered for his advocacy of police training and his attempts to raise the educational level of police officers, was one of few chiefs who supported policewomen, who were most likely to be appointed at the urging of outsiders over the objections of police chiefs.

Policewomen's supporters and advocates were those working in or seeking to expand women's influence in corrections, the juvenile courts, and in probation and parole. In none of these fields did the women seek close association with male colleagues. Women in corrections advocated for women's prisons and jails; in the juvenile courts, they sought female referees (judges) to adjudicate cases involving girls; and in policing, the women sought women's bureaus. This organizational model echoed corrections leaders' success in creating and taking control of women's prisons and juvenile institutions. Here, women were able to achieve top positions as wardens of all-female institutions as early as 1873, when Indiana established the Reformatory Institution of Women and Girls. It was the first independent women's prison, the first to have a female superintendent, and the first to be run by an entirely female staff (Freedman 1981). While early policewomen saw the development of women's bureaus as heralding their success, over time, and as the women's career orientations changed, the bureaus had the affect of isolating them from mainstream policing.

Others who advocated for appointments of first matrons and then policewomen were temperance leaders, social workers, and social hygienists (public health officials and medical practitioners). All were in the mainstream of what historian Anthony M. Platt (1977) termed "child savers," members of the newly developing professions that revolved around protecting children. Although not all child savers were women, Platt described the movement as influenced by the maternal values of middle-class women who extended their homemaker roles of family and childcare into the public sphere. In corrections, this led to women's institutions being set up in a cottage format that attempted to replicate a family structure (Freedman 1981; Rafter 1992).

In policing, even prior to the development of women's bureaus, it led to some women being described as "city mothers" and organized into a City Mother's Bureau. In the LAPD, Lucy Gray Thompson began using that title in the 1880s. The bureau was retained until 1963, when many of its duties were taken over by social welfare agencies (Appier 1998). Its affinity with these agencies can be seen in descriptions provided by Gray's daughter, Aletha Gilbert, who succeeded her mother. By 1922, Gray and her two assistants had established a day nursery for children of working mothers that was staffed by four nurses and also provided counseling to women and children (Gilbert 1922; LAPD 1974).

Similarly, women's bureau directors highlighted their facilities' homelike atmospheres. They described them as places women and girls could come for aid and advice and discuss their problems with women officers. Descriptions included the bureaus' locations away from the male police officers and their having easy chairs, couches, bright-colored curtains, flowers, and even caged canaries at the windows (Appier 1998; Schulz 1995).

At a time when policemen were required to have minimal education requirements beyond the ability to read and write English, the leaders of the policewomen's movement placed great emphasis on hiring women with college or at least high school diplomas and suggested hiring women with prior experience in social service, education, nursing, or fields with public contact. In addition to providing a clear delineation from male officers, these stringent requirements also set the policewomen apart from the less-educated matrons.

The high entry standards were endorsed not only by white women but by the African-American clubwomen who lobbied for appointments of policewomen of their race. Despite more limited opportunities for African-American women, the earliest black policewomen were accomplished members of their communities. Georgia Robinson, the first African-American female member of the LAPD, and possibly the first African-American policewoman, for instance, initially was appointed a matron based on her civic involvement and in 1916 was promoted to policewoman. Although records of the earliest black women appointed to the New York City Police Department (NYPD) are incomplete, at least one was a nurse who had also been a high school teacher. Others were often teachers, social workers, civic leaders, or ministers' wives (Schulz 1995). Cities that hired black policewomen around this time included Chicago, Washington, DC, Indianapolis, and Columbus and Toledo, Ohio; all the women were hired to work with African-American women and juveniles, primarily to patrol dance halls and other areas where guardians of morality were believed to be necessary (Dulaney 1996).

Two visible signs of police authority that the women eschewed were uniforms and firearms. United States policewomen virtually always worked in plainclothes, unlike early British policewomen, whose uniforms were described by Mary Sullivan, the head of the NYPD Women's Bureau, as "unattractive, mannish suits, topped by a helmet that looked like a soup tureen…" (Sullivan 1938, pp. 283–284). In addition to what was likely disdain for uniforms based on their social class and education level, the policewomen and their advocates stated that working in street clothes would allow them to interact with women and girls without the stigma of having been approached in public or visited at their homes by police officers. Most also went unarmed and avoided physical confrontations, although a number of exceptions existed. For instance, in San Francisco, Kathryne Eisenhart, one of the policewomen who came to be known as the “Three Kates” along with Kate O’Connor and Kathlyn Sullivan, was so seriously beaten during a 1917 arrest of two brothers that she retired on disability in 1931 after recurring physical problems. The two policewomen hired in San Diego in 1926 were described as “excellent marksmen,” one of whom shot a would-be assailant who lunged at her during a stakeout in a local park. A feature article about Detroit’s policewomen during World War II mentioned that some carried firearms while others chose not to (Schulz 1995).

By the 1950s, though, most departments had issued uniforms and firearms to their policewomen. The uniforms were primarily for special events, but the women were now expected to carry the firearms, along with handcuffs and their personal items, in handbags made specifically for this purpose. Indicating changes in the women’s view of themselves, Lois Lundell Higgins, president of the International Association of Women Police (IAWP), the successor to the IAP, in 1958, called policewomen the feminine arm of the law, the one that “rocks the cradle, and sometimes shoots a wicked .38” (Schulz 1995, p. 122).

While Higgins and the majority of the policewomen of her generation did not interpret this to mean policewomen should police on an equal basis with men, by the late 1960s some younger women chafed at the limitations to their careers brought about by unequal hiring standards, dissimilar training, fewer assignments open to them, and lack of upward mobility. At the time, women who were completely shut out of state policing or federal law enforcement positions began to question why these careers were closed to them.

The Uniformed Patrol Revolution

Until women began to patrol in uniform in marked police cars, the changes in their roles had been evolutionary. Depending on factors in particular departments, policewomen’s roles had changed from overwhelmingly preventive and investigative to enforcement-oriented. In some cities women worked in uniform (generally dark-colored skirts and white or light blue blouses, black or navy blue pumps, and the-by-now common utility shoulder handbag) at parks, beaches, and other places of public amusements. Many were involved in dangerous undercover assignments. Others worked with male colleagues on sensitive investigations. A woman was needed for the case, whether for her ability to blend in better than a man or men alone could, whether because it was perceived by male supervisors that she would be more able to elicit information from women victims or offenders, or for other reasons. Always, though, she was selected because she was a woman.

But having women patrol in uniform in a marked police car answering general calls for service from the public was not an evolution – it was a revolutionary change. This is belied by the casual way in which it occurred. In September 1968 in Indianapolis, policewomen Betty Blankenship and Elizabeth Coffal reminded their chief, Winston Churchill, that, years earlier, as a police academy instructor, he had commented that if he were ever in charge, he would permit women on uniformed patrol. With one’s day notice, he kept his word, sending the women out together as the history-making Car 47. Dispatchers, at the time mostly male, avoided sending the women on assignments; male officers worried the women would not be able to protect themselves or other officers. But the patrol partners received grudging acceptance after they arrested a man who had beaten a woman to death. Although neither remained on patrol for their entire careers, they opened up to women opportunities that had not previously existed. Within a year, Washington, DC, announced the end of separate entry requirements for male and female officers and within 2 years women also patrolled in Miami, Florida (Schulz 1995).

In conjunction with a number of earlier lawsuits against individual departments opening up civil service promotion ranks to policewoman, a number of laws passed in the 1960s and 1970s provided support for women’s demands to end sex-based titles and assignments and for full participation in policing. These included the 1963 Equal Pay Act, which had little effect until the

1970s when titles of patrolman and policewoman were changed to the unisex police officer. Its effectiveness had been hampered; because women worked under a separate title with different duties, their work had not considered equal. The 1964 Civil Rights Act also had little impact until 1972, when its provisions were extended to government agencies. Funds for police departments, though, played a major role in forcing change. The 1973 Crime Control Act specified that grantees would be ineligible for funds if their employment practices were considered discriminatory. On that basis, police departments – including state police agencies – that had avoid hiring women or equalizing requirements for male and female applicants and placing women on patrol began to comply.

At the federal level, in 1969 President Richard M. Nixon had issued Executive Order 11478, which prohibited discrimination in employment on the basis of race, color, religion, sex, national origin, handicap, or age. Earlier rulings had allowed women to be barred from positions that required carrying a firearm, so only after 1971, when the US Civil Service Commission cancelled the exemption, did women become eligible for federal law enforcement positions. The effect was immediate; that same year, the US Secret Service and the US Postal Inspection Service became the first agencies to hire women special agents, joined the following year by the Federal Bureau of Investigation (Schulz 2005, 2009).

Conclusion and Future Research

What does the future hold for women in law enforcement? The trends appear contradictory. The percentages of women overall in law enforcement agencies have not increased in the last decade. Combining all levels of agencies – local, county, state, and federal – women comprise about 15 % of sworn officers (Schulz 2012) yet the differences in career orientation between the men and the women appear to be shrinking.

Today, after almost a half century of women on patrol, it is difficult to imagine the thousands of studies that were undertaken to determine whether women were capable of patrol, whether they would make the same numbers and types of arrests as men, whether men would work with them, whether citizens would accept them, and, in general, whether women and men policed in similar or in different fashions. The studies, almost all focused on municipal policing, have resulted in contradictory findings, but generally found few substantive differences between female and male officers and sometimes have resulted in contradictory conclusions. But because the studies generally looked at only one department, or were based only on the patrol officers, or surveyed a self-selected group of women officers at conferences sponsored by women's law enforcement groups, it is difficult to generalize their findings beyond that women are competent patrol officers and that their male colleagues have come to accept their presence albeit sometimes still grudgingly.

In a meta-analysis of past research, Carol A. Archbold and Dorothy Moses Schulz (2012) found that recent studies have found more similarities than differences between men and women, while earlier studies seemed to find more differences. They posit that this change may result from presumptions by the researchers, attitude changes among women – and possibly men – entering police work, or police agencies' greater stress on community relations and involvement, the latter areas in which some earlier studies found women excelled. The findings may also result from these studies focusing on less gender-specific issues and more on factors that determine the reason for becoming a police officer, the decision to arrest or use force, and factors that influence the decisions by officers to compete for promotion.

Thus, there appears to be recognition among researchers that numbers and percentages do not tell the whole story. Questions that might be considered are whether women are accepted into law enforcement careers in the same percentages they apply, whether they complete training in percentages equal to their acceptance, whether there are organizational or societal barriers that contribute to the apparent stagnation in women's entry, and whether retention and promotion rates are similar for male and female officers.

The fragmented nature of United States policing makes progress more difficult to measure than in other countries, where there are – if not only one large national force – far fewer law enforcement agencies. Fewer agencies make it easier for researchers and demographers to count numbers and chart progress. Another issue is whether progress should be measured only in terms of upward mobility, particularly in a field where narrow organizational pyramids guarantee that few police officers will ever become chiefs of police and that, in fact, few rise to even such second-level supervisory ranks as corporal or sergeant.

Issues in Upward Mobility

An issue that has recently drawn considerable attention is upward mobility. Prior to the 1980s, few women held ranks higher than policewoman and the few who did were almost overwhelmingly in charge only of other women. The few women who were elected or appointed sheriffs were stand-ins for their husbands – they were appointed when their husbands died, or – particularly in Wisconsin – were elected in place of their husbands as way to avoid existing term limits laws (Schulz and Houghton 2003). This changed in 1985, with the selection of Penny Harrington as chief of the Portland (Oregon) Police Bureau (Schulz 2004). Although tenure for police chiefs is often brief, Harrington's was only 17 months, during which, she noted "controversy and confrontation were my constant companions" (Harrington 1999, p. 214). But they were her companions well before she was named chief; during her career she had filed more than 40 lawsuits against the department (Harrington 1999; Schulz 2004).

Other chiefs have been less controversial and most are likely to avoid discussions of their being a female chief rather than *the* chief. Yet female chiefs are still rare; Schulz (2004) estimated there were about 200 women chiefs, about 1 % of the approximately 18,000 police chiefs across the United States. Although high turnover and the large number of police agencies makes an accurate count virtually impossible, there are indications, primarily from newspaper articles documenting selection of a woman chief, that the number has doubled to about 2 % of women law enforcement chief executives (used to describe police chiefs or commissioners, sheriffs, and women leading federal law enforcement agencies).

Recent research into women in traditionally male fields has raised questions as to whether numbers and percentages provide a complete picture. Larger societal issues may play a role that has often been neglected. Studies of men in female-dominated professions such as librarianship and nursing, for instance, have found that men were advantaged in upward mobility, attributed primarily to having higher status in society based on their sex (Ott 1989; Yoder 1991). A number of studies, though, raise a question of whether upward mobility is the correct way to measure success, since many in law enforcement do not seek promotion at all (Whetstone and Deborah 1999; Whetstone 2001). Researchers who had anticipated that women would serve as change agents of the culture of law enforcement and corrections agencies have also indicated they were mistaken. They found, rather, that possibly because they believed themselves lacking in institutional support, women were traditional in their leadership styles and less willing to take chances (Zimmer 1986; Engel 2000).

While these studies appear to close off many areas of future research, they raise the possibilities that researchers need to look more carefully at cultural clues in particular agencies or types of agencies. Are there law enforcement agencies with styles that foster a desire to move up in rank or, contrarily, are there agencies in which the specialist units are so highly-regarded that officers are content to remain in them as long as possible? Is one culture better than the other; and whose definition of better would prevail? Is too much research emphasis placed solely on police officers – whether male or female – rather than on the higher ranking personnel? Similarly, can studies in local police departments be generalized to sheriffs' offices or to state police or federal law enforcement agencies? Lastly, might researchers focusing on women's place in law enforcement consider comparisons with women in other fields to better gauge whether acceptance, upward mobility, or the ability to fit into or alter an agency's culture can be measured across professions?

The importance of police in society and the unique responsibility they are given to curtail people's liberty and to exercise deadly force means that they will always be important centers of research. Who selects a career in policing, why they do so, and how they use the powers inherent in the position, and whether any or all of these are different for men or for women, will undoubtedly continue to be fruitful areas of study for future generations.

Wrongful Convictions in the Inquisitorial System

Gwladys Gilliéron
Distance Learning University Switzerland, Brig, Switzerland

Overview

The purpose of any criminal justice system is to deliver justice to all by convicting the guilty and protecting the innocent. Two model systems exist, which provide different rules to deal with the offender and bring him to justice. They are commonly known as the inquisitorial criminal justice system and the adversarial criminal justice system. The adversarial system is the system of law generally adopted in common law countries, whereas the inquisitorial justice system is usually found on the continent of Europe among civil law systems. They both aim to ensure that procedural fairness exists across the criminal justice system. Nowadays, however, it is commonly assumed that no criminal justice system belongs entirely to one of these two models.

Within the literature on wrongful convictions, most of the attention has been devoted to wrongful convictions in which innocent people have been convicted after trial. However, the reality today is that the normal trial proceeding is the exception and that the great majority of cases are resolved by way of alternative or summary proceedings, in which the public prosecutor plays a crucial role. It is certainly true that alternative proceedings are a simple method to relieve courts' heavy caseload. However, it must not be forgotten that simplification of proceeding usually goes along with restrictions on a criminal defendant's rights and also may reinforce the risk of wrongful convictions. Hence, the problem of wrongful convictions in these kinds of proceedings should deserve much more attention than what has been the case until now.

Taking the Swiss criminal justice as example, which is based on a modified inquisitorial tradition, this contribution highlights the risk of wrongful convictions especially in alternative proceedings. Conclusions drawn from the Swiss legal system may also be valid in all other criminal justice systems where alternative proceedings are the rule rather than the exception. Future researches should concentrate their efforts on wrongful convictions in alternative and summary proceedings. This is important in order to improve the quality of judicial systems.

Models of Criminal Justice Systems

The goal of every criminal justice system is to ensure that those guilty of committing a criminal offense are convicted and that the innocents are acquitted. In achieving this goal, the different criminal justice systems provide for different safeguards. Traditionally, criminal justice systems are either inquisitorial or adversarial. The inquisitorial system of justice is employed in many continental European jurisdictions, whereas criminal proceedings in the United States and in other common law countries such as England and Wales operate under an adversarial justice system. However, today it can be assumed that no criminal justice system is entirely either adversarial or inquisitorial. Continental jurisdictions have adopted adversarial elements, and inversely common law systems take over legal rules from inquisitorial justice systems. The Swiss criminal justice system, based on the inquisitorial tradition, took a step in this direction by introducing an abridged proceeding (*abgekürztes Verfahren*) that is similar to the American plea bargaining.

The distinction between both models of criminal justice systems has therefore become less important. In fact, in overloaded criminal justice systems of both models, criminal trials become relatively infrequent, and the determination of guilt is mainly made by the prosecutor. In the American criminal justice system, the overwhelming majority of criminal charges are resolved by guilty pleas, and virtually all of those are the result of plea bargaining. In 2010, about 97.5 % of cases in the federal system were settled by guilty pleas or nolo contendere (Maguire 2010). In the Swiss legal system, approximately 90 % of the convictions are based upon a penal order, a decision issued by a public prosecutor (Hutzler 2010). Hence, in reality, Switzerland and the United States mostly have an administrative criminal justice system today where the prosecutor combines the executive and judicial power. The public prosecutor is a public official with decision-making powers that are to a large extent adjudicatory. The problem is that the prosecutor faces extremely limited oversight of his decisions, and thus, wrongful convictions are a risk to seriously take into consideration.

Main Features of the Swiss Criminal Procedure

On January 1, 2011, the first Swiss Code of Criminal Procedure (CCrP) came into force and replaced the 26 cantonal criminal procedure codes and the Federal Act on the Administration of Federal Criminal Justice. This is the most significant legal reform that Switzerland has seen in this area of the law. The elimination of legal fragmentation has the aim to ensure increased equality before the law and greater legal certainty (Bundesrat 2005).

For efficiency reasons, the examining magistrate, previously found in some cantons following the French tradition, has been abolished, leaving only the public prosecutor. Thus, the public prosecutor occupies a central position and his powers are broad. He conducts the preliminary proceedings, pursues criminal offenses within the scope of the investigation, brings charges, and pleads in favor of the criminal charges (Article 16 para. 2 CCrP). In addition, in order to deal with an increasing caseload, prosecutors have been given more power and discretion to divert cases. The enormous power vested in the prosecution is compensated by the judge being responsible for compulsory acts (e.g., search and seizure) and extended defense powers (such as the right to be "immediately" assisted by a lawyer). The advantage of such an inquiry model is the achievement of a high grade of efficiency of prosecution by realizing homogenous investigation, examination, and charging (Bundesrat 2005). The abolition of the examining magistrate also brings the Swiss legal system closer to those used in common law systems.

The Swiss procedure is guided by the principle of the *factual truth* (*Prinzip der materiellen Wahrheit*). The goal of the prosecution is not to seek a conviction but to discover the truth and to apply the law. Hence, the public prosecutor has the duty to investigate in an objective and neutral way and must therefore take into account the incriminating and the exculpatory circumstances with equal care (Article 6 para. 2 CCrP). If the public prosecutor is convinced that a decision needs to be reviewed for factual or legal reasons, he is entitled to appeal. He may do this to the disadvantage as well as to the advantage of the condemned (Article 381 CCrP).

The prosecution is obliged to fully disclose its files to the defense, and a restriction to the entire disclosure of the files is only possible under certain conditions defined by law, namely, if there is reasonable suspicion that a party is misusing its rights, to ensure the safety of people or to guarantee public or private confidentiality interests (Article 108 CCrP). This obligation to fully disclose is based on the right to be heard, which is one of the basic fundamental legal rights in Switzerland (Article 29 para. 2 of the Swiss Federal Constitution; Article 107 CCrP) and the continental law in general. This rule may be of particular importance in the context of the abridged proceedings, a procedure that is comparable with American plea bargaining and is described later in this contribution. A person accused of a crime will be aware of the strengths and weaknesses of the case. If the accused then decides to confess to a criminal offense, he will act in full knowledge of the prosecutor's file.

In contrast to criminal proceedings operating under an adversarial justice system, in which the parties are each responsible to investigate the case and to present their evidence before a passive and neutral judge or jury that will decide on guilt, defense lawyers in an inquisitorial system usually do not conduct their own investigation and play only a limited role in establishing the relevant facts. It is the court that is required to actively investigate the case and is ultimately responsible for discovering the truth. It is based on the "free evaluation" (*freie Beweiswürdigung*) of all available evidence that the court reaches the decision about the innocence or guilt of the accused. The judge is required to be intimately convinced regarding the truth of the facts unless he admits them as being proven (Hauser et al. 2005; Trechsel and Killias 2004). The court must cite its rationale for the verdict and the sentence. The aim of this last duty is the protection of citizens against arbitrary state decisions.

In contrast to the adversarial system, a defendant's confession is considered similarly to other types of evidence, and the prosecution is still required to present a full and compelling case (Hauser et al. 2005). A confession is a mitigating factor of limited impact on the sentence. In the Swiss criminal justice system, a confession qualifies the defendant for a sentence reduction of about 10 % (Killias 2008).

The right to remain silent or the right against self-incrimination is also fundamental in an inquisitorial criminal justice system (Article 113 CCrP; Article 32 para. 2 the Swiss Federal Constitution; Article 6 subparagraph 2 European Convention for the Protection of Human Rights and Fundamental Freedoms (ECHR), and Article 14 para. 2 International Covenant on Civil and Political Rights (ICCPR)). The accused has the right to refuse any cooperation in the criminal proceedings, and no disadvantageous conclusions can be drawn from silence.

From the brief description of the Swiss criminal procedure, it is clear that it provides for different safeguards (i.e., right to be heard, right to remain silent, principle of the factual truth that oblige the prosecutor to investigate objectively) to ensure that those guilty of committing a criminal offense are convicted and that the innocents are acquitted. A trial serves as check on governmental excess and intends to assure the accuracy of the verdict. Alternative or summary proceedings are not invested with the same degree of safeguards that are present in the normal procedure and thus might present a higher risk of wrongful conviction.

The Swiss criminal justice system has two alternative proceedings, namely, the abridged and the penal order proceedings. These will be described in the following section.

Alternative Proceedings

Penal Order Proceedings

In Switzerland, the majority of convictions does not result from a court trial but is based upon a penal order. Overall, about 90 % of all cases are settled out of court (Hutzler 2010). In some cantons, closer to 97 % of the cases are dealt with by penal order (e.g., Basel in 2010, http://www.statistik-bs.ch/tabellen/t19/2). This procedure is often used in cases of traffic offenses, minor thefts, and possession of drugs.

The prosecutor issues a penal order (also known as summary punishment order or *Strafbefehl*) if the accused person has, in the preliminary proceedings, accepted responsibility for the factual circumstances of the case *or* if the circumstances have been otherwise sufficiently resolved. Hence, in the second scenario, a hearing of the accused prior to the decision is not a condition. In the penal order the circumstances of the cases are described and a sentence is imposed. This decision may be appealed by the defendant and other interested persons by submitting a written petition to the prosecutor within 10 days (Article 354 para. 1 CCrP). Grounds must be given for the appeal, except for an appeal by the defendant. Consequently, the case is tried in court (Article 356 CCrP). If no objection is made, the penal order becomes final and has the same effect as a judgment following a trial (Article 354 para. 3 CCrP). As a consequence, this written procedure may result in a judgment where the prosecutor decides mainly on the basis of the police files and without the parties being heard. However, since the defendant has the possibility to raise objection and ask for a full trial, this procedure is not seen as incompatible with the constitutional right to be heard (Hauser et al. 2005; Piquerez 2006).

The prosecutor has no discretion in deciding whether he wants to use the penal order or the ordinary proceedings. Once the legal requirements for the use of the penal order proceedings are fulfilled, the prosecutor must choose this way to deal with the criminal case.

The scope of application of the penal order proceedings, at the origin designed for petty offenses punishable with a fine, has widely been expanded over time. Today, the prosecutor has the possibility to impose a prison sentence of up to 6 months (Art. 352 para. 1 CCrP). This rule is quite problematic since a prison sentence is a sanction serious enough that it should not be imposed solely on the judgment of the prosecutor without compulsory preliminary hearing of the accused and without any judicial control.

The penal order is also used in many other European legal systems and is commonly referred to as the continental form of plea bargain (Langbein 1974; Trechsel and Killias 2004). However, various aspects differ between both proceedings. In the case of a penal order, the evaluation of the case is exclusively made by the prosecutor, and he is the one who imposes the sentence. During this process, the defendant, in contrast to American plea bargaining, is not represented by a lawyer. Since the prosecutor does not have the duty to hear him prior to the decision, the defendant usually does not participate. The defendant may only accept or refuse the order. A bargain between prosecution and defendant does not take place. In contrast to American plea bargaining, a defendant who does not accept the penal order and insists on a full trial does not take a risk of having a harsher sentence imposed by the court (Killias 2008; Trechsel and Killias 2008). This is mainly attributed to the fact that a penal order can only be issued if the facts are sufficiently clear and the culpability is not dubious, so that a reduction of the charges is unlikely to occur. As a consequence, the risk of false confession (i.e., accepting the penal order when the defendant is not guilty) does not exist to the same extent in the continental law as in the American system.

Abridged Proceedings

The CCrP has introduced the possibility of ending a case by way of abridged proceedings (*abgekürztes Verfahren*). This procedure is quite similar to the bargaining under the American system and thus brings the Swiss legal system closer to the common law systems. Prior to the introduction of the CCrP, three out of 26 cantons already had such an alternative procedure.

The accused person may submit an application to the prosecution for the case to be conducted by way of abridged proceedings provided that he accepts liability for those circumstances essential to the legal evaluation of the case (although an outright confession is not required) and that he accepts at least in principle the civil claims (Article 358 para. 1 CCrP). An abridged proceeding is only possible if the prosecution requests the imposition of a prison sentence not exceeding 5 years (Article 358 para. 2 CCrP).

If the application to the prosecution to handle the case by way of abridged proceedings is accepted, the defendant must have a lawyer to represent him (Article 130 (e) CCrP). With this rule, the protection of the accused person during the informal negations with the prosecution should be secured.

Informal negotiations are closed by an indictment the prosecution conveys to the parties. They have 10 days to accept or reject the indictment (Article 360 para. 2 CCrP). In addition to the points usually found in an indictment, this document contains the sentence and the warning to the parties that by accepting the indictment, they waive the right to ordinary proceedings and to initiate legal remedies (Article 360 para. 1 CCrP). The consequence of this provision is that the convicted may not file a petition for revision. This is especially the case for petition for revision based on new evidence, since the court does not conduct an evidentiary hearing; this is in contrast to the ordinary proceeding. However, the use of this legal remedy should still be possible to eliminate decisions that are unacceptable from a constitutional point of view (e.g., exercise of coercive power by the prosecution on the suspect, abuse of public office, or the decision is irreconcilably in contradiction with a later criminal decision which involves the same factual circumstances). If the parties reject the indictment, the prosecution will conduct ordinary proceedings (Article 360 para. 5 CCrP). If the indictment is accepted, the prosecution transmits the indictment together with the files to the Court of First Instance (Article 360 para. 4 CCrP). During the principal hearing, the court will have to establish whether the accused person accepts the circumstances of the case on which the charge is based, and whether this assertion corresponds to the position as set out in the files (Article 361 CCrP).

Following the principal hearing, the court retires and conducts its deliberation in private. The court has to determine whether the carrying out of abridged proceedings is lawful and appropriate, whether the charge corresponds to the conclusions of the principal hearing and to the files, and whether the sanctions requested are reasonable (Article 362 para. 1 CCrP). If the court comes to the conclusion that the requirements for a judgment by way of abridged proceedings are met, it converts the criminal offenses, sentence, and civil claim of the indictment into a judgment (Article 362 para. 2 CCrP). On the other hand, if the court estimates that the requirements are not met, it sends the files back to the prosecution in order to proceed by way of ordinary proceedings (Article 362 para. 3 CCrP). Declarations like confessions provided by the parties in respect of the abridged proceedings cannot be used in ordinary proceedings (Article 362 para. 4 CCrP). A party may only appeal against a judgment in abridged proceedings on the basis that it did not accept the indictment or that the judgment does not correspond to the indictment (Article 362 para. 5 CCrP).

Since the abridged proceeding was introduced only recently on a nationwide basis, it is too early to draw some clear conclusions on the dangers of the proceedings for innocent defendants. The canton of Basel-Landschaft was the first canton to introduce an abridged proceeding in 2000 so that some statements can be made based on its experience. Until now, this alternative procedure has been relatively rarely used. Between 2000 and 2008 a total of 96 persons have been convicted based on this proceeding. Hence, on average 12 accused are condemned by way of abridged proceedings per year. It seems that sentences are not less severe in this kind of proceedings as compared to similar cases judged by way of ordinary proceedings. It is true that the danger of false confession exists, since some defense lawyer might suggests their clients use the abridged proceedings, although no confession of the accused offense occurred during the preliminary proceedings. However, in such a situation it is not unusual that the court rejects to handle the case by way of abridged proceedings. Therefore, to a certain extent, the court can be considered as a safeguard against false confessions (Gilliéron 2010).

The risk with the Swiss abridged proceedings is that over time it comes closer to American plea bargaining and takes over not only its advantages but also its disadvantages. In the US criminal justice system, the court only rarely refuses to reject a guilty plea, so that it may be assumed that the court is not really an efficient safeguard against wrongful confessions. The reason for accepting guilty plea proposals is that the prosecutor knows all details about the case, whereas the judge has less background information on the alleged crime and the defendant. Moreover, if judges would start to call the prosecutors' decisions into question, the caseload would become overwhelming (Wright 2009). In fact, the judicial inquiry is limited to ascertaining that the defendant is of sound mind and understands the consequences of his actions, rather than examining the accuracy of the facts to which he is attesting. The judge is only required to assure that the conduct to which the defendant confesses constitutes in fact an offense under the statutory provision under which he is pleading guilty. In reality, the assessment of the defendant's responsibility is made within the executive branch, in the office of the prosecutor, and does not occur in court at all (Lynch 1998).

American plea bargaining may be defined as an "informal, administrative, inquisitorial process of adjudication, internal to the prosecutor's office – in absolute distinction from a model of adversarial determination of fact and law before a neutral judicial decision maker" (Lynch 2003, p. 1404). The risk inherent in plea bargain is best described by Barkow. According to her, plea bargaining "causes a systematic imbalance of power by allowing prosecutors to bypass the check of the judicial process" (Barkow 2006, p. 1050). In fact, the prosecutor faces extremely limited oversight over his decisions. Hence, abuse of discretion and arbitrariness might be a risk. This in turn favors the risk of wrongful convictions.

Is the Public Prosecutor the World's Most Objective Authority?

The Swiss legal system, by abolishing the examining magistrate, has adopted a system where the public prosecutor is the key actor in the criminal justice system. The public prosecutor has extremely wide powers since he is the one who conducts the preliminary proceedings, pursues criminal offenses, brings charges, and pleads in favor of the criminal charges (Article 16 para. 2 CCrP). Moreover, he makes all important decisions in alternative and summary criminal proceedings. The legitimate question that arises in this context is whether the public prosecutor is the world's most objective authority. On the one hand, the prosecutor is obliged to investigate in an objective and neutral way since he has a duty to truth and justice (Article 6 para. 2 CCrP). However, on the other hand, the prosecution represents the state at the trial. As a matter of fact, this last task excludes strict neutrality. It can be assumed that at trial, the prosecutor's aim is to seek a conviction. Furthermore, the great majority of cases are resolved by alternative proceedings such as the penal order proceeding, in which the public prosecutor takes the important decisions. In this alternative procedure, the prosecutor, in deciding whether to punish the defendant, is in reality an inquisitor seeking the "right" outcome. Taking all this into consideration, the public prosecutor's objectivity within criminal proceedings is questionable and may increase the risk of wrongful convictions.

However, the way the public prosecutor is controlled may limit the risk of abuse and hence wrongful convictions. To determine whether this is actually true, it is necessary to take a look at the structure and the manner of organization of the public prosecutor's office. Although Switzerland now has a unified criminal procedure, the organization of the public prosecution service – and in a broader sense the criminal justice authorities – remains a matter for the cantons (Art. 14 para. 2 CCrP). Thus, it is highly decentralized.

In general, prosecution services are organized hierarchically (Arn et al. 2011). Hence, prosecutors have to follow directives and instructions received from their superiors. In the majority of cantons, the Minister of Justice and hence the cantonal government stand at the top of the hierarchy. In some other cantons, the public prosecutor's office is part of the judiciary and under supervision of the cantonal Supreme Court. In those cantons where the public prosecutor is subordinated to the cantonal government, the latter only rarely issues instructions. Thus, the public prosecutor's office is autonomous and independent in a factual way regarding the functional scope, i.e., when fulfilling the tasks and in the decision practice (Hauser et al. 2005). At most, the cantonal government will issue general recommendations in order to ensure that certain aims of crime policy are pursued. In the other cantons, where the public prosecutor is as independent as the judiciary, the cantonal Supreme Court is normally not allowed to give any instructions. Its supervision is limited to receive and control the annual report (Cornu 2000). Hence, it is clear that prosecutors, in fulfilling their tasks, are to a large extent independent and are not really held accountable. It should be noted in this context that it is very important that prosecutors provide neutral, nonpolitical decisions in individual criminal cases and that prosecutorial independence is an essential element that contributes to achieving this goal. For this reason it is essential that the role of the judge does not continue to lose its significance since prosecutorial decisions can only be controlled effectively by the judiciary.

Wrongful Convictions in Switzerland

Inspired by research on wrongful convictions in Germany conducted by Karl Peters (1970–1974), a project supported by the Swiss National Science Foundation (SNSF) has analyzed all mistaken convictions (successful petitions of revision) in Switzerland between 1995 and 2004 (Killias et al. 2007). Over the considered time period, a total of 236 petitions for retrial have been admitted. The majority (159 successful petitions of revision) concerned penal orders. When considering the number of cases that are dealt with in this kind of summary proceedings, this outcome is not out of proportion. But it is highly probable that in this field, there are much more wrongful convictions than those discovered by the research. It is highly possible that the majority of convicted waive their right to challenge the decision and prefer to pay a fine (Gilliéron 2010; Killias 2008).

The results of the study show that wrongful convictions in which innocent people have been convicted after a trial play a minor role. Most cases where there was a successful petition of revision involved an excessive sentence imposed by the court when some mental problem of the convicted had not been recognized by the court and hence not been taken into account. In fact, the ignorance by the court of some mental problems of the convicted was a factor in 46.4 % of admitted petitions for retrial based on new evidence. In about one third of the admitted petition for revision, the court had convicted a factually innocent person, mostly due to perjury by “victims” of crimes against sexual integrity, or in other cases because of eyewitness misidentification or false confession by the defendant that he later repealed. The study did not identify exonerations due to DNA evidence (Killias et al. 2007). This might be the consequence of not storing items of physical evidence over a long period.

In contrast, wrongful convictions by penal order mainly concerned factually innocent defendants, who for the most part had been found guilty of a traffic violation and sentenced to a fine. Based on the available opinions, the granting of the motion for retrial led in 21 cases to a reduced sentence, in one case to a harsher sentence, and in 109 cases to the acquittal of the convicted. Wrongful identification and insufficient investigation of the facts were the leading factors contributing to wrongful convictions (Killias et al. 2007).

Risk of Wrongful Convictions Inherent in Penal Order Proceedings

There are different factors specific to the penal order proceedings that increase the risk of wrongful conviction (for a detailed discussion of these risks, see Gilliéron 2010). These are briefly described below.

Investigation: In the great majority of cases, the prosecutor bases his decision on the sole basis of the police accounts. However, those may be inaccurate or incomplete. The prosecutor is not required to hear the defendant, even if he has the intention to impose a prison sentence. In addition, it is also possible that the prosecutor expects that the defendant will make opposition if he is innocent. In sum, the prosecutor’s investigation is often not conducted with enough care.

Prosecution: The prosecution alone is responsible to issue the penal order. The decision is only subject to judicial control if the defendant or other interested persons make opposition. The fact that in this summary procedure the prosecutor acts as an inquisitor may contribute to increase the risk of wrongful convictions.

Form and time limit to make opposition: Defendants have a legal right to make written opposition within 10 days if they do not agree with the prosecutor’s decision. The short time span and the written form might hinder the defendant to exercise this right.

Defendant's behavior: Various reasons can explain why defendants miss the deadline to make opposition or decline to exercise this right. It is possible that due to functional illiteracy, the defendant is unable to understand the instructions about the right to make opposition. This assumption has some support in view of the fact that about 16 % of the Swiss population is unable to understand a text of some complexity (Notter et al. 2006). Other reasons for not contesting the order include indifference, ignorance of the law, and fear of unfavorable outcome, such as costs of the procedure.

Conclusions and Future Research

Many studies have focused their attention on wrongful convictions in which innocent people have been convicted after trial. In this context, the question whether an inquisitorial criminal justice system or an adversarial criminal justice system is better able to protect the innocents has often been discussed (see, e.g., Thomas 2008; Walpin 2003). Both models of criminal justice systems provide for different safeguards to ensure that those guilty of committing a criminal offense are convicted and that the innocents are acquitted. In the Swiss criminal justice system, based on a modified inquisitorial tradition, the right to be heard and in particular the full disclosure of the prosecutor's files and the obligation of the courts to cite their rationale for the verdict and the sentence may prevent the conviction of an innocent person. Furthermore, the principle of the factual truth that obliges the prosecutor to investigate in a neutral way may contribute to avoid and correct wrongful convictions.

However, nowadays, no criminal justice systems can claim to entirely belong to one of both models. Criminal justice systems that operate under an inquisitorial justice system have adopted adversarial elements and conversely. As a consequence, this distinction tends to lose its importance. This is reinforced by the fact that today, criminal trials are the exception rather than the rule. Today, the overwhelming majority of criminal matters are resolved by way of alternative or summary proceedings. In legal systems in which criminal trials become relatively infrequent, the determination of guilt is mainly made by the prosecutor. The prosecutor, by making important decisions in alternative proceedings, combines the executive and judicial power. His decisions are to a great extent adjudicatory. The problem in alternative proceedings is that the prosecutor faces extremely limited oversight of his decisions. Although a simplified procedure, such as the abridged proceedings under the Swiss legal system and American plea bargaining, still requires a decision by the court, the court hearing in this kind of procedure provides restriction on prosecutorial power to a much lesser degree. Therefore, wrongful convictions are a risk to seriously take into account.

In this contribution, the risk of wrongful convictions in the Swiss penal order proceedings, in which it is usual that the prosecutor takes his decision on the only base of the police report, has in particular been highlighted. At the origin, this summary procedure was designed for petty offenses punishable with a fine. Its field of application has widely expanded over time. Now, the prosecutor has the possibility to impose a custodial sentence of up to 6 months. Therefore, the penal order proceeding is not limited to petty offenses any more, but extends into criminal acts of some gravity. If the defendant does not make opposition to the decision, the decision is issued without judicial control. The wide scope of application of this procedure without any judicial control is more than critical, since this kind of proceedings is inclined to produce wrongful convictions and since almost all defendants are convicted in this way. Possible solutions that would help to prevent wrongful convictions would consist in having a judge being more actively involved (i.e., checking the penal order), a compulsory hearing of the defendant, and being represented by a lawyer if a custodial sentence is pronounced.

Concerning the abridged proceeding, it is too early to make some statements with regard to the risk of wrongful convictions. In a few years, more information will be available regarding its application frequency, the kind of crimes resolved in this way, and the problems related to it.

Alternative and summary proceedings certainly make sense if the aim of the criminal justice system is crime control or bureaucratic efficiency. However, if the aim of the justice system is the protection of individual rights, alternative proceedings are harder to justify.

It is clear that given the large amount of criminal cases that enter the criminal justice systems, it is not possible to give every defendant a criminal trial. Methods must be found to reserve full trials to those cases that deserve to go that route and treat the vast majority of other cases in another way. Future research on wrongful convictions should pay much more attention to alternative proceedings. A better understanding of the risks of wrongful convictions in these types of proceedings helps criminal justice systems to take measures in order to improve the quality of their legal system. The defendant should in turn benefit from this, since his rights would be better secured.

Overview

This entry reviews youth homicide trends in the United States over a 23-year period and describes key factors affecting increases and decreases in homicides by youth. It also summarizes a study of youth homicide perpetration from 1984 to 2006 that examined trends and predictors for two groups of young perpetrators – 13–17-year-olds and 18–24-year-olds. This study modeled city-specific predictors of *increases* in homicides by these age groups for 91 of the largest US cities. Overall, findings indicate that rates of homicide for juvenile and young adults followed the same general pattern over the 23 years: with a sharp escalation in 1984–1993, a significant downturn from 1994 to 1999, and a subsequent increase in 2000–2006. Structural disadvantage in large US cities was strongly associated with the sharp rise in perpetration of homicide by juveniles and young adults during the national homicide "epidemic" in the mid-1980s to early 1990s, as well as the more recent increase from 2000 to 2006. Gang presence and activity and illegal drug market activity were also consistently associated with increases in homicide offending by both age groups for both periods. Density of alcohol retail outlets had a significant relationship with increases in youth homicide perpetration for both age groups as well. This entry concludes with recommendations for prevention for city officials, local and federal legislators, stakeholders, providers, and advocacy groups.

Trends in Youth Homicide in the United States: 1984–2005

Since 1984, the United States has experienced two dominant trends in youth homicide**:** a dramatic increase in the mid-1980s and early 1990s, followed by a sharp decline for the rest of that decade. From the mid-1980s until the early 1990s, US homicide rates rose to their highest level since the beginning of modern crime statistics. This startling and unanticipated increase was characterized as an "epidemic" by leading homicide investigators like Cook and Laub (1998) and

Messner and his colleagues (2005). It mostly involved males, was fairly widespread across the country, and predominantly involved firearms (Fox and Zawitz 2002; Messner et al. 2005). Leading homicide researchers like Blumstein and his colleagues (2000), Cook and Laub (1998), Ousey and Augustine (2001), Ousey and Lee (2002), and many others offered explanations for the epidemic. Theories included greater prevalence of drug trafficking and drug markets in cities, greater availability and carrying of firearms, increased gang activity, changes in labor market structures, diminished economic opportunities for people living in marginalized communities, and diminished social and monetary support for families in poverty.

This historic spike in youth homicide culminated in 1993. Homicide rates then dropped dramatically, again unexpectedly. Explanations offered for the decline included reduced activity in illegal drug markets and lessening demand, improved economic conditions, greater access to housing and employment in urban areas, changes in alcohol consumption, and increased emphasis on law enforcement and imprisonment (e.g., Blumstein 1995; Blumstein and Wallman 2006; Blumstein et al. 2000; Ousey and Lee 2002; Moore and Tonry 1998). The decline lasted until the early 2000s, when reports from some US cities indicated a resurgence of urban-based violence by juveniles and young adults. National statistics also reflected an upsurge in violence and use of firearms among these groups. Homicide rates for young black males began to trend up in 2000 (Snyder and Sickmund 2006). Overall arrests of 15–24-year-olds for murder, robbery, and weapons offenses increased in 2004–2005 – for the first time in a decade (Butts and Snyder 2006). This unanticipated shift encouraged a renewed emphasis on identifying predictors of change (Fig. 1).

Factors Affecting Homicide Trends in the USA

The Relationship Between Cities and Homicide

Homicide trends vary greatly across types of homicide, as well as by age, race, circumstance-context, relationship, and gender (e.g., Flewelling and Williams 1999; Williams and Flewelling 1988; Blumstein 1995; Parker and Rebhun 1995). Rates must be disaggregated by key characteristics in order to identify patterns and predictors, since aggregated rates often mask counter trends and circumstances influencing homicide patterns for different groups (e.g., Browne and Williams 1993; Browne et al. 1999).

To understand youth homicide in the USA, it is critical to assess dynamics within cities, due to (a) the high proportion of US homicides that occur in urban areas and (b) the predominance of young, mostly male, perpetrators and victims in city-based homicide events.

Homicide trends vary across cities as well. For example, although the unprecedented increase in youth-perpetrated homicides from the mid-1980s to the early1990s was called a "national" epidemic, many US cities did *not* experience an increase in youth homicide during that period, and those that did demonstrated differing patterns in the epidemic's beginning, duration, and decline. Using Uniform Crime Reporting (UCR) data, Messner and his colleagues (2005) analyzed overall homicides rates for large US cities for the years 1979–2001 and found that just over *half* of the cities in the sample conformed to the national trend over the period. Large cities were most likely to experience an epidemic-like cycle; densely populated cities and cities with more severe levels of socioeconomic deprivation tended to have earlier entrance into and exit from the spike in youth homicide rates.

Similarly, McDowall and Loftin (2009) analyzed the extent to which trends in city-based crime rates corresponded to national crime trends over time using panel data from 139 large cities with populations over 100,000 for at least 30 years of a 45-year period (1960–2005), based on UCR offenses and population rates. In that 45-year period, national conditions must have exerted an effect at the city level during years of stability, rapid increase, and rapid decline to influence city crime rates. Results indicated that in an average year, nearly two-thirds of cities and their residents were subject to the national crime trend for that period. As with Messner et al.'s findings, larger cities were most likely to follow the national pattern, although smaller jurisdictions were also affected by nationwide conditions. Much of the variation in city crime rates remained dependent on *local* conditions *within* cities, however. National trends accounted for only about *one-fifth* of variation in local rates when between-city differences were removed.

City Characteristics Associated with Homicide

A variety of characteristics have been associated with homicide rates at the city level. In their classic study of *between*-city differences, Land and colleagues (Land et al. 1990) identified a set of key covariates that included resource deprivation (and/or affluence), e.g., families living below the poverty line, median family income, income inequality, and percent unemployed; family structure, e.g., percent divorced males and percent of children not living with both parents; population structure, including size and density and percent of the youth population; and geographical region in the USA. After the youth homicide epidemic of the late 1980s and early 1990s, other explanatory variables were added, including increases in illicit drug activity (particularly the trafficking of crack cocaine) and drug markets, a rise in US incarceration rates after 1980, and changes in law enforcement practices (Ousey and Lee 2002).

McCall and her colleagues (2008) extended earlier research by studying the extent to which *within-city* (rather than between-city) changes in structural covariates were associated with changes in the homicides rate for 83 of the largest US cities (populations over 100,000) from 1970 to 2000 and added shifts in the economy. Using a pooled cross-sectional time series model to examine the influence of within-city changes in covariates on changes in homicide rates over time, this study found that changes in resource deprivation, changes in the relative size of the youth population, and increases in drug sales arrest rates were significantly related to changes in homicide rates over four time points: 1970, 1980, 1990, and 2000.

Baumer (2008) also attempted to extend prior work on covariates by developing a more defined portrait of the determinants of crime trends for 1980–2004. He incorporated prior traditional factors and added immigration, wages, alcohol consumption, and youthful cohort variables for a sample of 114 US cities with populations of 100,000 or more (in 1980). Based on econometric panel modeling techniques, Baumer reported that unemployment rates were associated with increases in gun homicide rates overall; wages were negatively associated with non-gun homicides (pp. 159). Drug market measures yielded the most consistent significant effects in the study; these effects were strongest for youth homicide arrests. Baumer estimated that between 20 % and 40 % of the *increases* in the rates of overall homicide, gun homicide, and youth-perpetrated homicide from 1984 to 2004 were attributable to drug market activity and drug involvement. Conversely, a drop in unemployment during the 1990s coupled with a rise in wages during that period explained as much as 30 % of the *decline* in youth and non-gun homicides.

Structural Disadvantage in Cities

The impact of *economic and social disadvantage* on lethal violence in citie*s* has been documented across empirical studies of youth and adult homicide (Blumstein and Wallman 2006; Ousey and Augustine 2001; McCall et al 2008; Williams and Flewelling 1988). As noted, in the USA, homicide in general – and youth homicide in particular – is highly concentrated in communities with high levels of economic deprivation, joblessness, family disintegration, and racial segregation (Sampson and Wilson 1995). For example, the period of the youth homicide epidemic in the late 1980s corresponded to major changes in structural disadvantage in urban areas that weakened families and institutions responsible for social services and control.

Communities with higher levels of concentrated disadvantage often have fewer resources for protecting youth from involvement in illegal and dangerous activities, preventing proliferation of gangs, or mitigating the development of illegal drug markets. In their study of 83 large US cities for the years of 1970–2000, McCall and her colleagues (2008) found that an index of "resource deprivation" provided some of the strongest associations with increases in homicide rates within cities. Cities with *decreases* in the percent of families living in poverty, income inequality, and percent of children not living with both parents, coupled with *increases* in median family income, experienced *decreases* in their overall homicide rates. Each component also was independently and significantly associated with changes in city homicide rates.

Although black youth account for a disproportionate share of homicide arrests compared to their representation in the US population (e.g., Puzzanchera 2009), much of this may be explained by disadvantage. As in many other countries, structural disadvantage – and a corresponding lack of opportunity – is often particularly severe in communities of color. In their study of how city-level changes in social and economic disadvantage contribute to increases in youth homicide victimization for 15–19-year-old juveniles and 20–24-year-old young adults from 1990 to 2000, Strom and MacDonald (2007) found that increases in social and economic disadvantage were positively associated with increases in Black teenage, Black young adult, and White teenage homicide rates, independent of other factors. In general, cities with *increasing* economic disadvantage and family instability showed *increases* in youth homicide for both Blacks and Whites, independent of drug arrest rates, ethnic heterogeneity, region, and population density.

Illegal Drug Markets and US Homicide

Similar effects have been found for the influence of illegal drug markets on youth homicide. Analyzing the role of illegal drug markets in the 1980s–1990s youth homicide epidemic, Ousey and Lee (2002) used longitudinal data to examine whether within-city variation in the sale or manufacture of cocaine/opiates from 1984 to 1997 was associated with within-city variation in homicide perpetration rates during the period. Ousey and Lee modeled city-specific changes in drug market activity and homicide perpetration rates for 15–29-year-olds and the effect of between-city variation in levels of resource deprivation and found that levels of concentrated disadvantage within cities also influenced the relationship of drug market activities and homicide. Cities with *higher* levels of resource deprivation had significantly stronger relationships between illegal drug market activities and homicide perpetration by 15–29-year-olds. In cities with the *lowest* levels of resource deprivation, the relationship became negative.

The most popular explanation offered for the suddenness and extremity of the homicide epidemic was the explosion of illegal drug markets linked to the introduction of crack cocaine in the 1980s (Baumer et al. 1998; Blumstein and Wallman 2006). This theory was used to explain the sharp decline in the epidemic as well (e.g., Blumstein and Rosenfeld 1998). Although subsequent empirical studies documented the importance of illegal drug markets to the 1980s–1990s epidemic, studies by Ousey and Lee (2002) and others demonstrate that the effects were highly influenced by social context. A growth in drug-related arrests during this period was related to higher homicide arrest rates, but only for non-Latino White juveniles (see Ousey and Augustine 2001). In their study of changes in overall homicide rates from 1970 to 2000 in 83 large cities, McCall et al. (2008) found that the "drugs and violence" link suggested as a cause for the spike in youth homicide during the mid-1980s and early 1990s did not explain the decline in those rates during the last half of the 1990s. Similarly, Baumer's (2008) analyses suggested that crack cocaine was not a strong predictor of the decline in the 1990s.

Gang Presence/Activities and US Homicide

Another major challenge for US cities over the past several decades has been gang-related violence. In 2007, 86 % of agencies serving large US cities reported gang problems, in contrast to 50 % of agencies serving suburban areas and 35 % of agencies serving smaller cities. Based on their 2007 survey, Egley and O'Donnell (2009) estimated that there were more than 27,000 active gangs and approximately 788,000 gang members in the United States, with 80 % of gang members residing in large cities and suburban counties. Reports of gang-related homicides also tend to concentrate in America's most populous cities. As with other youth crime indicators during this period, one in five large cities reported an *increase* in gang homicides in 2007 compared with the previous year. Approximately two in five large cities reported increases in other violent offenses by gang members. Adolescent gang members account for a disproportionate share of serious violent offenses committed by juveniles. Longitudinal studies conducted by Thornberry and colleagues (Thornberry 1998; Krohn and Thornberry 2008) document that youth are more prone to serious and violent offenses when actively involved with a gang than before or after that affiliation.

Firearm Availability and US Homicide

The presence of weapons – particularly firearms – also has been associated with shifts in US homicide trends as well as the youth homicide epidemic. Blumstein speculated that, as adult sellers dominating drug markets were imprisoned, crack markets were increasingly staffed by young inexperienced street sellers who, lacking maturity and other skills, resolved conflicts with overwhelming force, often through the use of firearms (Blumstein 1995, pp. 29–31). However, in Baumer's recent (2008) analysis of data from 114 large US cities for the years of 1980–2004, his measure of firearm prevalence was not significantly associated with either youth or adult homicide.

Alcohol Availability and US Homicide

Finally, as Parker and colleagues note (2011), the relationship between homicide and alcohol availability is well established by empirical studies in North America, Europe, and some parts of Asia. Findings linking *youth* homicide and the availability of alcohol for purchase are mostly missing from the literature, however, especially at the city level and across long time periods, leaving a critical gap in our understanding of homicide perpetration in the USA.

Combining Key Factors Affecting Youth Homicide Trends: 1984–2006

Based on these findings and gaps in the literature, Browne, Williams, Parker, Strom, and Barrick conducted a National Institute of Justice-funded study, *Anticipating the Future Based on Analysis of the Past: Intercity Variation in Youth*

Homicide, 1984–2006, analyzing trends and predictors of youth homicide perpetration rates among juvenile and young adults 13–17 years old and 18–24 years old in the 91 largest US cities (per 1980 Census) – the first major study to focus exclusively on intercity variation in youth homicide trends. This study (a) analyzed *temporal trends within* cities during the dramatic escalation, decline, and subsequent increase in youth homicide rates; (b) explored whether the factors discussed above accounted for *variation* in youth homicide trends *between* cities; and (c) assessed whether the predictors applied *equally* to juvenile and young adult perpetration. The goal was to ***identify city characteristics associated with increases in homicides by juveniles and young adults in large US cities so future increases might be anticipated and prevented***.

Measures

The research team created a measure of structural disadvantage that included traditional risk factors as well as illegal drug activity, gang presence-activity, firearm availability, and alcohol availability. Data on youth homicide were drawn from the *Supplementary Homicide Report (SHR)* – a component of the *FBI's Uniform Crime Reporting Program*. The study compensated for missing data on offender characteristics in the SHR by using multiple imputation techniques. After data were multiply imputed, incidents were aggregated to the city level for calculations. (See Parker et al. 2011: 507–510 for details on study methods.) Analyses included only murder and nonnegligent manslaughter and excluded homicide by negligence or justifiable homicides, since those homicides are relatively rare and are not included in most definitions of criminal homicide. Analyses of incident-level data also included only incidents involving a single victim and a single perpetrator; again homicides with multiple perpetrators or victims are relatively rare. Data on the availability of alcohol within cities were gathered from the US Census of Economic Activity conducted every 5 years and were used to construct an annual time series for the density of retail alcohol outlets in each city. Other city-level characteristics – structural disadvantage, drug market activities, gang presence-activity, and firearm availability – were derived from the US Census County and City Data Books, the SHR, the annual National Youth Gangs Survey (Egley et al. 2006), and the Vital Statistics Multiple Cause of Death File, respectively.

Analyses

Analyses utilized Hierarchical Linear Modeling (HLM), effectively used in city-level homicide research by Ousey and Lee (2002) and others. This approach was selected since a set of models for nested data can be estimated simultaneously, such that the influence of the independent predictors of the dependent variable is estimated and, simultaneously, factors that measure differences among the clusters of cases at level 2 are assessed for their influence on the effects of the independent variables at the lower level at level 1. A second multilevel analytical approach, pooled cross-sectional time series (c.f. McCall et al 2008), was used to provide an additional analytical procedure with enhanced statistical power compared to HLM.

Key Findings

Using this combined measure of traditional risk factors, drug activity, gang presence-activity, and firearm and alcohol availability revealed that, **for the two age groups**, homicide perpetration among juveniles and young adults followed the same general trend between 1984 and 2006 in large US cities, with a sharp increase in youth homicide perpetration rates during the epidemic of the late 1980s to early 1990s, a significant downturn from 1994 to 1999, and a significant upturn from 2000 to 2006. **For the two periods of increase**, factors significantly associated with the perpetration of lethal violence during the years of the homicide epidemic were also associated with the subsequent increases in rates of homicides in 2000–2006.

Structural disadvantage and **gang presence-activity** in cities had consistent and significant effects on trends in youth homicide perpetration during the youth homicide epidemic and the increases in 2000–2006 as well. The *greater* the structural disadvantage and gang presence-activity within a city, the *greater* the escalation in youth homicide rates during the epidemic years. Although not as strong, this pattern also held for intercity variation during the increase in youth homicide perpetration in 2000–2006. **Drug market activity** within cities and over time also demonstrated consistent and positive effects on trends in youth homicide perpetration for 13–17-year-olds and 18–24-year-olds in the pooled cross-sectional time series analysis with its greater statistical power (but not in the HLM analysis).

Firearm availability in the pooled cross-sectional time series analysis (but not the HLM analysis) demonstrated significant and positive effects on trends in homicide perpetration for young adults ages 18–24 years old over the period. No statistically significant effects for firearm availability were found for younger perpetrators 13–17 years of age. **Alcohol availability** did show consistent effects on youth homicide perpetration for both juveniles and young adults, based on the measure of the density of alcohol retail outlets in cities (Parker et al. 2011). Similar effects have been found for adults in national as well as neighborhood level quantitative studies, but this is the first study to report this for these age groups. The proportion of young people in the population did not have statistically significant effects on city rates of juvenile and young adult homicide perpetration.

There are a number of limitations to the study. The models in these analyses used macro-level measures that did not directly capture dynamics at the *neighborhood* or *individual* level. Additionally, the use of city-level data, while advantageous for comparing risk factors between cities, does not capture *within*-city variations. For example, these measures do not indicate whether certain neighborhoods within a city have high or low levels of disadvantage, gang presence, or alcohol availability. However, the youth homicide study identified significant explanatory predictors across a particularly significant 23-year time period using two analytic strategies and multiple variables to enhance understanding of factors influencing increases in US homicide perpetration for two critical age groups.

Implications and Future Directions

As noted, the ultimate goal of the youth homicide study was to identify city characteristics associated with *increases* in homicides by juveniles and young adults in large US cities so that federal, state/regional, and local criminal justice leaders, practitioners, and advocates could develop and utilize a data-driven approach for monitoring and preparing solutions for crime involving youth. Study results documented that the ***increase in youth homicide perpetration*** in the USA from 2000 to 2006 occurred for both juveniles and young adults. Findings also showed that, despite occurring in two distinct time periods, there were ***consistent predictors for escalation*** in the perpetration of lethal violence by juveniles and young adults.

This is important from a preparedness and a prevention standpoint. The strong and consistent findings on the association of structural disadvantage and violent crime across multiple years in both age groups and periods of escalation are of particular relevance. Given the severe economic challenges facing the US and many other countries and their impact on urban areas, city officials, police departments, legislators, and community leaders need to be particularly vigilant to offset an escalation in lethal violence by youth related to resources and budgetary priorities over time.

The presence of gangs, drugs, and alcohol at the city level also are key components in cross-sectional and over time variation in youth homicide. Residents in communities with concentrated levels of unemployment and severe economic deprivation may be less able to handle delinquent youth, control illicit activities, or offer juveniles and young adults positive alternatives. Results of the youth homicide study's pooled time series analysis show significant effects for gang presence-activity, drug-related activities, and (for 18–24-year-olds only) firearm availability across 23-year period, highlighting the importance of preventive efforts in these areas. Findings on the impact of alcohol availability for both age groups also suggest a point of intervention, by indicating that reduction in the density of retail alcohol outlets in urban areas and neighborhoods may be an effective tool for violent crime reduction among youth.

Finally, in the youth homicide study, there were marked similarities in city-level explanatory predictors associated with juvenile and young adult violence trends. Although Butts and Snyder (2006) encouraged the *inclusion* of 18–24-year-olds in studies of youth homicide trends, to our knowledge, this is the first study that examines lethal youth violence trends and their city-level predictors separately for juveniles (ages 13–17) and young adults (ages 18–24). The importance of the identified risk factors for both age groups is not surprising. There is considerable overlap in the interactions of teenagers and young adults in urban settings, including family and other social interactions as well as local gang and drug market activities. Much of the gang literature describes age-integrated gangs composed of juveniles and young adults. Homicide data also consistently documents a substantial crossover between juvenile and young adult victims and offenders (e.g., Cook and Laub 1998). ***It is critical that any interventions or initiatives seeking to prevent or reduce youth violence not simply focus on juveniles under age 18***. They must also address criminally involved young adults with whom juveniles come in contact if the younger youth are to be deterred and protected.

By identifying and better understanding factors related to increases in youth homicide perpetration, policy makers, researchers, and community leaders can develop more effective and targeted strategies for responding to "at-risk" juveniles and young adults *before* periods of escalation (e.g., although a downturn has been reported in some national rates from 2007 through 2008 for violent crimes by youth, the perpetration rate for homicide by Black male juveniles ages 14–17 continued to increase from 2002 to 2008: Cooper and Smith 2011). Empirical findings can be utilized as a first step by cities, states, and practitioners and policy makers to:

1. **Support At-risk Youth, Particularly Youth Living in Structurally Disadvantaged Neighborhoods.** It is critical that proactive resources and programs for at-risk youth be increased by using comprehensive and integrated community-level, school-level, family-level, and individual-level interventions designed to strengthen young people's "core competencies" as well as the social contexts in which they reside. As Williams, Guerra, and their colleagues have noted, having such supports will help juveniles and young adults more effectively – without violence and other illegal activities – "beat the odds" (Kim et al. 2008; Guerra and Bradshaw 2008). Empirical studies document that, even in the face of severe disadvantage and pervasive danger, most young people accomplish the developmental tasks necessary to withstand the risks and live productive, healthy, and responsible adult lives (e.g., Elliott et al. 2006).
2. **Create Prevention Initiatives and Programs That Target Young Adults Ages 18–24 as Well as At-Risk Juveniles.** Results of the youth homicide study clearly demonstrate that juvenile and young adult trends in homicide perpetration are influenced by similar factors (with the exception of firearms availability). As a result, interventions – whether in the form of policing initiatives or community-based prevention strategies – should not *exclude* young adults. For example, this is the case with under age access to alcohol, since half of the population at risk in the 18–24 age group is below the legal minimum purchase age for alcohol. Enforcing existing laws with regard to under age access may have an important preventative impact on younger and older age groups.
3. **Develop Comprehensive and Multidisciplinary Approaches for Addressing Gangs.** Findings from the youth homicide study and other empirical research also

demonstrate the importance of gang presence and activity in influencing increases in fatal violence by juveniles and young adults. It is urgent that federal, state or region, and city policy makers work with law enforcement and crime prevention experts to assess gang activity proactively and incorporate that knowledge not simply into police planning but also into creative citywide and regional initiatives for community-based and social policy interventions.

4. **Inform Preparedness and Prevention Activities More Effectively.** Federal and local leaders should develop and utilize more data-driven approaches for enhancing crime preparedness and prevention activities. These activities could then be tied directly to the deployment and strengthening of policing and crime prevention resources in a more efficient manner, based on identified predictors of lethal youth violence during the escalation period of 1984–1993 and the relevance of those predictors for increases in 2000–2006. **At the federal level**, this would include compiling the necessary data sources and identifying cities particularly at risk of youth homicide increases based on past and current structural conditions and city-specific trends. **At the local level**, mayors, police chiefs, and other agencies charged with responding to or preventing crime should consistently review and analyze the data for their jurisdiction to identify emerging patterns and concerns.
5. The type of data collection and analysis we recommend would involve (1) analyzing multiple years of data to explore past and emerging city-based trends and (2) the use of data sources in *addition* to police crime data, including key economic and social indicators as well as specific measures of the prevalence of gang presence-activity, drug-related activity, and alcohol outlet density in the city. The *timeliness* and *quality* of crime and structural indicator data must be improved as well, so that these measures are useful for resource deployment and prevention.
6. **Improve Quality of Crime and City-level Indicator Data.** There also is a critical need to develop improved measures. The goal is to develop measures that can be *standardized* across jurisdictions and are as *independent* as possible of police activities and initiatives. One mechanism is to develop measures through survey data collection processes that monitor levels of gang activity or drug activity in specific communities. The regular collection of information using these types of approaches may be cost-prohibitive for some jurisdictions, however. Ultimately, from a national policy standpoint, decisions must be made as to whether the benefits associated with increased resources for collecting independent measures provide a significant return in (a) understanding these phenomena within and across cities and (b) monitoring and intervening effectively over time. In the absence of improved measures, many of the surprises associated with imprecise measures will continue.

Since the early 1980s, responses to crime in the United States have centered on law enforcement, sentencing, and incarceration or detention. A growing body of criminal justice literature suggests that investments in policing and other official forms of social control will have disappointing results unless the preconditions of structural disadvantage and attendant problems are addressed. For communities, states, regions, and nations, the benefits of preventing criminal activities and their outcomes among youth will far outweigh the investments required for proactive support.
